

16 MHz 8-bit Microcontroller, 16 KB Flash Memory,
12-bit ADC, 3 Timers, USART, I2C, High Current Ports

DS Rev. 1.21

Features

Core

- 8-bit CISC M8051 core

16 KB On-Chip Flash

- Endurance: 30,000 times
- In-System Programming (ISP)

256 bytes IRAM/512 bytes XRAM

GPIO (General-Purpose I/O)

- Normal I/O: max 30 ports
- High sink current port: max 8 ports

Timer/Counter

- Basic Interval Timer (BIT)
- Watch Timer (WT)
- Window Watchdog Timer (WDT)
- 8-bit × 1-ch (T0)
- 16-bit × 2-ch (T1/T2)

Programmable Pulse Generation

- Pulse generation (by T0/T1/T2)
- 16-bit complement PWM (dead time control)

I2C

- 8-bit x 1-ch

USART0/1 (UART + SPI)

- 8-bit USART × 2-ch or 8-bit SPI × 2-ch
- Receiver Time-Out (RTO)
- 0% Error Baud Rate

12-bit A/D Converter

- 15 External Input channels
- 1-channel for internal reference voltage

Power-On Reset

- Reset release level (1.32 V)

Low Voltage Reset

- 16-level detection

Low Voltage Indicator

- 13-level detection

Interrupt Sources

- EINT0 to 4, EINT5, EINT6, EINT7 to A, EINT10, EINT11, EINT12 (7)
- Timer 0/1/2 (3)
- WDT (1)
- BIT (1)
- WT (1)
- USART RX/TX (4)
- I2C (1)
- ADC (1)
- CRC (1)
- LVI (1)

Internal RC Oscillator

- HSI 32 MHz ±1.5% (TA= 0°C to +50°C)
- HSI 32 MHz ±2.0% (TA= -10°C to +70°C)
- HSI 32 MHz ±2.5% (TA= -40°C to +85°C)
- HSI 32 MHz ±5.0% (TA= -40°C to +105°C)
- LSI 128 kHz ±20% (TA= -40°C to +85°C)
- LSI 128 kHz ±30% (TA= -40°C to +105°C)

Power Down Mode

- STOP, IDLE mode

Operating Temperature

- -40°C to $+85^{\circ}\text{C}$
- -40°C to $+105^{\circ}\text{C}$

Operating Voltage and Frequency

- 1.8 V to 5.5 V (@32.768 kHz crystal)
- 2.2 V to 5.5 V (@4 MHz to 10 MHz with crystal)
- 2.4 V to 5.5 V (@4 MHz to 12 MHz with crystal)
- 1.8 V to 5.5 V (@0.5 MHz to 16 MHz with internal RC)

Packages

- 32-LQFP
- 28-TSSOP
- 28-SOP
- 24-QFN
- 20-TSSOP
- 20-SOP
- 16-SOPN
- Pb-free package

Minimum Instruction Execution Time

- 125 ns (@ 16 MHz main clock)
- 61 μs (@ 32.768 kHz sub clock)

Product Selection Table

Table 1. Device Summary

Part Number	FLASH	XRAM	IRAM	Timer (PWM)	Communication function		ADC 12-bit (Channel)	GPIO	High Current Port	Package	Temp. Range

1 Description

A96G166/A96A166/A96S166 is an advanced CMOS 8-bit microcontroller with 16 Kbytes of FLASH. This is a powerful microcontroller which provides a highly flexible and cost-effective solution to many embedded control applications.

1.1 Device Overview

In this section, features of A96G166/A96A166/A96S166 and peripheral counts are described.

Table 2. A96G166/A96A166/A96S166 Device Features and Peripheral Counts

Peripherals		Description
Core	CPU	8-bit CISC core (M8051, 2-clock per cycle)
	Interrupt	Up to 21 peripheral interrupts supported. • EINT0 to 4, EINT5, EINT6, EINT7 to A, EINT10, EINT11, EINT12 (7) • Timer 0/1/2 (3) • WDT (1) • BIT (1) • WT (1) • USART *Rx/Tx (4) • I2C (1) • ADC (1) • CRC (1) • LVI (1)
Memory	ROM (FLASH) capacity	• 16 Kbytes FLASH with self-read and write capability • In-system programming (ISP) • Endurance: 30,000times
	IRAM	256 bytes
	XRAM	512 bytes
Programmable pulse generation		• Pulse generation (by T0/T1/T2) • 16-bit Complement PWM (Dead time control)
Buzzer		8-bit × 1-ch
Minimum instruction execution time		• 125 ns (@ 16 MHz main clock) • 61 μs (@ 32.768 kHz sub clock)
Power down mode		• STOP mode • IDLE mode

Table 2. A96G166/A96A166/A96S166 Device Features and Peripheral Counts (continued)

Peripherals		Description
GPIO (General-Purpose I/O)		- Normal I/O: Max 30 ports - High sink current port: LED 8 × COM
Reset	Power-on reset	Reset release level: 1.32 V
	Low voltage reset	16-level detection 1.61/1.68/1.77/1.88/2.00/2.13/2.28/2.46/2.68/2.81/3.06/3.21/3.56/3.73/3.91/4.25 V
Low voltage indicator		13 levels detect 1.88/2.00/2.13/2.28/2.46/2.68/2.81/3.06/3.21/3.56/3.73/3.91/4.25 V
Watch Timer (WT)		3.91 ms/0.25 s/0.5 s/1 s/1 min interval at 32.768kHz
Timer/counter		- BIT (Basic interval timer) 8-bit × 1-ch. - WDT (Watchdog timer) 8-bit × 1-ch. 8-bit Timer × 1-ch (T0), 16-bit Timer × 2-ch (T1/T2)
Communication function	USART (UART+SPI)	8-bit USART or 8-bit SPI × 2-ch - Receiver timer-out (RTO) 0% error baud rate
	I2C	8-bit I2C × 1-ch
12-bit A/D converter		15 input channels
Oscillator type		4MHz to 12MHz crystal or ceramic for main clock 32.768kHz Crystal for sub clock
Internal RC oscillator		- HSI 32MHz ±3.0% (TA=-40°C to +85°C) - HSI 32MHz ±5.0% (TA=-40°C to +105°C) - LSI 128kHz ±20% (TA= -40°C to +85°C) - LSI 128kHz ±30% (TA= -40°C to +105°C)
Operating voltage and frequency		1.8 V to 5.5 V @ 32.768 kHz with crystal 2.2 V to 5.5 V @ 4 MHz to 10 MHz with crystal 2.4 V to 5.5 V @ 4 MHz to 12 MHz with crystal 1.8 V to 5.5 V @ 0.5 MHz to 16.0 MHz with internal RC
Operating temperature		-40°C to +85°C, -40°C to +105°C
Package		- Pb-free packages 32-LQFP 28-TSSOP 28-SOP 24-QFN 20-TSSOP 20-SOP

1.2 A96G166/A96A166/A96S166 Block Diagram

In this section, A96G166/A96A166/A96S166 device with peripherals are described in a block diagram.

Figure 1. A96G166/A96A166/A96S166 Block Diagram

2 Pinouts and Pin Description

In this chapter, A96G166/A96A166/A96S166 device pinouts and pin descriptions are described.

NOTES:

- The ^(*) is applied to 20-TSSOP of A96S166
- The P04–P06 and P26 are not in the 28-pin package.
- The P04–P06, P17, P20-P22 and P26 are not in the 24-pin package.
- The P04–P06, P14-P17, P20, P23, P26 and P33-P34 are not in the 20-pin package.
- The P02-P05, P10-P11, P16-P17, P20-P21, P23, P30-P31 and P33-P35 are not in the 16-pin package.
- The P32/RESETB (A96G166) pin is configured as one of the P32 and RESETB pin by the "CONFIGURE OPTION." (P35/RESETB : A96S166)
- If the P00/AN0/DSDA and P01/AN1/DSCL pins are connected to the programmer during power-on reset, the pins are automatically configured as In-system programming pins.
- The P00/AN0/DSDA and P01/AN1/DSCL pins are configured as inputs with internal pull-up resistor only during the reset or power-on reset.
- The P36/XIN, P37/XOUT, P33/SXOUT, and P34/SXIN pins are configured as a function pin by software control.
- (1) I=Input, O=Output, U=Pull-up, D=Pull-down, S=Schmitt-Trigger Input Type, C=CMOS Input Type, A=Analog, P=Power
- The * means 'Selected pin function after reset condition

3 Port Structures

In this chapter, two port structures are described. Figure 9 and Figure 10 show general purpose I/O port and external interrupt I/O port respectively.

Figure 9. General Purpose I/O Port

Figure 10. External Interrupt I/O Port

4 CPU (Central Processing Unit)

Central Processing Unit (CPU) of A96G140 is based on Mentor Graphics M8051EW core, which offers improved code efficiency and performance.

4.1 Architecture and Registers

Figure 11 shows a block diagram of the M8051EW architecture. As shown in the figure, the M8051EW supports both Program Memory and External Data Memory. In addition, it features a Debug Mode in which it can be driven through a dedicated debug interface.

Figure 11. M8051EW Architecture

Main features of the M8051EW are listed below:

- Two clocks per machine cycle architecture:
- Debug support (OCD and OCD II):
- Separate program and external data memory interfaces or a single multiplexed interface
- Support for synchronous and asynchronous Program, External Data and Internal Data Memory
- Wait states support for slow Program and External Data Memory
- 16-bit Data Memory address is generated through the Data Pointer register (DPTR register).
- 16-bit program counter is capable of addressing up to Flash size in Each device
- A single data pointer, two memory-mapped data pointers, or 2 banked data pointers
- Support 2 or 4 level of priority scheme – Up to 24 maskable Interrupt sources
- External Special Function Register (SFR) are memory mapped into Direct Memory at the address between 80 hex and FF hex.

4.2 Addressing

The M8051EW supports six types of addressing modes as listed below:

1. Direct addressing mode: In this mode, the operand is specified by the 8-bit address field. Only internal data and SFRs can be accessed using this mode.
2. Indirect addressing mode: In this mode, the operand is specified by addresses contained in a register. Two registers (R0 and R1) from the current bank or the Data Pointer may be used for addressing in this mode. Both internal and external Data Memory may be indirectly addressed.
3. Register addressing mode: In this mode, the operand is specified by the top 3 bits of the opcode, which selects one of the current bank of registers. Four banks of registers are available. The current bank is selected by the 3rd and 4th bits of the PSW.
4. Register specific addressing mode: In this mode, some instructions only operate on specific registers. This is defined by the opcode. In particular many accumulator operations and some stack pointer operations are defined in this manner.
5. Immediate DATA mode: In this mode, Instructions which use Immediate Data are 2 or more bytes long and the Immediate operand is stored in Program Memory as part of the instruction.

