Rev.1.20 Mar 2018

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
   "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
   "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.
   Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)

Notes for CMOS devices

(1) Voltage application waveform at input pin: Waveform distortion due to input noise or a reflected wave may cause malfunction. If the input of the CMOS device stays in the area between VIL (MAX) and VIH (MIN) due to noise, etc., the device may malfunction. Take care to prevent chattering noise from entering the device when the input level is fixed, and also in the transition period when the input level passes through the area between VIL (MAX) and VIH (MIN).

(2) Handling of unused input pins: Unconnected CMOS device inputs can be cause of malfunction. If an input pin is unconnected, it is possible that an internal input level may be generated due to noise, etc., causing malfunction. CMOS devices behave differently than Bipolar or NMOS devices. Input levels of CMOS devices must be fixed high or low by using pull-up or pull-down circuitry. Each unused pin should be connected to power supply or GND via a resistor if there is a possibility that it will be an output pin. All handling related to unused pins must be judged separately for each device and according to related specifications governing the device.

(3) Precaution against ESD: A strong electric field, when exposed to a MOS device, can cause destruction of the gate oxide and ultimately degrade the device operation. Steps must be taken to stop generation of static electricity as much as possible, and quickly dissipate it when it has occurred. Environmental control must be adequate. When it is dry, a humidifier should be used. It is recommended to avoid using insulators that easily build up static electricity. Semiconductor devices must be stored and transported in an anti-static container, static shielding bag or conductive material. All test and measurement tools including work benches and floors should be grounded. The operator should be grounded using a wrist strap. Semiconductor devices must not be touched with bare hands. Similar precautions need to be taken for PW boards with mounted semiconductor devices.

(4) Status before initialization: Power-on does not necessarily define the initial status of a MOS device. Immediately after the power source is turned ON, devices with reset functions have not yet been initialized. Hence, power-on does not guarantee output pin levels, I/O settings or contents of registers. A device is not initialized until the reset signal is received. A reset operation must be executed immediately after power-on for devices with reset functions.

(5) Power ON/OFF sequence: In the case of a device that uses different power supplies for the internal operation and external interface, as a rule, switch on the external power supply after switching on the internal power supply. When switching the power supply off, as a rule, switch off the external power supply and then the internal power supply. Use of the reverse power on/off sequences may result in the application of an overvoltage to the internal elements of the device, causing malfunction and degradation of internal elements due to the passage of an abnormal current. The correct power on/off sequence must be judged separately for each device and according to related specifications governing the device.

(6) Input of signal during power off state: Do not input signals or an I/O pull-up power supply while the device is not powered. The current injection that results from input of such a signal or I/O pull-up power supply may cause malfunction and the abnormal current that passes in the device at this time may cause degradation of internal elements. Input of signals during the power off state must be judged separately for each device and according to related specifications governing the device.

How to Use This Manual

Readers This manual is intended for users who wish to understand the functions of the RH850/P1M-E and design application systems using the following RH850/P1M-E microcontrollers:

Purpose This manual is intended to give users an understanding of the hardware functions of the RH850/P1M-E shown in the *Organization* below.

Organization This manual is divided into two parts: Hardware (this manual) and Architecture (RH850G3M User's Manual: Software).

Hardware	Software
Pin functions	Overview
CPU function	Processor Model
On-chip peripheral functions	Register Reference
Flash memory programming	Exceptions and Interrupts
	Memory Management
	Instruction Reference
	Reset
	Appendix

How to read this manual It is assumed that the readers of this manual have general knowledge in the fields of electrical engineering, logic circuits, and microcontrollers.

To understand the overall functions of the RH850/P1M-E.

→ Read this manual according to the Contents.

To understand the details of an instruction function

→ See RH850G3M User's Manual: Software (R01US0123E) available separately.

Conventions

Data significance: Higher digits on the left and lower digits on the right

Active low representation: $\overline{xxx}$ (overscore over pin or signal name)

Memory map address: Higher addresses on the top and lower addresses on the bottom

Note: Footnote for item marked with Note in the text

Caution: Information requiring particular attention

Remark: Supplementary information

Numeric representation: Binary ... xxxx or $xxxx_B$

Decimal ... xxxx

Hexadecimal ... $xxxx_H$

Prefix indicating power of 2 (address space, memory capacity):

K (kilo): $2^{10} = 1{,}024$

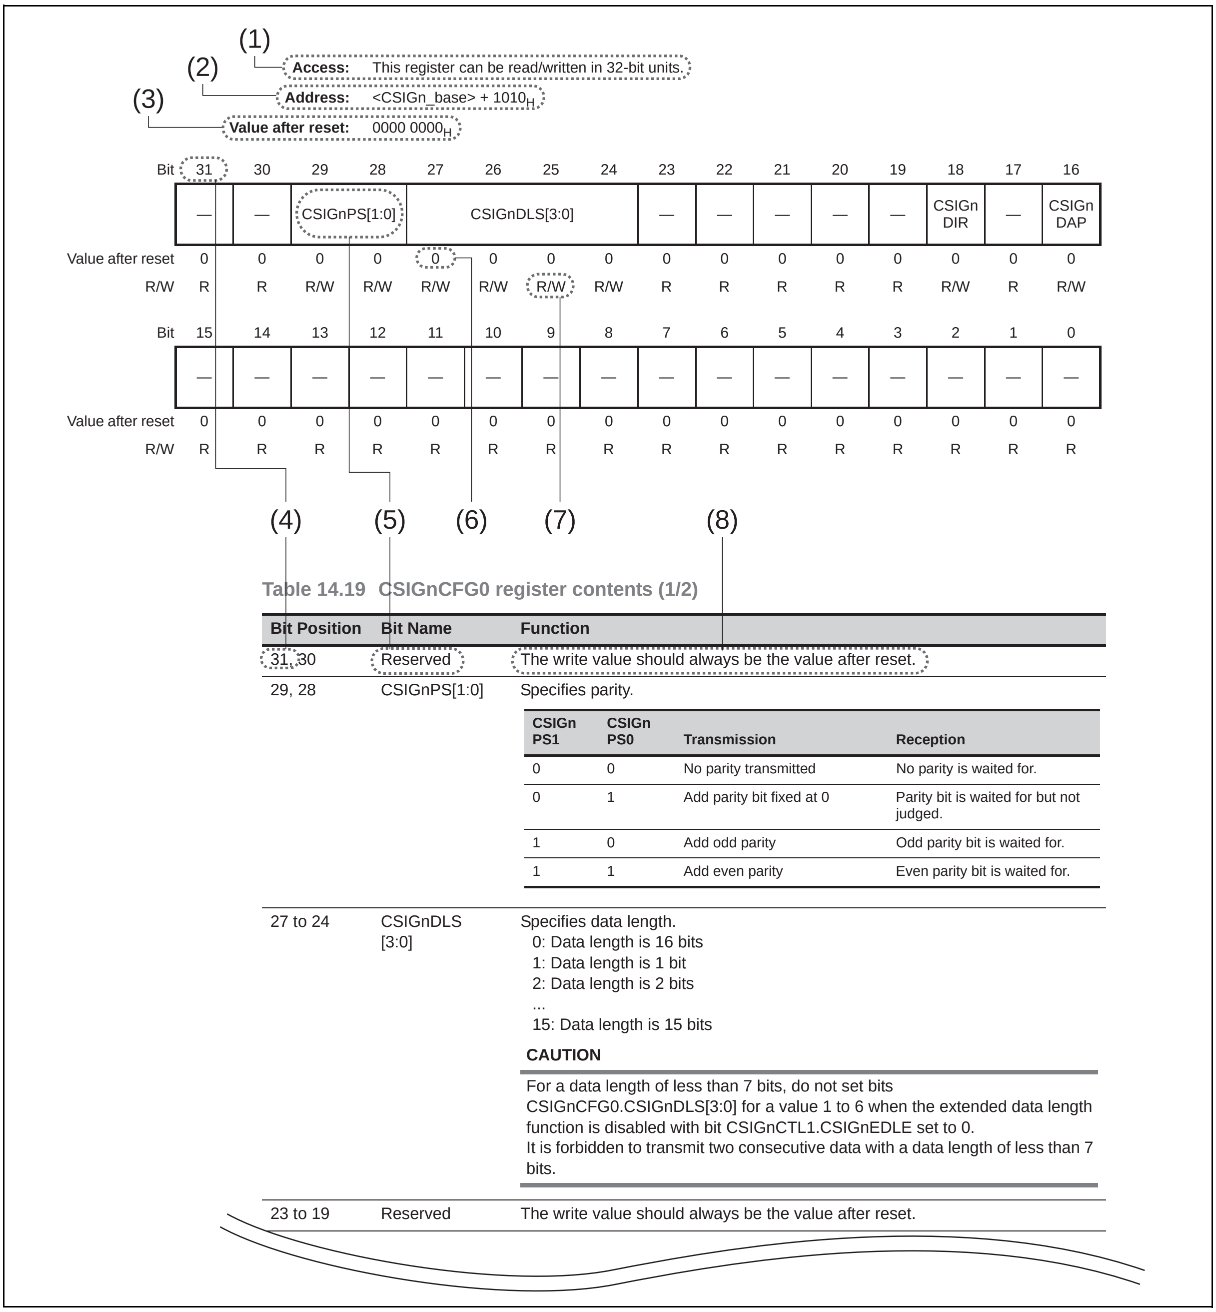
M (mega): $2^{20} = 1{,}024^2$

G (giga): $2^{30} = 1{,}024^3$

Description of Registers

Each register description includes register access, register address, and register value after a reset, a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meaning of the bit settings.

The standard format for bit charts and tables are described below.



(1) Access

The register can be accessed in the bit unit indicated here.

(2) Address

This is the register address.
For base address, see description of base address in each section.

(3) Value after a reset (in hexadecimal notation)

This is the value of all bits of the register after a reset. Values for bytes are given as numbers in the range from 0 to 9 and letters from A to F or as X where they are undefined.

(4) Bit position

This is the bit number.
The bits are numbered from 31 to 0 for 32-bit registers, 15 to 0 for 16-bit registers, and 7 to 0 for 8-bit registers.

(5) Bit name

Bit name or field name is indicated.
When clearly identifying the digits of a bit field is required, do so by using a form such as CSIGnDLS[3:0] above.
Indicate reserved bits by using a dash (—).

(6) Value after a reset (in binary notation)

This is the bit values after a reset.

0 : The value after a reset is 0.
1 : The value after a reset is 1.
— : The value after a reset is undefined.

(7) R/W

This is the bit attribute of all bits of the register.

R/W : The bit or field is readable and writable.
R : The bit or field is readable.
Note that all reserved bits are indicated as R.
When written, the value specified in the bit chart or the value after a reset should be written.
In case of writing to writable registers that also include non-reserved bits with the R-attribute, writing to the R-attribute bits will be ignored unless otherwise specified.
W : This bit or field is writable. When read, the value is undefined. If a value is indicated in the bit chart, the value is returned.

(8) Function

This is function of the bit.

Table of Contents

Section 1 Overview

RH850/P1M-E is a product series of Renesas Electronics’ single-chip microcomputer RH850 family. This section describes the overview of RH850/P1M-E.

This product has Security installed. For the specification of Security function, please contact with agent/distributor.

1.1 Outline

This product is a 32-bit single-chip microcomputer with multiple CPUs, Code Flash, Data Flash, RAM modules, DMA controllers, many communication interfaces that are used in the automotive applications, A/D converters, timer units, etc.
The main features are as below.

(1) RH850 CPU

This product contains two RH850G3Ms: one operates as the master CPU for normal operation and another as a checker CPU that monitors the operation of the master CPU. The two CPUs operate in lock step mode.

The architecture of this dual-core CPU unit realizes the compact footprint of the programs by 2-byte basic instructions and high-level language compiler oriented instruction sets. This dual-core CPU unit has very quick interrupt response time so that it can support hard real-time applications.

(2) On-chip Code Flash and Data Flash

This chip has high-speed Code Flash from which the CPU can fetch the instructions and the constant data. Its capacity is up to 2MB. This Code Flash can be reprogrammed in the situation that the chip is mounted in the application systems.

This chip also has Data Flash with EEPROM emulation capability. Its capacity is up to 64KB.

(3) Rich peripheral functionality

The RH850/P1M-E incorporates standard communication controllers such as CAN, LIN, FlexRay, and serial communications in addition to timers and A/D converters best suited for the automobile chassis applications. In addition, the RH850/P1M-E incorporates SENT and PSI5 communication controllers that can be used for sensor interface.

(4) Functional safety support

This chip equips several dedicated functionalities including the Lock-Step Dual Core configuration for the CPU, the memory protection with ECC, the bus protection with ECC, the peripheral module protection, and voltage/clock monitors to support the functional safety standard (ASIL) required in the automotive applications.

1.2 Application Fields

- Automotive field (including chassis control system)

1.3 Specification Overview

Table 1.1 Features in Each Product (1/2)

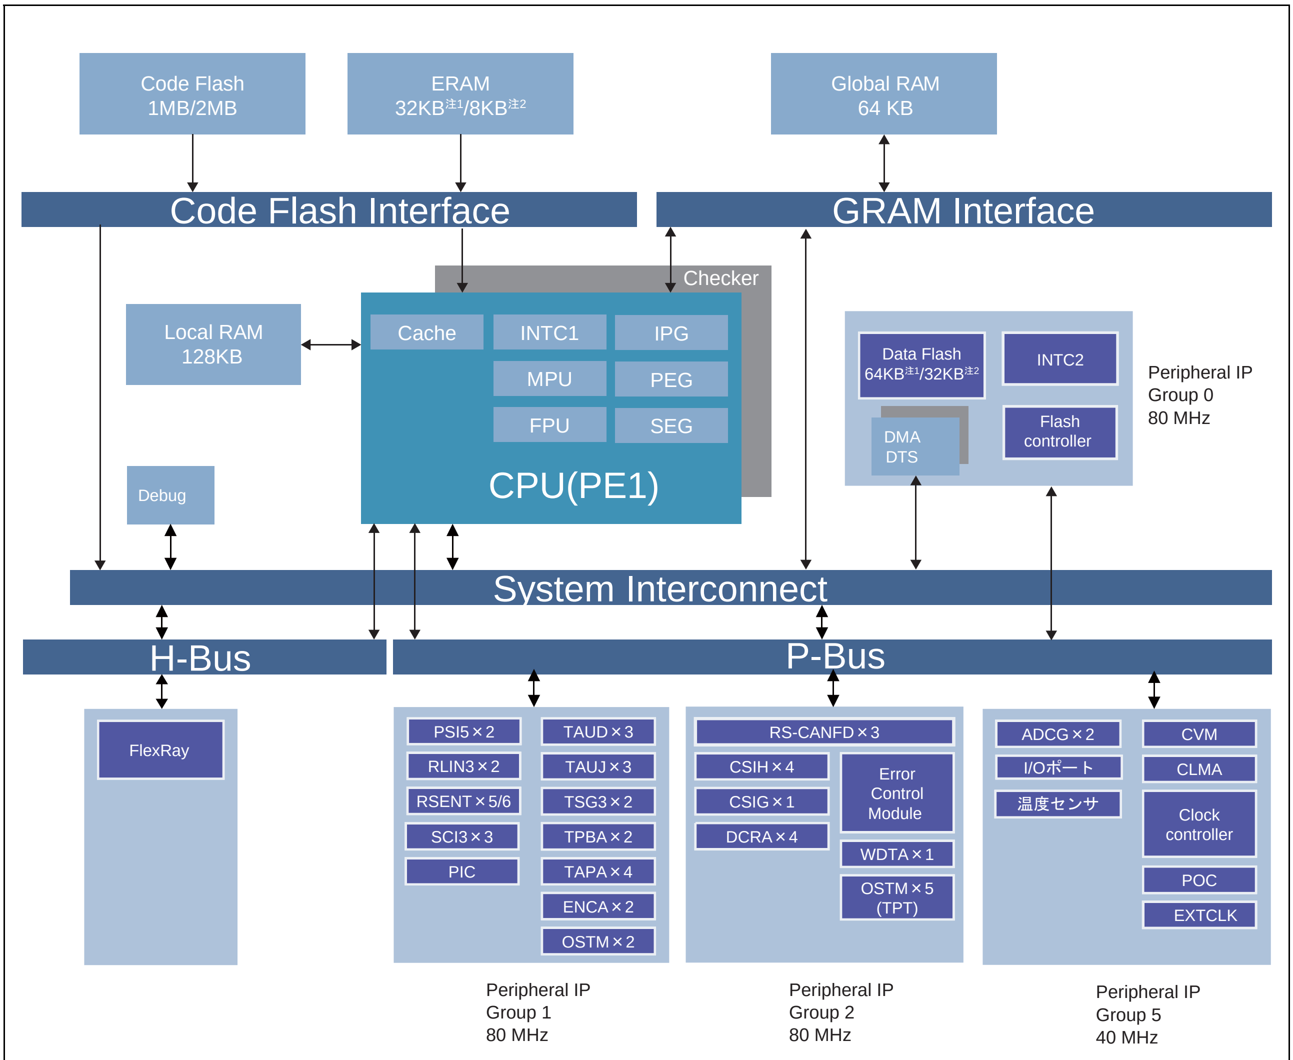
Product				RH850/P1M-E		
				100-pin	144-pin	
Package				LFQFP100 (14x14)	LFQFP144 (16x16)	LFQFP144 (20x20)
Product name	eVR	1MB		R7F701382	R7F701384	R7F701386
		2MB		R7F701376	R7F701378	R7F701380
	DPS	1MB		R7F701381	R7F701383	R7F701385
		2MB		R7F701375	R7F701377	R7F701379
CPU Subsystem	Frequency			160 MHz Main OSC = 16 MHz only		
	Main Core			1		
	Lockstep			Yes		
	FPU	Double prec.		Yes		
	MPU			16 ch		
	Cache (Inst.)			16 KB 4 way		
	RAM	Local RAM		128 KB		
		Global RAM		64 KB		
		Trace RAM		32 KB		
		ERAM (Emulation RAM)		32 KB[*1]/8 KB[*2]		
	INTC	INTC1		32 ch Redundant		
		INTC2		352 ch No Redundancy		
	DMA	DMAC		16 ch Redundant		
		DTS		128 ch Redundant		
Flash Memory	Code Flash			2 MB/1 MB		
	DATA Flash			64 KB[*1]/32 KB[*2]		
Safety	ECM			Yes		
	CVM			Yes		
	BIST with status flag			Yes		
	ERROROUT			Yes		
	Clock monitor			Yes		
A/D Converter	ADC 12 bit	module		2		
		Temperature sensor		Yes		
		Analog input	ADCG0	9 ch	12 ch	
			ADCG1	10 ch	12 ch	
		T & H	ADCG0	6		
			ADCG1	4		

Table 1.1 Features in Each Product (2/2)

Product			RH850/P1M-E 100-pin	RH850/P1M-E 144-pin
Timer	TAUD (16 bit × 16 ch)	modules	3	
	TAUJ (32 bit × 4 ch)	modules	3	
	TSG3	modules	2	
	TAPA (Hi-Z control)	modules	4	
	ENCA	modules	2	
	OSTM	modules	5	
	OSTM (Output)	modules	2	
	WDT	modules	1	
	TPBA (Timer Pattern Buffer)	modules	2	
	PIC (Peripheral interconnect)		Yes	
	Clock out	modules	2	
Communication Interface	RS-CANFD	channels	3	
	FlexRay	channels	2	
	PSI5	channels	2	
	RSENT	channels	5	6
	SCI 3 (Sync/Async USART)	channels	3	
	RLIN3 (LIN master/UART)	channels	2	
	CSIG (SPI)	channels	1	
	CSIH (SPI)	channels	4	
DataCRC			4	
Security (ICUS)			Yes	
Debug	Nexus-JTAG		Yes	
	LDU		Yes	
	AUD-RAM monitor		No	
	Branch Trace (for Debug) (Output)		No	
	Data Trace (for Debug) (Output)		No	
	Internal Branch Trace (to Trace RAM)		Yes	
	Internal Data Trace (to Trace RAM)		Yes	
	Measurement (Memory Read)		Yes	
Power Supply	Core		1.25 (DPS), eVR	
	I/O		3.3/5.0	
	ADC		3.3/5.0	

Note 1. Only available in devices with 2-MB flash memory.
Note 2. Only available in devices with 1-MB flash memory.

1.4 Block Configuration



Note 1. Only available in devices with 2-MB flash memory.
Note 2. Only available in devices with 1-MB flash memory.

Note 1. Only in 144-pin products.

2.2 Pin Expansion

2.2.1 Overview

This subsection describes pin functions, external pin lists, and external pin states at a reset and in each operating status.

2.2.2 List of Pin Functions

Table 2.2 lists functions of each pin. "Port number" in the table indicates that the function is supported, while "—" indicates that the function is not supported. Do not use the pin function that is not supported.

Table 2.2 Pin Function (1/16)

Category	Pin name	IO	Function	Alternative Port

Note 1. This is a dedicated pin. Do not use it as a port pin.

2.3 Port Functions

2.3.1 Features

Port Group

This product has the following numbers of port groups:

Table 2.3 RH850/P1M-E Port Group

Product	Number of Group	Name of Group
RH850/P1M-E	7	P0 to P5, JP0

Port Group Index n

Each port group is identified by its own index “n” (n = 0 to 5) throughout this section; e.g. PMCn for the port mode control register of the Pn pin.

Register Address

All port addresses are given as an offset from the individual base addresses, <JPORT0_base> and <PORT_base>.

Table 2.4 shows the base addresses, <JPORT0_base> and <PORT_base>.

Table 2.4 Port Base Address

Base address	Address
<PORT_base>	FFC1 0000_H
<JPORT0_base>	FFC2 0000_H

2.3.2 Overview

This product has various pins for input/output (I/O) functions, known as ports. The ports are organized in port groups.

This product also has several control registers to allocate the functions other than general I/O purpose to the corresponding pins.

For definitions of pin, port, and port group, see **Section 2.3.2.1, Terms**.

2.3.2.1 Terms

The terms descried in this section are defined as follows.

- Pin:
  Denotes a physical pin. Every pin is denoted by a unique pin number. Most pins can be used in multiple modes. Thus the pin name indicating its own function is assigned to each pin depending on the selected mode.
- Port group:
  Denotes a group of ports.
- Port mode / Port:
  A pin in port mode functions as a general purpose I/O pin. It is then called port.
  The corresponding name is Pn_m. For example, P0_7 denotes the port 7 of port group 0 and it is referred to as port P0_7.
- Alternative mode:
  In alternative mode, a pin can be used for non-general purpose I/O functions as well; e.g. as the I/O pin of on-chip peripherals. Therefore, the corresponding pin name depends on the selected function. For example, the INTP0 pin denotes the pin for one of the external interrupt inputs.
  Note that two or more different names can refer to the same physical pin, e.g. for P0_2 and INTP0. Those different names indicate the function in which the pin is being operated.
- Port type:
  The control circuit is selected based on a register setting, and the port type is determined based on the type of the control circuit.

(1) JTAG Ports

The JTAG port groups are used for connecting a debugger for on-chip debugging. These are special port groups provided because the microcontroller cannot be used for the user's application while on-chip debugging is being executed. When a debugger is not connected and the microcontroller is operating normally, these port groups can be used in the same way as the other port groups.

JTAG port group registers and bit names are prefixed by a “J”. For example, JP0 denotes JTAG port group 0, and JPM0.JPM0_m denotes the JPM0_m port mode bit of the JPM0 port mode register.

NOTE

In this section, the descriptions about all ports and their registers other than PFCn, PFCAEn, PIPCn, PINVn, and PODCEn apply to the JTAG port unless otherwise specified.

2.3.2.2 Overview of Pin Functions

The pin can operate in the following three different modes:

- Port mode (PMCn.PMCn_m = 0)
  The pin operates as a general purpose I/O port in port mode.
  PMn.PMn_m selects input or output.
- S/W I/O control alternative mode (PMCn.PMCn_m = 1, PIPCn.PIPCn_m = 0)
  The pin is operated by an alternative function in S/W I/O control alternative mode.
  The selection between input and output is made by S/W via the PMn.PMn_m control bits.
- Direct I/O control alternative mode (PMCn.PMCn_m = 1, PIPCn.PIPCn_m = 1)
  The pin is operated by an alternative function in direct I/O control alternative mode.
  In contrast to S/W I/O control alternative mode, input/out is directly controlled by the alternative function in this mode.

Table 2.5 shows the outline of the register settings.

Table 2.5 Pin Function Configuration (Outline)

Mode	Bit				I/O
	PMCn_m	PMn_m	PIPCn_m	PIBCn_m	
Port mode	0	0	X	X	O
		1		1	I
S/W I/O control alternative mode	1	0	0	X	O
		1	0	0	I
Direct I/O control alternative mode		X	1	X	Controlled by the alternative function

- S/W I/O control alternative modes (PIPCn.PIPCn_m = 0):
  - Outputs (PMn_m = 0): Alternative output mode 1 to 6
  - Inputs (PMn_m = 1): Alternative input mode 1 to 6
- Direct I/O control alternative modes (PIPCn.PIPCn_m = 1):
  - Input/Output of alternative output mode 1 to 6 and alternative input mode 1 to 6 are directly selected by the alternative function.

Table 2.6 Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)

Function	Register				I/O
	PFCAE	PFCE	PFC	PM*[1]	
Alternative output mode 1 (ALT-OUT1)	0	0	0	0	O
Alternative input mode 1 (ALT-IN1)	0	0	0	1	I
Alternative output mode 2 (ALT-OUT2)	0	0	1	0	O
Alternative input mode 2 (ALT-IN2)	0	0	1	1	I
Alternative output mode 3 (ALT-OUT3)	0	1	0	0	O
Alternative input mode 3 (ALT-IN3)	0	1	0	1	I
Alternative output mode 4 (ALT-OUT4)	0	1	1	0	O
Alternative input mode 4 (ALT-IN4)	0	1	1	1	I
Alternative output mode 5 (ALT-OUT5)	1	0	0	0	O
Alternative input mode 5 (ALT-IN5)	1	0	0	1	I
Alternative output mode 6 (ALT-OUT6)	1	0	1	0	O
Alternative input mode 6 (ALT-IN6)	1	0	1	1	I

Note 1. When PIPCn.PIPCn_m = 1, the I/O direction is directly controlled by the peripheral (alternative) function and PM is ignored.

When a pin is operated in alternative mode (PMCn.PMCn_m = 1), one of several alternative functions can be selected by the PFCn, PFCEn, and PFCAEn registers.

2.3.2.3 Pin Data Input/Output

The registers used for data input and output are described below.

The source of the data to be read via the PPRn register depends on pin mode.

Output data

In port mode (PMCn.PMCn_m = 0), the value of Pn.Pn_m is output from the Pn_m pin.

Input data

A read operation of the PPRn register returns either the value of the Pn_m pin, the associated bit of the port register Pn.Pn_m, or the data output by an alternative function.

The source of the data read via PPRn depends on pin mode and setting of several control bits.

Table 2.7 summarizes the differences of PPRn read modes.

Table 2.7 PPRn_m Read Values

PMC n_m	PM n_m	PIBC n_m	PIPC n_m	PODCE n_m	PODC n_m	Mode	PPRn_m read value
0	1	0	X	X	X	Port input, input buffer disabled	Pn.Pn_m bit
		1		X	X	Port input, input buffer enabled	Pn_m pin
	0	X		0	0	Port push-pull output	Pn.Pn_m bit*1
				0	1	Port N-ch open-drain output	
				1	0	Port push-pull output	
				1	1	Port P-ch open-drain output	
1	1	0	0	X	X	S/W I/O control alternative input	Pn_m pin
		1				Setting prohibited	—
	0	X		0	0	S/W I/O control alternative push-pull output	Alternative function internal output signal*1
				0	1	S/W I/O control alternative N-ch open-drain output	
				1	0	S/W I/O control alternative push-pull output	
				1	1	S/W I/O control alternative P-ch open-drain output	
	X		1	0	0	Direct I/O control alternative input or push-pull output	I/O port in alternative function mode: • Input: Pn_m pin • Output: Alternative function internal output signal*1
				0	1	Direct I/O control alternative input or N-ch open-drain output	
				1	0	Direct I/O control alternative input or push-pull output	
				1	1	Direct I/O control alternative input or P-ch open-drain output	

Note 1. When PBDCn_m = 1, Pn_m pin level is read via PPRn_m.

The control registers in **Table 2.7** have the following effects:

- PMCn.PMCn_m
  This bit selects either port mode (PMCn_m = 0) or alternative function mode (PMCn_m = 1).
- PMn.PMn_m
  This bit selects input (PMn_m = 1) or output (PMn_m = 0) in port mode (PMCn_m = 0) and S/W I/O control alternative mode (PMCn_m = 1, PIPCn_m = 0).
- PIBCn.PIBCn_m
  This bit disables (PIBCn_m = 0) or enables (PIBCn_m = 1) the input buffer in input port mode (PMCn_m = 0 and PMn_m = 1). When the input buffer is disabled, PPRn_m reads the Pn.Pn_m bit, otherwise the Pn_m pin level is returned.
- PIPCn.PIPCn_m
  This bit selects either the S/W or direct I/O control alternative mode.
- PBDCn.PBDCn_m
  Setting this bit to 1 forces to read the Pn_m pin level via PPRn_m. Thus this enables a bidirectional mode, where the level of pin Pn_m can also be read back when the port is operated in an output mode.
- PODCn.PODCn_m and PODCEn.PODCEn_m bits
  These bits select push-pull output (PODCn_m bit = 0), N-ch open-drain output (PODCn_m bit = 1 and PODCEn_m bit = 0), or P-ch open-drain output (PODCn_m bit = 1 and PODCEn_m bit = 1).