Example) `MOV A, #100`

It loads the Accumulator with the decimal number 100. The same number could be specified in hex digits as 64H.

6. Indexed addressing mode: In this mode, only Program Memory can be addressed. It is intended for simple implementation of look-up tables. A 16-bit base register (either the PC or the DPTR) is combined with an offset stored in the accumulator to access data in Program Memory.

4.3 Instruction Set

An instruction is a single operation of a processor that is defined by the instruction set. The M8051EW uses the instruction set of 8051 that is broadly classified into five functional categories:

1. Arithmetic instructions
2. Logical instructions
3. Data transfer instructions
4. Boolean instructions
5. Branching instructions

Major features of the instruction set are listed below. If users need detailed information about the instruction table, please refer to **Appendix** or **Instruction Table**:

- Instructions are either 1, 2 or 3 bytes long as listed in the 'Bytes'.
- Each instruction takes either 1, 2 or 4 machine cycles to execute.
1 machine cycle comprises 2 CCLK clock cycles.
- An M8051EW-specific instruction "MOVC @ (DPTR++) , A" is provided to enable software to be downloaded into Program Memory where it is implemented as RAM. This instruction can also be used subsequently to modify contents of the Program Memory RAM.
- Arithmetic Instruction
- Logical Instruction
- Internal data memory
- External data memory
- Unconditional Jumps
- Subroutine calls and returns
- Conditional Jumps
- Boolean Instructions
- Flag

5 Memory Organization

A96G166/A96A166/A96S166 addresses two separate address memory spaces:

- Program memory
- Data memory

By means of this logical separation of the memory, 8-bit CPU address can access the Data Memory more rapidly. 16-bit Data Memory address is generated through the DPTR register.

A96G166/A96A166/A96S166 provides on-chip 16 Kbytes of the ISP type flash program memory, which is readable and writable. Internal data memory (IRAM) is 256-byte and it includes the stack area. External data memory (XRAM) is 512-byte.

5.1 Program Memory

A 16-bit program counter is capable of addressing up to 64 Kbytes, and A96G166/A96A166/A96S166 has just 16 Kbytes program memory space.

Figure 12 shows a map of the lower part of the program memory.

After reset, CPU begins execution from location 0000H. Each interrupt is assigned a fixed location in the program memory. An interrupt causes the CPU to jump to the corresponding location, where it commences execution of the service routine.

An external interrupt 11, for example, is assigned to location 000BH. If the external interrupt 11 is going to be used, its service routine must begin at location 000BH. If the interrupt is not going to be used, its service location is available as general purpose program memory. If an interrupt service routine is short enough (as is often the case in control applications), it can reside entirely within an interval of 8-byte.

Longer service routines can use a jump instruction to skip over subsequent interrupt locations, if other interrupts are in use.

Figure 12. Program Memory Map

5.2 Data Memory

Internal data memory space is divided into three blocks, which are generally referred to as lower 128 bytes, upper 128 bytes, and SFR space. Internal data memory addresses are always one byte wide, which implies an address space of 256 bytes. In fact, the addressing modes for the internal data memory can accommodate up to 384 bytes by using a simple trick. Direct addresses higher than 7FH access one memory space, while indirect addresses higher than 7FH access a different memory space. Thus, as shown in Figure 13, the upper 128 bytes and SFR space occupy the same block of addresses, 80H through FFH, although they are physically separate entities.

The lower 128 bytes of RAM are present in all 8051 devices as mapped in Figure 14. The lowest 32 bytes are grouped into 4 banks of 8 registers. Program instructions call out these registers as R0 through R7. Two bits in the Program Status Word select which register bank is in use. This allows more efficient use of code space, since register instructions are shorter than instructions that use direct addressing.

The next 16 bytes above the register banks form a block of bit-addressable memory space. The 8051-instruction set includes a wide selection of single-bit instructions, and the 128 bits in this area can be directly addressed by these instructions. The bit addresses in this area are 00H through 7FH.

All of the bytes in the lower 128 bytes can be accessed by either direct or indirect addressing. The upper 128 bytes of RAM can only be accessed by indirect addressing. These spaces are used for data RAM and stack.

Figure 13. Data Memory Map

Figure 14. Lower 128 bytes of RAM

5.3 External Data Memory

A96G166/A96A166/A96S166 has 512 bytes of XRAM and XSFR. This area has no relation with RAM/FLASH. It can be read and written to through SFR with 8-bit unit.

Figure 15. XDATA Memory Area

6 I/O Ports

A96G166/A96A166/A96S166 has ten groups of I/O ports (P0 to P2). Each port can be easily configured as an I/O pin, an internal pull up or an open-drain pin to meet various system configurations and design requirements. P0 includes a function that can generate interrupt signals according to state of a pin.

6.1 P0 Port

6.1.1 P0 Port Description

P0 is an 8-bit I/O port. P0 control registers consist of P0 data register (P0), P0 direction register (P0IO), debounce enable register (P0DB), P0 pull-up resistor selection register (P0PU), and P0 open-drain selection register (P0OD). Refer to the port function selection registers for the P0 function selection.

6.2 P1 Port

6.2.1 P1 Port Description

P1 is an 8-bit I/O port. P1 control registers consist of P1 data register (P1), P1 direction register (P1IO), debounce enable register (P1DB), P1 pull-up resistor selection register (P1PU), and P1 open-drain selection register (P1OD). Refer to the port function selection registers for the P1 function selection.

6.3 P2 Port

6.3.1 P2 Port Description

P2 is an 8-bit I/O port. P2 control registers consist of P2 data register (P2), P2 direction register (P2IO), P2 pull-up resistor selection register (P2PU) and P2 open-drain selection register (P2OD). Refer to the port function selection registers for the P2 function selection.

6.4 P3 Port

6.4.1 P3 Port Description

P3 is an 8-bit I/O port. P3 control registers consist of P3 data register (P3), P3 direction register (P3IO) and P3 pull-up resistor selection register (P3PU). Refer to the port function selection registers for the P3 function selection.

7 Interrupt Controller

A96G166/A96A166/A96S166 supports up to 21 interrupt sources. The interrupts have separate enable register bits associated with them, allowing software control. In addition, they have four levels of priority assigned to themselves.

A non-maskable interrupt source is always enabled with a higher priority than any other interrupt source and is not controlled by software.

Interrupt controller of A96G166/A96A166/A96S166 has following features:

- Request receive from 21 interrupt sources
- 6 groups of priority
- 4 levels of priority
- Multi Interrupt possibility
- A request of higher priority level is served first, when multiple requests of different priority levels are received simultaneously.
- Each interrupt source can be controlled by EA bit and each IEx bit
- Interrupt latency of 3 to 9 machine cycles in single interrupt system

A non-maskable interrupt is always enabled, while maskable interrupts are enabled through four pairs of interrupt enable registers (IE, IE1, IE2, and IE3). Each bit of IE, IE1, IE2, IE3 register individually enables/disables the corresponding interrupt source. Overall control is provided by bit 7 of IE (EA). When EA is set to '0', all interrupts are disabled: when EA is set to '1', interrupts are individually enabled or disabled through the other bits of the interrupt enable registers. The EA bit is always cleared to '0' jumping to an interrupt service vector and set to '1' executing the [RETI] instruction. The A96G166/A96A166/A96S166 supports a four-level priority scheme. Each maskable interrupt is individually assigned to one of four priority levels according to IP and IP1.

Default interrupt mode is level-trigger mode basically, but if needed, it is possible to change to edge-trigger mode. Figure 16 shows the Interrupt Group Priority Level that is available for sharing interrupt priority. Priority of a group is set by two bits of interrupt priority registers (one bit from IP, another one from IP1). Interrupt service routine serves higher priority interrupt first. If two requests of different priority levels are received simultaneously, the request of higher priority level is served prior to the lower one.

Figure 16. Interrupt Group Priority Level

7.1 Block Diagram

Figure 17. Interrupt Controller Block Diagram

7.2 Interrupt Vector Table

Interrupt controller of A96G166/A96A166/A96S166 supports 21 interrupt sources as shown in Table 8. When interrupt is served, long call instruction (LCALL) is executed and program counter jumps to the vector address. All interrupt requests have their own priority order.

Table 8. Interrupt Vector Address Table

Interrupt source	Symbol	Interrupt Enable Bit	Priority	Mask	Vector address
Hardware Reset	RESETB	—	0	Non-Maskable	0000H
External Interrupt 10	INT0	IE.0	1	Maskable	0003H
External Interrupt 11	INT1	IE.1	2	Maskable	000BH
External Interrupt 12	INT2	IE.2	3	Maskable	0013H
-	INT3	IE.3	4	Maskable	001BH
-	INT4	IE.4	5	Maskable	0023H
External Interrupt 0-4	INT5	IE.5	6	Maskable	002BH
External Interrupt 5	INT6	IE1.0	7	Maskable	0033H
External Interrupt 6	INT7	IE1.1	8	Maskable	003BH
I2C Interrupt	INT8	IE1.2	9	Maskable	0043H
USART1 RX Interrupt	INT9	IE1.3	10	Maskable	004BH
USART1 TX Interrupt	INT10	IE1.4	11	Maskable	0053H
USART0 RX Interrupt	INT11	IE1.5	12	Maskable	005BH
USART0 TX Interrupt	INT12	IE2.0	13	Maskable	0063H
T0 Match Interrupt	INT13	IE2.1	14	Maskable	006BH
T1 Match Interrupt	INT14	IE2.2	15	Maskable	0073H
T2 Match Interrupt	INT15	IE2.3	16	Maskable	007BH
-	INT16	IE2.4	17	Maskable	0083H
External Interrupt 7-A	INT17	IE2.5	18	Maskable	008BH
ADC Interrupt	INT18	IE3.0	19	Maskable	0093H
CRC Interrupt	INT19	IE3.1	20	Maskable	009BH
WT Interrupt	INT20	IE3.2	21	Maskable	00A3H
WDT Interrupt	INT21	IE3.3	22	Maskable	00ABH
BIT Interrupt	INT22	IE3.4	23	Maskable	00B3H
LVI Interrupt	INT23	IE3.5	24	Maskable	00BBH

For maskable interrupt execution, the EA bit must be set to '1' and a specific interrupt must be enabled by writing '1' to associated bit in the IEx. If an interrupt request is received, the specific interrupt request flag is set to '1'. And it remains '1' until CPU accepts the interrupt. If the interrupt is served, the interrupt request flag will be cleared automatically.

8 Clock Generator

As shown in Figure 18, a clock generator produces basic clock pulses which provide a system clock for CPU and peripheral hardware.

It contains main/sub-frequency clock oscillator. The main/sub clock can operate easily by attaching a crystal between the XIN/SXIN and XOUT/SXOUT pin, respectively. The main/sub clock can be also obtained from the external oscillator. For this, it is necessary to place external clock signal into the XIN/SXIN pin and open XOUT/SXOUT pin.

Default system clock is 16 MHz INT-RC Oscillator. To stabilize the system internally, 128 kHz LOW INT-RC oscillator on POR is recommended.

Oscillators in the clock generator are described in the following:

- Calibrated high internal RC oscillator (32 MHz)
 - HSI OSC/2 (16 MHz, default system clock)
 - HSI OSC/4 (8 MHz)
 - HSI OSC/8 (4 MHz)
 - HSI OSC/16 (2 MHz)
 - HSI OSC/32 (1 MHz)
 - HSI OSC/64 (0.5 MHz)
- Main crystal oscillator (0.4 to 12 MHz)
- Sub-crystal Oscillator (32.768 kHz)
- Internal LSI oscillator (128 kHz)

8.1 Clock Generator Block Diagram

In this section, a clock generator of A96G166/A96A166/A96S166 is described in a block diagram.

Figure 18. Clock Generator Block Diagram

9 Basic Interval Timer

A96G166/A96A166/A96S166 has a free running 8-bit Basic Interval Timer (BIT). BIT generates the time base for watchdog timer counting and provides a basic interval timer interrupt (BITIFR).

BIT of A96G166/A96A166/A96S166 features the following:

- During Power-On, BIT gives a stable clock generation time
- On exiting Stop mode, BIT gives a stable clock generation time
- As a timer, BIT generates a timer interrupt.

9.1 BIT Block Diagram

In this section, basic interval timer of A96G166/A96A166/A96S166 is described in a block diagram.

10 Watchdog Timer

The watchdog timer rapidly detects the CPU malfunction such as endless looping caused by noise or something like that and resumes the CPU to the normal state. The watchdog timer signal for malfunction detection can be used as either a CPU reset or an interrupt request.

When the watchdog timer is not being used for malfunction detection, it can be used as a timer to generate an interrupt at fixed intervals. When 75% of the overflow time is reached, a watchdog interrupt can be generated.

The overflow time of the watchdog timer can select by WDTOVF[2:0] of WDTCR. If an overflow occurs, an internal reset is generated. The WDTRC operation in the STOP/IDLE mode differs as follows depending on the setting value of WDTPDON.

If WDTPDON = 0, the WDTRC operation stops in the STOP/IDLE mode and if WDTPDON = 1, the WDTRC operation in the STOP/IDLE mode. The Watchdog timer operates on the 4 kHz, based on clock 128 kHz Ring oscillator clock.

Watchdog reset occurs in the following cases:

- When the watchdog timer counter overflows
- When the data except “96H” is written to the WDTC register
- When the data “96H” is written to the WDTC register during a window close period

10.1 WDT Block Diagram

Figure 20. Watchdog Timer Block Diagram

11 Watch Timer

Watch timer (WT) has functions for RTC (Real Time Clock) operation. It is generally used for RTC design. WT consists of a clock source select circuit, a timer counter circuit, an output select circuit and watch timer control registers.

Prior to operating WT, a user needs to determine an input clock source and output interval, and to set WTEN to '1' in watch timer control register (WTCR). It is able to be executed simultaneously or individually. To stop or reset WT, clear the WTEN bit in WTCR register.

Although CPU is in STOP mode, a sub clock can be alive so that WT continues its operation. Watch timer counter circuits may be composed of 21-bit counter which contains low 14-bit with binary counter and high 7-bit counter in order to increase resolution. In WTDR, it can control WT clear and set interval value at write time, and it can read 7-bit WT counter value at read time.

11.1 WT Block Diagram

In this section, watch timer of A96G166/A96A166/A96S166 is described in a block diagram.

Figure 21. Watch Timer Block Diagram

12 Timer 0/1/2

12.1 Timer 0

An 8-bit timer 0 consists of a multiplexer, a timer 0 counter register, a timer 0 data register, a timer 0 capture data register and a timer 0 control register (T0CNT, T0DR, T0CDR, T0CR).

Timer 0 operates in one of three modes described in the followings:

- 8-bit timer/counter mode
- 8-bit PWM output mode
- 8-bit capture mode

Timer/counter 0 can be clocked by an internal or an external clock source (EC0). The clock source is selected by clock selection logic which is controlled by clock selection bits T0CK[2:0].

- TIMER0 clock source: $f_x/2$, $f_x/4$, $f_x/8$, $f_x/32$, $f_x/128$, $f_x/512$, $f_x/2048$ and EC0

In capture mode, data is captured into input capture data register (T0CDR) by EINT10. In timer/counter mode, whenever counter value is equal to T0DR, T0O port toggles. In addition, timer 0 outputs PWM waveform through PWM0O port in the PWM mode.

Table 9. Timer 0 Operating Mode

T0EN	T0MS[1:0]	T0CK[2:0]	Timer 0
1	00	XXX	8-bit Timer/Counter Mode
1	01	XXX	8-bit PWM Mode
1	1X	XXX	8-bit Capture Mode

12.1.1 Timer 0 Block Diagram

Figure 22. 8-bit Timer 0 Block Diagram

12.2 Timer 1

A 16-bit timer 1 consists of multiplexer, timer 1 A data register high/low, timer 1 B data register high/low and timer 1 control register high/low (T1ADRH, T1ADRL, T1BDRH, T1BDRL, T1CRH, T1CRL).

Timer 1 operates in one of the following modes:

- 16-bit timer/counter mode
- 16-bit capture mode
- 16-bit PPG output mode (one-shot mode)
- 16-bit PPG output mode (repeat mode)

The timer/counter 1 uses an internal clock or an external clock (EC1) as an input clock source. The clock sources are described below, and one is selected by clock selection logic which is controlled by clock selection bits (T1CK[2:0]).

- TIMER 1 clock source: $f_x/1$, $f_x/2$, $f_x/4$, $f_x/8$, $f_x/64$, $f_x/2048$, HSI and EC1

In capture mode, the data is captured into input capture data register (T1BDRH/T1BDRL) by EINT11. Timer 1 results in the comparison between counter and data register through T1O port in timer/counter mode. In addition, Timer 1 outputs PWM waveform through PWM1O port in the PPG mode.

Table 10. TIMER 1 Operating Modes

T1EN	P1FSRL[5:4]	T1MS[1:0]	T1CK[2:0]	Timer 1
1	01	00	XXX	16-bit Timer/Counter Mode
1	00	01	XXX	16-bit Capture Mode
1	01	10	XXX	16-bit PPG Mode (one-shot mode)
1	01	11	XXX	16-bit PPG Mode (repeat mode)

12.2.1 16-bit Timer 1 Block Diagram

In this section, a 16-bit timer 1 is described in a block diagram.

Figure 23. 16-bit Timer 1 Block Diagram

12.3 Timer 2

A 16-bit timer 2 consists of a multiplexer, timer 2 A data high/low register, timer 2 B data high/low register and timer 2 control high/low register (T2ADRH, T2ADRL, T2BDRH, T2BDRL, T2CRH, and T2CRL).

Timer 2 operates in one of the following modes:

- 16-bit timer/counter mode
- 16-bit capture mode
- 16-bit PPG output mode (one-shot mode)
- 16-bit PPG output mode (repeat mode)

The timer/counter 2 can be a divided clock of a system clock which is selected from prescaler output, external clock(EC2) and T1 A Match (timer 1 A match signal). The clock source is selected by a clock selection logic, controlled by clock selection bits (T2CK[2:0]).

- TIMER 2 clock source: $f_x/1$, $f_x/2$, $f_x/4$, $f_x/8$, $f_x/128$, $f_x/512$, EC2 and T1 A Match

In capture mode, data is captured into input capture data registers (T2BDRH/T2BDRL) by EINT12. In timer/counter mode, whenever counter value is equal to T2ADRH/L, T2O port toggles. In addition, the timer 2 outputs PWM waveform to PWM2O port in the PPG mode.

Table 11. TIMER 2 Operating Modes

T2EN	P1FSRL[7:6]	T2MS[1:0]	T2CK[2:0]	Timer 2
1	01	00	XXX	16-bit Timer/Counter Mode
1	00	01	XXX	16-bit Capture Mode
1	01	10	XXX	16-bit PPG Mode (one-shot mode)
1	01	11	XXX	16-bit PPG Mode (repeat mode)

12.3.1 16-bit Timer 2 Block Diagram

In this section, a 16-bit timer 2 is described in a block diagram.

Figure 24. 16-bit Timer 2 Block Diagram

13 Buzzer Driver

A buzzer of A96G166/A96A166/A96S166 consists of 8-bit counter, a buzzer data register (BUZDR), and a buzzer control register (BUZCR). It outputs square wave (61.035 Hz to 125.0 kHz @ 8 MHz) through P11/AN8/EINT6/EC1/BUZO pin, and its buzzer data register (BUZDR) controls the buzzer frequency (refer to the following expression). In a buzzer control register (BUZCR), BUCK[2:0] bits select a source clock divided by prescaler.

$$f_{\text{BUZ}}(\text{Hz}) = \frac{\text{Oscillator Frequency}}{2 \times \text{Prescaler Ratio} \times (\text{BUZDR} + 1)}$$

Table 12. Buzzer Frequency at 8 MHz

BUZDR[7:0]	Buzzer Frequency (kHz)			
	BUZCR[3:1]=000	BUZCR[3:1]=001	BUZCR[3:1]=010	BUZCR[3:1]=011
0000_0000	125 kHz	62.5 kHz	31.25 kHz	15.625 kHz
0000_0001	62.5 kHz	31.25 kHz	15.625 kHz	7.812 kHz
...	...	...	...	...
1111_1101	492.126 Hz	246.063 Hz	123.031 Hz	61.515 Hz
1111_1110	490.196 Hz	245.098 Hz	122.549 Hz	61.274 Hz
1111_1111	488.281 Hz	244.141 Hz	122.07 Hz	61.035 Hz

13.1 Buzzer Driver Block Diagram

Figure 25. Buzzer Driver Block Diagram

14 12-bit ADC

Analog-to-digital converter (ADC) of A96G166/A96A166/A96S166 allows conversion of an analog input signal to corresponding 12-bit digital value. This A/D module has eight analog inputs. Output of the multiplexer becomes input into the converter which generates the result through successive approximation.