Write to the Pn Register

The data to be output via port Pn_m in port mode (PMCn.PMCn_m = 0) is held in the port register Pn.

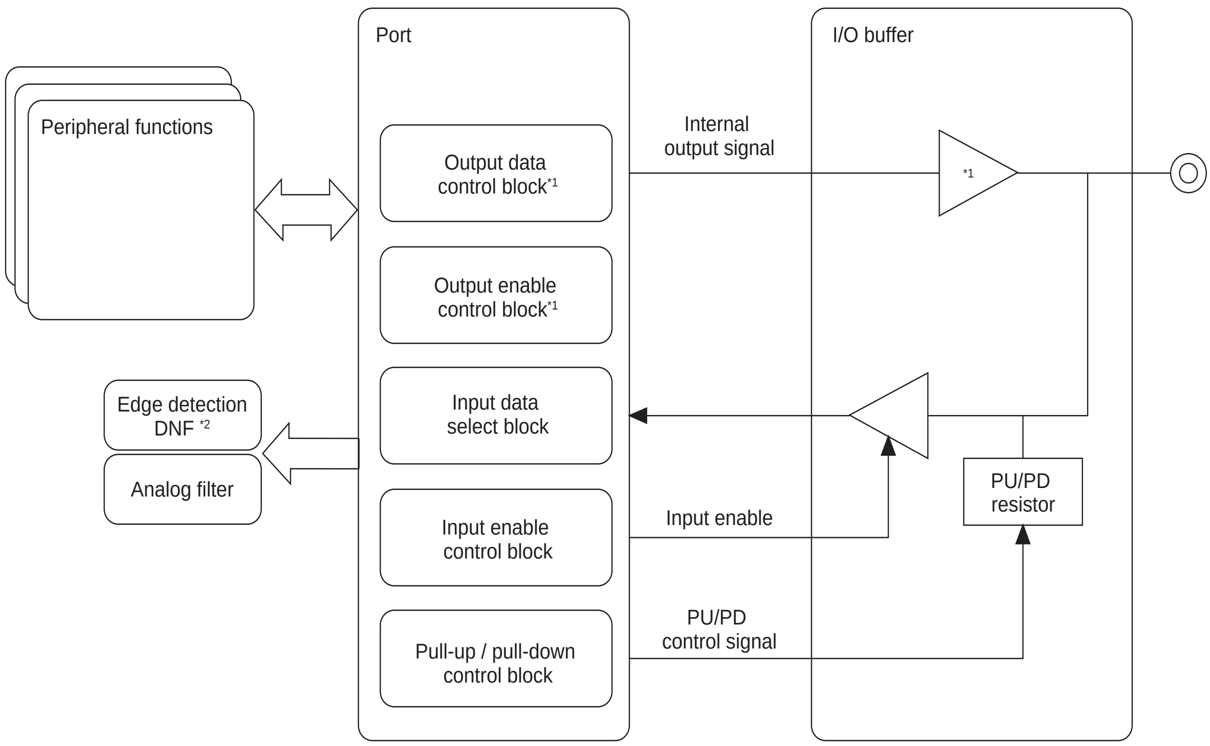
The Pn data can be rewritten in the following two different ways:

- Direct write to the Pn register
  New data can be directly written to the Pn register.
- Indirect operation to the Pn bit (set/reset/not)
  The indirect Pn operation is possible using the following two registers:
  - Port set/reset register: PSRn
    When the bit PSRn.PSRn_(m+16) = 1, the value of bit PSRn.PSRn_m determines the value of Pn.Pn_m.
    Thus Pn_m can be set/reset without a direct write to Pn.
  - Port NOT register: PNOTn
    Setting PNOTn.PNOTn_m = 1 inverts the bit Pn.Pn_m without a direct write to Pn_m.
    Additionally, reading the level of the output pin can read the inverted value of the value that was initially set.

The indirect Pn set/reset/not operation provides access to single bits (not limited to one bit) of the Pn register while leaving all other Pn bits untouched.

2.3.3 Port Type

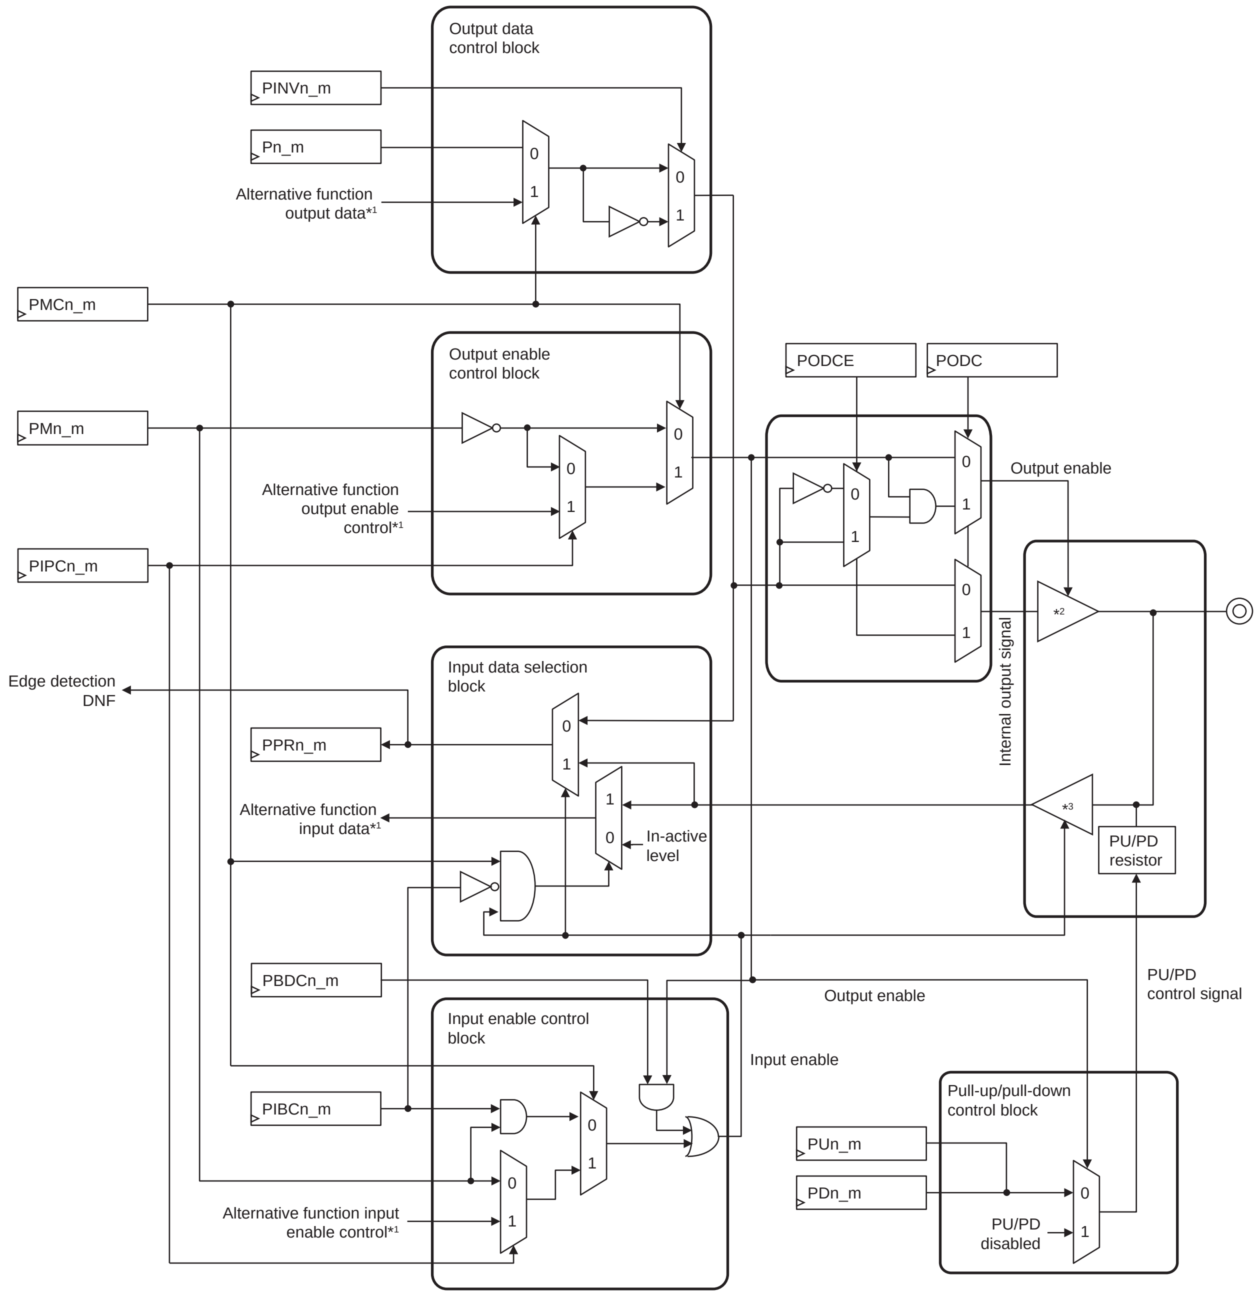
Figure 2.3 shows the overall configuration of the pins. For the details of port blocks, see **Figure 2.4**.



Note 1. Because analog input pins are only for input, they do not incorporate output-related functions.
Note 2. For details of the edge-detection DNF function and the relevant pins, see **Table 2.50, List of Input Pins with a Noise Filter**.

Figure 2.3 Block Diagram of Pin Configuration

Figure 2.4 shows the logical circuitry of the port control functions. The diagram is only a logical reference and does not show the real circuitry.



Note 1. This is the signal of the alternative function selected by PFCn_m, PFCEn_m, and PFCAEn_m.

Note 2. The output driving ability is set by PDSCn_m and PUCCn_m.

Note 3. The type of the input buffer is set by PISAn.

Figure 2.4 Port Control Logic Diagram

2.3.4 Port Group Configuration Register

This section starts with an overview of all configuration registers and then presents all registers in detail. The configuration registers are classified as follows:

- **2.3.4.2 Pin Function Configuration**
- **2.3.4.3 Pin Data Input/Output**
- **2.3.4.4 Configuration of Electrical Characteristics**

2.3.4.1 Outline

The following registers are used for the configuration of the individual pins of the port groups:

Table 2.8 Registers for Port Group Configuration (1/2)

Register Name	Symbol	Address
Pin function setting		
Port control register	PCRn_m	<PORT_base> + $2000_H + n \times 40_H + 4_H \times m$
	JPCR0_m	<JPORT0_base> + $2000_H + 4_H \times m$
Port mode control register	PMCn	<PORT_base> + $0014_H + n \times 40_H$
	JPMC0	<JPORT0_base> + 0014_H
Port mode control set/reset register	PMCSRn	<PORT_base> + $0024_H + n \times 40_H$
	JPMCSR0	<JPORT0_base> + 0024_H
Port IP control register	PIPCn	<PORT_base> + $4008_H + n \times 40_H$
Port mode register	PMn	<PORT_base> + $0010_H + n \times 40_H$
	JPM0	<JPORT0_base> + 0010_H
Port mode set/reset register	PMSRn	<PORT_base> + $0020_H + n \times 40_H$
	JPMSR0	<JPORT0_base> + 0020_H
Port input buffer control register	PIBCn	<PORT_base> + $4000_H + n \times 40_H$
	JPIBC0	<JPORT0_base> + 4000_H
Port function control register	PFCn	<PORT_base> + $0018_H + n \times 40_H$
Port function control expansion register	PFCEn	<PORT_base> + $001C_H + n \times 40_H$
	JPFCE0	<JPORT0_base> + $001C_H$
Port function control addition expansion register	PFCAEn	<PORT_base> + $0028_H + n \times 40_H$
Pin data input/output		
Port bi-direction control register	PBDCn	<PORT_base> + $4004_H + n \times 40_H$
	JPBDC0	<JPORT0_base> + 4004_H
Port pin read register	PPRn	<PORT_base> + $000C_H + n \times 40_H$
	JPPR0	<JPORT0_base> + $000C_H$
Port register	Pn	<PORT_base> + $0000_H + n \times 40_H$
	JP0	<JPORT0_base> + 0000_H
Port NOT register	PNOTn	<PORT_base> + $0008_H + n \times 40_H$
	JPNOT0	<JPORT0_base> + 0008_H
Port set/reset register	PSRn	<PORT_base> + $0004_H + n \times 40_H$
	JPSR0	<JPORT0_base> + 0004_H
Port output level inversion register	PINVn	<PORT_base> + $0030_H + n \times 40_H$

Table 2.8 Registers for Port Group Configuration (2/2)

Register Name	Symbol	Address
Specifying electrical characteristics		
Pull-up option register	PUn	<PORT_base> + $400C_H$ + n × 40_H
	JPU0	<JPORT0_base> + $400C_H$
Pull-down option register	PDn	<PORT_base> + 4010_H + n × 40_H
	JPD0	<JPORT0_base> + 4010_H
Port drive strength control register	PDSCn	<PORT_base> + 4018_H + n × 40_H
	JPDSC0	<JPORT0_base> + 4018_H
Port open-drain control register	PODCn	<PORT_base> + 4014_H + n × 40_H
	JPODC0	<JPORT0_base> + 4014_H
Port open-drain control expansion register	PODCEn	<PORT_base> + $403C_H$ + n × 40_H
Port universal control register	PUCCn	<PORT_base> + 4028_H + n × 40_H
	JPUCC0	<JPORT0_base> + 4028_H
Port input buffer selection register	PISAn	<PORT_base> + $402C_H$ + n × 40_H
	JPISA0	<JPORT0_base> + $402C_H$

Note: n: Port group number
m: Bit number in a port group

Base address

The PORTn base addresses, <PORT_Base> and <JPORT0_Base> are defined in **Register Address**, **Section 2.3.1, Features**.

Value after a reset

The value after a reset depends on the port, and are not described in the following register descriptions, but are given in **Section 2.4.1.1, List of Port Registers**.

2.3.4.2 Pin Function Configuration

(1) PMCn/JPMC0 — Port Mode Control Register

This register specifies whether the individual pins of port group n are in port mode or in alternative mode.

Access: PMCn: This register can be read/written in 16-bit units.
JPMC0: This register can be read/written in 8-bit units.

Address: PMCn: <PORT_base> + 0014_H + n × 40_H
JPMC0: <JPORT0_base> + 0014_H*1

Value after reset: PMCn: 0000_H
JPMC0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 2.9 PMCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMCn_[15:0]	Specifies the operation mode of the corresponding pin. 0: Port mode 1: Alternative mode

CAUTIONS

1. The I/O control is not performed by just setting alternative mode (PMCn.PMCn_m). When the alternative function performs direct I/O control, set also the PIPCn.PIPCn_m bit to 1.
2. When a port is used as an input pin in alternative mode, there is a pin that passes a noise filter. Such a pin might need FCLA0CTLm.DFNAnCTL and the DNFAnEN register to be set.
For details, see **Section 2.6, Noise Filter and Edge Level Detection Circuit**.

NOTES

1. The control bits of the JTAG port mode control register (JPMC0) are JPMC0_[7:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(2) PMCSRn/JPMCSR0 — Port Mode Control Set/Reset Register

This register provides an alternative method to write data to a bit in the PMCn register.

The upper 16 bits of PMCSRn specify whether the data of the corresponding lower 16 bits of PMCSRn is written to the PMCn.PMCn_m bit.

Access: This register can be read/written in 32-bit units.
PMCSRn: Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMCn register.
JPMCSR: Bits 31 to 8 are always read as $0000\ 00_H$. Reading bits 7 to 0 returns the value of the JPMCn register.

Address: PMCSRn: <PORT_base> + 0024_H + n × 40_H
JPMCSR0: <JPORT0_base> + 0024_H*1

Value after reset: $0000\ 0000_H$

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.10 PMCSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMCSRn_ [31:16]	Specifies whether the value of the corresponding lower bit of PMCSRn_[15:0] is written to PMCn_m: 0: PMCn_m does not depend on PMCSRn_m. 1: The value of PMCn_m is the same as that of PMCSRn_m. Example: When PMCSRn.PMCSRn_31 = 1, the value of bit PMCSRn.PMCSRn_15 is written to bit PMCn.PMCn_15.
15 to 0	PMCSRn_ [15:0]	Specifies the PMCn_m value when the corresponding upper bit PMCSRn_(m+16) is 1: 0: PMCn_m = 0 1: PMCn_m = 1

NOTES

1. The control bits of the JTAG port mode control set/reset register (JPMCSR0) are JPMCSR0_[31:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(3) PIPCn — Port IP Control Register

This register specifies whether the I/O direction of pin Pn_m is controlled by the port mode register PMn.PMn_m or by an alternative function.

When the Pn_m pin is operated in alternative mode (PMCn.PMCn_m = 1) and the alternative function directly controls the I/O direction of Pn_m, PIPCn.PIPCn_m must be set to 1 as well.

This hands over I/O control to the alternative function and overrules the PMn.PMn_m setting.

Access: This register can be read/written in 16-bit units.

Address: PIPCn: <PORT_base> + 4008_H + n × 40_H*1

Value after reset: 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.11 PIPCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIPCn_[15:0]	Specifies the I/O control mode. 0: I/O mode is selected by PMn.PMn_m (software I/O control). 1: I/O mode is selected by the peripheral function (direct I/O control).

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(4) PMn/JPM0 — Port Mode Register

The PMn register specifies whether the individual pins of port group n are in input mode or in output mode.

Access:	PMn: This register can be read/written in 16-bit units. JPM0: This register can be read/written in 8-bit units.
Address:	PMn: <PORT_base> + 0010_H + n × 40_H JPM0: <JPORT0_base> + 0010_H *1
Value after reset:	PM0: $FBFF_H$, PM1 to 5: $FFFF_H$ JPM0: FF_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Note 1. PM0: 0
PM1 to PM5: 1

Table 2.12 PMn Register Contents

Bit Position	Bit Name	Function
15 to 0	PMn_[15:0]	Specifies input/output mode of the corresponding pin. 0: Output mode (output enabled) 1: Input mode (output disabled)

NOTES

1. When a port is used in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1), the input buffer needs to be enabled (PIBCn.PIBCn_m = 1).
2. After reset, PIPCn.PIPCn_m = 0 is set (I/O mode is controlled with PMn.PMn_m). Thus, PMn_m specifies the I/O direction of port mode (PMCn.PMCn_m = 0) and alternative mode (PMCn.PMCn_m = 1).
3. The control bits of the JTAG port mode register (JPM0) are JPM0_[7:0].
4. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(5) PMSRn/JPMSR0 — Port Mode Set/Reset Register n

This register provides an alternative method to write data to a bit in the PMn register.

The upper 16 bits of PMSRn specify whether the data of the corresponding lower 16 bits of PMSRn is written to the PMn.PMn_m bit.

Access: This register can be read/written in 32-bit units.
PMSRn: Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMn register.
JPMSRn: Bits 31 to 8 are always read as 0000 00_H. Reading bits 7 to 0 returns the value of the JPMCn register.

Address: PMSRn: <PORT_base> + 0020_H + n × 40_H
JPMSR0: <JPORT0_base> + 0020_H*1

Value after reset: PMSR0: 0000 $FBFF_H$, PMSR1 to 5: 0000 $FFFF_H$
JPMSR0: 0000 $00FF_H$

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Note 2. PMSR1 to PMSR5: 1
PMSR0, JPMSR0: 0

Table 2.13 PMSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PMSRn_[31:16]	Specifies whether the value of the corresponding lower bit of PMSRn_[15:0] is written to PMn_m: 0: PMn_m does not depend on PMSRn_m. 1: The value of PMn_m is the same as that of PMSRn_m. Example: When PMSRn.PMSRn_31 = 1, the value of bit PMSRn.PMSRn_15 is written to bit PMn.PMn_15 and output.
15 to 0	PMSRn_[15:0]	Specifies the PMn_m value when the corresponding upper bit PMSRn_(m+16) is 1: 0: PMn_m = 0 1: PMn_m = 1

NOTES

1. The control bits of the JTAG port mode set/reset register (JPMSR0) are JPMSR0_[31:0]
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(6) PIBCn/JPIBC0 — Port Input Buffer Control Register

This register enables and disables the input buffer in input port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 1).

Additionally, when pins are in bidirectional mode (PBDCn.PBDCn_m = 1), it is capable of selecting shared output level loop-back function and pin output level-read function with the setting of PIBCn.PIBCn_m. For details, see **(1) PBDCn/JPBDC0 — Port Bi-Direction Control Register** in **Section 2.3.4.3, Pin Data Input/Output**.

Access: PIBCn: This register can be read/written in 16-bit units.
JPIBC0: This register can be read/written in 8-bit units.

Address: PIBCn: <PORT_base> + 4000_H + n × 40_H
JPIBC0: <JPORT0_base> + 4000_H*1

Value after reset: PIBCn: 0000_H
JPIBC0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.14 PIBCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PIBCn_[15:0]	Enables/disables the input buffer: 0: Input buffer is disabled. 1: Input buffer is enabled.

NOTES

1. When the input buffer is disabled, it does not consume flow-through current even if the pin level is in Hi-Z state. Thus, the pin does not need to be fixed to a high or low level externally.
2. The control bits of the JTAG port input buffer control register (JPIBC0) are JPIBC0_[7:0].
3. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(7) PFCn — Port Function Control Register

This register, together with the PFCEn and PFCAEn registers, specifies an alternative function of the pins.

Some alternative functions require direct I/O control of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register can be read/written in 16-bit units.

Address: <PORT_base> + 0018_H + n × 40_H*1

Value after reset: 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.15 PFCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCn_[15:0]	Specifies an alternative function of a pin. See **Table 2.6, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)**.

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(8) PFCEn / JPFCE0 — Port Function Control Expansion Register

This register, together with the PFCn and PFCAEn registers, specifies an alternative function of the pins.

Some alternative functions directly controls input/output of pin Pn_m. For such alternative functions PIPCn.PIPCn_m must be set to 1 as well.

For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: PFCEn: This register can be read/written in 16-bit units.
JPFCE0: This register can be read/written in 8-bit units.

Address: PFCEn: <PORT_base> + $001C_H$ + n × 40_H
JPFCE0: <JPORT0_base> + $001C_H$*1

Value after reset: PFCEn: 0000_H
JPFCE0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.16 PFCEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCEn_[15:0]	Specifies an alternative function of a pin. See **Table 2.6, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)** for details.

NOTES

1. The control bits of the JTAG port function control expansion register (JPFCE0) are JPFCE0_[7:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(9) PFCAEn — Port Function Control Additional Expansion Register

This register, together with the PFCn and PFCEn registers, specifies an alternative function of the pins.

Some alternative functions directly controls input/output of pin Pn_m. For such an alternative functions PIPCn.PIPCn_m must be set to 1 as well. For other alternative functions, input/output must be specified by PMn.PMn_m.

Access: This register can be read/written in 16-bit units.

Address: <PORT_base> + 0028_H + n × 40_H*1

Value after reset: 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.17 PFCAEn Register Contents

Bit Position	Bit Name	Function
15 to 0	PFCAEn_[15:0]	Specifies an alternative function of a pin. See **Table 2.6, Outline of Alternative Mode Selection (PMCn.PMCn_m = 1)** for details.

Table 2.18 Setting Alternative Functions

PFCAEn_m	PFCEn_m	PFCn_m	PMn_m	Function
0	0	0	1	1st alternative function / Input
			0	1st alternative function / Output
		1	1	2nd alternative function / Input
			0	2nd alternative function / Output
	1	0	1	3rd alternative function / Input
			0	3rd alternative function / Output
		1	1	4th alternative function / Input
			0	4th alternative function / Output
1	0	0	1	5th alternative function / Input
			0	5th alternative function / Output
		1	1	6th alternative function / Input
			0	6th alternative function / Output
	1	X	X	Setting prohibited

CAUTION

- After selecting the alternative function by the PFCn_m, PFCEn_m or PFCAEn_m register, set the PMCn_m register to 1.
- With this product, the I/O of some functions is multiplexed in two pins, but only either one can be used as a pin function. Setting the same pin function in two pins is prohibited.
  For example, if the a/b/c pin is used as b, the b/d/e pin cannot be used as b. In this case, the b/d/e pin must be configured as the pin function other than b.

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

2.3.4.3 Pin Data Input/Output

(1) PBDCn/JPBDC0 — Port Bi-Direction Control Register

This register enables the input buffer when a port is used in output mode and sets in bi-direction mode. In bi-direction mode, PPRn.PPRn_m can read the level of the Pn_m pin.

- Alternative output level loopback function
  When the Pn_m pin is used as the alternative output function, the actual pin output level based on the alternative output function can be looped back to the alternative input side by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m= 0. For example, the pin output level based on the first alternative function can be looped back to the same alternative input side. Also the pin output level can be read via PPRn.PPRn_m.
- Pin output level read function
  When the Pn_m pin is used as the general output port function or the alternative output function, the actual pin output level can be read via PPRn.PPRn_m by setting PBDCn.PBDCn_m = 1 and PIBCn.PIBCn_m = 1. Under this setting, the pin output level will never be looped back to the alternative input side even in alternative output mode.

Access: PBDCn: This register can be read/written in 16-bit units.
JPBDC0: This register can be read/written in 8-bit units.

Address: PBDCn: <PORT_base> + 4004_H + n × 40_H
JPBDC0: <JPORT0_base> + 4004_H*1

Value after reset: PBDCn: 0000_H
JPBDC0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PBDCn_15	PBDCn_14	PBDCn_13	PBDCn_12	PBDCn_11	PBDCn_10	PBDCn_9	PBDCn_8	PBDCn_7	PBDCn_6	PBDCn_5	PBDCn_4	PBDCn_3	PBDCn_2	PBDCn_1	PBDCn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 2.19 PBDCn Register Contents

Bit Position	Bit Name	Function
15 to 0	PBDCn_[15:0]	Enables/disables bi-direction mode of the corresponding pin. 0: Bi-direction mode disabled 1: Bi-direction mode enabled

CAUTION

When the Pn_m port is used as an alternative output function (PMCn.PMCn_m = 1, PMn.PMn_m = 0), if bidirectional mode is enabled (PBDCn.PBDCn_m = 1), the level of the Pn_m pin can be read with PPRn.PPRn_m.

However, the output of the alternative output function is input to the alternative input function of the same pin (the alternative input function that is set with PFCn.PFCn_m, PFCEn.PFCEn_m, and PFCAEn.PFCAEn_m). If this alternative input function is used in another pin, note that the output of the alternative output function and alternative input in other pins are input internally (OR input).

NOTES

1. The control bits of the JTAG port bi-direction control register (JPBDC0) are JPBDC0_[7:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(2) PPRn/JPPR0 — Port Pin Read Register

This register reflects an actual Pn_m pin level, a Pn.Pn_m bit value, or an output level of the alternative function. The value to be read depends on various control settings as described in **Table 2.7, PPRn_m Read Values**.

Access: PPRn: This register can be read only in 16-bit units.
JPPR0: This register can only be read in 8-bit units.

Address: PPRn: <PORT_base> + $000C_H$ + n × 40_H
JPPR0: <JPORT0_base> + $000C_H$*1

Value after reset: PPRn: 0000_H
JPPR0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.20 PPRn Register Contents

Bit Position	Bit Name	Function
15 to 0	PPRn_[15:0]	Pin Pn_m, Pn.Pn_m value or alternative function output.

NOTES

1. For details about the read value of the PPRn register, see **Section 2.3.2.3, Pin Data Input/ Output**.
2. The control bits of the JTAG port pin read register (JPPR0) are JPPR0_[7:0].
3. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(3) Pn/JP0 — Port Register

This register sets and holds the Pn.Pn_m data to be output via the related Pn_m port in output port mode (PMCn.PMCn_m = 0 and PMn.PMn_m = 0).

Access: Pn: This register can be read/written in 16-bit units.
JP0: This register can be read/written in 8-bit units.

Address: Pn: <PORT_base> + 0000_H + n × 40_H
JP0: <JPORT0_base> + 0000_H*1

Value after reset: Pn: 0000_H
JP0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.21 Pn Register Contents

Bit Position	Bit Name	Function
15 to 0	Pn_[15:0]	Sets the output level of pin m (m = 0 to 15): 0: Low level output 1: High level output

NOTES

- The bits of this register can be manipulated by various means; refer to the subsection, **Write to the Pn Register** in **Section 2.3.2.3, Pin Data Input/Output**.
- The control bits of the JTAG port register (JP0) are JP0_[7:0].
- For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(4) PNOTn/JPNOT0 — Port NOT Register

This register enables inverting the Pn_m bit of the port register without directly writing to Pn.

Access: PNOTn: This register can be written in 16-bit units. The read value is always 0000_H.
JPNOT0: This register can only be written in 8-bit units. The read value is always 00_H.

Address: PNOTn: <PORT_base> + 0008_H + n × 40_H
JPNOT0: <JPORT0_base> + 0008_H*1

Value after reset: PNOTn: 0000_H
JPNOT0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PNOTn_15	PNOTn_14	PNOTn_13	PNOTn_12	PNOTn_11	PNOTn_10	PNOTn_9	PNOTn_8	PNOTn_7	PNOTn_6	PNOTn_5	PNOTn_4	PNOTn_3	PNOTn_2	PNOTn_1	PNOTn_0

R/W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W	W

Table 2.22 PNOTn Register Contents

Bit Position	Bit Name	Function
15 to 0	PNOTn_[15:0]	Specifies if Pn.Pn_m is inverted or not: 0: Pn.Pn_m is not inverted (Pn_m → Pn_m) 1: Pn.Pn_m is inverted ($\overline{\text{Pn\_m}}$ → Pn_m)

NOTES

1. The control bits of the JTAG port not register (JPNOT0) are JPNOT0_[7:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(5) PSRn/JPSR0 — Port Set/Reset Register

This register provides an alternative method to write data to a bit in the Pn register.

The upper 16 bits of PSRn specify whether the data of the corresponding lower 16 bits of PSRn is written to the Pn.Pn_m bit.

Access: This register can be read/written in 32-bit units.
PSRn: Bits 31 to 16 are always read as 0000_H. Reading bits 15 to 0 returns the value of the PMCn register.
JPSRn: Bits 31 to 8 are always read as $0000\ 00_H$. Reading bits 15 to 0 returns the value of the JPn register.

Address: PSRn: <PORT_base> + 0004_H + n × 40_H
JPSR0: <JPORT0_base> + 0004_H*1

Value after reset: PSRn: $0000\ 0000_H$
JPSR0: $0000\ 0000_H$

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.23 PSRn Register Contents

Bit Position	Bit Name	Function
31 to 16	PSRn_[31:16]	Specifies whether the value of the corresponding lower bit of PSRn_[15:0] is written to Pn_m: 0: Pn_m does not depend on PSRn_m. 1: The value of Pn_m is the same as that of PSRn_m. Example: When PSRn.PSRn_31 = 1, the value of bit PSRn.PSRn_15 is written to bit Pn.Pn_15.
15 to 0	PSRn_[15:0]	Specifies the Pn_m value when the corresponding upper bit PSRn_(m+16) is 1: 0: Pn_m = 0 1: Pn_m = 1

NOTES

1. The control bits of the JTAG port set/reset register (JPSR0) are JPSR0_[31:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(6) PINVn — Port Output Level Inversion Register

This register enables inverting the output level from a pin. It is effective when the pin is in output mode regardless of port output mode or alternative output mode.

Access: This register can be read/written in 32-bit units.

Address: <PORT_base> + 0030_H + n × 40_H*1

Value after reset: $0000\ 0000_H$

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.24 PINVn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PINVn_[15:0]	Specifies whether the output level from a pin is inverted or not. 0: Pin output level is not inverted. 1: Pin output level is inverted.

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

2.3.4.4 Configuration of Electrical Characteristics

(1) PUn/JPU0 — Pull-up Option Register

This register specifies whether an on-chip pull-up resistor is connected to an input pin.

Access: PUn: This register can be read/written in 16-bit units.
JPU0: This register can be read/written in 8-bit units.

Address: PUn: <PORT_base> + $400C_H$ + n × 40_H
JPU0: <JPORT0_base> + $400C_H$*1

Value after reset: PUn: 0000_H
JPU0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PUn_15	PUn_14	PUn_13	PUn_12	PUn_11	PUn_10	PUn_9	PUn_8	PUn_7	PUn_6	PUn_5	PUn_4	PUn_3	PUn_2	PUn_1	PUn_0

Table 2.25 PUn Register Contents

Bit Position	Bit Name	Function
15 to 0	PUn_[15:0]	Specifies whether an on-chip pull-up resistor is connected to the corresponding pin: 0: No on-chip pull-up resistor is connected. 1: On-chip pull-up resistor is connected.

NOTES

1. Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
2. The on-chip pull-up resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-up option register (JPU0) are JPU0_[7:0].
4. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(2) PDn/JPD0 — Pull-down Option Register

This register specifies whether an on-chip pull-down resistor is connected to an input pin.

Access: PDn: This register can be read/written in 16-bit units.
JPD0: This register can be read/written in 8-bit units.

Address: PDn: <PORT_base> + 4010_H + n × 40_H
JPD0: <JPORT0_base> + 4010_H*1

Value after reset: PDn: 0000_H
JPD0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PDn_15	PDn_14	PDn_13	PDn_12	PDn_11	PDn_10	PDn_9	PDn_8	PDn_7	PDn_6	PDn_5	PDn_4	PDn_3	PDn_2	PDn_1	PDn_0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 2.26 PDn Register Contents

Bit Position	Bit Name	Function
15 to 0	PDn_[15:0]	Specifies whether a on-chip pull-down resistor is connected to the corresponding pin: 0: No on-chip pull-down resistor is connected. 1: On-chip pull-down resistor is connected.

NOTES

1. Do not set PUn.PUn_m = 1 and PDn.PDn_m = 1 to a single pin.
2. The on-chip pull-down resistor has no effect when the pin is operated in output mode.
3. The control bits of the JTAG pull-down option register (JPD0) are JPD0_[7:0].
4. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(3) PODCn/JPODC0 — Port Open-drain Control Register

This register selects push-pull or open-drain as the output buffer function.

Access: This register can be read/written in 32-bit units.

Address: PODCn: <PORT_base> + 4014_H + n × 40_H
JPODC0: <JPORT0_base> + 4014_H*1

Value after reset: PODC0: 0000 0400_H, PODC1 to 5: 0000 0000_H
JPODC0: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Note 1. PODC0: 1
PODC1 to PODC5, JPODC0: 0

Table 2.27 PODCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PODCn_[15:0]	Specify the output circuit characteristics of Pn_m(m = 0 to 15), together with the PODCEn_[15:0] bits.

PODCEn_m	PODCn_m	Output Circuit Characteristics
0	0	Push-pull
0	1	N-ch open-drain
1	0	Push-pull
1	1	P-ch open-drain

Specify the output circuit characteristics of JPn_m(m = 0 to 15).

JPODCn_m	Output Circuit Characteristics
0	Push-pull
1	N-ch open-drain

NOTES

1. The control bits for the JTAG port open-drain control register (JPODC0) are JPODC0_[31:0].
2. For details on the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

(4) PODCEn — Port Open-drain Control Expansion Register

This register selects push-pull or open-drain as the output buffer function.

Access: This register can be read/written in 32-bit units.

Address: <PORT_base> + $403C_H$ + n × 40_H *1

Value after reset: $0000\ 0000_H$

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.28 PODCEn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PODCEn_[15:0]	Specify the output circuit characteristics of pin m (m = 0 to 15), together with the PODCn_[15:0] bits.

PODCEn_m	PODCn_m	Output Circuit Characteristics
0	0	Push-pull
0	1	N-ch open-drain
1	0	Push-pull
1	1	P-ch open-drain

(5) PDSCn/JPDSC0 — Port Drive Strength Control Register

This register specifies the output drive strength of a port pin. High- or low-speed mode (high or low drive strength) of an output buffer is selectable by using this function.

Access: This register can be read/written in 32-bit units.

Address: PDSCn: <PORT_base> + 4018_H + n × 40_H
JPDSC0: <JPORT0_base> + 4018_H*1

Value after reset: PDSC0: 0000 0400_H, PDSC1 to 5: 0000 0000_H
JPDSC0: 0000 0000_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Note 1. PDSC0: 1
PDSC1 to PDSC5, JPDSC0: 0

Table 2.29 PDSCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PDSCn_[15:0]	Specifies the output buffer characteristics of pin m (m = 0 to 15), together with the PUCCn_[15:0] bits.

PUCCn_m	PDSCn_m	Output Buffer Characteristics
0	0	SLOW
0	1	FAST
1	0	MIDDLE
1	1	MIDDLE

NOTES

1. The control bits for the JTAG port drive strength control register (JPDSC0) are JPDSC0_[31:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.
3. For the output buffer characteristics of the driving ability, see Section 37.9.2, Driving Ability.
4. Settings for driving ability are effective even if an alternative function is in use on the pin.
5. When the driving ability is set to “fast”, the pin produces a larger driving current than when the setting is “slow”. For the allowable total driving currents, see Section 37.8.3, Allowed Output Current.

(6) PUCCn/JPUCC0 — Port Universal Control Register

This register expands the function to specify the characteristics of an output buffer.

It can specify three output buffer characteristics, together with the Port Drive Strength Control Register (PDSCn).

Access: This register can be read/written in 32-bit units.

Address: PUCCn: <PORT_base> + 4028$_H$ + n × 40$_H$
JPUCC0: <JPORT0_base> + 4028$_H$*1

Value after reset: PUCCn: 0000 0000$_H$
JPUCC0: 0000 0000$_H$

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Table 2.30 PUCCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	PUCCn_[15:0]	Specifies the output buffer characteristics of pin m (m = 0 to 15), together with the PDSCn_[15:0] bits.

PUCCn_m	PDSCn_m	Output Buffer Characteristics
0	0	SLOW
0	1	FAST
1	0	MIDDLE
1	1	MIDDLE

NOTES

1. The control bits of the JTAG port universal control register (JPUCC0) are JPUCC0_[31:0].
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.
3. For the output buffer characteristics of the driving ability, see Section 37.9.2, Driving Ability.
4. Settings for driving ability are effective even if an alternative function is in use on the pin.
5. When the driving ability is set to “fast”, the pin produces a larger driving current than when the setting is “slow”. For the allowable total driving currents, see Section 37.8.3, Allowed OutputCurrent.

(7) PISAn/JPISA0 — Port Input Buffer Selection Register

This register specifies the input buffer characteristics.

Access: PISAn: This register can be read/written in 16-bit units.
JPISA0: This register can be read/written in 8-bit units.

Address: PISAn: <PORT_base> + $402C_H$ + n × 40_H
JPISA0: <JPORT0_base> + $402C_H$*1

Value after reset: PISA0: 0400_H, PISA1 to 4: 0000_H
JPISA0: 00_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PISAn_15	PISAn_14	PISAn_13	PISAn_12	PISAn_11	PISAn_10	PISAn_9	PISAn_8	PISAn_7	PISAn_6	PISAn_5	PISAn_4	PISAn_3	PISAn_2	PISAn_1	PISAn_0
Value after reset	0	0	0	0	0	*1	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. PISA0: 1
PISA1 to PISA4, JPISA0: 0

Table 2.31 PISAn Register Contents

Bit Position	Bit Name	Function
15 to 0	PISAn_[15:0]	Specify the input buffer characteristics. 0: Type 1 (Schmitt) 1: Type 2 (CMOS)

NOTES

1. For details about the definition of type 1 and type 2, see **Section 2.3.5.4, Input Buffer Control (PISA)**.
2. For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.
3. The control bits for the JTAG port input buffer select register (JPISA0) are JPISA0_[7:0]

2.3.4.5 Pin-unit Register

(1) PCRn_m/JPCR0_m — Port Control Register

Each register of a port group can be accessed via this register and a PCR register can set some functions of a single pin. For example, setting bit 6 of the PCRn_m register to 1 sets bit m of the PMCn register to 1 also.

Access: This register can be read/written in 32-bit units.

Address: PCRn_m: <PORT_base> + 2000_H + n × 40_H + 4_H × m
JPCR0_m: <JPORT0_base> + 2000_H + 4_H × m*1

Value after reset: PCR0_10: 1140 0000_H, PCRn_m except for PCR0_10: 0000 0010_H
JPCR0_m: 0000 0010_H

Note 1. The number of valid bit positions (the value m) depends on the number of pins included in each device. See the list of registers by group (**Table 2.36, List of Registers in Port Group 0**, **Table 2.37, List of Registers in Port Group 1**, **Table 2.38, List of Registers in Port Group 2**, **Table 2.39, List of Registers in Port Group 3**, **Table 2.40, List of Registers in Port Group 4**,**Table 2.41, List of Registers in Port Group 5**, **Table 2.42, List of Registers in Port Group JP0**) in **Section 2.4.1.1, List of Port Registers**.

Note 2. The PINVn, PODCn, PODCEn, PUCCn, and PDSCn registers cannot be set via this register.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	PINV	—	PODC	PODCE	—	PUCC	PDSC	—	PISA	—	—	PU	PD	PBDC	PIBC
Value after reset	0	0	0	0	0	0	0	0	0	*1	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	P	—	—	—	PPR	—	PMC	PIPC	PM	—	PFCAE	PFCE	PFC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	*2	0	0	0	0
R/W	R	R	R	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Note 1. PCR0_10: 1
PCRn_m except PCR0_10, JPCR0_m: 0

Note 2. PCR0_10: 0
PCRn_m except PCR0_10, JPCR0_m: 1

Table 2.32 PCRn_m Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is read. When writing, write the value after reset.
30	PINV	The value of bit m of the PINVn register can be read.
29	Reserved	When read, the value after reset is read. When writing, write the value after reset.
28	PODC	The value of bit m of the PODCn register can be read.
27	PODCE	The value of bit m of the PODCEn register can be read.
26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25	PUCC	The value of bit m of the PUCCn register can be read.
24	PDSC	The value of bit m of the PDSCn register can be read.
23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22	PISA	Same function as bit m of the PISAn register.
21, 20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19	PU	Same function as bit m of the PUn register

Table 2.32 PCRn_m Register Contents (2/2)

Bit Position	Bit Name	Function
18	PD	Same function as bit m of the PDn register
17	PBDC	Same function as bit m of the PBDCn register
16	PIBC	Same function as bit m of the PIBCn register
15 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12	P	Same function as bit m of the Pn register
11 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	PPR	The value of bit m of the PPRn register can be read.
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	PMC	Same function as bit m of the PMCn register
5	PIPC	Same function as bit m of the PIPCn register
4	PM	Same function as bit m of the PMn register
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	PFCAE	Same function as bit m of the PFCAEn register
1	PFCE	Same function as bit m of the PFCEn register
0	PFC	Same function as bit m of the PFCn register

NOTE

For details about the relevant port groups and bits, see **Section 2.4.1.1, List of Port Registers**.

2.3.4.6 Example of Port Configuration Flowchart

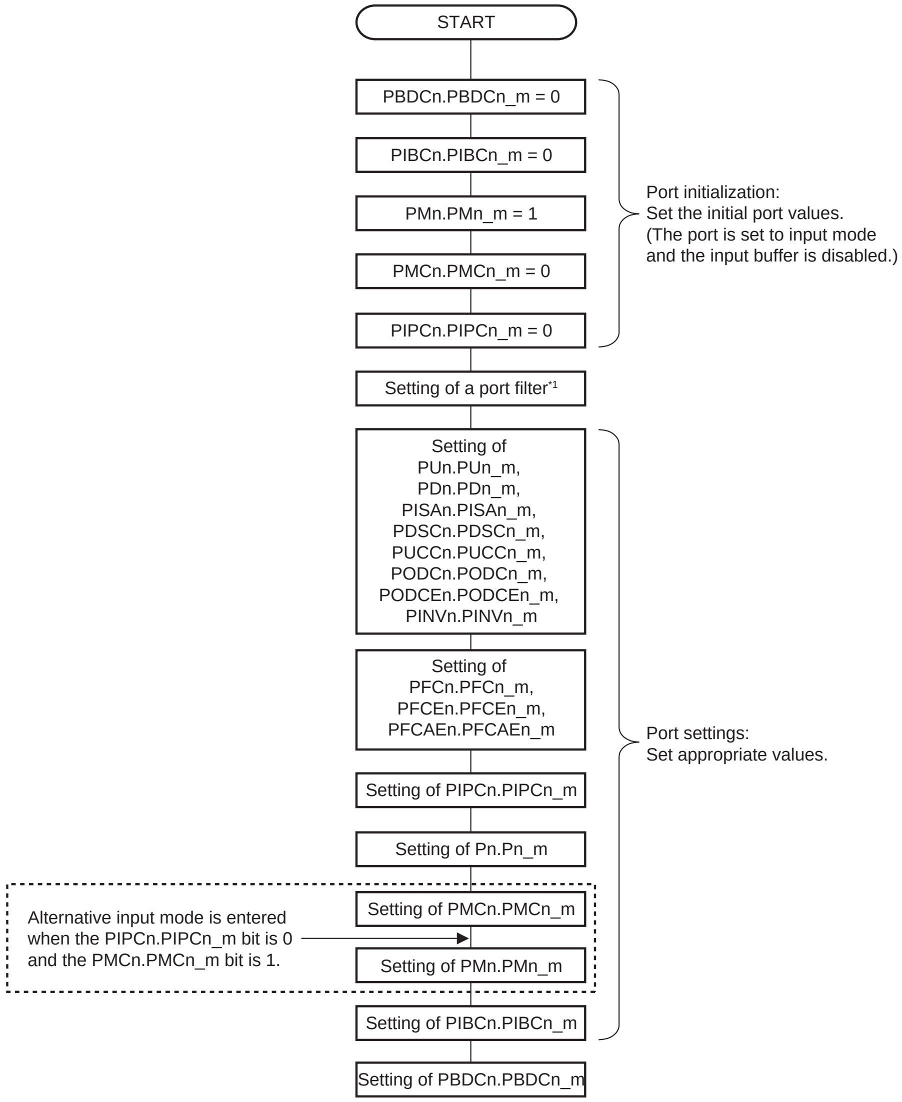
The followings are examples of the port configuration flow.

CAUTION

When a pin is set to an alternative output mode while the PIPCn.PIPCn_m bit is 0, it may be temporarily switched to an alternative input mode. This occurs during the period between setting of the PMCn.PMCn_m bit to 1 and setting of the PMn.PMn_m bit to 0. Due to this possibility of a pin being temporarily switched to an alternative input mode, if a pin has an interrupt-related signal as an alternative function, disable the interrupt or make sure that it is ignored.

(1) Batch Setting

The following shows an example to collectively set a port group.



Note 1. While PMCn.PMCn_m bit is 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI and INTP7 to INTP9 interrupt signals:

- The port filter is set to rising edge or both edges detection and the PMCn.PMCn_m bit is set to 1 while the input terminal is at high level.

For INTP0 to INTP6 and INTP10 to INTP12 interrupt signals:

- The port filter is set to falling edge or both edges detection and the PMCn.PMCn_m bit is set to 1 while the input terminal is at low level.

In order to avoid an unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMCn register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2.5 Example of Port Configuration Flow (batch setting)

(2) Individual Setting

The following shows an example to individually set a port group.

And it is capable of setting simultaneous bits at once within the configurable range described below by using PCRn_m register.

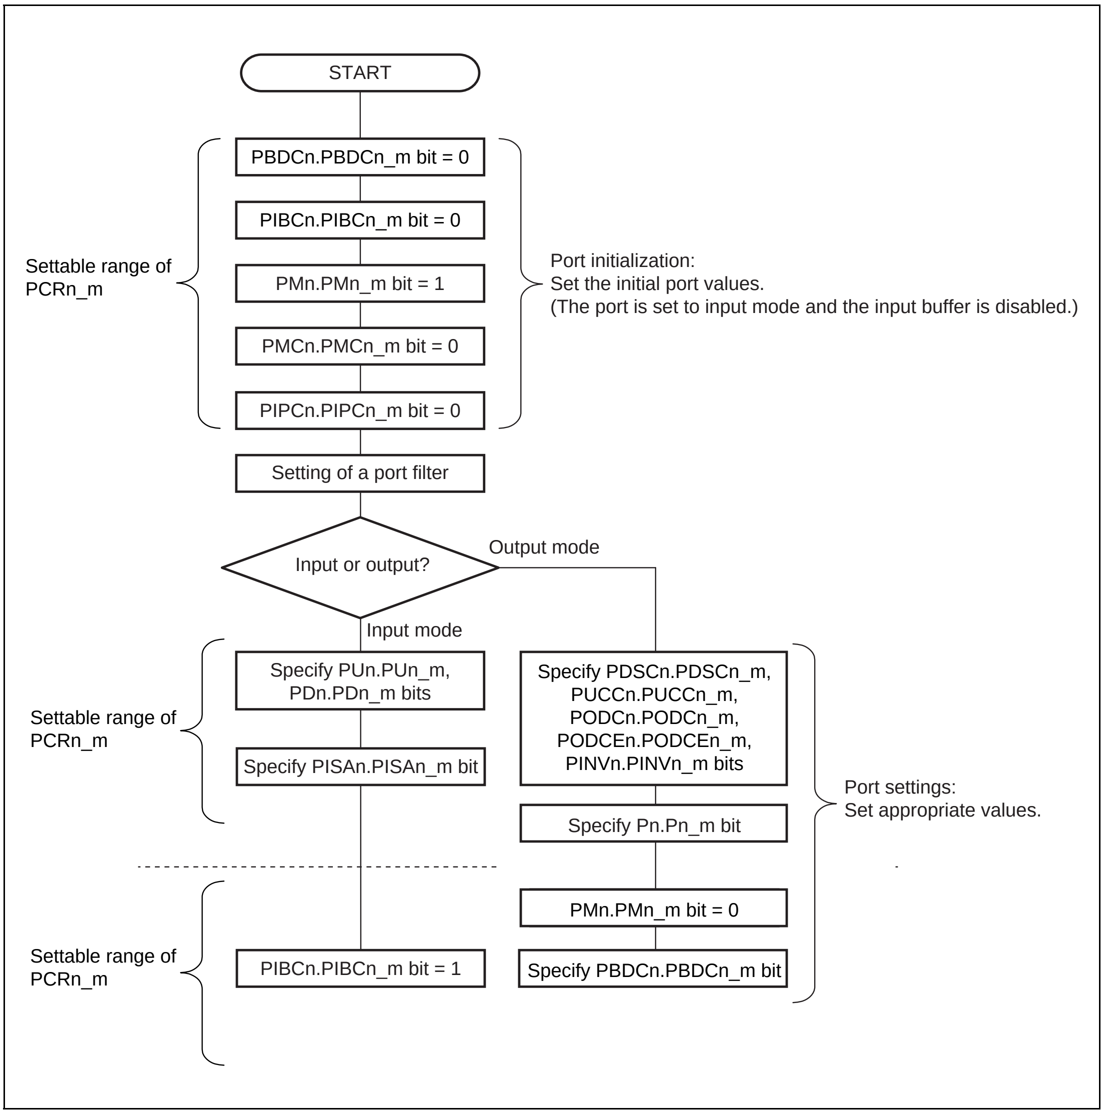


Figure 2.6 Example of Port Configuration Flow (in port mode)

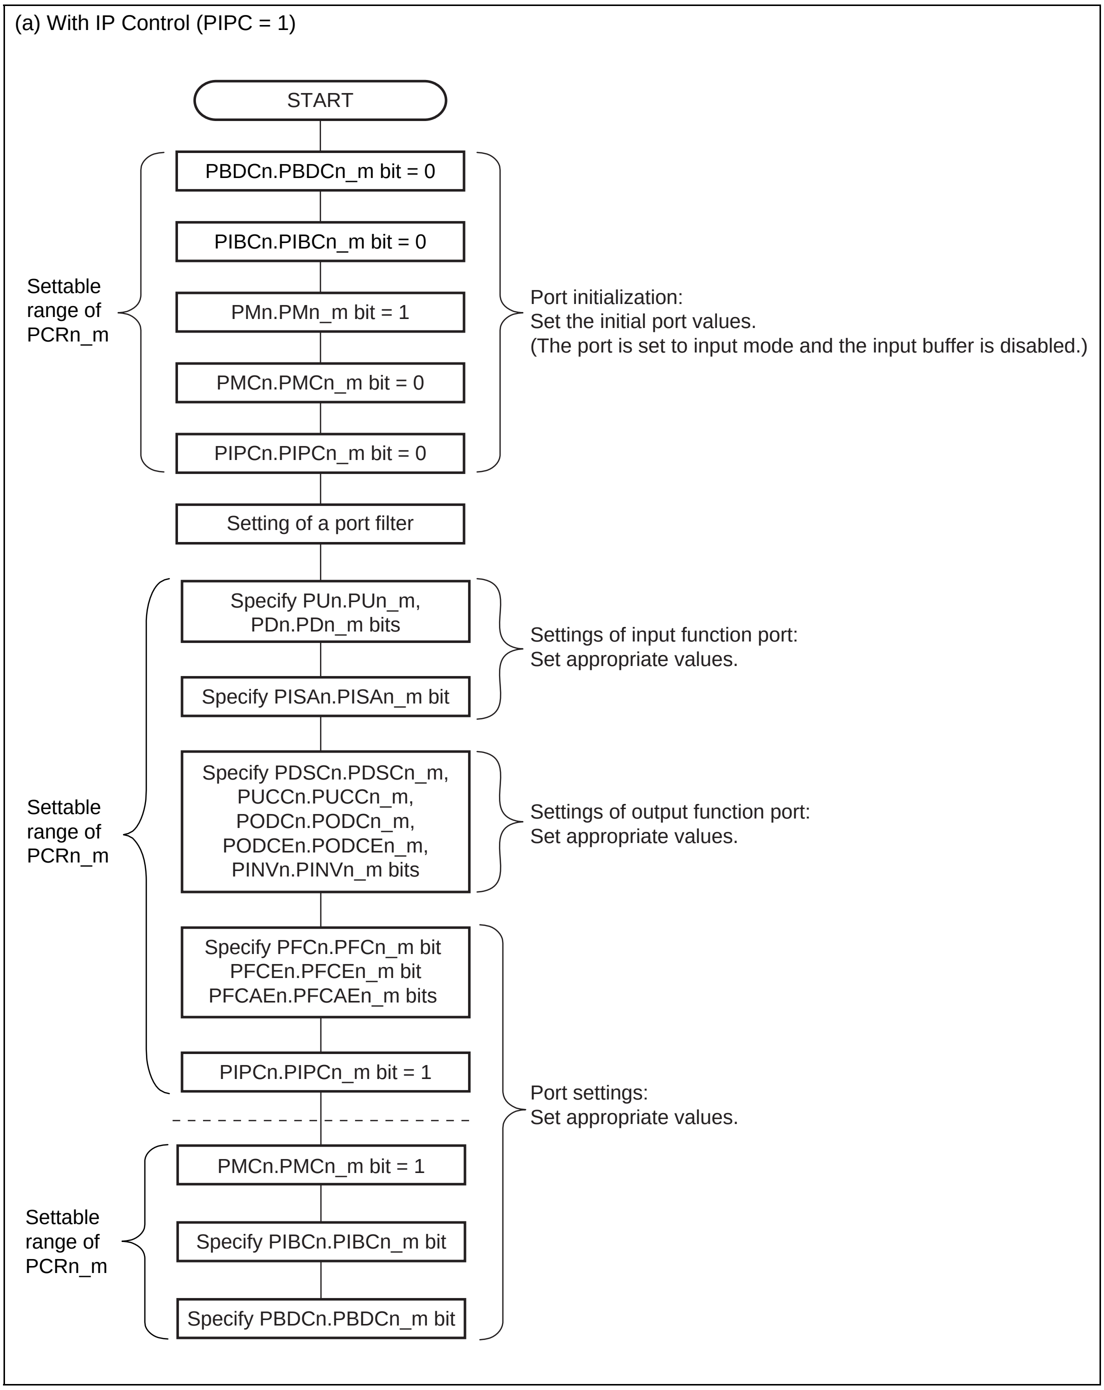

Figure 2.7 Example of Port Configuration Flow (in alternative mode)(1/2)

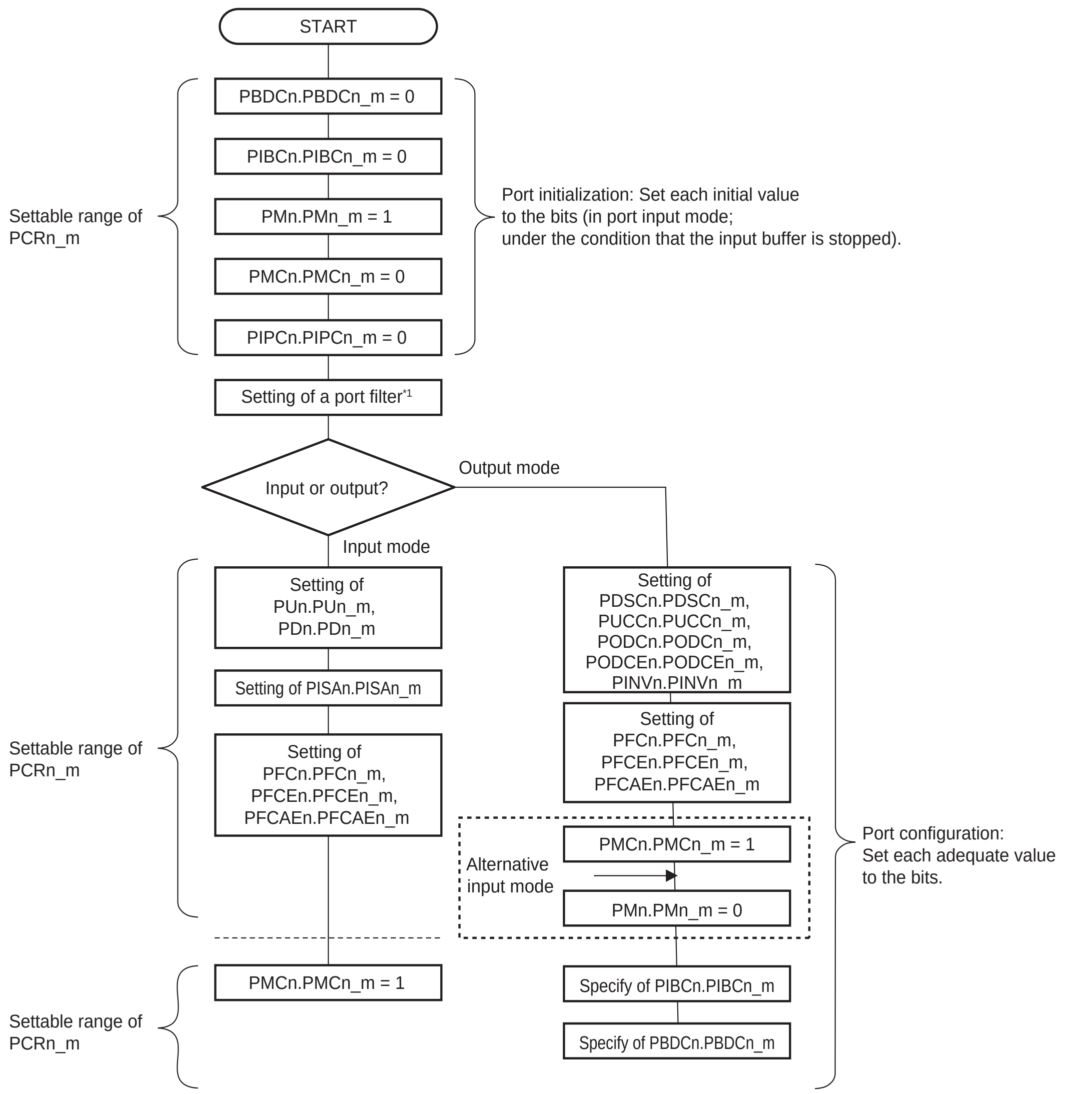
(b) Without IP Control (PIPC = 0)



Note 1. While PMCn.PMCn_m bit is 0, an interrupt may be triggered during the configuration of the port registers under the following conditions:

For NMI and INTP7 to INTP9 interrupt signals:

- The port filter is set to rising edge or both edges detection and the PMCn.PMCn_m bit is set to 1 while the input terminal is at high level.