The A/D module has four registers which are the A/D converter control high register (ADCCRH), A/D converter control low register (ADCCRL), A/D converter data high register (ADCDRH), and A/D converter data low register (ADCDDL).

ADSEL[3:0] bits are used to select channels to be converted. To execute A/D conversion, TRIG[2:0] bits should be set to 'xxx'. Registers ADCDRH and ADCDDL contain the result of A/D conversion. When the conversion is completed, the result is loaded into ADCDRH and ADCDDL, A/D conversion status bit AFLAG is set to '1', and A/D interrupt is set. During the A/D conversion, AFLAG bit is read as '0'.

14.1 Block Diagram

In this section, the 12-bit ADC is described in a block diagram, and an analog input pin and a power pin with capacitors respectively are described.

Figure 26. 12-bit ADC Block Diagram

Figure 27. A/D Analog Input Pin with a Capacitor

15 I2C

The I²C is one of industrial standard serial communication protocols, and which uses two bus lines Serial Data Line (SDA) and Serial Clock Line (SCL) to exchange data. Because both SDA and SCL lines are open-drain outputs, each line needs pull-up resistor. The features are as shown below.

- Compatible with I2C bus standard
- Multi-master operation
- Up to 400 kHz data transfer speed
- 7-bit address
- Support 2 slave addresses
- Both master and slave operation
- Bus busy detection

Figure 28. I²C Block Diagram

16 USART 0/1

Universal Synchronous and Asynchronous serial Receiver and Transmitter (USART) is a highly flexible serial communication device. A96G166/A96A166/A96S166 has two USART function blocks, USART0 and USART1, which have the same functionality. The main features are listed below.

- Full-duplex operation (Independent Serial Receive and Transmit Registers)
- Asynchronous or synchronous operation
- Master or slave clocked synchronous and SPI operation
- Supports all four SPI modes of operation (mode 0, 1, 2, 3)
- LSB first or MSB first data transfer in SPI mode
- High resolution baud rate generator
- Supports serial frames with 5,6,7,8, or 9 data bits and 1 or 2 stop bits
- Odd or even parity generation and parity check supported by hardware
- Data OverRun detection
- Framing Error detection
- Digital low pass filter
- Three separate interrupts on TX complete, TX data register empty and RX complete
- Double speed asynchronous communication mode

USART has three main parts such as a clock generator, a transmitter and a receiver.

The clock generation logic consists of a synchronization logic for external clock input used by synchronous or SPI slave operation, and a baud rate generator for asynchronous or master (synchronous or SPI) operation.

The transmitter consists of a single write buffer, a serial shift register, parity generator and control logic for handling different serial frame formats. Write buffer allows a continuous transfer of data without any delay between frames.

The receiver is the most complex part of the USART module due to its clock and data recovery units. Recovery unit is used for asynchronous data reception. In addition to the recovery unit, the receiver includes a parity checker, a shift register, a two level receive FIFO (UDATA) and control logic. The receiver supports the same frame formats as the transmitter and can detect Frame Error, Data OverRun and Parity Errors.

16.1 Block Diagram

Figure 29. USARTn Block Diagram (n=0, 1)

17 CRC

Using the CRC, memory of specific areas can be monitored. This is a one-time operation, and reset is required for continuous operation.

In CRC MNT mode, when the CRC read is finished, CRC_FLAG occurs. In CRC validate mode, if the CRC validate fails after the CRC reading is finished, CRC_FLAG occurs. CRC_FAIL indicates the status of validate results when the CRC read is finished. If the CRC_FLAG is generated and the interrupt is enabled, interrupt service routine is served. CRC-FLAG is not cleared by hardware. CRC-TYPE 0 to 3 are not supported. Validate is done by comparing the CRC_MNT register and the CRC register value. CRC is not automatically initialized; therefore, a new CRC must be calculated after clearing CRC_H and CRC_L.

Table 13. CRC Mode

CRC TYPE	CRC mode	CRC input	Condition of CRC_FLAG	Condition of CRC reset
CRC_TYPE = 4	MNT	Flash Data	After CRC reading	-
CRC_TYPE = 6	Validate	Flash Data	After CRC reading & Validate fail	Validate fail

17.1 Block Diagram

Figure 30. CRC Block Diagram

18 Power Down Operation

A96G166/A96A166/A96S166 has two power-down modes to minimize the power consumption of the device. In power down mode, power consumption is reduced considerably.

Three power saving functions of A96G166/A96A166/A96S166 are Main-IDLE mode, Sub-IDLE mode and STOP mode. During one of these three modes, program will be stopped.

18.1 Peripheral Operation in IDLE/STOP Mode

Table 14 shows operation status of each peripheral in IDLE mode and STOP mode.

Table 14. Peripheral Operation Status during Power-Down Mode

Peripheral	IDLE mode	STOP mode
CPU	ALL CPU operations are disabled.	ALL CPU operations are disabled.
RAM	Retains.	Retains.
Basic Interval Timer	Operates continuously.	Stops (can be operated with WDTRC OSC).
Watchdog Timer	Operates continuously.	Stops (can be operated with WDTRC OSC).
Watch Timer	Operates continuously.	Stops (can be operated with sub clock).
Timer0/1/2	Operates continuously.	Halts (only when the event counter mode is enabled, timer operates normally).
ADC	Operates continuously.	Stops.
BUZ	Operates continuously.	Stops.
USART 0/1	Operates continuously.	Only operates with external clock.
I2C	Operates continuously.	Stops.
Internal osc (32 MHz)	Oscillates.	Stops when the system clock (fx) is fHSI.
WDTRC osc (128 kHz)	Can be operated with setting value.	Can be operated programmable.
Main Osc (0.4 to 12 MHz)	Oscillates.	Stops when fx = fXIN.
Sub Osc (32.768 kHz)	Oscillates.	Can be operated programmable.
I/O Port	Retains.	Retains.
Control register	Retains.	Retains.
Address data bus	Retains.	Retains.
Release method	By RESET All Interrupts	• By RESET • Timer Interrupt (EC0, EC1) • External Interrupt • USART 0/1 by RX • WT (sub clock) • WDT • I2C (Slave mode)

19 Reset

Table 15 shows hardware setting values of main peripherals.

Table 15. Hardware Setting Values in Reset State

On chip hardware	initial value
Program Counter (PC)	0000h
Accumulator	00h
Stack Pointer (SP)	07h
Peripheral Clock	On
Control Register	Refer to the peripheral registers

A96G166/A96A166/A96S166 has five types of reset sources as shown in the followings:

- External RESETB
- Power-On RESET (POR)
- WDT Overflow Reset (In the case of WDTEN = `1`)
- Low Voltage Reset (In the case of LVREN = `0`)
- OCD Reset

19.1 Reset Block Diagram

In this section, reset unit is described in a block diagram.

Figure 31. Reset Block Diagram

20 Memory Programming

A96G166/A96A166/A96S166 has flash memory to which a program can be written, erased, and overwritten while mounted on the board. Serial ISP mode is supported.

Flash of A96G166/A96A166/A96S166 features the following:

- Flash Size: 16 Kbytes
- Single power supply program and erase
- Command interface for fast program and erase operation
- Up to 30,000 program/erase cycles at typical voltage and temperature for flash memory
- Security feature

20.1 Memory Map

20.1.1 Flash Memory Map

Program memory uses 16 Kbytes of flash memory. It is read by byte and written by byte or page. One page is 32-byte.

Figure 32. Flash Memory Map

Figure 33. Address Configuration of Flash Memory

21 Electrical Characteristics

21.1 Absolute Maximum Ratings

Table 16. Absolute Maximum Ratings

Parameter	Symbol	Rating ⁽²⁾	Unit	Remark
Supply voltage	VDD	-0.3 to +6.5	V	–
Normal voltage pin	V _I	-0.3 to VDD+0.3	V	Voltage on any pin with respect to VSS
	V _O	-0.3 to VDD+0.3	V	
	I _{OH}	42.5	mA	Maximum current output sourced by (I _{OH} per I/O pin)
	ΣI _{OH}	112	mA	Maximum current (ΣI _{OH})
	I _{OL1}	50	mA	Maximum current (I _{OL1} per I/O pin)
	ΣI _{OL1}	101	mA	Maximum current (ΣI _{OL1})
	I _{OL2}	160	mA	Maximum current sunk by (I _{OL2} per I/O pin)
	ΣI _{OL2}	160	mA	Maximum current by LED Drive (ΣI _{OL2})
Total power dissipation	P _T	600	mW	–
Storage temperature	T _{STG}	-65 to +150	°C	–

NOTES:

1. Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. The measured value for the parameters and conditions listed were confirmed by simulation.