For INTP0 to INTP6 and INTP10 to INTP12 interrupt signals:

- The port filter is set to falling edge or both edges detection and the PMCn.PMCn_m bit is set to 1 while the input terminal is at low level.

In order to avoid an unintended interrupt occurrence, use the following configuration sequence:

1. Configure the PMCn register.
2. Wait for the period of pulse rejection.
3. Configure the edge/level detection register.

Figure 2.8 Example of Port Configuration Flow (in alternative mode) (2/2)

2.3.5 Functional Selection

2.3.5.1 Register Configuration in Use of the Alternative Function

When the pin alternative function is used, set PMCn_m = 1 and select the alternative numbers of PFCn_m, PFCEn_m, and PFCAEn_m. In several peripheral functions, a single alternative I/O function is allocated to multiple pins. However, such an alternative function should not be enabled in multiple pins at the same time. For example, an external interrupt input, INTP0 is allocated to P0_2 and P2_5, but this alternative function can only be selected in either of them.

2.3.5.2 Alternative Function to be used in Direct I/O Control Alternative Mode

When the pins listed in **Table 2.33** are used, switch to direct I/O control alternative mode. When setting PIPCn_m = 1, the PMn_m value which has been set is ignored because the peripheral function enables or disables inputs and outputs of the buffer.

Table 2.33 List of the Pins which is Available for Direct I/O Control Alternative Mode Setting

Function	Pin Name
CSIH0	CSIH0SCO
	CSIH0SO
CSIH1	CSIH1SCO
	CSIH1SO
CSIH2	CSIH2SCO
	CSIH2SO
CSIH3	CSIH3SCO
	CSIH3SO
CSIG0	CSIG0SCO
	CSIG0SO
TSG30	TSG30O1
	TSG30O2
	TSG30O3
	TSG30O4
	TSG30O5
	TSG30O6
TSG31	TSG31O1
	TSG31O2
	TSG31O3
	TSG31O4
	TSG31O5
	TSG31O6

CAUTION

Do not set PIPCn_m to 1 at pins not listed in Table 2.33.

2.3.5.3 Register Setting in Use of an Analog Input Pin

Since ADCGnIm (SAR-A/D) for an analog input are always connected to the A/D converter, setting of a port register to select a pin function is not required.

2.3.5.4 Input Buffer Control (PISA)

This device can select the input buffer characteristics (type 1 or type 2) of a port with the PISAn register. The following table lists applicable pins.

Table 2.34 Selection of Input Buffer Characteristics (1/2)

Port Name	Input Buffer Selection		Remarks	Device			
	Type 1 (PISAn_m = 0)	Type 2 (PISAn_m = 1)		100-pin (eVR)	100-pin (DPS)	144-pin (eVR)	144-pin (DPS)

2.4 Organization of Port Groups

2.4.1 Port Function

2.4.1.1 List of Port Registers

Table 2.36 to **Table 2.42** show detailed bitmaps of control registers in each port group. In the bitmap field, "√" means an effective bit and "—" means a reserved one. Reserved areas are always read as the value after a reset. The write value also should be the value after a reset.

Table 2.36 List of Registers in Port Group 0 (1/2)

Port Group Name	Register Name	R/W	Value after reset	Access Size	Bitmap																Remarks
					15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

P0_11				ADCG1CNV2					TSG31PTSI0/ ENCA0E0					—	—	√	√
P0_12				ADCG1CNV3					TSG31PTSI1/ ENCA0E1					—	—	√	√
P0_13		OSTM0O		TAUD1O15	TAUD2I7		INTP9	TAUD2O7	TSG31PTSI2/ ENCA0EC		SCI31SCI	SCI31SCO	$\overline{\text{EVTI}}$	√	√	√	√
P0_14				ADCG1CNV4										—	—	√	√

Note: P0_10: $\overline{\text{RESETOUT}}$

P0_10 is in initial state, $\overline{\text{RESETOUT}}$, and outputs low level.

After reset release, the setting will be as below.

- PM0.PM0_10 = 0: output port
- PODC0.PODC0_10: Nch open-drain output

After reset release, $\overline{\text{RESETOUT}}$ output is stopped by changing the setting above.

When a reset is generated during operation, this pin becomes $\overline{\text{RESETOUT}}$ and outputs low level.

For the state of pins, see **Section 8.4.8, Reset Output ($\overline{\text{RESETOUT}}$)**.

2.5 DNF

Digital Noise Filter (DNF) eliminates digital noise from external input signals. This product includes two sorts of DNF: peripheral function DNF and edge detection DNF.

2.5.1 Example of Noise Elimination

Figure 2.9 shows an example of noise elimination in peripheral function DNF and edge detection DNF. In this example, the sampling clock, the sampling count, and the current output level are set to 1/2 of the DNF input clock, two (twice), and low, respectively. "○" in the figure means that high level is detected.

In input examples 1, 2, and 3, in which the same level is detected twice consecutively, the change in the input signal is output internally.

In input examples 4, 5, and 6, in which the same level is not detected twice consecutively, input signal is regarded as noise and eliminated. Therefore, no change in the internal output is found.

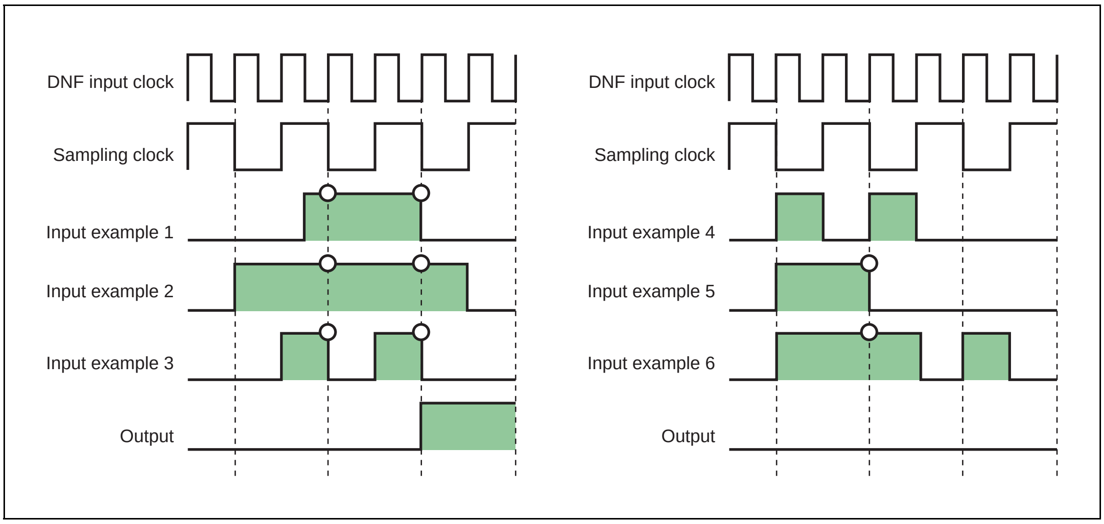

Figure 2.9 Timing Chart of Digital Noise Elimination

2.6 Noise Filter and Edge Level Detection Circuit

Some signals that are input to a pin pass the filter to eliminate noises and glitches. This product supports both analog filter and digital filter.

Additionally, the product also supports the function of detecting an edge or level after a pass through a filter.

The first section describes port input signals to which filters are allocated and the types of the filters, the noise filter and edge level detection control register and its control bits, and an overview of the register address and others.

For details about the digital/analog filter function and the noise filter and edge level detection control register, see **Section 2.6.1, Allocation of Port Filters**.

2.6.1 Allocation of Port Filters

The following is a list of input pins that have analog filter or digital filter.

Table 2.50 List of Input Pins with a Noise Filter (1/6)

2.6.2 Filter Type

2.6.2.1 Digital Filter Type A (INTP/RXD Alternative) Input Pin

The input pin of digital filter type A has a digital filter and the edge detection function. The digital filter and edge detection are controlled with the following registers. Interrupt signals and data received signals of peripheral functions are shared.

- Filter control register FCLAnCTLm
  Ports with each digital filter have the dedicated FCLAnCTLm register.
- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAnEN
  The register enables or disables digital noise elimination.

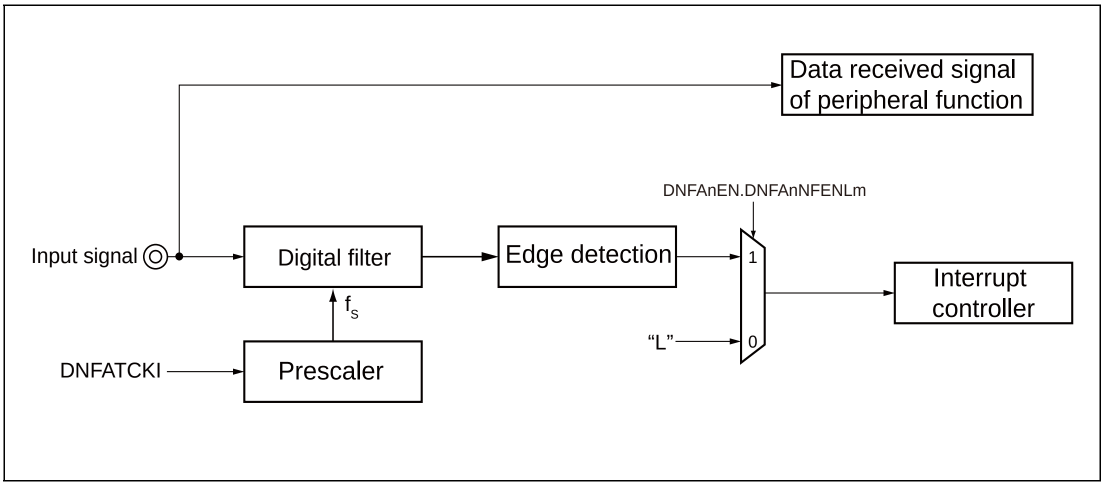

Figure 2.10 Block Diagram of Digital Filter Type A

CAUTION

Set DNFAnEN.DNFAnNFENLm to 1 to enable input to interrupt controller.

2.6.2.2 Digital Filter Type B (INTP/ESO Alternative) Input Pin

The input pin of digital filter type B has a digital filter, analog filter, and the edge detection function. The digital filter and edge detection are controlled with the following registers. Interrupt signals and Hi-Z output control signals are shared.

- Filter control register FCLAnCTLm
  Ports with each digital filter have the dedicated FCLAnCTLm register.
- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAnEN
  The register selects a digital filter or analog filter.

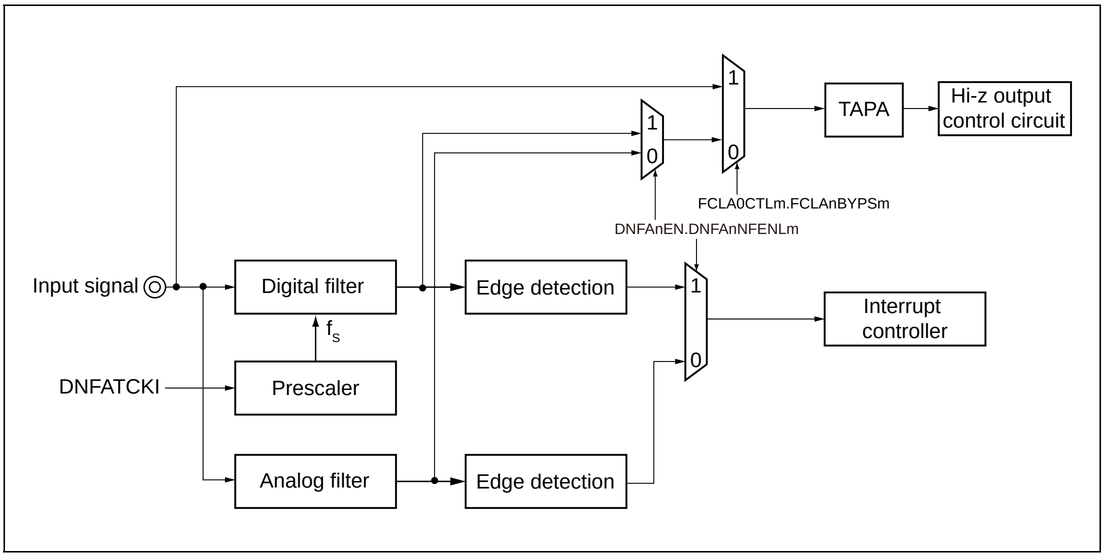

Figure 2.11 Block Diagram of Digital Filter Type B

2.6.2.3 Digital Filter Type C (for INTP9 and NMI) Input Pin

The input pin of digital filter type C has a digital filter and the edge detection function. The digital filter and edge detection are controlled with the following registers.

- Filter control register FCLAnCTLm
  Ports with each digital filter have the dedicated FCLAnCTLm register.
- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAnEN
  The register enables or disables digital noise elimination.

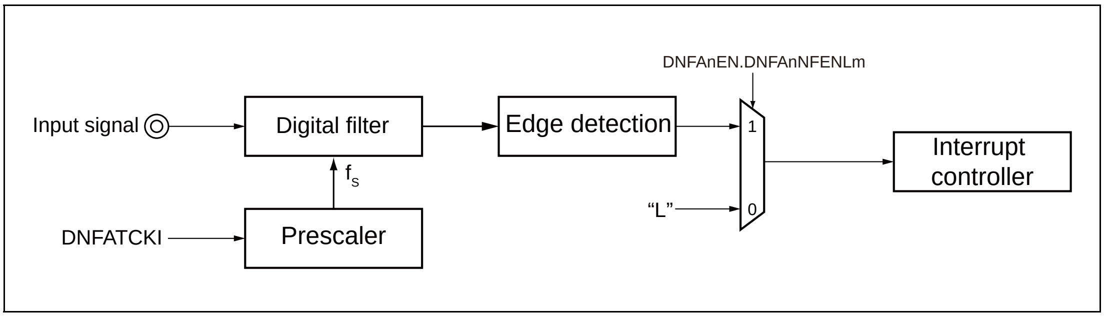

Figure 2.12 Block Diagram of Digital Filter Type C

CAUTION

Set DNFAnEN.DNFAnNFENLm to 1 to enable input to interrupt controller.

2.6.2.4 Digital Filter Type D (for SENT, PSI5) Input Pin

The input pin of digital filter type D has a digital filter and analog filter. The digital filter and analog filter are controlled with the following registers.

- Filter control register FCLAnCTLm
  The dedicated FCLAnCTLm register is available for each port with digital filter.
- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAnEN
  The register selects a digital filter or analog filter.

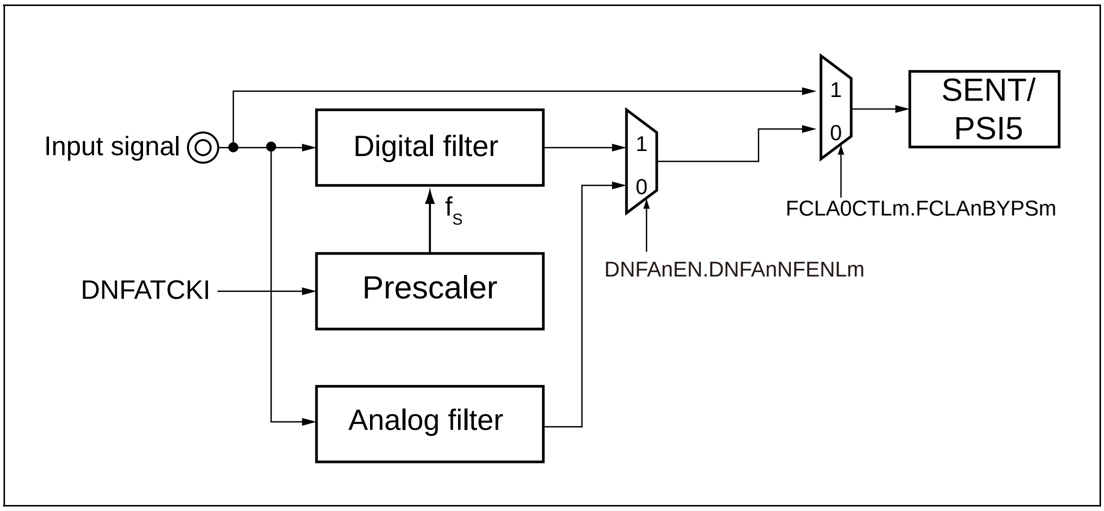

Figure 2.13 Block Diagram of Digital Filter Type D

2.6.2.5 Digital Filter Type E (No Edge Detection) Input Pin

The input pin of digital filter type E has a digital filter. The digital filter is controlled with the following register.

- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAnEN
  This register enables or disables digital noise elimination.

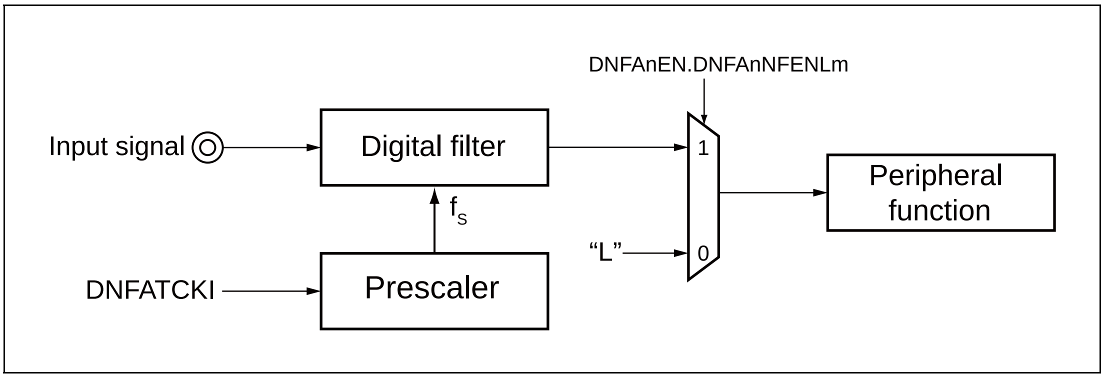

Figure 2.14 Block Diagram of Digital Filter Type E

2.6.2.6 Digital Filter Type F (No Edge Detection) Input Pin

The input pin of digital filter type F has a digital filter. The digital filter is controlled with the following register.

- Digital noise elimination control register DNFAnCTL
  Each DNFAnCTL control register controls digital filter processing.
- Digital noise elimination enable register DNFAnEN
  This register enables or disables digital noise elimination.

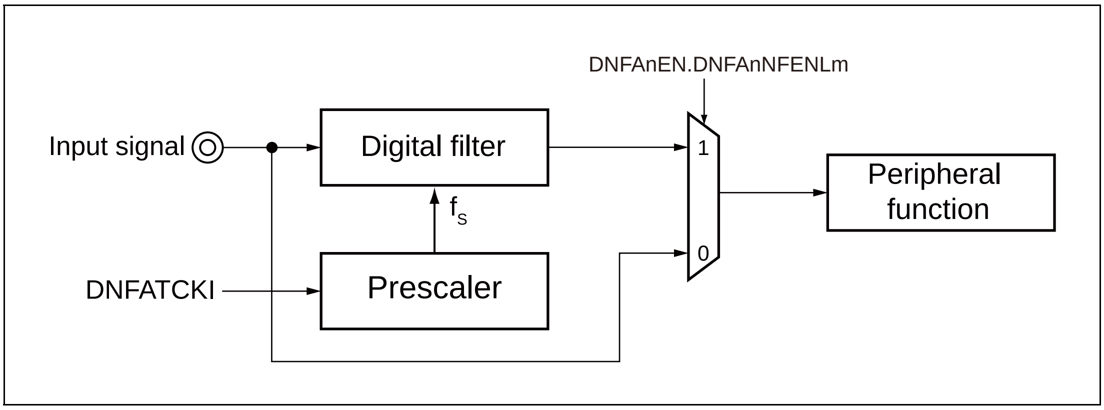

Figure 2.15 Block Diagram of Digital Filter Type F

2.6.2.7 Analog Filter ANF Input Pin

The analog filter input pin has only an analog filter.

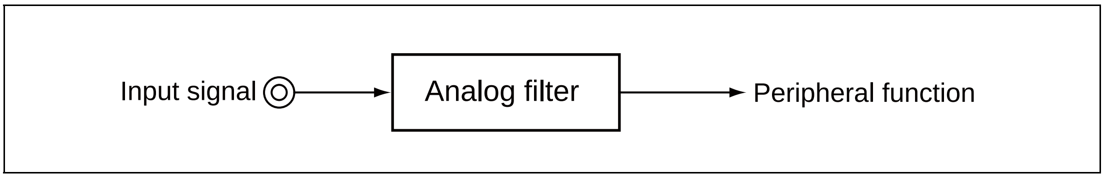

Figure 2.16 Block Diagram of Analog Filter ANF

2.6.3 Registers

2.6.3.1 List of Registers

The digital noise filter is controlled and operated by the following registers.

Table 2.51 List of Digital Noise Filter Registers

Register Name	Symbol	Address
Filter control register	FCLAnCTLm	See **Table 2.50, List of Input Pins with a Noise Filter**.
Digital noise elimination control register	DNFAnCTL	FFC3 0000_H + n × 100_H
Digital noise elimination enable register	DNFAnEN	FFC3 0000_H + n × 100_H + 4_H
Digital noise elimination enable register L	DNFAnENL	FFC3 0000_H + n × 100_H + C_H
Digital noise elimination sampling clock source select register	DNFCKSnC	See **Section 2.6.3.6, DNFCKSnC — Digital Noise Elimination Sampling Clock Source Selection Register**.
Digital noise elimination sampling clock source status register	DNFCSCnSTAT	See **Section 2.6.3.7, DNFCSCnSTAT — Digital Noise Elimination Sampling Clock Source Status Register**.

CAUTIONS

1. **Do not change any setting of any related control register (FCLAnCTLm, DNFAnCTL, DNFAnEN, DNFAnENL, and DNFCKSnC) while the digital filter is enabled (DNFAnEN.DNFAnNFENLm = 1). Attempting to change any of the settings may lead to unexpected output from the filter.**
2. **Each of the registers has bits to which no function is assigned. Unless otherwise specified, do not write any value other than the initial value to these bits. Correct operation cannot be guaranteed if writing of other values is attempted.**

2.6.3.2 FCLAnCTLm — Filter Control Register

This register controls the analog and digital filter operation.

Operations differ according to the filter type. For details, see **Section 2.6.2, Filter Type**.

Access: This register can be read/written in 8-bit or 1-bit units.

Address: See **Table 2.50, List of Input Pins with a Noise Filter**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0

R/W	R/W	R	R	R	R	R	R/W	R/W

Table 2.52 FCLAnCTLm Register Contents

Bit Position	Bit Name	Function
7	FCLAnBYPSm	Filter and bypass control of the alternative function 0: Filters and bypasses are disabled. 1: Filters and bypasses are enabled.
6 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	FCLAnINTFm	Falling edge detection control 0: Falling edge detection disabled 1: Falling edge detection enabled
0	FCLAnINTRm	Rising edge detection control 0: Rising edge detection disabled 1: Rising edge detection enabled

NOTE

For details about the relevant Pins, see **Table 2.50, List of Input Pins with a Noise Filter**.

2.6.3.3 DNFAnCTL — Digital Noise Elimination Control Register

This register specifies characteristics of the digital noise elimination filter.

Access: This register can be read/written in 8-bit units.

Address: See **Table 2.50, List of Input Pins with a Noise Filter**.

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	DNFAnNFSTS[1:0]		—	—	DNFAnPRS[2:0]

110_B	DNFATCKI / 64
111_B	DNFATCKI / 128

NOTE

For details about the relevant Pins, see **Table 2.50, List of Input Pins with a Noise Filter**.

2.6.3.4 DNFAnEN — Digital Noise Elimination Enable Register

This register enables or disables digital noise elimination for an arbitrary input signal.

Operations differ according to the filter type. For details, see **Section 2.6.2, Filter Type**.

Access: This register can be read/written in 16-bit units.

Address: See **Table 2.50, List of Input Pins with a Noise Filter**.

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 2.54 DNFAnEN Register Contents

Bit Position	Bit Name	Function
15 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7 to 0	DNFAnNFENL [7:0]	Digital Noise Elimination Control 0: Digital noise elimination disabled (Analog noise elimination is enabled.)*1 1: Digital noise elimination enabled

Note 1. For digital filter Type B and D

NOTE

- For details about the relevant Pins, see **Table 2.50, List of Input Pins with a Noise Filter**.
- Bits DNFAnNFENL[7:0] which are not listed in **Table 2.59, List of Input Pins with a Noise Filter** are reserved. When read, the value after reset is read. When writing, write the value after reset.

2.6.3.5 DNFAnENL — Digital Noise Elimination Enable Register

This register corresponds to the lower 8 bits of the DNFAnEN register.

Access: This register can be read/written 8- and 1- bit units.

Address: FFC3 0000_H + n × 100_H + C_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	DNFAn NFENL7	DNFAn NFENL6	DNFAn NFENL5	DNFAn NFENL4	DNFAn NFENL3	DNFAn NFENL2	DNFAn NFENL1	DNFAn NFENL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

For details of the respective bit functions, see **Section 2.6.3.4, DNFAnEN — Digital Noise Elimination Enable Register**.

2.6.3.6 DNFCKSnC — Digital Noise Elimination Sampling Clock Source Selection Register

This register selects the clock source for digital noise sampling clock frequency (DNFATCKI). (n = 100 to 114)

Access: This register can be read / written in 32-bit units.

Address:
DNFCKS100C FFF8 9120_H
DNFCKS101C FFF8 9128_H
DNFCKS106C FFF8 9130_H
DNFCKS107C FFF8 9138_H
DNFCKS108C FFF8 9140_H
DNFCKS109C FFF8 9148_H
DNFCKS110C FFF8 9150_H

2.6.3.7 DNFCSCnSTAT — Digital Noise Elimination Sampling Clock Source Status Register

This register is used to check the status of the sampling clock source for digital noise sampling clock (DNFATCKI). (n = 100 to 114)

Access: This register can be read only in 32-bit units.

Address: DNFCSC100STAT FFF8 9124$_H$
DNFCSC101STAT FFF8 912C$_H$
DNFCSC106STAT FFF8 9134$_H$

2.6.4 Notes for Digital Noise Filter

(1) When digital filter output signal is input for alternative function:
Enable the digital filter (DNFAnEN.DNFAnENm (m = 0 to 7) = 1), and switch the port pin to alternative function after a lapse of the following time.

s = DNFAnNFSTS[1:0] + 2
Time = s × 1/fs + 2 × 1/DNFATCKI

(2) When an event output signal of the digital filter is used as an interrupt:
Enable the digital filter (DNFAnEN.DNFAnENm (m = 0 to 7) = 1 while interrupt is disabled.
Enable the digital filter and clear the interrupt request flag after a lapse of the following time, then enable the interrupt.

Time = s × 1/fs + 3 × 1/DNFATCKI

2.7 Pin State

Table 2.57, **Table 2.58**, and **Table 2.59** show detailed pin states. Some pins may not be included depending on grades and packages of the product. For the pins included in each product, see **Table 2.1, Pin Assignment**, in **Section 2.1, Pin Connection Diagrams**.

Table 2.57 Pin State in Single Chip Mode (Normal Mode)

Port	Pin Category	OPJTAG/ OPEVTI/ OPEVTO	Power OFF	DCUTRST = L				
				RESET pin = L Power ON	Reset Release*[1]	Field BIST	RUN (User program)	CVM Reset
GPIO		—	—	Hi-Z	Hi-Z	Hi-Z	Operate	Hi-Z
JP0_x	JP0_0 to JP0_3, JP0_5	OPJTAG = 00	—	Hi-Z	Hi-Z	Hi-Z	Operate	Hi-Z
	DCUTDI	OPJTAG = 11	—					
	DCUTDO							
	DCUTCK							
	DCUTMS							
	DCUTRDY							
	LPDI	OPJTAG = 01	—					
	LPDO							
	LPDCLK							
	JP0_3							
	LPDCLKOUT							
P0_13	GPIO (EVTI)	OPEVTI = 1	—	Hi-Z			Operate	Hi-Z
	EVTI	OPEVTI = 0	—					
RESET		—	—	L (PD)	H (PD)	H (PD)	H (PD)	H (PD)
ERROROUT		—	—	Hi-Z before RESET is released.	L	L	Operate	Hi-Z
P0_10	RESETOUT (/GPIO)	OPEVTO = 1 or DCUTRST = L	—	L	L	L	H*[4] (set “High” by user program)	L
	EVTO	OPEVTO = 0 and DCUTRST = H	—	N.A.	N.A.	N.A.	N.A.	N.A.
CVMOUT		—	—	L → H*[2]	H	H	H	L
FLMD0*[3]		—	—	L (PD)	L (PD)	L (PD)	L (PD)	L (PD)
P3_14	FLMD1(/GPIO)	—	—	Hi-Z	Hi-Z	Hi-Z	Operate*[4]	Hi-Z
X1/X2		—	—	Stop → Run	Run	Run	Run	Run
ANI		—	—	Hi-Z	Hi-Z	Hi-Z	Operate	Hi-Z
DCUTRST		—	—	L (PD)	L (PD)	L (PD)	L (PD)	L (PD)

Note 1. The states listed in the table are those following release from a pin reset, ECM reset, SW reset, or CVM reset.

Note 2. Once CVMOUT is driven high, it continues to reflect the voltage status even if the RESET pin is driven low.

Note 3. Drive FLMD0 low.

Note 4. This pin functions as a port pin.

Table 2.58 Pin State in Single Chip Mode (Debug Mode)

Port	Pin Category	OPJTAG/ OPEVTI/ OPEVTO	DCUTRST = H RUN	 RESET pin = L	 Reset Release*1	 Debugger Initiated Reset	 CVM Reset
GPIO		—	Operate	Hi-Z	Hi-Z	Hi-Z	Hi-Z
JP0_x	JP0_0 to JP0_3, JP0_5	OPJTAG = 00	N.A.			N.A.	N.A.
	DCUTDI	OPJTAG = 11	Operate (If JTAG is selected based on OPJTAG setting.)			Operate	Operate
	DCUTDO						
	DCUTCK						
	DCUTMS						
	DCUTRDY						
	LPDI	OPJTAG = 01	Operate (If LPD4P is selected based on OPJTAG setting.)				
	LPDO						
	LPDCLK						
	JP0_3		Operate	Hi-Z	Hi-Z	Hi-Z	Hi-Z
	LPDCLKOUT		Operate (if LPD4P is selected based on OPJTAG setting)			Operate	Operate
P0_13	GPIO (EVTI)	OPEVTI = 1	Operate	Hi-Z	Hi-Z	Hi-Z	Hi-Z
	EVTI	OPEVTI = 0	Operate (If EVTI is selected based on OPEVTI setting.)			Operate	Operate
RESET		—	H (PD)	L (PD)	H (PD)	H (PD)	H (PD)
ERROROUT		—	Operate	Hi-Z	L	L	Hi-Z
P0_10	RESETOUT (/GPIO)	OPEVTO = 1 or DCUTRST = L	H*2 (Set to "High" by user program)	L	L	L	L
	EVTO	OPEVTO = 0 and DCUTRST = H	Operate (If EVTO is selected based on OPJTAG setting.)			Operate	Operate
CVMOUT		—	H	H	H	L	L
FLMD0*3		—	L (PD)	L (PD)	L (PD)	L (PD)	L (PD)
P3_14	FLMD1(/GPIO)	—	Operate*2	Hi-Z	Hi-Z	Hi-Z	Hi-Z
X1/X2		—	Run	Run	Run	Run	Run
ANI		—	Operate	Hi-Z	Hi-Z	Hi-Z	Hi-Z
DCUTRST		—	H (PD)	H (PD)	H (PD)	H (PD)	H (PD)

Note 1. The states listed in the table are those following release from a pin reset, debug reset, ECM reset, SW reset, or CVM reset.

Note 2. This pin functions as a port pin.

Note 3. Drive FLMD0 low.

Table 2.59 Pin State in Serial Programming Mode

Port	Pin Category	OPJTAG/ OPEVTI/ OPEVTO	Power OFF	DCUTRST = L		
				RESET pin = L Power ON	Reset Release	RUN (Serial Programming Mode)
GPIO		—	—	Hi-Z	Hi-Z	Operate
JP0_x	JTAG PORT (FLSCI3RXD (FPDR)/ FLSCI3TXD (FPDT)/ FLSCI3SCKI (FPCK))	OPJTAG = xx	—	Hi-Z	Hi-Z	Operate
P0_13	GPIO (EVTI)	OPEVTI = x	—	Hi-Z	Hi-Z	Operate as GPIO (not depend on OPEVTI setting)
RESET		—	—	L (PD)	H (PD)	H (PD)
ERROROUT		—	—	Hi-Z	L	Operate
P0_10	RESETOUT(/GPIO)	OPEVTO = x or DCUTRST = x	—	L	L	L
CVMOUT		—	—	L → H	H (masked) *1	H (masked) *1
FLMD0*2		—	—	H (PD)	H (PD)	H (PD)
P3_14	FLMD1(/GPIO)*2	—	—	L	L	L
X1/X2		—	—	Stop→ Run	Run	Run
ANI		—	—	Hi-Z	Hi-Z	Operate
DCUTRST		—	—	L (PD)	L (PD)	L (PD)

Note 1. CVMOUT is masked and outputs high level in serial programming mode.

Note 2. Drive the FLMD0 pin to the high level and the FLMD1 pin to the low level.

2.8 Handling of Unused Pins

The alternative functions can be selected in the option bytes, please refer **Section 35.10.3, OPBT2 — Option Byte 2**.

We recommend use of pull-up/-down resistor with the value of 1 kΩ or above.

When pull-up/-down resistor is used, connect a resistor between two pins. Do not directly connect the pins with a wire.

Table 2.60 Handling of Unused Pins (JP0)

Pin Name	Alternative Function	Handling of Unused Pins
JP0_0	GPI/O	Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m = 1 or JPMC0_m = 1): Connected to E1VCC or E1VSS through resistor Output: Open
	DCUTDI	Connected to E1VCC through resistor
	LPDI	Open
JP0_1	GPI/O	Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
	DCUTDO	Open
	LPDO	Open
JP0_2	GPI	Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor
	DCUTCK	Open
	LPDCLK	Open
JP0_3	GPI/O	Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
	DCUTMS	Connected to E1VCC through resistor
JP0_4	$\overline{\mathrm{DCUTRST}}$	Connected to VSS
JP0_5	GPI/O	Input: When input buffer is disabled in input port mode (JPIBC0_m=0 and JPMC0_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (JPIBC0_m=1 or JPMC0_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
	$\overline{\mathrm{DCUTRDY}}$	Open
	LPDCLKOUT	Open

Table 2.61 Handling of Unused Pins (P0) (1/2)

Pin Name	Alternative Function	Handling of Unused Pins
P0_0 P0_1 P0_2	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_3	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_4	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_5	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_6	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_7	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_8	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open
P0_9	GPI/O	Input: When input buffer is disabled in input port mode (PIBCn_m=0 and PMCn_m=0): Open When input buffer is enabled in input port mode or input is selected in S/W I/O control alternative mode (PIBCn_m=1 or PMCn_m=1): Connected to E1VCC or E1VSS through resistor Output: Open

Section 3 CPU System

3.1 Overview

3.1.1 Block Configuration

Figure 3.1 shows the block configuration diagram.

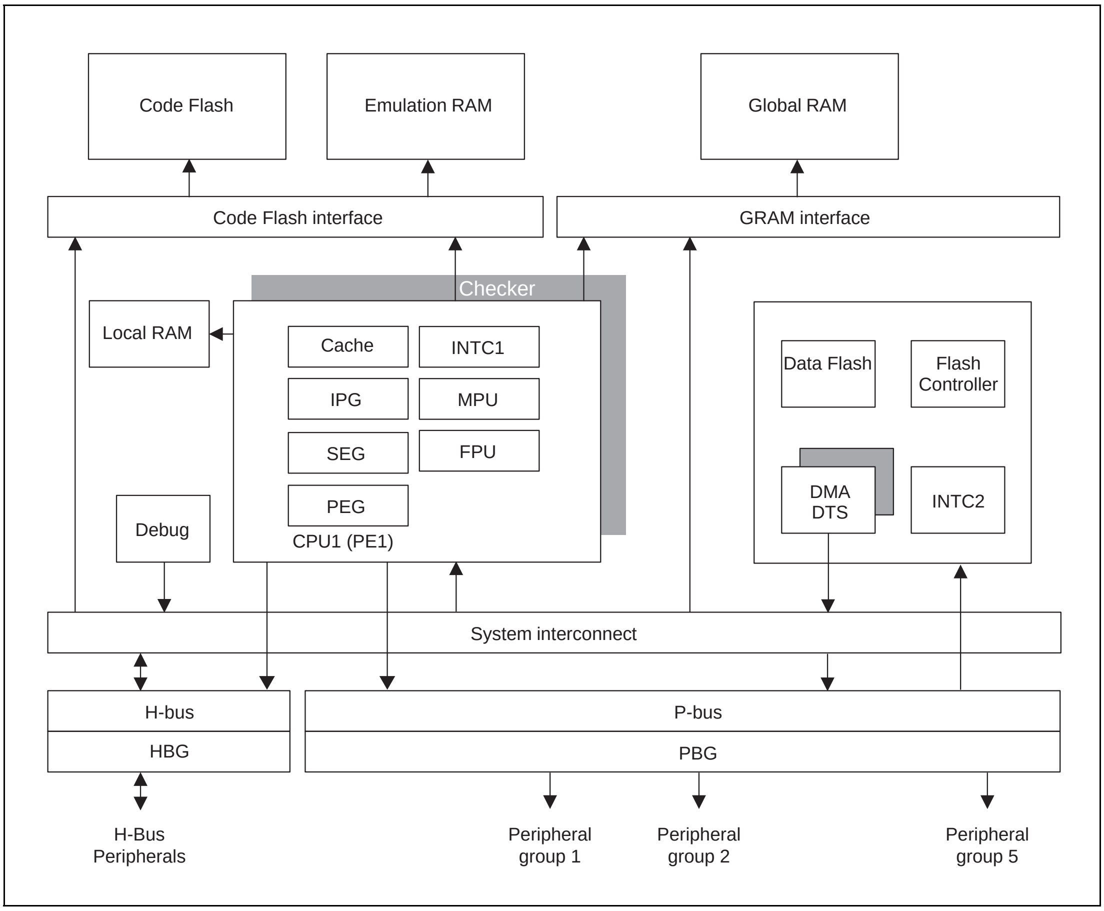

Figure 3.1 Block Configuration Diagram

CPU1 (PE1)

The RH850 G3M core is included as a main CPU. CPU1 also includes the checker core for safety assurance.

Local RAM

A high-speed accessible local RAM is included.

Global RAM

The Global RAM is a mass on-chip RAM that all PEs can share.

Code Flash

A mass Code Flash is included for program storage. CPU1 and the Code Flash are connected with each other via the Code Flash interface.

Emulation RAM

It is a RAM to emulate the Code Flash. The programs can be replaced without rewriting the Code Flash through control from an external tool.

Data Flash

It is a Flash memory being rewritable by the CPU.

P-Bus and H-Bus

The P-bus and H-bus connect the peripheral IPs. The P-bus is divided into peripheral groups 1, 2 and 5.

INTC1, INTC2

The interrupt controller consists of INTC1 and INTC2. INTC1 has a redundant configuration with the checker core.

DMA

Two DMA transfer modules, DMAC and DTS, are included. The DMA is provided with a checker for safety.

Slave Guard

The slave guard is a system to prevent unauthorized access from the specific bus master, consisting of the following guard structures.

(1) PE Guard (PEG)

The PE guard is a system to prevent unauthorized access to the resources in the PE from the external master. After reset release, access is prohibited except access from the PE itself.

(2) Internal Peripheral Guard (IPG)

Each PE has an "Internal Peripheral Guard" (IPG) that protects the registers of peripherals inside the PE against unauthorized accesses.

(3) System Error Generation (SEG)

The registers controls how to response SYSERR.

(4) Global RAM Guard (GRG)

The global RAM guard is a system to prevent unauthorized access to the global RAM from the external master. After reset release, the global RAM is unprotected (accessible from all bus masters).

(5) Peripheral Guard (PBG, HBG)

The peripheral guard is a system to prevent unauthorized access to peripheral devices from the external master. Peripheral devices are in the protected state excluding PE1 after release from the reset state.

3.2 CPU

3.2.1 Core Functions

3.2.1.1 Features

Table 3.1 lists features of the RH850G3M core.

Table 3.1 Features of the RH850G3M Core

Item	Feature
CPU	• Advanced 32-bit architecture for embedded control • 32-bit internal data bus • Thirty-two 32-bit general registers • RISC-type instruction sets – Long-/short-format load/store instructions – Three-operand instructions – Instruction sets based on C language • CPU operating modes – User mode and supervisor mode • Address space: 4-Gbyte linear address space for both data and instructions • Instructions: A snooze instruction (SNOOZE) is included for temporary suspension by switching the CPU clock signal (CLK_CPU) off for 32 clock cycles.
Coprocessor	• A floating-point operation coprocessor (FPU) mounted – Supports single precision (32 bits) and double precision (64 bits). – Supports data types and exceptions conforming to IEEE754. – Rounding mode: Neighborhood, 0 direction, +∞ direction, and -∞ direction – Handling denormalized numbers: Rounding down to 0 or exception notification to conform to IEEE754
Exception/ Interrupt	• 16 interrupt priority levels settable for each channel • Vector selection method selectable according to performance request or memory usage – Direct branching exception vectors – Indirect branching exception vectors referring to the address table – Supports the high-speed save/restore processing of the context by the dedicated instructions (PUSHSP and POPSP) at the generation of an interrupt
Memory management	• Memory protection function (MPU): 16 areas settable
Cache	• Instruction cache

3.2.1.2 Register Set

This subsection explains the program registers and system registers incorporated in this CPU.

(1) Program Registers

Program registers include the general-purpose registers (r0 to r31) and program counter (PC).
r0 always retains 0, whereas the value after reset is undefined in r1 to r31.

Table 3.2 List of Program Registers

Program Register	Name	Function	Description
General-purpose registers	r0	Zero register	Always retains “0”
	r1	Assembler reserved register	Used as working register for generating addresses
	r2	Register for address and data variables (used when the real-time OS used does not use this register)	
	r3	Stack pointer (SP)	Used for generating a stack frame when a function is called
	r4	Global pointer (GP)	Used for accessing a global variable in the data area
	r5	Text pointer (TP)	Used as a register that indicates the start of the text area (area where program code is placed)
	r6 to r29	Register for addresses and data variables	
	r30	Element pointer (EP)	Used as a base pointer for generating addresses when accessing memory
	r31	Link pointer (LP)	Used when the compiler calls a function
Program counter	PC	Retains instruction addresses during execution of programs	

NOTE

For further descriptions of r1, r3 to r5, and r31 used for an assembler and/or C compiler, see the specification of each software development environment.

(a) General-Purpose Registers

A total of 32 general-purpose registers (r0 to r31) are provided. All of these registers can be used for either data variables or address variables.

Of the general-purpose registers, r0 to r5, r30, and r31 are assumed to be used for special purposes in software development environments, so it is necessary to note the following when using them.

1. r0, r3, and r30

   These registers are implicitly used by instructions.

   r0 is a register that always retains “0”. It is used for operations that use 0 and addressing with base address being 0.

   r3 is implicitly used by the PREPARE, DISPOSE, PUSHSP, and POPSP instructions.

   r30 is used as a base pointer when the SLD instruction or SST instruction accesses memory.

2. r1, r4, r5, and r31

   These registers are implicitly used by the assembler and C compiler.

   When using these registers, register contents must first be saved so they are not lost and can be restored after the registers are used.

3. r2

   This register might be used by a real-time OS in some cases. If the real-time OS that is being used is not using r2, r2 can be used as a register for address variables or data variables.

(b) PC — Program Counter

The PC retains the address of the instruction being executed. Bit 0 is fixed to 0, and branching to an odd number address is disabled.

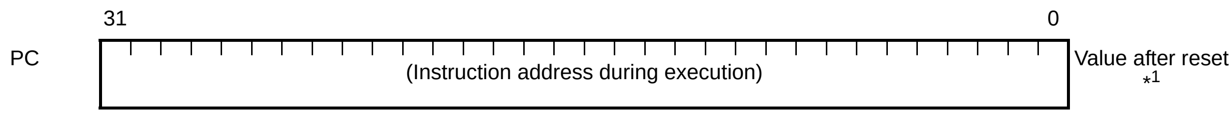

Table 3.3 PC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	PC31-1	These bits indicate the address of the instruction being executed.	R/W	*1
0	PC0	This bit is fixed to 0, and branching to an odd number address is disabled.	R/W	0

Note 1. The value after reset differs depending on the setting value of the reset vector. For details, see **(q) RBASE — Reset vector base address register**.

(2) Basic System Registers

The basic system registers are used to control CPU status and to retain exception information.

System registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.4 Basic System Registers

Register No. (regID, selID)	Name	Function	Access Permission
SR0, 0	EIPC	Status save registers when acknowledging EI level exception	SV
SR1, 0	EIPSW	Status save registers when acknowledging EI level exception	SV
SR2, 0	FEPC	Status save registers when acknowledging FE level exception	SV
SR3, 0	FEPSW	Status save registers when acknowledging FE level exception	SV
SR5, 0	PSW	Program status word	*1
SR6, 0	FPSR	Refer to **(4) FPU Function Registers**.	CU0 and SV
SR7, 0	FPEPC	Refer to **(4) FPU Function Registers**.	CU0 and SV
SR8, 0	FPST	Refer to **(4) FPU Function Registers**.	CU0
SR9, 0	FPCC	Refer to **(4) FPU Function Registers**.	CU0
SR10, 0	FPCFG	Refer to **(4) FPU Function Registers**.	CU0
SR11, 0	FPEC	Refer to **(4) FPU Function Registers**.	CU0 and SV
SR13, 0	EIIC	EI level exception cause	SV
SR14, 0	FEIC	FE level exception cause	SV
SR16, 0	CTPC	CALLT execution status save register	UM
SR17, 0	CTPSW	CALLT execution status save register	UM
SR20, 0	CTBP	CALLT base pointer	UM
SR28, 0	EIWR	EI level exception working register	SV
SR29, 0	FEWR	FE level exception working register	SV
SR31, 0	BSEL	Not implemented. A value of 0 is returned when read and writing is ignored.	SV
SR0, 1	MCFG0	Machine configuration	SV
SR2, 1	RBASE	Reset vector base address	SV
SR3, 1	EBASE	Exception handler vector address	SV
SR4, 1	INTBP	Base address of the interrupt handler table	SV
SR5, 1	MCTL	CPU control	SV
SR6, 1	PID	Processor ID	SV
SR11, 1	SCCFG	SYSCALL operation setting	SV
SR12, 1	SCBP	SYSCALL base pointer	SV
SR0, 2	HTCFG0	Thread configuration	SV
SR6, 2	MEA	Memory error address	SV
SR7, 2	ASID	Address space ID	SV
SR8, 2	MEI	Memory error information	SV

Note 1. The access permission differs depending on the bit.

(a) EIPC — Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the address of the instruction that was being executed when the EI level exception occurred, or of the next instruction, is saved to the EIPC register (see “Types of Exceptions” in the *RH850G3M User's Manual: Software*.).

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the EIPC register. An odd-numbered address must not be specified.

	31 … 0	
EIPC	EIPC31-0	Value after reset Undefined

Table 3.5 EIPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	EIPC31-1	These bits indicate the PC saved when an EI level exception is acknowledged.	R/W	Undefined
0	EIPC0	This bit indicates the PC saved when an EI level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the EIRET instruction is executed is 0.	R/W	Undefined

(b) EIPSW — Status save register when acknowledging EI level exception

When an EI level exception is acknowledged, the current PSW setting is saved to the EIPSW register.

Because there is only one pair of EI level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

CAUTION

Bits 11 to 9 cannot usually be changed since these bits are associated with debugging.

	31	30	29	28	27	26	25	24	23	22	21	20	19	18 to 16	15	14	13	12	11 to 9	8	7	6	5	4	3	2	1	0	
EIPSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	CU2-0	EBV	0	0	0	Debug	0	NP	EP	ID	SAT	CY	OV	S	Z	Value after reset 0000 0020_H

Table 3.6 EIPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an EI level exception is acknowledged.	R/W	0
29 to 19	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18 to 16	CU2-0	These bits store the PSW.CU 2 to 0 field setting when an EI level exception is acknowledged. (CU2-1 are reserved for future expansion. Be sure to set to 0.)	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an EI level exception is acknowledged.	R/W	0
14 to 12	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
11 to 9	Debug	These bits store the PSW.Debug field setting when an EI level exception is acknowledged.	R/W	0
8	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an EI level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an EI level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an EI level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an EI level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an EI level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an EI level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an EI level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an EI level exception is acknowledged.	R/W	0

(c) FEPC — Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the address of the instruction that was being executed when the FE level exception occurred, or of the next instruction, is saved to the FEPC register (see “Types of Exceptions” in *RH850G3M User's Manual: Software*.).

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

Be sure to set an even-numbered address to the FEPC register. An odd-numbered address must not be specified.

	31 … 0	
FEPC	FEPC31-0	Value after reset Undefined

Table 3.7 FEPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	FEPC31-1	These bits indicate the PC saved when an FE level exception is acknowledged.	R/W	Undefined
0	FEPC0	This bit indicates the PC saved when an FE level exception is acknowledged. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the FERET instruction is executed is 0.	R/W	Undefined

(d) FEPSW — Status save register when acknowledging FE level exception

When an FE level exception is acknowledged, the current PSW setting is saved to the FEPSW register.

Because there is only one pair of FE level exception status save registers, when processing multiple exceptions, the contents of these registers must be saved by a program.

CAUTION

Bits 11 to 9 cannot usually be changed since these bits are associated with debugging.

	31	30	29										19	18–16	15	14		12	11–9	8	7	6	5	4	3	2	1	0	
FEPSW	0	UM	0	0	0	0	0	0	0	0	0	0	0	CU2-0	EBV	0	0	0	Debug	0	NP	EP	ID	SAT	CY	OV	S	Z	Value after reset 0000 0020H

Table 3.8 FEPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
30	UM	This bit stores the PSW.UM bit setting when an FE level exception is acknowledged.	R/W	0
29 to 19	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18 to 16	CU2-0	These bits store the PSW.CU 2 to 0 field setting when an FE level exception is acknowledged. (CU2-1 are reserved for future expansion. Be sure to set to 0.)	R/W	0
15	EBV	This bit stores the PSW.EBV bit setting when an FE level exception is acknowledged.	R/W	0
14 to 12	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
11 to 9	Debug	These bits store the PSW.Debug field setting when an FE level exception is acknowledged.	R/W	0
8	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	NP	This bit stores the PSW.NP bit setting when an FE level exception is acknowledged.	R/W	0
6	EP	This bit stores the PSW.EP bit setting when an FE level exception is acknowledged.	R/W	0
5	ID	This bit stores the PSW.ID bit setting when an FE level exception is acknowledged.	R/W	1
4	SAT	This bit stores the PSW.SAT bit setting when an FE level exception is acknowledged.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when an FE level exception is acknowledged.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when an FE level exception is acknowledged.	R/W	0
1	S	This bit stores the PSW.S bit setting when an FE level exception is acknowledged.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when an FE level exception is acknowledged.	R/W	0

(e) PSW — Program status word

PSW (program status word) is a set of flags that indicate the program status (instruction execution result) and bits that indicate the operation status of the CPU (flags are bits in the PSW that are referenced by a condition instruction (Bcond, CMOV, etc.)).

CAUTIONS

1. **When the LDSR instruction is used to change the contents of bits 7 to 0 in this register, the changed contents become valid immediately after completion of the LDSR instruction execution.**
2. **The access permission for the PSW register differs depending on the bit. All bits can be read, but some bits can only be written under certain conditions. See Table 3.9, Access Permission for PSW Register for the access permission for each bit.**

Table 3.9 Access Permission for PSW Register

Bit		Access Permission When Reading	Access Permission When Writing
30	UM	UM	SV*1
18 to 16	CU2-0		SV*1
15	EBV		SV*1
11 to 9	Debug		Special*1
7	NP		SV*1
6	EP		SV*1
5	ID		SV*1
4	SAT		UM
3	CY		UM
2	OV		UM
1	S		UM
0	Z		UM

Note 1. The access permission for the whole PSW register is UM, so the PIE exception does not occur even if the register is written by using an LDSR instruction when PSW.UM is 1. In this case, writing is ignored.

PSW

31	30	29										19	18–16	15	14		12	11–9	8	7	6	5	4	3	2	1	0
0	UM	0	0	0	0	0	0	0	0	0	0	0	CU2-0	EBV	0	0	0	Debug	0	NP	EP	ID	SAT	CY	OV	S	Z

Value after reset 0000 0020$_H$

Table 3.10 PSW Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
30	UM	This bit indicates that the CPU is in user mode (UM mode). 0: Supervisor mode 1: User mode	R/W	0
29 to 19	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
18 to 16	CU2-CU0	This bit indicates the coprocessor use permissions. When the bit corresponding to the coprocessor is 0, a coprocessor use prohibition exception is generated in response to execution of a coprocessor instruction or access to coprocessor resources system registers. CU2 bit 18 : (Reserved for future expansion. Be sure to clear to 0.) CU1 bit 17 : (Reserved for future expansion. Be sure to clear to 0.) CU0 bit 16 : FPU	R/W	0

Table 3.10 PSW Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
15	EBV	This bit indicates the reset vector and exception vector operation. See the description on RBASE ((q) RBASE — Reset Vector Base Address Register) and EBASE ((r) EBASE — Exception Handler Vector Address Register) in this section.	R/W	0
14 to 12	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
11 to 9	Debug	These bits are used in the debugging functions of development tools. In normal operation, set these bits to 0.	R/W	0
8	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	NP	This bit disables the acknowledgement of FE level exception. When an FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level and FE level exceptions. As for the exceptions which the NP bit disables the acknowledgment, see the *Exception Cause List of RH850G3M User's Manual: Software*. 0: The acknowledgement of FE level exception is enabled. 1: The acknowledgement of FE level exception is disabled.	R/W	0
6	EP	This bit indicates that an exception other than an interrupt controlled by the interrupt controller is being serviced. It is set to 1 when the corresponding exception occurs. This bit does not affect acknowledging an exception request even when it is set to 1. 0: An exception other than an interrupt is not being serviced. 1: An exception other than an interrupt is being serviced.	R/W	0
5	ID	This bit disables the acknowledgement of EI level exception. When an EI level or FE level exception is acknowledged, this bit is set to 1 to disable the acknowledgement of EI level exception. As for the exceptions which the ID bit disables the acknowledgment, see the *Exception Cause List of RH850G3M User's Manual: Software*. This bit is also used to disable EI level exceptions from being acknowledged as a critical section while an ordinary program or interrupt is being serviced. It is set to 1 when the DI instruction is executed, and cleared to 0 when the EI instruction is executed. The change of the ID bit by the EI or ID instruction will be enabled from the next instruction. 0: The acknowledgement of EI level exception is enabled. 1: The acknowledgement of EI level exception is disabled.	R/W	1
4	SAT*1	This bit indicates that the operation result is saturated because the result of a saturated operation instruction operation has overflowed. This is a cumulative flag, so when the operation result of the saturated operation instruction becomes saturated, this bit is set to 1, but it is not cleared to 0 when the operation result for a subsequent instruction is not saturated. This bit is cleared to 0 by the LDSR instruction. This bit is neither set to 1 nor cleared to 0 when an arithmetic operation instruction is executed. 0: Not saturated 1: Saturated	R/W	0
3	CY	This bit indicates whether a carry or borrow has occurred in the operation result. 0: Carry or borrow has not occurred. 1: Carry or borrow has occurred.	R/W	0
2	OV*1	This bit indicates whether or not an overflow has occurred during an operation. 0: Overflow has not occurred. 1: Overflow has occurred.	R/W	0
1	S*1	This bit indicates whether or not the result of an operation is negative. 0: Result of operation is positive or 0. 1: Result of operation is negative	R/W	0
0	Z	This bit indicates whether or not the result of an operation is 0. 0: Result of operation is not 0. 1: Result of operation is 0.	R/W	0

Note 1. The operation result of the saturation processing is determined in accordance with the contents of the OV flag and S flag during a saturated operation. When only the OV flag is set to 1 during a saturated operation, the SAT flag is set to 1.

Operation result status	Flag status			Operation result after saturation processing
	SAT	OV	S	
Exceeded positive maximum value	1	1	0	7FFF $FFFF_H$
Exceeded negative maximum value	1	1	1	8000 0000_H
Positive (maximum value not exceeded)	Value prior to operation is retained.	0	0	Operation result itself
Negative (maximum value not exceeded)			1	

(f) EIIC — EI level exception source register

The EIIC register retains the source of any EI level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception source.

EIIC

31 0

EIIC31-0

Value after reset 0000 0000_H

Table 3.11 EIIC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	EIIC31-0	These bits store the exception source code when an EI level exception is acknowledged. See the **Table 6.11, Interrupt Exception Handler and Priority**, and *"Exception Cause List"* in the *RH850G3M User's Manual: Software* about stored exception source code. The EIIC31-16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(g) FEIC — FE level exception source register

The FEIC register retains the source of any FE level exception that occurs. The value retained in this register is an exception code corresponding to a specific exception source.

FEIC

31 0

FEIC31-0

Value after reset 0000 0000_H

Table 3.12 FEIC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	FEIC31-0	These bits store the exception source code when an FE level exception is acknowledged. See the **Table 6.11, Interrupt Exception Handler and Priority**, and *"Exception Cause List"* in the *RH850G3M User's Manual: Software* about stored exception source code. The FEIC31-16 field stores detailed exception source codes defined individually for each exception. If there is no particular definition, these bits are set to 0.	R/W	0

(h) CTPC — Status save register when executing CALLT register

When a CALLT instruction is executed, the address of the next instruction after the CALLT instruction is saved to CTPC. Be sure to set an even-numbered address to the CTPC register. An odd-numbered address must not be specified.