21.2 Recommended Operating Conditions

Table 17. Recommended Operating Conditions

(T_A=-40°C to 85°C or T_A=-40°C to 105°C)

Parameter	Symbol	Conditions		Min	Typ	Max	Unit
Operating Voltage	VDD	f _X = 32 to 38 kHz	Sub Crystal	1.8	–	5.5	V
		f _X = 4 to 10 MHz	Main Crystal	2.2	–	5.5	
		f _X = 4 to 12 MHz		2.4	–	5.5	
		f _X = 0.5 to 16 MHz	Internal RC	1.8	–	5.5	
Operating Temperature	T _{OPR}	VDD=1.8 V to 5.5 V		-40	–	85	°C
				-40	–	105	

21.3 A/D Converter Characteristics

Table 18. A/D Converter Characteristics

($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ or $T_A = -40^\circ\text{C}$ to 105°C , $V_{DD} = 2.2\text{ V}$ to 5.5 V , $V_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions		Min	Typ	Max	Unit
Integral Linear Error	ILE	AVDD = 5.0 V MCLK = 8 MHz		–	±4	±8	LSB
Differential Linearity Error	DLE			–	±1	±2	
Offset Error of Top	EOT			–	±4	±8	
Offset Error of Bottom	EOB			–	±2	±4	
Conversion Time	t _{CON}	12-bit resolution, 8 MHz		7.5	–	–	μs
Analog Input Voltage	V _{AN}	–		VSS	–	VDD	V
Analog Input Leakage Current	I _{AN}	VDDREF = 5.12 V		–	1	2	μA
ADC Operating Current	I _{ADC} ⁽⁶⁾	Enable	VDD = 5.12 V	–	1	2	mA
		Disable		–	–	0.1	μA

NOTES:

1. When VDD is lower than 2.2 V, the ADC resolution will get worse.
2. Zero offset error is the difference between 000000000000 and the converted output for zero input voltage (VSS).
3. Full scale error is the difference between 111111111111 and the converted output for full-scale input voltage (VDD).
4. If VDD is less than or equal to 2.2 V, the resolution degrades by 1-bit whenever VDD drops 0.1 V.
5. (@ADCLK = 0.5 MHz, under 2.2 V, resolution has no test.)
6. ADCLK must be less than 0.5 MHz. Furthermore, if ADCLK is less than 0.125 MHz, it can be improved INL characteristic.
7. The measured value for the parameters and conditions listed were confirmed by simulation.

Table 19. Recommended ADC Resolution

($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ or $T_A = -40^\circ\text{C}$ to 105°C , $V_{DD} = 2.5\text{ V}$ to 5.5 V , $V_{SS} = 0\text{ V}$)

VDD [V]	Resolution	Conditions
2.6	12-bit/Upper 12-bit	ADCLK ≤ 0.5 MHz
2.5	12-bit/Upper 12-bit	
2.4	12-bit/Upper 12-bit	
2.3	12-bit/Upper 12-bit	
2.2	11-bit/Upper 11-bit	
2.1	10-bit/Upper 10-bit	
2.0	9-bit/Upper 9-bit	
1.9	8-bit/Upper 8-bit	
1.8	7-bit/Upper 7-bit	

NOTE:

1. Guaranteed by design.

21.4 VDC1.55 Reference Voltage Characteristics

Table 20. VDC1.55 Reference Voltage Characteristics

($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ or $T_A = -40^\circ\text{C}$ to 105°C , $V_{DD} = 1.8\text{ V}$ to 5.5 V , $V_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
VDC 1.55 Reference Voltage	VDC 1.55	–	–	1.55	–	V

21.5 Power On Reset Characteristics

Table 21. Power-On Reset Characteristics

(T_A=-40°C to +85°C or T_A=-40°C to 105°C, VDD=1.8 V to 5.5 V, VSS=0 V)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
RESET Release Level	V _{POR} ⁽¹⁾	—	—	1.32	—	V
VDD Voltage Rising Time	t _R ⁽¹⁾	—	0.05	—	50.0	V/ms
Minimum Pulse Width	t _{LW} ⁽¹⁾	—	100	—	—	μs
POR Current	I _{POR} ⁽¹⁾	—	—	0.2	—	μA

NOTE:

1. The measured value for the parameters and conditions listed were confirmed by simulation.

21.6 Low Voltage Reset and Low Voltage Indicator Characteristics

Table 22. LVR and LVI Characteristics

(T_A=-40°C to +85°C or T_A=-40°C to 105°C, VDD=1.8 V to 5.5 V, VSS=0 V)

Parameter	Symbol	Conditions		Min	Typ	Max	Unit
Detection Level	V _{LVR} V _{LVI}	The LVR can select all levels. But LVI can select other levels except 1.61/1.68/1.77 V because the minimum operating voltage is 1.8 V. V _{LVR} /V _{LVI} can be measured when voltage drops (falling level).		-	1.61	1.75	V
				1.55	1.68	1.81	
				1.63	1.77	1.91	
				1.73	1.88	2.03	
				1.84	2.00	2.16	
				1.96	2.13	2.30	
				2.10	2.28	2.46	
				2.26	2.46	2.66	
				2.47	2.68	2.89	
				2.59	2.81	3.03	
				2.82	3.06	3.30	
				2.95	3.21	3.47	
				3.28	3.56	3.84	
				3.43	3.73	4.03	
				3.60	3.91	4.22	
3.91	4.25	4.59					
Hysteresis	△V	—		—	30	180	mV
Minimum Pulse Width	t _{LW}	—		100	—	—	μs
LVR and LVI Current	I _{BL}	Enable (Both)	VDD= 3 V, @RUN Mode	—	14.0	24.0	μA
		Enable (One of two)		—	10.0	18.0	
		Disable (Both)	VDD= 3 V	—	—	0.1	

NOTE:

1. Guaranteed by design.

21.7 High Speed Internal RC Oscillator Characteristics

Table 23. High Speed Internal RC Oscillator Characteristics

($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ or $T_A = -40^\circ\text{C}$ to 105°C , $V_{DD} = 1.8\text{ V}$ to 5.5 V , $V_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions		Min	Typ	Max	Unit
Frequency	f _{IRC}	V _{DD} = 1.8 V to 5.5 V		–	32	–	MHz
Tolerance	–	T _A = 0°C to +50°C	With 0.1 μF Bypass Capacitors	–	–	±1.5	%
		T _A = -10°C to +70°C				±2.0	
		T _A = -40°C to +85°C				±2.5	
		T _A = -40°C to +105°C				±5.0	
Clock Duty Ratio	TOD ⁽²⁾	–		40	50	60	%
Stabilization Time	T _{HFS} ⁽²⁾	–		–	–	100	μs
IRC Current	I _{IRC}	Enable		–	0.2	–	mA
		Disable		–	–	0.1	μA

NOTES:

1. A 0.1 μF bypass capacitor should be connected to V_{DD} and V_{SS} .
2. The measured value for the parameters and conditions listed were confirmed by simulation.

21.8 Low Speed Internal RC Oscillator Characteristics

Table 24. Low Speed Internal Oscillator Characteristics

($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ or $T_A = -40^\circ\text{C}$ to 105°C , $V_{DD} = 1.8\text{ V}$ to 5.5 V , $V_{SS} = 0\text{ V}$)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Frequency	f_{LSI}	$T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$	102	128	154	kHz
		$T_A = -40^\circ\text{C}$ to $+105^\circ\text{C}$	90	128	166	
Stabilization Time	T_{LSI} ⁽¹⁾	–	–	–	1	ms
LSI Current	I_{LSI}	Enable	–	1	–	μA
		Disable	–	–	0.1	

NOTE:

1. The measured value for the parameters and conditions listed were confirmed by simulation.

21.9 DC Characteristics

Table 25. DC Characteristics

 (T_A= -40°C to +85°C or T_A=-40°C to 105°C, VDD= 1.8 V to 5.5 V, VSS= 0 V)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
Input High Voltage	V _{IH}	All input pins	0.7VDD	–	VDD	V
Input Low Voltage	V _{IL}	All input pins	–	–	0.3VDD	V
Output High Voltage	V _{OH1}	VDD=4.5 V, I _{OH} =-8.57 mA, All output ports;	VDD-1.0	–	–	V
	V _{OH2}	VDD=4.5 V, I _{OH} = -19 mA, All output ports;	VDD-2.0	–	–	V
Output Low Voltage	V _{OL1}	VDD=4.5 V, I _{OL} = 10 mA, All output ports except V _{OL2}	–	–	1.0	V
	V _{OL2}	VDD=4.5 V, I _{OL} = 160 mA, LEDx High sink current output	–	1.5	3	V
Input High Leakage Current	I _{IH1}	All input ports VDD=5.0 V	–	–	1	μA
Input Low Leakage Current	I _{IL}	All input ports VDD=5.0 V	-1	–	–	μA
Pull-Up Resistor	R _{PU1}	V _I =0 V, T _A = 25°C VDD=5.0 V All Input ports	25	50	100	KΩ
OSC feedback resistor	R _{X1}	XIN= VSS, XOUT= Floating T _A = 25°C, VDD= 5 V	0.76	1.3	10.51	MΩ
	R _{X2}	SXIN= VSS, SXOUT= Floating T _A = 25°C, VDD= 5 V	6.25	13.53	36.98	
Supply Current	I _{DD1} (RUN)	f _{XIN} = 12 MHz, VDD= 5 V	–	2.5	–	mA
		f _{XIN} = 8 MHz, VDD= 5 V	–	2.0	–	
		f _{XIN} = 4 MHz, VDD= 5 V	–	1.5	–	
		f _{HSl} = 16 MHz, VDD= 5 V	0.7	–	4.0	
		f _{LSI} = 128 kHz, VDD= 5 V	–	190	–	
	I _{DD2} (IDLE)	f _{XIN} = 12 MHz, VDD= 5 V	–	1.8	–	mA
		f _{XIN} = 8 MHz, VDD= 5 V	–	1.5	–	
		f _{HSl} = 16 MHz, VDD= 5 V	0.5	–	3.0	
		f _{LSI} = 128 kHz, VDD= 5 V	–	185	–	
	I _{DD3} (STOP1)	STOP @ WDT on, VDD= 5.5 V, T _A =25°C	–	–	22	μA
	I _{DD4} (STOP2)	STOP @ WDT off & LVR off, VDD= 5.5 V, T _A =25°C	–	2	7	

NOTES:

- Where the f_{XIN} is an external main oscillator, f_{SUB} is an external sub oscillator, the f_{HSl} and f_{LSI} are an internal RC oscillator, and the f_x is the selected system clock.
- All supply current items don't include the current of an internal Watchdog timer RC (WDTRC) oscillator and a peripheral block.
- All supply current items include the current of the power-on reset (POR) block.