	31 … 0	
CTPC	CTPC31-0	Value after reset Undefined

Table 3.13 CTPC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	CTPC31-1	These bits indicate the PC of the instruction after the CALLT instruction.	R/W	Undefined
0	CTPC0	This bit indicates the PC of the instruction after the CALLT instruction. Always set this bit to 0. Even if it is set to 1, the value transferred to the PC when the CTRET instruction is executed is 0.	R/W	Undefined

(i) CTPSW — Status save register when executing CALLT register

When a CALLT instruction is executed, some of the PSW (program status word) settings are saved to CTPSW.

	31																											4	3	2	1	0	
CTPSW	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SAT	CY	OV	S	Z	Value after reset 0000 0000_H

Table 3.14 CTPSW Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
4	SAT	This bit stores the PSW.SAT bit setting when the CALLT instruction is executed.	R/W	0
3	CY	This bit stores the PSW.CY bit setting when the CALLT instruction is executed.	R/W	0
2	OV	This bit stores the PSW.OV bit setting when the CALLT instruction is executed.	R/W	0
1	S	This bit stores the PSW.S bit setting when the CALLT instruction is executed.	R/W	0
0	Z	This bit stores the PSW.Z bit setting when the CALLT instruction is executed.	R/W	0

(j) CTBP — CALLT base pointer register

The CTBP register is used to specify table addresses of the CALLT instruction and generate target addresses.

Be sure to set the CTBP register to a Half-word address.

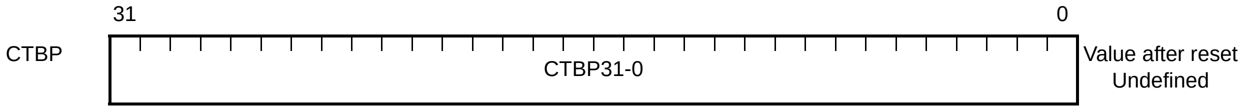

Table 3.15 CTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	CTBP31-1	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the first address in the table used by the CALLT instruction.	R/W	Undefined
0	CTBP0	These bits indicate the base pointer address of the CALLT instruction. These bits indicate the first address in the table used by the CALLT instruction. Always set this bit to 0.	R	0

(k) ASID — Address space ID register

This is the address space ID. This is used to identify the address space provided by the memory management function.

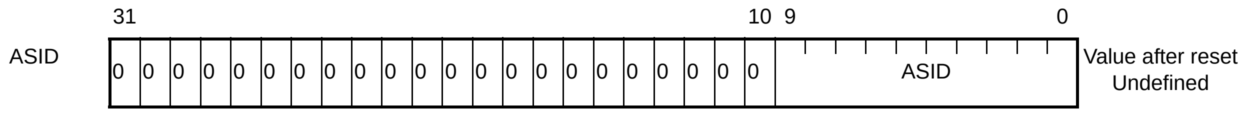

Table 3.16 ASID Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 10	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
9 to 0	ASID	This is the address space ID.	R/W	Undefined

(l) EIWR — EI level exception working register

The EIWR register is used as a working register when an EI level exception has occurred.

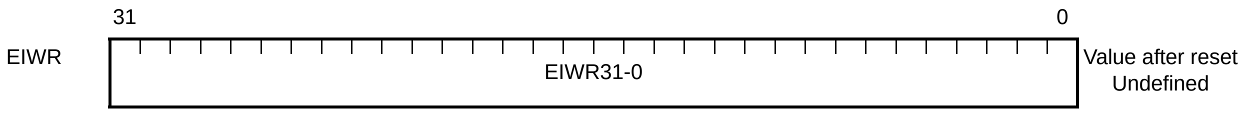

Table 3.17 EIWR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	EIWR31-0	These bits constitute a working register that can be used for any purpose during the processing of an EI level exception. Use this register for purposes such as storing the values of general-purpose registers.	R/W	Undefined

(m) FEWR — FE level exception working register

The FEWR register is used as a working register when an FE level exception has occurred.

	31 … 0	
FEWR	FEWR31-0	Value after reset Undefined

Table 3.18 FEWR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	FEWR31-0	These bits constitute a working register that can be used for any purpose during the processing of an FE level exception. Use this register for purposes such as storing the values of general-purpose registers.	R/W	Undefined

(n) HTCFG0 — Thread configuration register

	31	30	29	28	27	26	25	24	23	22	21	20	19	18 to 16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
HTCFG0	0	0	0	0	0	0	0	0	0	0	0	0	0	PEID	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	Value after reset*1

Table 3.19 HTCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 19	Reserved	(Reserved for future expansion. When read, the value after reset is read.)	R	0
18 to 16	PEID	These bits indicate the processor element number.	R	*2
15	Reserved	(Reserved for future expansion. When read, the value after reset is read.)	R	1
14 to 0	Reserved	(Reserved for future expansion. When read, the value after reset is read.)	R	0

Note 1. The value for CPU1 (PE1) in this device is 0001 8000_H.

Note 2. The value for CPU1 (PE1) in this device is 001_B.

(o) MEA — Memory error address register

	31 … 0	
MEA	MEA	Value after reset Undefined

Table 3.20 MEA Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MEA	These bits store the violation address when an MAE (misaligned) or MPU occurs.	R/W	Undefined

(p) MEI — Memory error information register

This register is used to store information about the instruction that caused the exception when a misaligned (MAE) or memory protection (MDP) exception occurs.

Bit	31	30	29	28	27	26	25	24	23	22	21	20 to 16	15	14	13	12	11	10, 9	8	7	6	5 to 1	0
MEI	0	0	0	0	0	0	0	0	0	0	0	REG	0	0	0	0	0	DS	U	0	0	ITYPE	RW

Value after reset
Undefined

Table 3.21 MEI Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 21	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
20 to 16	REG4-0	These bits indicate the number of the source or destination register of the instruction that caused the exception. For details, see **Table 3.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
15 to 11	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
10, 9	DS	These bits indicate the data type of the instruction that caused the exception.*1 0: Byte (8 bits) 1: Half-word (16 bits) 2: Word (32 bits) 3: Double-word (64 bits) For details, see **Table 3.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
8	U	These bits indicate the sign extension method of the instruction that caused the exception. 0: Signed 1: Unsigned For details, see **Table 3.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
7, 6	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
5 to 1	ITYPE4-0	These bits indicate the instruction that caused the exception. For details, see **Table 3.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined
0	RW	This bit indicates whether the operation of the instruction that caused the exception was read (Load-memory) or write (Store-memory) 0: Read (Load-memory) 1: Write (Store-memory) For details, see **Table 3.22, Instructions Causing Exceptions and Values of MEI Register**.	R/W	Undefined

Note 1. Even if the data is divided and access is made several times due to the specifications of the hardware, the original data type indicated by the instruction is stored.

Table 3.22 Instructions Causing Exceptions and Values of MEI Register (1/2)

Note 1. This exception occurs when the instruction executes a read access.

Note 2. It depends on actual operation.

Note 3. When the table reference interrupt vector is read.

NOTE

dst: Destination register number, src: Source register number

(q) RBASE — Reset vector base address register

This register indicates the reset vector address when there is a reset. If the PSW.EBV bit is 0, this vector address is also used as the exception vector address.

RBASE	31 … 9	8	7	6	5	4	3	2	1	0	Value after reset
	RBASE31-9	0	0	0	0	0	0	0	0	RINT	*1 0000 0000_H

Table 3.23 RBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	RBASE31-9	These bits indicate the value of the upper 23 bits (bits 31 to 9) of the reset vector address when there is a reset. The lower 9 bits (bits 8 to 0) of the reset vector address are all handled as 0. This address is also used as the exception vector when PSW.EBV = 0.	R	*1
8 to 1	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	RINT	When the RINT bit is set, the exception handler address for interrupt processing is reduced. For details, see *"Direct vector method"* in the *RH850G3M User's Manual: Software*. This bit is valid when PSW.EBV = 0.	R	0

Note 1. Please refer to **Figure 35.4, Utilizing the Variable Reset Vector Function to Update the Boot Program** for detail.

(r) EBASE — Exception handler vector address register

This register indicates the exception handler vector address. This register is valid when the PSW.EBV bit is 1.

EBASE	31 … 9	8	7	6	5	4	3	2	1	0	Value after reset
	EBASE31-9	0	0	0	0	0	0	0	0	RINT	Undefined

Table 3.24 EBASE Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	EBASE31-9	The upper 23 bits (bits 31 to 9) of the base address of the exception handler routine are set to the address specified by this register. The lower 9 bits (bits 8 to 0) of the base address are all handled as 0, and are converted to an address to which the offset address of each exception is added.	R/W	Undefined
8 to 1	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	RINT	When the RINT bit is set, the offset address of the exception handler used during interrupt servicing is decremented. For details, see *"Direct vector method"* in the *RH850G3M User's Manual: Software*.	R/W	Undefined

(s) INTBP — Base address of the interrupt handler table register

This register indicates the base address of the address table when the table reference method is selected as the interrupt handler address selection method.

	31 to 9	8	7	6	5	4	3	2	1	0	
INTBP	INTBP31-9	0	0	0	0	0	0	0	0	0	Value after reset Undefined

Table 3.25 INTBP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	INTBP31-9	These bits indicate the base pointer address of the table reference method of the interrupt. The value indicated by these bits is the first address in the table used to determine the exception handler when the interrupt specified to use the table reference method (EIINT0 to EIINT383) is acknowledged. The bit names are not assigned because EBASE8-0 bits are always 0.	R/W	Undefined
8 to 0	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0

(t) PID — Processor ID register

The PID register retains a processor identifier that is unique to the CPU. The PID register is a read-only register.

CAUTION

The PID register indicates information used to identify the incorporated CPU core and CPU core configuration. Usage such that the software behavior varies dynamically according to the PID register information is not assumed.

	31 to 0	
PID	PID	Value after reset 0580 0714_H

Table 3.26 PID Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 24	PID	Architecture identifier This identifier indicates the architecture of the processor.	R	05_H
23 to 8		Function identifier This identifier indicates the functions of the processor. These bits indicate whether or not functions defined per bit are implemented (1: implemented, 0: not implemented). Bit 23 to 11 Reserved Bit 10 Double-precision floating-point operation function Bit 9 Single-precision floating-point operation function Bit 8 Memory protection function (MPU)	R	8007_H
7 to 0		Version identifier This identifier indicates the version of the processor.	R	14_H

(u) SCCFG — SYSCALL operation setting register

This register is used to specify operations related to the SYSCALL instruction. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

SCCFG

31 to 8	7 to 0	
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0	SIZE	Value after reset Undefined

Table 3.27 SCCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 8	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7 to 0	SIZE	These bits specify the maximum number of entries of a table that the SYSCALL instruction references. The maximum number of entries the SYSCALL instruction references is 1 if SIZE is 0, and 256 if SIZE is 255. By setting the maximum number of entries appropriately in accordance with the number of functions branched by the SYSCALL instruction, the memory area can be effectively used. If a vector exceeding the maximum number of entries is specified for the SYSCALL instruction, the first entry is selected. Place an error processing routine at the first entry.	R/W	Undefined

(v) SCBP — SYSCALL base pointer register

The SCBP register is used to specify a table address of the SYSCALL instruction and generate a target address. Be sure to set an appropriate value to this register before using the SYSCALL instruction.

Be sure to set a word address to the SCBP register.

SCBP

31 to 0	
SCBP31-0	Value after reset Undefined

Table 3.28 SCBP Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	SCBP31-2	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the first address in the table used by the SYSCALL instruction.	R/W	Undefined
1, 0	SCBP1-0	These bits indicate the base pointer address of the SYSCALL instruction. These bits indicate the first address in the table used by the SYSCALL instruction. Always set these bits to 0.	R	0

(w) MCFG0 — Machine configuration register

This register indicates the CPU configuration.

	31										21	20				16	15											4	3	2	1	0	
MCFG0	0	0	0	0	0	0	0	0	0	0	0	SPID					0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	Value after reset 0002 0004_H

Table 3.29 MCFG0 Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 21	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
20 to 16	SPID	These bits indicate the system protection number. It is not possible to write "00000_B"/"00001_B" to SPID. If written, these value is "00010_B".	R/W	00010_B
15 to 4	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
3	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
2	Reserved	(Reserved for future expansion. Be sure to set to 1.)	R	1
1	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0

(x) MCTL — Machine control register

This register is used to control the CPU.

	31	30																												2	1	0	
MCTL	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	MA	UIC	Value after reset 8000 0000_H

Table 3.30 MCTL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	Reserved	(Reserved for future expansion. Be sure to set to 1.)	R	1
30 to 2	Reserved	(Reserved for future expansion. Be sure to set to 0.)	R	0
1	MA	This bit specifies the operation when a misaligned access occurs. 0: An exception occurs.*1 1: An exception does not occur.*2	R/W	0
0	UIC	This bit is used to control the interrupt enable/disable operation in user mode. When this bit is set to 1, executing the EI/DI instruction become possible in user mode.	R/W	0

Note 1. Excluding LD.DW and ST.DW instructions executed at an address at a word boundary.

Note 2. If the MA bit is 1, the CPU divides a single misaligned data access into multiple aligned accesses. In this case, the instruction atomicity is not guaranteed.

When MA bit is “1”, CPU divides the transaction from one misaligned data access to multiple aligned data accesses. In this case, atomic characteristics of the instruction are not guaranteed.

Access Conditions		Cycles Divided by the CPU		
Data Width	**Address**	**1st**	**2nd**	**3rd**
16 bits	2n + 1	8-bit access to 2n + 1	8-bit access to 2n + 2	—
32 bits	4n + 1	8-bit access to 4n + 1	16-bit access to 4n + 2	8-bit access to 4n + 4
32 bits	4n + 2	16-bit access to 4n + 2	16-bit access to 4n + 4	—
32 bits	4n + 3	8-bit access to 4n + 3	16-bit access to 4n + 4	8-bit access to 4n + 6

(3) Interrupt Function Registers

(a) Interrupt function system register

Reading from/writing to an interrupt function system register is performed by specifying the system register number, which consists of the register number and selection identifier, with the LDSR or STSR instructions.

Table 3.31 Interrupt Function System Registers

Register No. (reg.ID, sel.ID)	Symbol	Function	Access Permission
SR7, 1	FPIPR	FPI exception interrupt priority setting	SV
SR10, 2	ISPR	Priority of interrupt being serviced	SV
SR11, 2	PMR	Interrupt priority masking	SV
SR12, 2	ICSR	Interrupt control status	SV
SR13, 2	INTCFG	Interrupt function setting	SV

(b) FPIPR — FPI exception interrupt priority setting register

This register specifies the FPI exception interrupt priority.

	31																										5	4 … 0	
FPIPR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	FPIPR	Value after reset $0000\ 0000_H$

Table 3.32 FPIPR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
4 to 0	FPIPR	These bits specify the priority of the floating-point operation exception interrupt (FPI, indicating imprecision). Values from 0 to 16 should be used; a value greater than or equal to 17 is prohibited. FPI exceptions are handled according to this interrupt priority, which is specified in advance. When generated at the same time as another interrupt with the same priority level, the FPI takes priority. **NOTE** If these bits are set to 16 or higher values, handling is as if the setting were 16.	R/W	0

(c) ISPR — Priority of interrupt being serviced register

This register holds the priority of the EIINTn interrupt being serviced by the CPU per priority. This priority value is then used to perform priority ceiling processing when multiple interrupts are generated.

	31															16	15 to 0	
ISPR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	ISP15-0	Value after reset $0000\ 0000_H$

Table 3.33 ISPR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 16	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
15 to 0	ISP15-0	These bits indicate the acknowledgment status of an EIINTn interrupt with a priority that corresponds to the relevant bit position*[1]. 0: An interrupt request for an interrupt whose priority corresponds to the relevant bit position has not been acknowledged. 1: An interrupt request for an interrupt whose priority corresponds to the relevant position is being serviced by the CPU core. The bit positions correspond to the following priority levels: Bit / Priority 0 / Priority 0 (highest) 1 / Priority 1 : 14 / Priority 14 15 / Priority 15 When an interrupt request (EIINTn) is acknowledged, the bit corresponding to the acknowledged interrupt request is automatically set to 1. If PSW.EP is 0 when the EIRET instruction is executed, the bit with the highest priority among the ISP15-0 bits that are set (0 is the highest priority) is cleared to 0.*[2] While a bit in this register is set to 1, same and lower priority interrupts (EIINTn) and FPI exception*[3] are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged. When performing software-based priority control using the PMR register, be sure to clear this register by using the INTCFG.ISPC bit functions.	R*[4]	0

Note 1. For details, see *"Exception Priority of Interrupts and the Priority Mask"* in the *RH850G3M User's Manual: Software*.

Note 2. Interrupt acknowledgment and auto-updating of values when the EIRET instruction is executed are disabled by setting (1) the INTCFG.ISPC bit. It is recommended to enable auto-updating of values, so in normal cases, the INTCFG.ISPC bit should be cleared to 0.

Note 3. Since FPI exceptions have the same level of priority as this interrupt (EIINTn), they are affected by the ISPR in the same way as the interrupt. The priority of the FPI exception is set by the FPIPR register.

Note 4. This is R or R/W, depending on the setting of the INTCFG.ISPC bit. It is recommended to use this register as a read-only (R) register in normal cases.

(d) PMR — Interrupt priority masking register

This register is used to mask the specified interrupt priority.

	31															16	15 to 0	
PMR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	PM15-0	Value after reset 0000 0000$_H$

Table 3.34 PMR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 16	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
15 to 0	PM15-0	These bits mask an interrupt request with a priority level that corresponds to the relevant bit position. 0: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is enabled. 1: Servicing of an interrupt request with a priority that corresponds to the relevant bit position is disabled. The bit positions correspond to the following priority levels: Bit / Priority 0 / Priority 0 (highest) 1 / Priority 1 : 14 / Priority 14 15 / Priority 15 and priority 16 (lowest) While a bit in this register is set to 1, interrupts (EIINTn) with the priority corresponding to that bit and FPI exception*[1] are masked. Priority level judgment is therefore not performed when the system is determining whether to acknowledge an exception, meaning that exceptions will not be acknowledged*[2].	R/W	0

Note 1. Since a FPI exception is specified as the same level of priority as that of an interrupt (EIINTn), it is affected by the PMR like interrupts. The priority of FPI exception is set by the FPIPR register.

Note 2. Specify the masks by setting the bits to 1 in order from the lowest-priority bit. For example, FF00$_H$ can be set, but F0F0$_H$ or 00FF$_H$ cannot.

(e) ICSR — Interrupt control status register

This register indicates the interrupt control status in the CPU.

	31																													2	1	0	
ICSR	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	PMFP	PMEI	Value after reset 0000 0000$_H$

Table 3.35 ICSR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	PMFP	This bit indicates that an FPI exception with the priority level masked by the PMR register exists.	R	0
0	PMEI	This bit indicates that an interrupt (EIINTn) with the priority level masked by the PMR register exists	R	0

(f) INTCFG — Interrupt function setting register

This register is used to specify settings related to the CPU’s internal interrupt function.

	31																													1	0	
INTCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	ISPC	Value after reset 0000 0000$_H$

Table 3.36 INTCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 1	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	ISPC	This bit changes how the ISPR register is written. 0: The ISPR register is automatically updated. Updates triggered by the program (via execution of LDSR instruction) are ignored. 1: The ISPR register is not automatically updated. Updates triggered by the program (via execution of LDSR instruction) are performed. If this bit is cleared to 0, the bits of the ISPR register are automatically set to 1 when an interrupt (EIINTn) is acknowledged, and cleared to 0 when the EIRET instruction is executed. In this case, the bits are not updated by an LDSR instruction executed by the program. If this bit is set to 1, the bits of the ISPR register are not updated by the acknowledgement of an interrupt (EIINTn) or by execution of the EIRET instruction. In this case, the bits can be updated by an LDSR instruction executed by the program. In normal cases, the ISPC bit should be cleared (0). When performing software-based priority control, however, set this bit to 1 and perform priority control by using the PMR register.	R/W	0

(4) FPU Function Registers

(a) Floating-point operation registers

The FPU uses the CPU general-purpose registers (r0 to r31). There are no register files used only for floating-point operations.

- Single-precision floating-point instruction

  Thirty-two 32-bit registers can be specified. These correspond to the general-purpose registers r0 to r31.

- Double-precision floating-point instruction

  Sixteen 64-bit registers can be specified. These correspond to the register pairs each using one pair of general-purpose registers, ({r1, r0}, {r3, r2} … {r31, r30}). Each register pair is specified in the instruction format with an even numbered register. Because r0 is a zero register (always holds "0"), in principle {r1, r0} should not be used by a double-precision floating-point instruction.

(b) Floating-point system registers

The FPU can use the following system registers to control floating-point operation. Reading from/ writing to a floating-point system register is performed by specifying the system register number, which consists of the register number and selection identifier, with the LDSR or STSR instructions. For details of the registers, see "*Floating-Point Function System Registers*" in the *RH850G3M User's Manual: Software*.

Table 3.37 FPU System Registers

Register No. (reg.ID, sel.ID)	Symbol	Function	Access Permission
SR6, 0	FPSR	Floating-point operation setting/status	CU0 and SV
SR7, 0	FPEPC	Floating-point operation exception program counter	CU0 and SV
SR8, 0	FPST	Floating-point status	CU0
SR9, 0	FPCC	Floating-point operation comparison result	CU0
SR10, 0	FPCFG	Floating-point function setting	CU0
SR11, 0	FPEC	Floating-point operation exception control	CU0 and SV

(5) MPU Function Registers

(a) MPU function system registers

Reading from/writing to an MPU function system register is performed by specifying the system register number, which consists of the register number and selection identifier, with the LDSR or STSR instructions.

Table 3.38 MPU Function System Registers (1/2)

Register No. (reg.ID, sel.ID)	Symbol	Function	Access Permission
SR0, 5	MPM	Memory protection operation mode setting	SV
SR1, 5	MPRC	MPU region control	SV
SR4, 5	MPBRGN	MPU base region number	SV
SR5, 5	MPTRGN	MPU end region number	SV
SR8, 5	MCA	Memory protection setting check address	SV
SR9, 5	MCS	Memory protection setting check size	SV
SR10, 5	MCC	Memory protection setting check command	SV
SR11, 5	MCR	Memory protection setting check result	SV
SR0, 6	MPLA0	Protection area minimum address	SV
SR1, 6	MPUA0	Protection area maximum address	SV
SR2, 6	MPAT0	Protection area attribute	SV
SR4, 6	MPLA1	Protection area minimum address	SV
SR5, 6	MPUA1	Protection area maximum address	SV
SR6, 6	MPAT1	Protection area attribute	SV
SR8, 6	MPLA2	Lower address of the protection area	SV
SR9, 6	MPUA2	Protection area maximum address	SV
SR10, 6	MPAT2	Protection area attribute	SV
SR12, 6	MPLA3	Protection area minimum address	SV
SR13, 6	MPUA3	Protection area maximum address	SV
SR14, 6	MPAT3	Protection area attribute	SV
SR16, 6	MPLA4	Protection area minimum address	SV
SR17, 6	MPUA4	Protection area maximum address	SV
SR18, 6	MPAT4	Protection area attribute	SV
SR20, 6	MPLA5	Protection area minimum address	SV
SR21, 6	MPUA5	Protection area maximum address	SV
SR22, 6	MPAT5	Protection area attribute	SV
SR24, 6	MPLA6	Protection area minimum address	SV
SR25, 6	MPUA6	Protection area maximum address	SV
SR26, 6	MPAT6	Protection area attribute	SV
SR28, 6	MPLA7	Protection area minimum address	SV
SR29, 6	MPUA7	Protection area maximum address	SV
SR30, 6	MPAT7	Protection area attribute	SV
SR0, 7	MPLA8	Protection area minimum address	SV
SR1, 7	MPUA8	Protection area maximum address	SV
SR2, 7	MPAT8	Protection area attribute	SV
SR4, 7	MPLA9	Protection area minimum address	SV
SR5, 7	MPUA9	Protection area maximum address	SV

Table 3.38 MPU Function System Registers (2/2)

Register No. (reg.ID, sel.ID)	Symbol	Function	Access Permission
SR6, 7	MPAT9	Protection area attribute	SV
SR8, 7	MPLA10	Protection area minimum address	SV
SR9, 7	MPUA10	Protection area maximum address	SV
SR10, 7	MPAT10	Protection area attribute	SV
SR12, 7	MPLA11	Protection area minimum address	SV
SR13, 7	MPUA11	Protection area maximum address	SV
SR14, 7	MPAT11	Protection area attribute	SV
SR16, 7	MPLA12	Protection area minimum address	SV
SR17, 7	MPUA12	Protection area maximum address	SV
SR18, 7	MPAT12	Protection area attribute	SV
SR20, 7	MPLA13	Protection area minimum address	SV
SR21, 7	MPUA13	Protection area maximum address	SV
SR22, 7	MPAT13	Protection area attribute	SV
SR24, 7	MPLA14	Protection area minimum address	SV
SR25, 7	MPUA14	Protection area maximum address	SV
SR26, 7	MPAT14	Protection area attribute	SV
SR28, 7	MPLA15	Protection area minimum address	SV
SR29, 7	MPUA15	Protection area maximum address	SV
SR30, 7	MPAT15	Protection area attribute	SV

(b) MPM — Memory protection operation mode register

The memory protection mode register is used to define the basic operating state of the memory protection function.

	31																												2	1	0	
MPM	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	SVP	MPE	Value after reset $0000\ 0000_H$

Table 3.39 MPM Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	SVP	In SV mode. (when PSW.UM = 0), this bit is used to specify whether to restrict access according to the SX, SW, and SR bits of the MPAT register for each protection area.*1 0: As usual, implicitly enable all access in SV mode. 1: Restrict access according to the SX, SW, and SR bits even in SV mode.*2	R/W	0
0	MPE	This bit is used to specify whether to enable or disable MPU function. 0: Disable 1: Enable	R/W	0

Note 1. When the SVP bit is set to 1, access is restricted according to the setting of each protection area even in SV mode. Therefore, specify protection areas before setting the SVP bit to prevent the access of the program itself from being restricted.

Note 2. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(c) MPRC — MPU region control register

Bits used to perform special memory protection function operations are located in this register.

	31															16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
MPRC	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	E15	E14	E13	E12	E11	E10	E9	E8	E7	E6	E5	E4	E3	E2	E1	E0	Value after reset 0000 0000$_H$

Table 3.40 MPRC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 16	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
15 to 0	E15-E0	These are the enable bits for each protection area. Bit En is a copy of bit MPATn.E (where n = 15 to 0).	R/W	0

(d) MPBRGN — MPU base region register

This register indicates the minimum usable MPU area number.

	31																										5	4 to 0	
MPBRGN	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	MPBRGN	Value after reset 0000 0000$_H$

Table 3.41 MPBRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
4 to 0	MPBRGN	These bits indicate the smallest number of an MPU area. These bits are always read as 0.	R	0

(e) MPTRGN — MPU end region register

This register indicates the maximum usable MPU area number + 1.

MPTRGN

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4 to 0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	MPTRGN

Value after reset
0000 0010_H

Table 3.42 MPTRGN Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 5	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
4 to 0	MPTRGN	These bits indicate the largest number of an MPU area + 1. These bits indicate the maximum number of MPU areas incorporated into the hardware. The number of protection areas in this device is 16.	R	10_H

(f) MCA — Memory protection setting check address register

This register is used to specify the base address of the area for which a memory protection setting check is to be performed.

MCA

31 to 0
MCA31-0

Value after reset
Undefined

Table 3.43 MCA Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MCA31-0	These bits are used to specify the start address of the memory area subject to a memory protection setting check in bytes.	R/W	Undefined

(g) MCS — Memory protection setting check size register

This register is used to specify the size of the area for which a memory protection setting check is to be performed.

MCS

31 to 0
MCS31-0

Value after reset
Undefined

Table 3.44 MCS Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MCS31-0	These bits specify the size of the target area to specify the size of the memory area subject to a memory protection setting check in bytes. Checking in areas below the address value in the MCS register is not possible because the specified size is handled as an unsigned integer. Do not set 0000 0000_H in the MCS register.	R/W	Undefined

(h) MCC — Memory protection setting check command register

This command register is used to start a memory protection setting check.

	31 … 0	
MCC	MCC31-0	Value after reset 0000 0000_H

Table 3.45 MCC Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	MCC31-0	When any value is written to the MCC register, a memory protection setting check starts. Setting the MCA and MCS registers and then writing to this register leads to storage of the result of checking in the MCR register. Since writing any value to this register starts the check, doing so does not require any extra registers when r0 is used as a source register. The result of checking is reflected according to any area setting regardless of the setting of the PSW.UM bit. The value read from the MCC register is always 0000 0000_H.	R/W	0

(i) MCR — Memory protection setting check result register

This register is used to store the results of a memory protection setting check.

CAUTION

1. If the specified area to be checked crosses 0000 0000_H, it is judged as an area setting error, and the MCR.OV bit is set to 1. This means that the MCR.OV bit must be checked to access the check results. Do not use the check result until it is confirmed that the result is not invalid (OV = 0).
2. When the default set (MPM.DX, DW, DR) is set to 1, a correct result may not be obtained in some cases. If the specified default is to be enabled, do not use the memory protection setting check function.

	31 … 9	8	7	6	5	4	3	2	1	0	
MCR	0 (all bits)	OV	0	0	SXE	SWE	SRE	UXE	UWE	URE	Value after reset Undefined

Table 3.46 MCR Register Contents (1/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 9	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
8	OV	If the specified area includes 0000 0000_H or 7FFF $FFFF_H$, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
7, 6	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
5	SXE	If the specified area is contained within one protection area and execution is permitted for that area in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
4	SWE	If the specified area is contained within one protection area and writing to that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
3	SRE	If the specified area is contained within one protection area and reading from that area is permitted in supervisor mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

Table 3.46 MCR Register Contents (2/2)

Bit Position	Bit Name	Function	R/W	Value After Reset
2	UXE	If the specified area is contained within one protection area and execution is permitted for that area in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
1	UWE	If the specified area is contained within one protection area and writing to that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined
0	URE	If the specified area is contained within one protection area and reading from that area is permitted in user mode, 1 is stored in this bit. In other cases, 0 is stored in this bit.	R/W	Undefined

(j) MPLAn — Protection area minimum address register

These registers indicate the minimum address of area n (where n = 0 to 15).