21.10 AC Characteristics

Table 26. AC Characteristics

($T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$ or $T_A = -40^\circ\text{C}$ to 105°C , $V_{DD} = 1.8\text{ V}$ to 5.5 V)

Parameter	Symbol	Conditions	Min	Typ	Max	Unit
RESETB input low width	$t_{RSL}^{(1)}$	Input, $V_{DD} = 5\text{ V}$	50	—	—	μs
Interrupt input high, low width	$t_{INTH}^{(1)}$, $t_{INTL}^{(1)}$	All interrupt, $V_{DD} = 5\text{ V}$	200	—	—	ns
External Counter Input High, Low Pulse Width	$t_{ECWH}^{(1)}$, $t_{ECWL}^{(1)}$	EC_n , $V_{DD} = 5\text{ V}$ ($n = 0, 1, 2$)	200	—	—

22 Debug and Flash Programming

This chapter describes the information on debugging and flash programming of the microcontrollers.

22.1 Core and Debug Tool Information

ABOV's 8-bit microcontroller uses OCD (On-Chip Debugger) interface for debugging, which is ABOV's own interface. The OCD not only monitors and controls the core but also supports the read and write operations of external memory and devices. In addition, it supports memory monitoring and break functions.

Debug interfaces such as OCD interface enable microcontrollers to write to internal programmable memory, allowing them to support ISP (In-System Program) that makes it possible to write as a single chip or as an embedded chip in the system.

Table 37 provides information on the core and debug emulation interface.

Table 37. Core and Debug Information

	Value	Description
Device Name	A96G166, A96A166, A96S166	
Series	96 series	
Core	M8051	
Extended Stack Pointer	No	94, 97 series only
Debug Interface	OCD 1	
Number of Break Point	8	
Real-time Monitoring	No	OCD 2 only
Run Flag Port	No	OCD 2 option

22.1.1 Features of 94/96/97 Series Core

ABOV's 8-bit microcontroller contains an M8051/CM8051 core that is an improved version of the 8051 original microcontroller. The M8051/CM8051 core is compatible with the 8051 and reduces time of operation cycles. It makes development easier by providing the OCD debug function.

ABOV's 8-bit microcontroller has a core of 94-series, 96-series, or 97-series, that is basically compatible with the 8051 series at the instruction set level.

A core of each series uses different Debug Interface respectively as shown in Table 38.

Table 38. Core and Debug Interface by Series

	Core	Debug Interface
96 Series	M8051	OCD 1
97 Series	M8051	OCD 2
94 Series	CM8051	OCD 2

Features of each series are compared in Table 39.

Table 39. Feature Comparison Chart by Series and Cores

	96 Series	97 Series	94 Series
CPU Core	M8051	M8051	CM8051
Cycle Compatible with MCS51	1/6	1/6	No
OCD Function	OCD 1	OCD 2	OCD 2
Program BUS	8-bit		
Data Bus	8-bit IRAM/XRAM separated		8-bit single SRAM
EA Auto Clear ⁽¹⁾	Yes	Yes	Yes
EA=0, Idle/Stope Mode Wake up	Yes	Yes	Yes
Interrupt Priority ⁽²⁾	6 group × 4 level	Interrupt × 4 level	Interrupt × 2 level
Nested Interrupt Priority	4 level	4 level	Interrupt × 2 level (max. 4 times)
SFR Bus (Read/Write)	Two ports	Two ports	Single port
Stack Extension	X	O	O
Register	SRAM		
Register Bank	4		
CPU/Flash Clock Ratio	×1		
Pipeline	No	No	2-stage (IF + ID / EX)
DHRY Stone Score (I8051: 1.00)	6.0	6.0	8.4
Average Instruction Set Exe. Cycle Compare with i8051	×6.0	×6.0	×6.4
Power Consumption/DHRY (@synthesis)	52.27 μA/MHz	52.27 μA/MHz	30.19 μA/MHz

NOTES:

1. EA means that All Interrupt Enable bit or Disable bit (Standard 8051).
2. Group: When a programmer selects a specific interrupt (e.g. Interrupt1), Whole interrupts: 0, 6, 12, and 18 have higher priorities.
3. The A96G140/A96G148/A96A148 has the 96 series core and OCD 1 interface.
4. The A96G140/A96G148/A96A148 can be operated with the OCD II dongle too, because the OCD II dongle includes all functions of the OCD1.

ABOV's 8-bit microcontrollers maintain binary compatibility with 8051 cores; however, the cores and series have differences in performances, core functionalities, and debug interfaces.

The following sections describe the differences among the series.

22.1.2 OCD Type of 94/96/97 Series Core

Cores of 96-series use OCD 1 for a debug interface, while cores of 94-series and 97-series use OCD 2 for debug interfaces. The OCD 1 and OCD 2 use the same method on the Hardware; however, the protocols are incompatible with each other.

In the OCD 2, it is able to measure the emulation time through the “Run Flag” pin.

Table 40. OCD Type of Each Series

Series	96-Series	97-Series	94-Series	Remark
OCD type	OCD 1	OCD 2	OCD 2	

In Table 41, debug interfaces of the OCD 1 and OCD 2 are compared.

Table 41. Comparison of OCD 1 and OCD 2

	Value	Description
OCD 1	Break point MAX.8	PC break only
OCD 2	Break point MAX.12	With RAM break • Code, XDATA, IDATA • 1-/8-/16-/32-bit compare
	Real-time monitoring	Code, XDATA, IDATA
	Frequency output	Examine CPU frequency
	Run Flag port	Option for run-time measurement

96 Series – OCD 1

The 96 series support basic operations of debug interfaces such as Run, Stop, Step, Break point, register reading/writing, Memory reading/writing, and SFR reading/writing.

94 Series and 97 Series – OCD 2

The 94 series and 97 series support the features listed below, as well as the features of the OCD 1 (however, the protocol is not compatible with the OCD1).:

- RTM support: CODE, XDATA, IDATA are updated during the Run Time (Real Time Monitoring available).
- Run Flag support: Emulation Time can be measured in OCD mode (using the Run Flag port).
- RAM Break support: IDATA, SFR, and XDATA break are added.

22.1.3 Interrupt Priority of 94/96/97 Series Core

In M8051, users can set interrupt priorities by group. The 96-series microcontroller with the basic M8051 core only supports interrupt priorities in group units. In the 94-series or 97-series microcontroller, users set interrupt priorities to have more functions than the existing functions and can set individual priority for each interrupt source.

Table 42. Interrupt Priorities in Groups and Levels

Series	96-Series	97-Series	94-Series	Remark
Interrupt Priority	6 Grouped 4 Level	Fully 4 Level	Fully 4 Level	96 Series: - IP/IP (Interrupt Priority Register) 94, 97 Series: - IPxL/IPxH (Interrupt Priority Register)

96 Series

- The priorities by group are available only with IP/IP1 settings.
 - With IP/IP1 settings, users can set interrupt priorities by group unit.
 - The interrupt priority of a group unit (4 interrupts in a group) can be changed to the level between 0 and 3 according to the value of IP/IP1.

94, 97 Series

- The individual interrupt priority can be set by setting IPxL/IPxH (x=0 to 3).
- The individual interrupt priority can be changed to the level between 0 and 3 according to the value of IPxL/IPxH (x=0 to 3).

22.1.4 Extended Stack Pointer of 94/96/97 Series Core

The M8051 uses IRAM area for Stack Pointer. However, 94-series and 97-series microcontrollers use both IRAM area and XRAM area for Stack Pointer by configuring additional registers.

The XSP and XSPCR registers are involved in this functionality as described below:

- By configuring the XSP/XSPCR register, the XRAM area can be used for the Stack Pointer.
 - The XSPCR decides whether to use XRAM for Stack Pointer.
 - ♦ If XSPCR='0', IRAM is available for Stack Pointer.
 - ♦ If XSPCR='1', XRAM is available for Stack Pointer.
 - The XSP decides the position of XRAM Stack Pointer.
 - ♦ This is valid only if XSPCR='1'.

Figure 57. Configuration of the Extended Stack Pointer

$$\text{STACK\_POINTER} = \{\text{XSP}[7:0], \text{SP}[7:0]\} = \text{XRAM\_TOP} - \text{STACK\_SIZE}$$

Ex) If only 256bytes of XRAM will be used for stack,

- XRAM_TOP = 4 KB (0x0FFF)
- STACK_SIZE = 256 bytes (0x0100)
- XSPCR= 1, XSP= 0x0E
- SP=0xFF setting
- Stack Pointer Position = 0x0FFF - 0x0100= 0x0EFF

22.2 OCD (On-Chip Debugger) Emulator and Debugger

Microcontrollers with 8051 cores have an OCD (On-Chip Debugger), a debug emulation block. The OCD is connected to a target microcontroller using two lines such as DSCL and DSDA. The DSCL is used for a clock signal and the DSDA is for a bi-directional data.

The two lines work for the core management and control by doing register management and execution, step execution, break point and watch functions. In addition, they control and monitor the internal memory and the device by reading and writing.

Table 43. Debug Feature by Series

Series name	96-series	97-series	94-series
OCD function	OCD 1	OCD 2	OCD 2
Max. number of breakpoints	8	8	4
Saving stack in XRAM	No	Yes	Yes
Real time monitoring	No	Yes	Yes
Run flag support	No	Yes	Yes

The OCD 2 applied to 94-series and 97-series provides the RTM (Real Time Monitoring) function that monitors internal memory and I/O status without stopping the debugging. In addition, the OCD 2 provides the breakpoint function (RAM Break Function) for the IDATA, SFR, and XDATA.

The following functions have been extended from the OCD 2:

- Emulation Time can be measured in OCD mode (using the Run Flag port)
- CODE, XDATA, IDATA are updated during the Run-time (Real Time Monitoring available).
- IDATA, SFR, XDATA break are added (RAM Break support).

Figure 58 shows the standard 10-pin connector of OCD 1 and OCD 2.

Figure 58. OCD 1 and OCD 2 Connector Pin Diagram

Table 44 describes the pins used for the OCD 1 and OCD 2.

Table 44. OCD 1 and OCD 2 Pin Description

Pin name	Microcontroller function in Debug Mode	
	I/O	Description
DSCL	I	Serial clock pin. Input only pin.
DSDA	I/O	- Serial data pin. - Output port when reading and input port when programming. - IT can be assigned as input/push-pull output port.
VDD, VSS	—	Logic power supply pin.

The OCD emulator supports ABOV's 8051 series microcontroller's emulation. The OCD uses two wires that are interfaced between PC and the microcontroller, which is attached to user's system. The OCD can read or change the value of the microcontroller's internal memory and I/O peripherals. In addition, the OCD controls the microcontroller's internal debugging logic. This means OCD controls emulation, step run, monitoring and many more functions regarding debugging.

The OCD debugger program runs underneath MS operating systems such as MS-Windows. For more details, visit the ABOV website (www.abovsemi.com), and download debugger software and corresponding manuals.

- Connection:
 - DSCL (A96G166/A96A166/A96S166 P01 port)
 - DSDA (A96G166/A96A166/A96S166 P00 port)

Figure 59 shows pinouts of OCD connector.

Figure 59. Debugger (OCD1/OCD2) and Pinouts

22.2.1 On-Chip Debug System

A96G166/A96A166/A96S166 supports On-chip debug (OCD) system. We recommend developing and debugging program with A96G1xx series. The OCD system of A96G166/A96A166/A96S166 can be used for programming the non-volatile memories and on-chip debugging.

This section provides detailed descriptions for programming via the OCD interface. Table 45 describes the features of the OCD.

Table 45. OCD Features

Two wire external interface	• 1 for serial clock input • 1 for bi-directional serial data bus
Debugger accesses	• All internal peripherals • Internal data RAM • Program Counter • Flash memory and data EEPROM memory
Extensive On-Chip Debugging support for Break Conditions	• Break instruction • Single step break • Program memory break points on single address • Programming of Flash, EEPROM, Fuses, and Lock bits through the two-wire interface • On-Chip Debugging supported by Dr. Choice®
Operating frequency	The maximum frequency of a target microcontroller

Figure 60 shows a block diagram of the OCD interface and the On-chip Debug system.

Figure 60. On-Chip Debugging System in Block Diagram

Entering debug mode

While communicating through the OCD, users can enter the microcontroller into DEBUG mode by applying power to it. This means that the microcontroller enters DEBUG mode when specific signals are applied to DSCL and DSDA at the moment of initialization when the microcontroller is powered on.

Therefore, control of the microcontroller power supply (VCC or VDD) is required, and care must be taken not to place capacitive loads such as large capacity condenser on the power pins.

Please remember that the microcontroller can enter DEBUG mode only when power is applied, and it cannot enter DEBUG mode once the OCD is run.

Figure 61. Timing Diagram of Debug Mode Entry

22.2.2 Two-Wire Communication Protocol

For the OCD interface, the semi-duplex communication protocol is used through separate two wires, the DSCL and DSDA. The DSCL is used for a serial clock signal and the DSDA is used for bi-directional serial address and data.

A unit packet of transmission data is 10-bit long and consists of a byte of data, 1-bit of parity, and 1-bit of acknowledge. A parity check bit and a receive acknowledge bit are transmitted to guarantee stability of data communication. A communication packet includes a start bit and an end bit to indicate the start and end of the communication.

More detailed information on this communication protocol is listed below:

Basic transmission packet

- A 10-bit packet transmission using two-pin interface.
- A packet consists of 8-bit data, 1-bit parity and 1-bit acknowledge.
- Parity is even of '1' for 8-bit data in transmitter.
- Receiver generates acknowledge bit as '0' when transmission for 8-bit data and its parity has no error.
- When transmitter has no acknowledge (Acknowledge bit is '1' at tenth clock), error process is executed in transmitter.
- When acknowledge error is generated, host PC makes stop condition and transmits command which has error again.
- Background debugger command is composed of a bundle of packets.
- Start condition and stop condition notify the start and the stop of background debugger command respectively.

Figure 62. 10-bit Transmission Packet

Packet transmission timing

Figure 63 shows a timing diagram of a packet transmission using the OCD communication protocol.

A start bit in the figure means start of a packet and is valid when the DSDA falls from 'H' to 'L' while External Host maintains the DSCL to 'H'. After the valid start bit, communication data is transferred and received between a Host and a microcontroller.

An end bit means end of the data transmission and is valid when the DSDA changes from 'L' to 'H' while a Debugger maintains DSCL to 'H'. Next, the microcontroller places the bus in a wait state and processes the received data.

Figure 63. Data Transfer on OCD

Figure 64 shows a timing diagram of each bit based on the state of the DSCL clock and the DSDA data. Similar to I2C signal, the DSDA data is allowed to change when the DSCL is 'L'. If the data changes when DSCL is 'H', the change means 'START' or 'STOP'.

Figure 64. Bit Transfer on Serial Bus

Figure 65. Start and Stop Condition

During the OCD communication, each data byte is transferred in accompany with a parity bit. When data is transferred in succession, a receiver returns the acknowledge bit to inform that it received.

As shown in Figure 66, when transferring data, a receiver outputs the DSDA to 'L' to inform the normal reception of data. If a receiver outputs DSDA to 'H', it means error reception of data.

Figure 66. Acknowledge on the Serial Bus

While the Host Debugger executes data communications, if a microcontroller needs communication delay or process delay, it can request communication delay to the Host Debugger.

Figure 67 shows timing diagrams where a microcontroller requests communication delay to the Host Debugger. If the microcontroller requests timing delay of the DSCL signal that the Host Debugger outputs, the microcontroller maintains the DSCL signal to 'L' to delay the clock change although the Host Debugger changes DSCL to 'H'.

Figure 67. Clock Synchronization during Wait Procedure

22.3 Flash Programming

Program memory of A96G166/A96A166/A96S166 is a Flash type. The Flash ROM is accessed through four pins such as DSCL, DSDA, VDD and VSS in serial data format. For more information about Flash memory programming, please refer to **20 Memory Programming**.

Table 46 describes corresponding pins and I/O status.

Table 46. Pins for Flash Programming

Pin name	Main chip pin name	During programming	
		I/O	Description
DSCL	P01	I	Serial clock pin. Input only pin.
DSDA	P00	I/O	Serial data pin. Output port when reading and input port when programming. Can be assigned as input/push-pull output port.
VDD, VSS	VDD, VSS	—	Logic power supply pin.

22.3.1 On-Board Programming

Microcontroller needs only four signal lines including VDD and VSS pins, to program the Flash ROM using serial protocol. Therefore, on-board programming is possible if the programming signal lines are considered at the time the PCB of application board is designed.

22.4 Connection of Transmission

OCD's two-wire communication interfaces use the Open-Drain Method (Wire-AND Bi-Directional I/O).

Normally, it is recommended to place a resistor greater than 4.7 k Ω for the DSCL and DSDA respectively. The capacitive load is recommended to be less than 100 pF. Outside these ranges, because communication may not be accomplished, the connection to Debug mode is not guaranteed.

Figure 68. Connection of Transmission

22.5 Circuit Design Guide

To program Flash memory, programming tools require four signal lines, DSCL, DSDA, VDD, and VSS. When designing a PCB circuit, the four signal lines for on-board programming should be considered. In addition, care must be taken when designing circuits related to these signal pins, because rising and falling timing of DSCL and DSDA are very important for proper programming.

Care must also be taken when the OCD pins are used exclusively or shared with other functions.

Figure 69 shows an example circuit where the OCD pins (DSCL and DSDA) are shared with other functions. They must be connected when debugging or executing In System Program (ISP).

Normally, the OCD pins are connected to outside to execute the predefined functions. Even when they are connected for debugging or executing ISP directly, the OCD pins are shared with other functions by using resistors as shown in Figure 69. By doing this, the OCD pins process the normal external signals and execute the OCD functions first when they are shared.

Figure 69. PCB Design Guide for On-Board Programming

23 Package Information

Appendix

Instruction Table

Instructions are either 1, 2 or 3 bytes long as listed in the 'Bytes' column below. Each instruction takes either 1, 2 or 4 machine cycles to execute as listed in the following table. 1 machine cycle comprises 2 system clock cycles.

Table 48. Instruction Table

ARITHMETIC				
Mnemonic	Description	Bytes	Cycles	Hex code
ADD A,Rn	Add register to A	1	1	28-2F
ADD A,dir	Add direct byte to A	2	1	25
ADD A,@Ri	Add indirect memory to A	1	1	26-27
ADD A,#data	Add immediate to A	2	1	24
ADDC A,Rn	Add register to A with carry	1	1	38-3F
ADDC A,dir	Add direct byte to A with carry	2	1	35
ADDC A,@Ri	Add indirect memory to A with carry	1	1	36-37
ADDC A,#data	Add immediate to A with carry	2	1	34
SUBB A,Rn	Subtract register from A with borrow	1	1	98-9F
SUBB A,dir	Subtract direct byte from A with borrow	2	1	95
SUBB A,@Ri	Subtract indirect memory from A with borrow	1	1	96-97
SUBB A,#data	Subtract immediate from A with borrow	2	1	94
INC A	Increment A	1	1	04
INC Rn	Increment register	1	1	08-0F
INC dir	Increment direct byte	2	1	05
INC @Ri	Increment indirect memory	1	1	06-07
DEC A	Decrement A	1	1	14
DEC Rn	Decrement register	1	1	18-1F
DEC dir	Decrement direct byte	2	1	15
DEC @Ri	Decrement indirect memory	1	1	16-17
INC DPTR	Increment data pointer	1	2	A3
MUL AB	Multiply A by B	1	4	A4
DIV AB	Divide A by B	1	4	84
DAA	Decimal Adjust A	1	1	D4

Table 48. Instruction Table (continued)

LOGICAL				
Mnemonic	Description	Bytes	Cycles	Hex code
ANL A,Rn	AND register to A	1	1	58-5F
ANL A,dir	AND direct byte to A	2	1	55
ANL A,@Ri	AND indirect memory to A	1	1	56-57
ANL A,#data	AND immediate to A	2	1	54
ANL dir,A	AND A to direct byte	2	1	52
ANL dir,#data	AND immediate to direct byte	3	2	53
ORL A,Rn	OR register to A	1	1	48-4F
ORL A,dir	OR direct byte to A	2	1	45
ORL A,@Ri	OR indirect memory to A	1	1	46-47
ORL A,#data	OR immediate to A	2	1	44
ORL dir,A	OR A to direct byte	2	1	42
ORL dir,#data	OR immediate to direct byte	3	2	43
XRL A,Rn	Exclusive-OR register to A	1	1	68-6F
XRL A,dir	Exclusive-OR direct byte to A	2	1	65
XRL A,@Ri	Exclusive-OR indirect memory to A	1	1	66-67
XRL A,#data	Exclusive-OR immediate to A	2	1	64
XRL dir,A	Exclusive-OR A to direct byte	2	1	62
XRL dir,#data	Exclusive-OR immediate to direct byte	3	2	63
CLR A	Clear A	1	1	E4
CPL A	Complement A	1	1	F4
SWAP A	Swap Nibbles of A	1	1	C4
RL A	Rotate A left	1	1	23
RLC A	Rotate A left through carry	1	1	33
RR A	Rotate A right	1	1	03
RRC A	Rotate A right through carry	1	1	13