	31 … 2	1	0	
MPLAn	MPLA31-2	0	0	Value after reset Undefined

Table 3.47 MPLAn Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	MPLA31-2	These bits indicate the minimum address of area n. The MPLAn.MPLA1-0 bits are implicitly set to 0.	R/W	Undefined
1, 0	Reserved	Reserved for future expansion. Be sure to clear these bits to 0.	R	0

(k) MPUAn — Protection area maximum address register

These registers indicate the maximum address of area n (where n = 0 to 15).

	31 … 2	1	0	
MPUAn	MPUA31-2	0	0	Value after reset Undefined

Table 3.48 MPUAn Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	MPUA31-2	These bits indicate the maximum address of area n. The MPUAn.MPUA1-0 bits are implicitly set to 1.	R/W	Undefined
1, 0	Reserved	Reserved for future expansion. Be sure to clear these bits to 0.	R	0

(l) MPATn — Protection area attribute register

These registers indicate the attributes of area n (where n = 0 to 15).

	31	30	29	28	27	26	25 to 16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
MPATn	0	0	0	0	0	0	ASID	0	0	0	0	0	0	0	0	E	G	SX	SW	SR	UX	UW	UR	Value after reset Undefined

Table 3.49 MPATn Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 26	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
25 to 16	ASID	These bits indicate the ASID value to be used as the area match condition.	R/W	Undefined
15 to 8	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
7	E	This bit indicates whether area n is enabled or disabled. 0: Area n is disabled. 1: Area n is enabled.	R/W	0
6	G	0: ASID match is the condition. 1: ASID match is not the condition. When this bit is 0, the condition of the area match is MPATn.ASID = ASID.ASID. When this bit is 1, the values of MPATn.ASID and ASID.ASID is not the condition.	R/W	Undefined
5	SX	This bit indicates the execution privilege in supervisor mode.*1 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
4	SW	This bit indicates the write permission in supervisor mode.*1 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
3	SR	This bit indicates the read permission in supervisor mode*1 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined
2	UX	This bit indicates the execution privilege in user mode. 0: Execution is disabled. 1: Execution is enabled.	R/W	Undefined
1	UW	This bit indicates the write permission in user mode. 0: Writing is disabled. 1: Writing is enabled.	R/W	Undefined
0	UR	This bit indicates the read permission in user mode. 0: Reading is disabled. 1: Reading is enabled.	R/W	Undefined

Note 1. If access is restricted in SV mode, execution of MDP exceptions or the MIP exception handling itself might not be possible depending on the settings. Be careful to specify settings so that access to the memory area necessary for the exception handler and exception handling is permitted.

(6) Cache Operation Function Registers

(a) Cache control function system registers

Cache control function system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.50 Cache Operation Function Registers

Register No. (reg.ID, sel.ID)	Symbol	Function	Access Permission
SR16, 4	ICTAGL	Instruction cache tag Lo access	SV
SR17, 4	ICTAGH	Instruction cache tag Hi access	SV
SR18, 4	ICDATL	Instruction cache data Lo access	SV
SR19, 4	ICDATH	Instruction cache data Hi access	SV
SR24, 4	ICCTRL	Instruction cache control	SV
SR26, 4	ICCFG	Instruction cache configuration	SV
SR28, 4	ICERR	Instruction cache error	SV

(b) ICTAGL — Instruction cache tag Lo access register

This register is used for CIST and CILD instructions for the instruction cache. This register holds values to be stored in the tag RAM of the instruction cache by the execution of CIST instructions and values read from the tag RAM of the instruction cache by the execution of CILD instructions.

	31 to 10	9	8	7	6	5, 4	3	2	1	0	
ICTAGL	LPN	0	0	0	0	LRU	0	L	0	V	Value after reset Undefined

Table 3.51 ICTAGL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 10	LPN	These bits hold the values of 24 to 12 bits of physical page numbers. When writing, always write 0 to bits 31 to 25 and bits 11 to 10.	R/W	Undefined
9 to 6	Reserved	(Reserved for future expansion. When writing, always write 0 to these bits.)	R	0
5, 4	LRU	These bits indicate the LRU information of the specified cache line. The CIST instruction cannot be used to change the LRU information to desired values.	R/W	Undefined
3	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
2	L	This bit holds the lock information.	R/W	Undefined
1	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	V	This bit retains whether the specified cache line is enabled or disabled.	R/W	Undefined

(c) ICTAGH — Instruction cache tag Hi access register

This register is used for a CIST or CILD instruction for the instruction cache. This register stores the value to be stored in the instruction cache tag RAM on CIST execution and the value read from the instruction cache tag RAM on CILD execution.

ICTAGH

31	30	29	28	27	26	25	24	23 to 16	15 to 8	7	6	5	4	3	2	1 to 0
WD	PD	WT	PT	0	0	0	0	DATAECC	TAGECC	0	*1	0	0	0	0	*1

Value after reset Undefined

Note 1. Undefined

Table 3.52 ICTAGH Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	WD	When this bit is set to 1, executing a CIST instruction updates the cache data RAM.	R/W	Undefined
30	PD	When this bit is set to 1 during CIST execution, values in the DATAECC field are overwritten to ECC for data RAM. When this value is 0, ECC is generated automatically from the write data.	R/W	Undefined
29	WT	When this bit is set to 1 during CIST execution, tag RAM of cache is updated.	R/W	Undefined
28	PT	When this bit is set to 1 during CIST execution, values in the TAGECC field are overwritten to ECC for tag RAM. When this value is 0, ECC is generated automatically from the write data.	R/W	Undefined
27 to 24	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
23 to 16	DATAECC	These bits store ECC for data RAM.	R/W	Undefined
15 to 8	TAGECC	These bits store ECC for tag RAM. Write 0 to bit 15.	R/W	Undefined
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.	R	0
6	Reserved	When read, an undefined value is read. When writing, always write 0.	R	Undefined
5 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.	R	0
1, 0	Reserved	When read, an undefined value is read. When writing, always write 0.	R	Undefined

(d) ICDATL — Instruction cache data Lo access register

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of CIST, values that are stored to the data RAM for the instruction cache are stored. During execution of CILD, values read from the data RAM for the instruction cache are stored.

ICDATL

31 to 0
DATAL

Value after reset Undefined

Table 3.53 ICDATL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	DATAL	Bits 31 to 0 or bits 95 to 64 are stored among the instruction data of a block in the specified cache line. The stored bits are specified by the offset of index. Offset of index = 0000: Bits 31 to 0 Offset of index = 1000: Bits 95 to 64	R/W	Undefined

(e) ICDATH — Instruction cache data Hi access register

This register is used by the CIST/CILD instruction in relation to the instruction cache. During execution of CIST, values that are stored to the data RAM for the instruction cache are stored. During execution of CILD, values read from the data RAM for the instruction cache are stored.

ICDATH	31 to 0	Value after reset
	DATAH	Undefined

Table 3.54 ICDATH Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 0	DATAH	Bits 63 to 32 or bits 127 to 96 are stored among the instruction data of a block in the specified cache line. The stored bits are specified by the offset of index. Offset of index = 0000: Bits 63 to 32 Offset of index = 1000: Bits 127 to 96	R/W	Undefined

(f) ICCTRL — Instruction cache control register

This register controls the instruction cache.

ICCTRL — Value after reset: 0003 0003_H

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	D1EIV	1	0	0	0	0	0	0	0	ICHCLR	0	0	0	0	0	ICHEIV	ICHEMK	ICHEN

Table 3.55 ICCTRL Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 18	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
17	D1EIV	This bit selects the operation in response to 1-bit errors in the data RAM. 0: The error is corrected and then processing continues, but the address of the entry that had an error is retained. 1: The error is not corrected, the entry is cleared, and fetching is repeated. This bit is read as the previous value until the setting is actually reflected in the instruction cache.	R/W	1
16	Reserved	(Reserved for future expansion. Be sure to set to 1.)	R	1
15 to 9	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
8	ICHCLR	Setting this bit to 1 clears the whole instruction cache in a single operation. After this bit has been set to 1, it will be read as 1 until clearing is completed. The read value of this bit is 0 once clearing of the cache is completed.	R/W	0
7 to 3	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
2	ICHEIV	Setting this bit to 1 allows the instruction cache to be automatically disabled (ICHEN bit to be cleared to 0) when a cache error occurs.	R/W	0
1	ICHEMK	Setting this bit to 1 selects masking of cache error exception notifications for the CPU when cache errors are encountered.	R/W	1
0	ICHEN	This bit disables or enables the instruction cache. 0: Instruction cache is disabled. 1: Instruction cache is enabled. This bit is read as the previous value until the setting is actually reflected in the instruction cache.	R/W	1

(g) ICCFG — Instruction cache configuration register

This register shows the configuration of the instruction cache.

	31														17	16	15	14 to 8	7 to 4	3 to 0	
ICCFG	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	ICHSIZE	ICHLINE	ICHWAY	Value after reset 0001 1084_H

Table 3.56 ICCFG Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 17	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
16	Reserved	(Reserved for future expansion. Be sure to set to 1.)	R	1
15	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
14 to 8	ICHSIZE	These bits indicate the capacity (in Kbytes) of the instruction cache. 001 0000: 16 Kbytes	R	10_H
7 to 4	ICHLINE	These bits indicate the number of lines per 1 way in the instruction cache. 1000: 256 lines	R	8_H
3 to 0	ICHWAY	These bits indicate the number of ways of the instruction cache. 0100: 4 ways	R	4_H

(h) ICERR — Instruction cache error register

This register stores cache error data of the instruction cache.

Once the ICHERR bit is set to 1, subsequent cache error data is not stored in this register until the ICHERR bit is cleared to 0. Also, the ICERR register is not updated while the cache is being accessed by the CILD instruction.

ICERR

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14 13	12 … 5	4	3	2	1	0
CISTW	0	ESMH	ESPBSE	ESTE1	ESTE2	ESDC	ESDE	0	0	ERMMH	ERMPBSE	ERMTE1	ERMTE2	ERMDC	ERMDE	0	ICHEWY	ICHEIX	ICHERQ	ICHED	ICHET	0	ICHERR

Value after reset
Undefined

Table 3.57 ICERR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31	CISTW	This bit is set to indicate that the destination way specified for a CISTI instruction was in error. Although the entry information is overwritten so that writing is completed, the V bit will be cleared the next time the cache line is read (i.e. reading will be judged to have missed the cache). However, setting of this bit is not accompanied by an exception for the CPU.	R/W	0
30	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
29	ESMH	Error status: multi-hit	R/W	Undefined
28	ESPBSE	Error status: way error	R/W	Undefined
27	ESTE1	Error status: 1-bit error in the tag RAM	R/W	Undefined
26	ESTE2	Error status: 2-bit error in the tag RAM	R/W	Undefined
25	ESDC	Error status: 1-bit correction in the data RAM	R/W	Undefined
24	ESDE	Error status: 2-bit error in the data RAM	R/W	Undefined
23, 22	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
21	ERMMH	Error exception notification mask: multi-hit	R/W	0
20	ERMPBSE	Error exception notification mask: way error	R/W	0
19	ERMTE1	Error exception notification mask: 1-bit error in the tag RAM	R/W	0
18	ERMTE2	Error exception notification mask: 2-bit error in the tag RAM	R/W	0
17	ERMDC	Error exception notification mask: 1-bit correction in the data RAM	R/W	0
16	ERMDE	Error exception notification mask: 2-bit error in the data RAM	R/W	0
15	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
14, 13	ICHEWY	These bits retain a way number where a cache error occurs.	R/W	Undefined
12 to 5	ICHEIX	These bits retain a cache index where a cache error occurs.	R/W	Undefined
4	ICHERQ	Setting of this bit to 1 indicates that the CPU is being notified of a cache error exception. If cache error exceptions are masked, however, the CPU is not notified of an exception even when this bit is set to 1.	R/W	0
3	ICHED	This bit indicates that an error occurs in the data RAM.	R/W	0
2	ICHET	This bit indicates that an error occurs in the tag RAM.	R/W	0
1	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
0	ICHERR	This bit is set to 1 when a cache error occurs.	R/W	0

(7) Data Buffer Operation Function Registers

(a) Data buffer control function system registers

Data buffer control system registers are read from or written to by using the LDSR and STSR instructions and specifying the system register number, which is made up of a register number and selection ID.

Table 3.58 Data Buffer Operation Function Registers

Register No. (reg.ID, sel.ID)	Symbol	Function	Access Permission
SR24,13	CDBCR	Data buffer control register	SV

(b) CDBCR — Data Buffer Control Register

This register controls the data buffer.

CDBCR

31																													2	1	0
0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	CDBCLR	CDBEN

Value after reset 0000 0001_H

Table 3.59 CDBCR Register Contents

Bit Position	Bit Name	Function	R/W	Value After Reset
31 to 2	Reserved	(Reserved for future expansion. Be sure to clear to 0.)	R	0
1	CDBCLR	When this bit is set to 1, the data buffer is cleared at a time. This bit is always read as 0.	W	0
0	CDBEN	This bit disables or enables the data buffer. 0: Data buffer is disabled. 1: Data buffer is enabled.	R/W	1

3.2.2 Instruction Cache and Data Buffer

3.2.2.1 Features

A 16-Kbyte and 4-way set-associative Instruction Cache is mounted between the CPU1 and the Code Flash. The Instruction Cache and the Code Flash are connected to each other via a 128-bit dedicated bus to minimize penalties caused by a cache miss-hit. Also a Data Buffer is mounted between the CPU1 and the Code Flash to achieve high-speed data access. The 32-MB area from 0000 0000_H to 01FF $FFFF_H$ in the address space is intended for the Instruction Cache and Data Buffer.

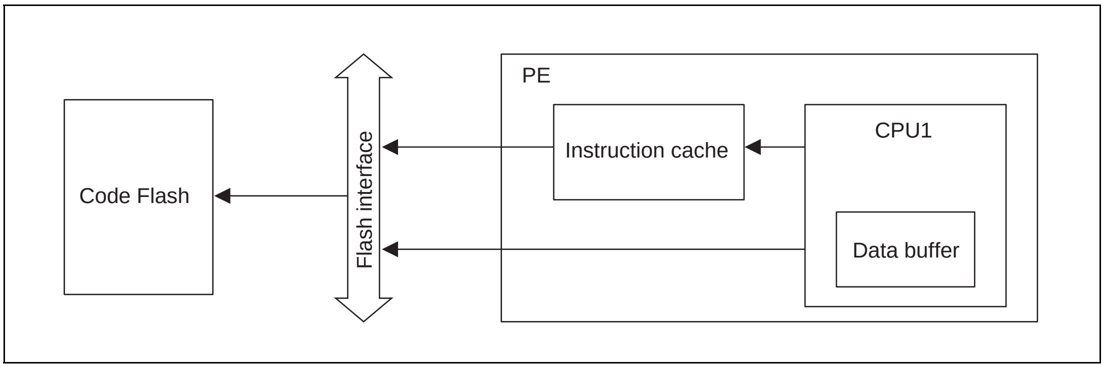

Figure 3.2 Instruction Cache and Data Buffer

3.2.2.2 Instruction Cache Function

The 16-Kbyte and 4-way set-associative cache includes four ways consisting of 256-entry blocks of four words per line, amounting to 16-Kbyte capacity in total. The ways are divided into two groups, way group 0 consisting of way0 and way1 and way group 1 consisting of way2 and way3. The way group can be selected and used by decoding of the address information of the access destination. If a cache error occurs, each line is refilled by a replace algorithm using LRU. CPU instruction fetches from the Code Flash are performed via the instruction cache.

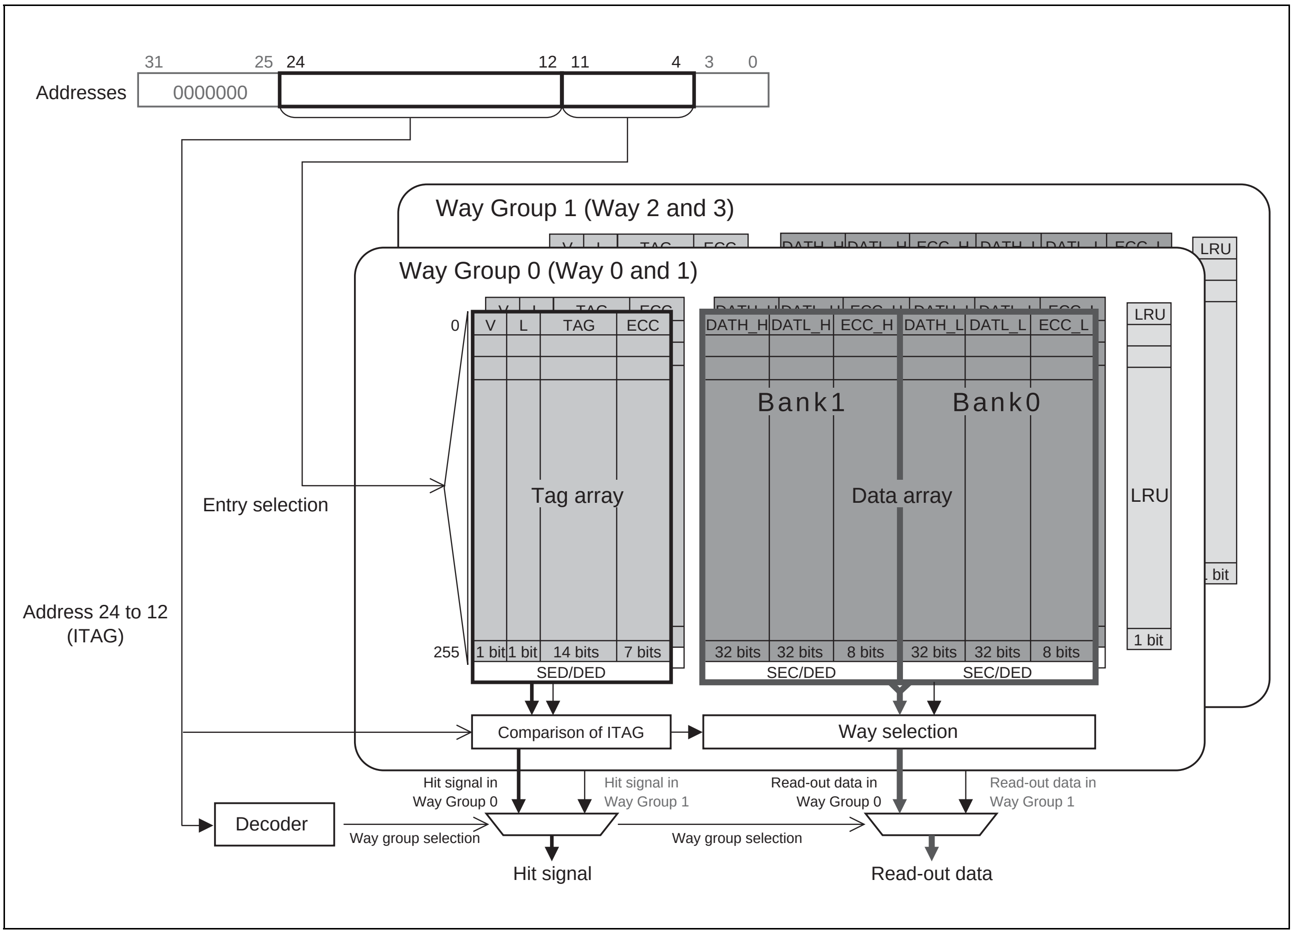

Figure 3.3 Instruction Cache Configuration

Tag Array

V bit	This bit indicates whether valid data is stored in the cache line. Setting of this bit to 1 makes the cache line data valid. The V bit is initialized to 0 by reset.
L bit	This bit indicates whether a cache line is locked or not. Setting of this bit to 1 locks the cache line and it can not be replaced with new data. The L bit is valid only when the V bit is 1, and it is not initialized by reset.
TAG	Among 32 bits in the operable addresses of the data line to be cached, bits 24 to 12 are stored in this bit. The TAG bit is not initialized by reset.
ECC	The ECC of the tag array is stored in this bit. The ECC bit is not initialized by reset.

Data Array

DATH_H, DATH_L, DATL_H, DATL_L	The 128-bit cache line data is stored per 32 bits as follows: the bits [127:96], [95:64], [63:32], [31:0] in the DATH_H, DATL_H, DATH_L, and DATL_L, respectively. In the CIST or CILD operation in response to a cache instruction, the ICDATH register is used for DATH_H and DATH_L and ICDATL is used for DATL_H and DATL_L.
ECC_H, ECC_L	The ECC of the data in bits [127:64] and [63:0] are stored in ECC_H and ECC_L, respectively.

LRU

LRU	The LRU information in the same way group is stored in this data array. The LRU is initialized by reset.

CAUTION

When writing test data to the tag array of the instruction cache in the CIST instruction and then fetching the relevant line, write the tag information in units of way group. For example, when writing tag information to a line on the way 0 side of way group 0, also write the tag information of the same line on the way 1 side and then perform instruction fetch

- **When writing data to way group 0 (way0, way1), write a value that makes the Exclusive OR of the ICTAGL.LPN bit 0.**
- **When writing data to way group 1 (way2, way3), write a value that makes the Exclusive OR of the ICTAGL.LPN bit 1.**

When a value other than those above is written to the tag array and instruction fetch is performed, a way error occurs and the ICERR.ESPBSE bit is set to 1. When the same tag information is written to the same lines of two ways in a way group and instruction fetch is performed, a multi-hit error occurs and the ICERR.ESMH bit is set to 1.

3.2.2.3 Data Buffer Function

The four-line buffer with 128 bits per line is mounted as a data buffer. The data of 128 bits per line read from the Code Flash is stored in the data buffer. The data is read out from the data buffer after the next access to the same address, so the Code Flash is not accessed again.

3.2.3 Reliability Functions

3.2.3.1 PE Guard Function (PEG)

(1) Overview of the PEG Function

The PEG is a constituent of the slave guard system to prevent unauthorized access to the resources in the PE from the external master. This function protects access to the local RAM in the PE. In the initial state after a reset, all access by masters other than the PE itself is disabled. Setting the registers listed in **(3) List of PEG Protection Setting Registers**, enables access by masters other than the PE itself.

- Detecting PE guard violation

  If the external master outside the PE makes an unauthorized access to the resource area in the PE for which PE guard is set, the access is detected as a PE guard violation. PE Guard informs it to ECM and reports the details about the access in registers.

- Blocking unauthorized accesses

  When a PE guard violation is detected, unauthorized accesses to the internal resources of the PE are blocked to prevent the contents of PE resources from being modified illegally.

- Notifying occurrence of violation

  An error response to an unauthorized access is sent to the request source of external master (except H-Bus master peripherals). When the DMAC or DTS makes an unauthorized access, meanwhile, a DMA transfer error is detected.

(2) Protection Made by SPID

- Setting PEG Protection
  - Up to eight areas can be set depending on the Local RAM address of the own PE.
  - The area range is specified by the base address and the mask bit (4 Kbytes to 4 Gbytes).
  - “Read enable” and “write enable” can be set for each area.
  - “Enable” or “disable” can be selected on each system protection identifier (SPID) for each area.
- Access permission by the system protection identifier (SPID) (see **Figure 3.4**)

1. When any of enabled area 0 to area 7 is to be accessed, go to step 2.
   Otherwise, return an error response.
2. Are all the conditions below for the relevant area met?
   - The system protection identifier (SPID) is enabled.
   - Required operations (read/write) are enabled.
     Otherwise, return an error response.

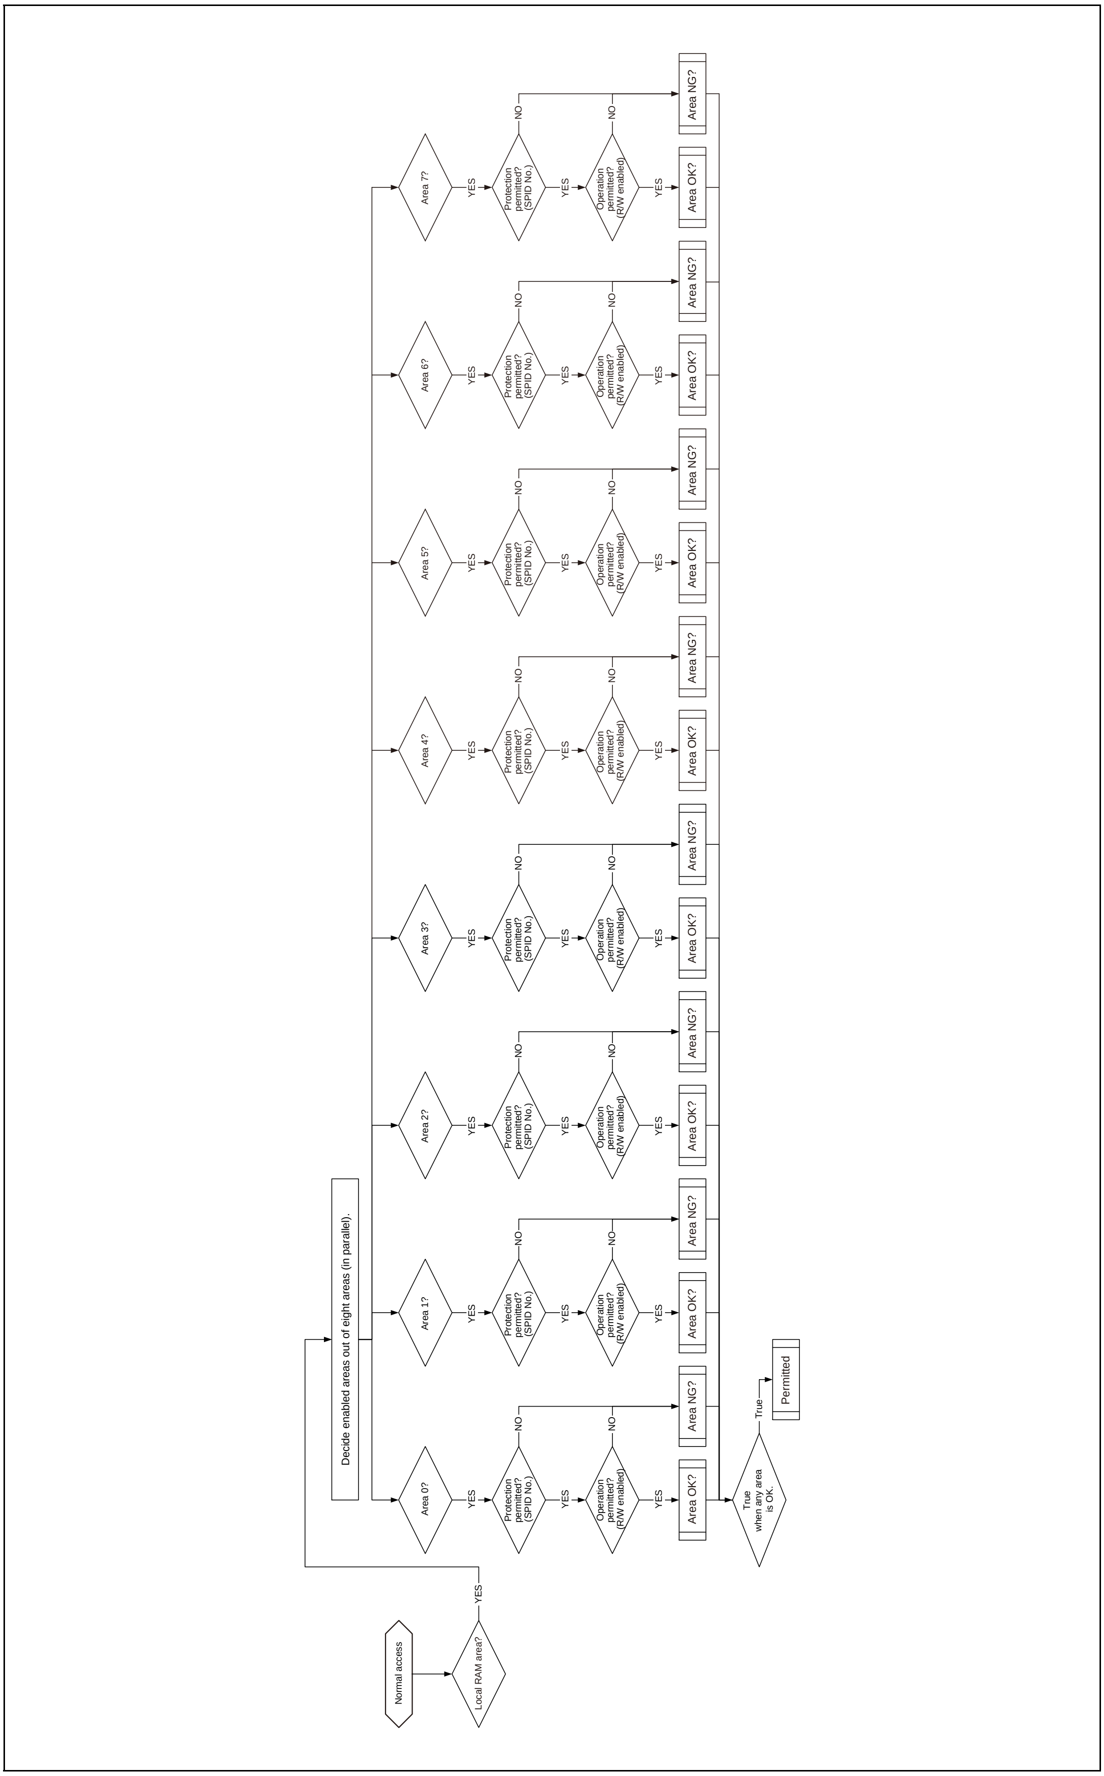

Figure 3.4 Access Permission by the System Protection Identifier (SPID)

(3) List of PEG Protection Setting Registers

Make necessary settings for the following registers to protect PE resources from unauthorized accesses by the external master.