Table 48. Instruction Table (continued)

DATA TRANSFER				
Mnemonic	Description	Bytes	Cycles	Hex code
MOV A,Rn	Move register to A	1	1	E8-EF
MOV A,dir	Move direct byte to A	2	1	E5
MOV A,@Ri	Move indirect memory to A	1	1	E6-E7
MOV A,#data	Move immediate to A	2	1	74
MOV Rn,A	Move A to register	1	1	F8-FF
MOV Rn,dir	Move direct byte to register	2	2	A8-AF
MOV Rn,#data	Move immediate to register	2	1	78-7F
MOV dir,A	Move A to direct byte	2	1	F5
MOV dir,Rn	Move register to direct byte	2	2	88-8F
MOV dir,dir	Move direct byte to direct byte	3	2	85
MOV dir,@Ri	Move indirect memory to direct byte	2	2	86-87
MOV dir,#data	Move immediate to direct byte	3	2	75
MOV @Ri,A	Move A to indirect memory	1	1	F6-F7
MOV @Ri,dir	Move direct byte to indirect memory	2	2	A6-A7
MOV @Ri,#data	Move immediate to indirect memory	2	1	76-77
MOV DPTR,#data	Move immediate to data pointer	3	2	90
MOVC A,@A+DPTR	Move code byte relative DPTR to A	1	2	93
MOVC A,@A+PC	Move code byte relative PC to A	1	2	83
MOVX A,@Ri	Move external data(A8) to A	1	2	E2-E3
MOVX A,@DPTR	Move external data(A16) to A	1	2	E0
MOVX @Ri,A	Move A to external data(A8)	1	2	F2-F3
MOVX @DPTR,A	Move A to external data(A16)	1	2	F0
PUSH dir	Push direct byte onto stack	2	2	C0
POP dir	Pop direct byte from stack	2	2	D0
XCH A,Rn	Exchange A and register	1	1	C8-CF
XCH A,dir	Exchange A and direct byte	2	1	C5
XCH A,@Ri	Exchange A and indirect memory	1	1	C6-C7
XCHD A,@Ri	Exchange A and indirect memory nibble	1	1	D6-D7

Table 48. Instruction Table (continued)

BOOLEAN				
Mnemonic	Description	Bytes	Cycles	Hex code
CLR C	Clear carry	1	1	C3
CLR bit	Clear direct bit	2	1	C2
SETB C	Set carry	1	1	D3
SETB bit	Set direct bit	2	1	D2
CPL C	Complement carry	1	1	B3
CPL bit	Complement direct bit	2	1	B2
ANL C,bit	AND direct bit to carry	2	2	82
ANL C,/bit	AND direct bit inverse to carry	2	2	B0
ORL C,bit	OR direct bit to carry	2	2	72
ORL C,/bit	OR direct bit inverse to carry	2	2	A0
MOV C,bit	Move direct bit to carry	2	1	A2
MOV bit,C	Move carry to direct bit	2	2	92

Table 48. Instruction Table (continued)

BRANCHING				
Mnemonic	Description	Bytes	Cycles	Hex code
ACALL addr 11	Absolute jump to subroutine	2	2	11→F1
LCALL addr 16	Long jump to subroutine	3	2	12
RET	Return from subroutine	1	2	22
RETI	Return from interrupt	1	2	32
AJMP addr 11	Absolute jump unconditional	2	2	01→E1
LJMP addr 16	Long jump unconditional	3	2	02
SJMP rel	Short jump (relative address)	2	2	80
JC rel	Jump on carry = 1	2	2	40
JNC rel	Jump on carry = 0	2	2	50
JB bit,rel	Jump on direct bit = 1	3	2	20
JNB bit,rel	Jump on direct bit = 0	3	2	30
JBC bit,rel	Jump on direct bit = 1 and clear	3	2	10
JMP @A+DPTR	Jump indirect relative DPTR	1	2	73
JZ rel	Jump on accumulator = 0	2	2	60
JNZ rel	Jump on accumulator ≠0	2	2	70
CJNE A,dir,rel	Compare A, direct jne relative	3	2	B5
CJNE A,#d,rel	Compare A, immediate jne relative	3	2	B4
CJNE Rn,#d,rel	Compare register, immediate jne relative	3	2	B8-BF
CJNE @Ri,#d,rel	Compare indirect, immediate jne relative	3	2	B6-B7
DJNZ Rn,rel	Decrement register, jnz relative	2	2	D8-DF
DJNZ dir,rel	Decrement direct byte, jnz relative	3	2	D5

Table 48. Instruction Table (continued)

MISCELLANEOUS				
Mnemonic	Description	Bytes	Cycles	Hex code
NOP	No operation	1	1	00
ADDITIONAL INSTRUCTIONS (selected through EO[7:4])				
Mnemonic	Description	Bytes	Cycles	Hex code
MOVC @(DPTR++), A	M8051W/M8051EW-specific instruction supporting software download into program memory	1	2	A5
TRAP	Software break command	1	1	A5

In the above table, entries such as E8-EF indicate continuous blocks of hex opcodes used for 8 different registers. Register numbers of which are defined by the lowest three bits of the corresponding code. Non-continuous blocks of codes, shown as '11→F1' (for example), are used for absolute jumps and calls, with the top 3 bits of the code being used to store the top three bits of the destination address.

CJNE instructions use abbreviation of #d for immediate data; other instructions use #data as an abbreviation.

Revision History

Date	Revision	Description
2019.10.29	1.00	First creation
2019.11.07	1.01	Modified temperature specification. Updated "21.3 A/D Converter Characteristics" on page 64.
2019.12.03	1.02	Updated "21.5 Power On Reset Characteristics" on page 65. Updated "21.6 Low Voltage Reset and Low Voltage Indicator Characteristics" on page 65.
2020.04.20	1.03	Updated Figure 3
2020.05.22	1.04	Modified "Low voltage reset and low voltage indicator characteristics"
2020.06.08	1.05	Changed the name of P1DB to P12DB at Table 4. SFR Map Summary. Changed the name of each bit for P12DB at P12DB register description. Corrected the I/O symbol of LED0 ~ LED7 to O at Table 3. Normal Pin Description. Corrected an address typo of FPCR0, RTOCH0 and RTOCL0 register. Deleted AVREF at Figure 26. 12-bit ADC Block Diagram. Deleted Figure 58. A/D Power (AVREF) Pin with a Capacitor. Changed the maximum analog input voltage to VDD at Table 18. A/D Converter Characteristics. Updated Basic Interval Timer Block Diagram at Figure 19. Added the description of V_{LVD}/V_{LVI} at Table 22. LVR and LVI Characteristics. Extended maximum operating temperature up to 105°C as well as 85°C.
2020.07.16	1.06	Enhanced the minimum ADC operation voltage to 2.2V at Table 18. A/D Converter Characteristics. Deleted Analog Reference Voltage item at Table 18. A/D Converter Characteristics. Added the note of "Guaranteed by design" at Table 19. Recommended ADC Resolution. Corrected the conditions of Input High/Low Leakage Current and Supply Current at Table 25. DC Characteristics. Corrected the symbol of package type at Figure 77. A96G166/A96A166/A96S166 Device Numbering Nomenclature. Added 16 SOPN package at Figure 2. A96G166 16-SOPN Pin Assignment, Table 3. Normal Pin Description and Figure 70. 16-SOPN Package Outline. Added A96G166AE at Table 47. A96G166/A96A166/A96S166 Device Ordering Information. Updated the table and figures for USART characteristics in 21 Electrical Characteristics. Corrected the typo for Flash size at Figure 1. A96G166/A96A166/A96S166 Block Diagram.
2020.07.31	1.07	Corrected the typo of P2FSRH and P3FSRL at 5.3 P2 port and 5.4 P3 port paragraph.
2020.08.31	1.08	Advanced Flash Endurance times from 10,000 to 30,000.
2020.09.28	1.09	Updated the initial value in Table 6. SFR Map.
2021.01.13	1.10	Added a new device of A96A166FD. Modified the bit position of EIPOL1 at 6.11.6 Interrupt register description. Modified the invalid number of USART at Table 2.

Date	Revision	Description
		A96G166/A96A166/A96S166 Device Features and Peripheral Counts.
2021.04.02	1.11	Corrected the typo of P3FSRL and IE2 at 6.5.2 Register description for P3 and 7.11.1 Interrupt Enable Register (IE, IE1, IE2, and IE3).
2021.04.22	1.12	Corrected the description of CONFIGURE OPTION 1 register at 19.6 Configure option. Updated High Speed Internal RC Oscillator Tolerance at Table 23. High Speed Internal RC Oscillator Characteristics. Corrected the frequency unit from KHz to kHz. Added details of the feature on page 1.
2021.05.20	1.13	Updated the U1STAT SFR address (0xF8 → 0xF7)
2022.04.11	1.14	Added 4 CPU (Central Processing Unit). Updated 22 Debug and Flash Programming chapter. Marked simulation data in 21 Electrical Characteristics. Added Figure 51. Filters Used on a Reset and Table 36. Reset Pin Component Values on page 85. Deleted the table of Input/Output Capacitance in Electrical Characteristics. Corrected the address of UnSTAT at Figure 29. USARTn Block Diagram(n=0,1). Corrected the description for WDTRTI of WDTCSR register in User's Manual.
2022.08.19	1.15	Corrected the order of Configure option registers. Corrected the description of CONFIGURE OPTION 3 register.
2022.10.13	1.16	Revised the font of this document
2023.03.31	1.17	Corrected the graph of Figure 52~ Figure 56 at 21.22 Typical Characteristics Modified the A96G166 24 QFN Pin Assignment. Updated External resetb input time
2023.07.12	1.18	Updated the A96G166 28 TSSOP Pin Assignment
2024.12.02	1.19	Updated the disclaimer.
2025.01.10	1.20	Updated notes on capture mode when using Timer 0/1/2. Updated I _{DD4} (STOP2) of supply current. Updated the ADC trigger signal in Figure 26.
2026.04.30	1.21	Updated the Figure 18.