- Accesses to the Local RAM in the PE are permitted as detection targets.
- For accesses to the register set, no access restriction is provided independently for the PEG function. Set access protections such as IPG at the user side as necessary.
- To set PEG protection, follow the procedure below. (n = 0 to 7)
  - Set the PE guard area n mask setting register as PEGGnMK.
  - Set the PE guard area n base setting register as PEGGnBA.

Table 3.60 PEG Protection Setting Registers (Base Address: FFFE $E600_H$)

Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit				Value After Reset
						1	8	16	32

(4) Register Set

(a) PEGGnMK — PE Guard Area n Mask Setting Register (n = 0 to 7)

In combination with the PEGGnBA register, this register specifies a range or ranges within PE guard protection area n. Setting a GnMASK bit to 1 masks the corresponding address bit in the PEGGnBA register and places the corresponding area or area inside the range of PE guard area n. The minimum size of the PE guard protection area is 4KB.

Ex) With the settings of PEGGnBA[31:12]=FEBF6$_H$ and PEGGnMK[31:12]=00008$_H$, the PE guard protection area n is specified within the ranges from FEBF 6000$_H$ to FEBF 6FFF$_H$ and FEBF E000$_H$ to FEBF EFFF$_H$.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. Refer to **Table 3.60, PEG Protection Setting Registers (Base Address: FFFE E600$_H$)**.

Table 3.62 PEGGnMK Register Contents

Bit Position	Bit Name	Function
31 to 12	GnMASK	0: Target address bits are compared when determining the PE guard area. 1: Target address bits are not compared when determining the PE guard area.
11 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(b) PEGGnBA — PE Guard Area n Base Setting Register (n = 0 to 7)

In combination with the PEGGnMK register, this register specifies a range or ranges within PE guard protection area n. Setting the GnEN bit to 1 brings the address enable conditions specified by this register and the PEGGnMK register into effect.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GnBASE															
Value after reset *1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. Refer to **Table 3.60, PEG Protection Setting Registers (Base Address: FFFE E600$_H$)**.

Table 3.63 PEGGnBA Register Contents

Bit Position	Bit Name	Function
31 to 12	GnBASE	Base address that specifies PE guard protection area n
11 to 5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	GnLOCK	Enables write protect to the registers (PEGGnBA, PEGGnMK, PEGGnSP) of PE guard control. This bit can be written once after reset. 0: Registers are not protected. 1: Registers are protected.
3	Reserved	This bit is always read as 0. The write value should always be 0.
2	GnWR	Enables write access to PE guard protection area n. 0: Write access is disabled. 1: Write access is enabled.
1	GnRD	Enables read access to PE guard protection area n. 0: Read access is disabled. 1: Read access is enabled.
0	GnEN	Enables the access enable condition settings for the PE guard protection area n. 0: Settings for access enable conditions are disabled 1: Settings for access enable conditions are enabled

CAUTION

PEGGnBA.GnEN is cleared by writing to the PEGGnMK register.

(c) PEGGnSP — PE Guard Area n enable Setting Register (n = 0 to 7)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 3.67 PGERRINFO_PE1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When written, write value after reset. Read value is always value after reset.
7 to 5	PEID	PEID of the bus master that initiated the access
4 to 0	SPID	SPID of the bus master that initiated the access

3.2.3.2 PE's Internal Peripherals Protection Function (IPG)

(1) Overview of the IPG Function

The IPG is a system to prevent unauthorized accesses to peripherals from the CPU core equipped with the IPG. The IPG achieves the following functions. The IPG covers accesses to resources except the Code Flash and the local RAM.

step (1) Detecting violation of peripherals protection

If the CPU makes an unauthorized access to an area (peripherals) for which peripherals protection is set, the access is detected as "violation of peripherals protection."

step (2) Storing unauthorized-access information

When a violation of peripherals protection is detected, the unauthorized-access information is stored in the IPG's internal register.

step (3) Blocking unauthorized accesses

When a violation of peripherals protection is detected, unauthorized accesses to peripherals are blocked to prevent contents of peripherals from being modified illegally.

step (4) Notifying violation

When a violation of peripherals protection is detected, a system error exception (SYSERR exception) request for generating an exception is made to ask the CPU to stop the processing.

For system error exceptions (SYSERR exceptions), see **Section 3.2.3.3, System Error Notification Control Function (SEG)**.

step (5) Invalidating subsequent accesses

When a violation of peripherals protection is detected, subsequent accesses (regardless of authorized or unauthorized accesses) are blocked until instructions from the CPU are received.

NOTE

Even if a request for generating an exception is immediately sent to the CPU in step (4) above, a subsequent access issued (before receiving a request from the IPG) by the CPU that does not know an occurrence of violation may illegally modify contents of peripherals. (Accesses after a violation has occurred result in unauthorized accesses.)

(2) IPG Function

- This function invalidates accesses according to their attributes (including address, transfer type, and access right).
- After an access right violation is detected until the error flag (described later) is cleared by writing by the software, subsequent accesses are invalidated. However, invalidation is applied only to accesses from the CPU and is not applied to accesses from outside the CPU core. Invalidation is performed independently of addresses.
- When a request for accessing different peripherals simultaneously is made due to misalignment or double-word access, the access is executed when all such accesses are enabled.

(3) IPG Protection Setting Registers for Illegal Users

To protect peripherals from unauthorized accesses by programs in user mode, necessary settings are required for the registers listed below.

- Accesses in user mode are to be detected.
- This register set is intended for IPG settings related to user mode and reading the IPG settings in own machine.

Table 3.68 IPG registers (Base Address: FFFE $E000_H$)

Address Offset	Size (Byte)	Register Name	Abbreviation	Right*1	R/W	Operable Bit				Value After Reset
						1	8	16	32

Note 1. Registers for which “SV” is described are accessible by accesses with SV right (UM = 0).

(4) Register Set

(a) IPGECRUM — Peripherals Protection Violation Access Information Register

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	DS				EX	WR	RD	VD
Value after reset	0	0	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

×: Undefined (retained)

Table 3.69 Register Contents of IPGECRUM

Bit Position	Bit Name	Function
15, 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13 to 8	Reserved	The read value is undefined. The write value should always be 0.
7 to 4	DS	These bits store the data size of access that made a violation. 1000: Double-word (8 bytes) 0100: Word (4 bytes) 0010: Half-word (2 bytes) 0001: Byte Other than above: RFU
3	EX	This bit is set to 1 when a violation occurred in an instruction fetch read access. In other cases, this bit is cleared to 0.
2	WR	This bit is set to 1 when a violation occurred in a write access or bit operation or CAXI. In other cases, this bit is cleared to 0.
1	RD	This bit is set to 1 when a violation occurred in a read access or bit operation or CAXI. In other cases, this bit is cleared to 0.
0	VD	This bit is set to 1 when a violation of peripherals protection is detected by a program with the relevant right. If another violation of peripheral protection is detected, data of this IPGECRUM register and the IPGADRUM register is updated.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripherals protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(b) IPGADRUM — Peripherals Protection Violation Access Address Register

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	EADR															
Value after reset	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x	x
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

×: Undefined (retained)

Table 3.70 Register Contents of IPGADRUM

Bit Position	Bit Name	Function
31 to 0	EADR	These bits store the address of the access in which a violation occurred.

NOTE

When the IRE bit value of the IPGENUM register (described later) is 0 and violation of peripherals protection by a program operating in user mode is an instruction fetch read access, no bit of this register is updated.

(c) IPGENUM — Peripherals Protection Enable Register

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IRE	E
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 3.71 Register Contents of IPGENUM

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	IRE	This bit sets whether to store the access information in the peripherals protection violation access address register and the peripherals protection violation access information register when a violation of peripherals protection occurred in an instruction fetch access. 0: Instruction fetch access information is not stored. (Value after reset) 1: Instruction fetch access information is stored. **CAUTION** If you do not want to detect speculative instruction fetches (no instruction is executed in some cases), clear this bit to 0.
0	E	This bit enables or disables the peripherals protection function against accesses by the relevant access right. 0: The peripherals protection function is disabled. (Value after reset) 1: The peripherals protection function is enabled.

(d) IPGPMTUM0 — Peripherals Protection Setting Register 0

Bit	7	6	5	4	3	2	1	0
	—	X1	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R	R

Table 3.72 Register Contents of IPGPMTUM0

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	X1	This bit sets whether to enable instruction fetch read access to Peripheral IP groups. 0: Instruction fetch read access to Peripheral IP groups is treated as violation. (Value after reset) 1: Instruction fetch read access to Peripheral IP groups is not restricted.
5	W1	This bit sets whether to enable write access to Peripheral IP groups. 0: Write access to Peripheral IP groups is treated as violation. (Value after reset) 1: Write access to Peripheral IP groups is not restricted.
4	R1	This bit sets whether to enable read access to Peripheral IP groups. 0: Read access to Peripheral IP groups is treated as violation. (Value after reset) 1: Read access to Peripheral IP groups is not restricted.
3 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(e) IPGPMTUM1 — Peripherals Protection Setting Register 1

Bit	7	6	5	4	3	2	1	0
	—	X1	—	—	—	X0	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R	R	R	R/W	R	R

Table 3.73 Register Contents of IPGPMTUM1

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	X1	This bit sets whether to enable instruction fetch read access to GRAM Bank B. 0: Instruction fetch read access to GRAM Bank B is treated as violation. (Value after reset) 1: Instruction fetch read access to GRAM Bank B is not restricted.
5 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	X0	This bit sets whether to enable instruction fetch read access to GRAM Bank A. 0: Instruction fetch read access to GRAM Bank A is treated as violation. (Value after reset) 1: Instruction fetch read access to GRAM Bank A is not restricted.
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

(f) IPGPMTUM2 — Peripherals Protection Setting Register 2

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 3.74 Register Contents of IPGPMTUM2

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	W1	This bit sets whether to enable write access to COMPTEST. 0: Write access to COMPTEST is treated as violation. (Value after reset) 1: Write access to COMPTEST is not restricted.
4	R1	This bit sets whether to enable read access to COMPTEST. 0: Read access to COMPTEST is treated as violation. (Value after reset) 1: Read access to COMPTEST is not restricted.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	W0	This bit sets whether to enable write access to INTC1. 0: Write access to INTC1 is treated as violation. (Value after reset) 1: Write access to INTC1 is not restricted.
0	R0	This bit sets whether to enable read access to INTC1. 0: Read access to INTC1 is treated as violation. (Value after reset) 1: Read access to INTC1 is not restricted.

(g) IPGPMTUM3 — Peripherals Protection Setting Register 3

Bit	7	6	5	4	3	2	1	0
	—	—	W1	R1	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 3.75 Register Contents of IPGPMTUM3

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.
5	W1	This bit sets whether to enable write access to SYSERRGen. 0: Write access to SYSERRGen is treated as violation. (Value after reset) 1: Write access to SYSERRGen is not restricted.
4	R1	This bit sets whether to enable read access to SYSERRGen. 0: Read access to SYSERRGen is treated as violation. (Value after reset) 1: Read access to SYSERRGen is not restricted
3 to 0	Reserved	When read, the value after reset always is read. When writing, always write the value after reset.

(h) IPGPMTUM4 — Peripherals Protection Setting Register 4

Bit	7	6	5	4	3	2	1	0
	—	X1	W1	R1	—	—	W0	R0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R	R	R/W	R/W

Table 3.76 Register Contents of IPGPMTUM4

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	X1	This bit sets whether to enable instruction fetch read access to peripherals to be connected to the H-Bus. 0: Instruction fetch read access to peripherals to be connected to the H-Bus is treated as violation. (Value after reset) 1: Instruction fetch read access to peripherals to be connected to the H-Bus is not restricted.
5	W1	This bit sets whether to enable write access to peripherals to be connected to the H-Bus. 0: Write access to peripherals to be connected to the H-Bus is treated as violation. (Value after reset) 1: Write access to peripherals to be connected to the H-Bus is not restricted.
4	R1	This bit sets whether to enable read access to peripherals to be connected to the H-Bus. 0: Read access to peripherals to be connected to the H-Bus is treated as violation. (Value after reset) 1: Read access to peripherals to be connected to the H-Bus is not restricted.
3, 2	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
1	W0	This bit sets whether to enable write access to PEG. 0: Write access to PEG is treated as violation. (Value after reset) 1: Write access to PEG is not restricted.
0	R0	This bit sets whether to enable read access to PEG. 0: Read access to PEG is treated as violation. (Value after reset) 1: Read access to PEG is not restricted

3.2.3.3 System Error Notification Control Function (SEG)

Errors due to an instruction fetch or data access can be the sources of system error exceptions. A SYSERR exception is an FE level exception from which return or recovery is not possible.

SEG (SysErrGen) controls the notification and record of the error by the data access. Instruction cache errors occurred on the RAM are notified to the SEG. For details, see section **(a) SEGCONT — Error Notification Control Register** and **(c) Additional information on SYSERR exception**.

Multiple error occurrence inputs are categorized according to error factors, and are processed sequentially from the highest-priority error factor, generating an FE-level asynchronous exception (SYSERR).

The bit position of the SEGFLAG register becomes the priority of error factors. Error factors of lower bits take precedence over error factors of upper bits.

Error information is recorded once regardless of error frequency.

The error with the highest priority of error factor (in case errors occurred simultaneously) is valid. Recorded error information is not overwritten by subsequent errors.

(1) List of SEG Function Control Registers

Table 3.77 SEG Register (Base Address: FFFE $E980_H$)

Address Offset	Size (Byte)	Register Name	Abbreviation	Right	R/W	Operable Bit 1	8	16	32	Value After Reset
$+00_H$	2	Error notification control register	SEGCONT	—	R/W *1	—	—	√	—	0000_H
$+02_H$	2	Error occurrence retention register	SEGFLAG	—	R/W *1	—	—	√	—	0000_H
$+08_H$	4	Error factor retention register (address)	SEGADDR	—	R/W *1	—	—	√	√	Undefined (retained)

Note 1. Write accesses from user mode are ignored.

NOTE

- If an access is made with an address offset or operable bits other than those specified above, an error response is returned.
- Write access is only possible with the SV privilege (UM = 0). Attempting to write, if these conditions do not hold, leads to an error response being returned.
- No restriction is provided for read accesses.
  - Read accesses to ranges permitted by other protection systems are enabled at any time.

(2) Register Set

(a) SEGCONT — Error Notification Control Register

- This register is used to enable (= 1) or disable (= 0) notification of SYSERR request in response to error flags that store error occurrence status according to factors.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	VPGE	VCRE	—	TCME	—	VCIE	—	ICCE	—	NEE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R/W	R	R/W	R	R/W	R	R/W

Table 3.78 SEGCONT Register Contents (1/2)

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	VPGE	This bit notifies an error in writing access to P-Bus. The error includes the followings: • P-Bus guard error • Address EDC error • Data ECC error • Access to unimplemented area in the P-Bus
8	VCRE	This bit notifies the IPG violation access detection and subsequent access blocking (including instruction fetch).*1
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCME	This bit notifies an error in accessing data to local RAM. The error includes the following cases: • ECC error • Access to the RAM-unimplemented area in the local RAM
5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 3.78 SEGCONT Register Contents (2/2)

Bit Position	Bit Name	Function

4	VCIE	This bit notifies an error from the GRAM, Code Flash, H-bus or P-bus.
		The error includes the followings:
		• in reading access to P-Bus
		  – P-Bus guard error
		  – Address EDC error
		  – Data ECC error
		  – access to unimplemented area in the P-Bus
		• access to unimplemented area in the CPU-specific functions
		• in access to H-Bus
		  – H-Bus guard error
		  – access to unimplemented area in the H-Bus area
		• in access to Code Flash
		  – Address Parity error
		  – Data ECC error
		• in access to system peripheral
		  – FFFF 0000_H to FFFF $4FFF_H$
		  – FFFE 0000_H to FFFE $BFFF_H$
		  – FB00 0000_H to FE9F $FFFF_H$
		  – F300 0000_H to F8FF $FFFF_H$
		• in access to Global RAM
		  – GRAM guard error
		  – Address ECC error
		  – Data ECC error
		• This bit notifies of an IPG violation access detection and subsequent access blocking.*[1]
		• This bit notifies of an access privilege violation.
		  – Read or write access to the IPG Protection Setting Registers by user mode (PSW.UM = 1).
		  – Write access to the SEG Function Control Registers by user mode (PSW.UM = 1).

3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	ICCE	Instruction cache error notification enable The error occurred in the instruction cache is handled when the instruction cache system register, ICCTRL.ICHEMK, is set to 0 (whose value after reset is 1): For instruction cache errors, see (h) ICERR — Instruction Cache Error Register in Section 3.2.1.2, Register Set
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	NEE	This bit notifies the correctable ECC error. Code Flash, Global RAM, Local RAM. To enable this function, it is necessary to set VCIE or TCME bit to 1 at the same time.

Note 1. Please refer the IPGADRUM register of **Section 3.2.3.2, PE's Internal Peripherals Protection Function (IPG)** for an error factor addresses.

(b) SEGFLAG — Error Occurrence Retention Register

- The register SEGFLAG indicates from which slaves error responses have been received so far. SEGFLAG is not cleared automatically. Clearing can be performed by writing a zero into the register.
- Writing to the register enables both setting and clearing.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	VPGF	VCRF	—	TCMF	—	VCIF	—	ICCF	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R/W	R	R/W	R	R/W	R	R

Table 3.79 SEGFLAG Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	VPGF	Flag corresponding to bit 9 of the SEGCONT register
8	VCRF	Flag corresponding to bit 8 of the SEGCONT register
7	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
6	TCMF	Flag corresponding to bit 6 of the SEGCONT register
5	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
4	VCIF	Flag corresponding to bit 4 of the SEGCONT register
3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	ICCF	Flag corresponding to bit 2 of the SEGCONT register
1, 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Table 3.80 Relationship Between System Error Exception Cause Code and SEGFLAG

FEIC	Error Cause
10_H	Reserved
11_H	Instruction fetch from Code Flash
12_H	SEGFLAG.ICCF
13_H	Instruction fetch from other than Code Flash
14_H	SEGFLAG.VCIF
15_H	Reserved
16_H	SEGFLAG.TCMF
17_H	Reserved
18_H	SEGFLAG.VCRF
19_H	SEGFLAG.VPGF

(c) SEGADDR — SEG Error Information Register (Address)

This register records information of an error source that notifies a SYSERR request (only one history is recorded). It records the addresses where the error factors for the VCIF and TCMF bits of the SEGFLAG register were found. The error factors except VCIF and TCMF bits will be recorded as 0000 0000_H. This register cannot be modified when the error occurrence flag to enable notification is set.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Address[31:16]

R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Address[15:0]															
Value after reset	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×	×
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

×: Undefined (retained)

Note 1. This register cannot be modified when the error occurrence flag to enable notification is set.

Table 3.81 SEGADDR Register Contents

Bit Position	Bit Name	Function
31 to 0	Address[31:0]	These bits hold the address at which SYSERR was generated. (If the error was caused by an access to the local RAM area, the lower 19 bits of the address are held, and the upper 13 bits are cleared to 0.)

(3) SEG Function

(a) SEG function: Notifying a SYSERR request due to an error flag

- Setting an error flag takes precedence over clearing the same flag.
  - Simultaneous clearing operation is ignored.
- Priority of error factors
  - The bit position of the notification-enabled SEGFLAG register becomes the priority of error factors. Error factors of lower bits take precedence over error factors of upper bits. Notification is made from the highest-priority error factor.
  - The bit position of error factors is notified as a “SYSERR factor code.”
- Conditions for starting SYSERR request notification
  - Even if a SEGFLAG register bit is set to 1, notification is not made.
  - Notification is made immediately after a SEGCONT register bit is set to 1.
  - After clearing SEGFLAG register bits of error notification subject, notification is made depending on priority of SEGFLAG register bits except for cleared bits (re-arbitration).
- Finishing notification at a SYSERR request response
  - Even after notification is finished, the flag is not cleared automatically.
  - Notification is not made until re-arbitration is performed by setting or clearing the flag.
  - If an error flag that is prioritized higher than the error factor is set prior to a request response, the notification information may be replaced with an upper SYSERR factor code.

(b) SEG function: Recording error factor information

- When notification-enabled error occurrence is input, the error address is retained in the above register.
  - No information is retained by setting or clearing an error flag described in “**(3) (a) SEG function: Notifying a SYSERR request due to an error flag**” above.
  - When multiple error occurrence inputs are present simultaneously, information other than the prioritized error factor is not retained.
- While the notification-enabled error flag described in “**(3) (a) SEG function: Notifying a SYSERR request due to an error flag**” above is set to 1, overwrite to the above register is inhibited
  - If error occurrence input continues, information of subsequent error factors is not retained.
  - To cancel the register overwrite prohibition, clear either SEGCONT or SEGFLAG register (or both of them).

(c) Additional information on SYSERR exception

- Even if an SYSERR exception occurs, the value of the PSW.EBV bit is kept and the base address of an exception handler does not change.
- Error detection in instruction cache
  Even if an error is detected in instruction cache, resumable SYSERR exception by instruction fetch factor does not occur. Instruction cache automatically invalidates the entry which includes an error and the CPU continues the instruction execution by refeching from the Code Flash. When the ICCTRL.ICHEMK bit in the system register is set to 0, an error occurred in instruction cache is notified to the SEG.

3.2.3.4 Checker Core

The CPU1 (PE1) has the Checker Core for safety assurance, resulting in a highly reliable system. Monitoring the outputs from the CPU1 (PE1) and the Checker Core with the comparator all the time enables immediate detection of the CPU1 (PE1) abnormal operations. Duplication by the checker core covers the CPU core, FPU, MPU, PEG, IPG, SEG, and INTC1. The CPU1 can also conduct a fault diagnosis test of its own comparator through a pseudo-error generated by the COMPTEST module. Please refer to **Section 31, Functional Safety** for detail.

CAUTION

Reading of any register with an undefined value after a reset in a PE or writing to memory or a register outside the PE may cause a lock step comparison error. The values of some program registers and system registers are undefined after a reset, so pay attention to this when saving register values on the stack in RAM.

3.3 Inter CPU Functions Overview

3.3.1 Processor Element Identifier

The PEID, each processor element ID number, can be read from the PEID field in the HTCFG0 register. Which CPU core performs a specific program can be understood by referring to the PEID. The following shows the PEID of this product.

CPU core	PEID
CPU1 (PE1)	001_B

3.3.2 Exclusive Function

The Local RAM and Global RAM are available as a resource for exclusive control. Atomic operation instructions LDL/STC, CAXI, SET1, CLR1, and NOT1 can be performed for the Local RAM and the Global RAM. Such instructions can not be performed to H-Bus area.

3.3.3 Write-Through Buffer for Global RAM

It is accessible by CPU core through a 64-bit bus. CPU1 (PE1) has a Write-Through Buffer (WT-Buffer or WT-Buf for short). The WT-Buf consists of 2 banks (one for each GRAM bank) and each bank consists of 8 entries x 64bits. The WT-Buf behavior is summarized below according to access type from PE:

Read hit: data are returned from the WT-Buf.

Read miss: data are read from GRAM and they are registered in WT-Buf

Write hit: Both WT-Buf and GRAM are updated

Write miss (no RmW): Both WT-Buf and GRAM are updated

Write miss (with RmW): Read from GRAM first and write the parts to both WT-Buf and GRAM

The data coherency between GRAM and WT-Buffer is always kept because the same data is always written to GRAM and WT-Buffer at the same time. The data coherency between PE and DMA is also kept, as DMA writes to GRAM as well as WT-Buffer at the same time and DMA always reads from GRAM not from WT-Buffer.

The WT-Buffer equips invalidation timer to invalidate the entries automatically. Invalidation timer cycle count can be chosen from 16-cycles/64-cycles/256-cycles. Software invalidation is also possible and one register is provided for this purpose.

The WT-Buffer configuration itself can also be chosen either On or Off. After reset, WT-Buffer is set as On.

(1) List of Write-Through Buffer Control Registers

Table 3.82 Write-Through Buffer Control Register (Base Address: FFFF 7A00$_H$)

Address	Register Name	Function	Access Width	Value after reset
<GRAMC_QOSREG_base> + 4$_H$	GRAMCWTBCONFIG0	GRAMC WTBuf Configuration Register 0	32bit	0000 0001$_H$
<GRAMC_QOSREG_base> + 8$_H$	GRAMCWTBCONFIG1	GRAMC WTBuf Configuration Register 1	32bit	0000 0007$_H$
<GRAMC_QOSREG_base> + C$_H$	GRAMCWTBCONFIG2	GRAMC WTBuf Configuration Register 2	32bit	0000 0000$_H$

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WTbuf Mode
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 3.83 GRAMCWTBCONFIG0 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	WTBufMode	This bit sets whether to enable WT Buf 0: disable WT Buf 1: enable WT Buf

CAUTION

The value of GRAMCWTBCONFIG0.WTBufMode bit may be changed only when all bus masters are not access to Global RAM.

(b) GRAMCWTBCONFIG1 — GRAMC WTBuf Configuration Register 1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	WTBufTmrCmp		WTBufTmrEn
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 3.84 GRAMCWTBCONFIG1 Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2 to 1	WTBufTmrCmp	These bits set WT Buf invalidate timer count number. 00: 16 cycles 01: 32 cycles 10: 64 cycles 11: 256 cycles
0	WTBufTmrEn	This bit sets whether to enable WT Buf invalidation timer. 0: disable WT Buf invalidate timer count down 1: enable WT Buf invalidate timer count down All WT Buf entries are flushed when this bit is set from 1 to 0.

(c) GRAMCWTBCONFIG2 — GRAMC WTBuf Configuration Register 2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	WTBufTmcClr
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R*1

Note 1. The function of this bit is used by read access.

Table 3.85 GRAMCWTBCONFIG2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	WTBufTmcClr	When this register is read, All WT Buf entries are flushed. The read value of this bit is always 0.

3.4 Usage Notes

3.4.1 Synchronization of Store Instruction Completion and Subsequent Instruction Generation

When a control register is updated by a store instruction, there is a time lag after the CPU executes the store instruction and before the control register is actually updated. Therefore, if the updated content of the control register is to be used by the instruction following the store instruction, the appropriate synchronization is required. How to perform synchronization processing is shown below. For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see APPENDIX A. HAZARD RESOLUTION PROCEDURE FOR SYSTEM REGISTERS in the RH850G3M User's Manual: Software.

3.4.1.1 When updated results in the control registers are reflected in the implementation of a subsequent instruction:

[Example 1]

This includes the following case: an interrupt is enabled by implementation of an EI instruction after an interrupt request is cleared by access from the control register in the INTC2 and the peripheral circuits. Proceed as follows in this case.

1. Execute the store instruction to update a control register (ST.W, etc.).
2. Perform a dummy read of the above control register (LD.W etc.).
3. Execute SYNCP.
4. Execute the subsequent instruction (EI).

[Example 2]

Implement the same processing even when the access required after waiting to secure the updating of a given control register (register A) is to another control register (register B). This includes the following cases: the interlinked operation of different peripheral modules and when releasing the interrupt mask in INTC after making peripheral module settings. However, this processing is unnecessary if control registers A and B are in the same group of peripheral IP modules or control registers A and B are both in the CPU's own peripheral modules.

1. Execute the store instruction to update control register A (ST.W, etc.).
2. Perform a dummy read of the above control register (LD.W, etc.).
3. Execute SYNCP.
4. Execute the store instruction to access control register B (ST.W, LD.W, etc.).

The same processing is also required when access to control registers and memory within the scope of protection starts after waiting for the completion of settings for safety functions such as memory protection, ECC checking, and so on.

For details of the peripheral groups, see **Section 1.4, Block Configuration**.

For the procedures to synchronize updating system registers by LDSR instruction and the subsequent instruction execution, see *APPENDIX A. Hazard Resolution Procedure for System Registers* in the *RH850G3M User's Manual: Software*.

3.4.1.2 When the updated results of the control registers or memory to be used in the instruction fetch of the subsequent instruction:

(a) In case of writing the instructions to the RAM before jumping to the RAM to execute instructions from the RAM, take the following procedure.

1. Execute the store instruction to update a memory (ST.W, etc.).
2. Perform a dummy read of the above-mentioned memory (LD.W, etc.).
3. Execute SYNCP
4. Execute SYNCI.
5. Execute the subsequent instruction (branch instruction, etc.).

(b) In case of updating control registers for memory protection and ECC functions before jumping to the memory to be controlled by the registers, take the following procedure.

1. Execute the store instruction to update a control register (ST.W, etc.).
2. Perform a dummy read of the above-mentioned control register (LD.W, etc.).
3. Execute SYNCP.
4. Execute SYNCI.
5. Execute the subsequent instruction (branch instruction, etc.).

3.4.1.3 When switching the code flash memory area:

In this case, see *Section 9, Usage Notes, (7) Update of BFASELR register* in the *RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

3.4.2 Accesses to Registers by Bit-Manipulation Instructions

Writing by using bit-manipulation instructions consists of atomic read-modify-write processing in 8-bit units. Thus, access by a bit-manipulation instruction is only possible for registers for which reading and writing in 8-bit units is possible. If a register includes multiple flag bits, the read-modify-write operation may lead to the clearing of flags that were not actually targets for clearing.

Write access to the FlexRay registers by using bit-manipulation instructions is not atomic. Access by other masters may interrupt the read-modify-write processing of these instructions.

3.4.3 Ensuring Coherency after Code Flash Programming

The CPU has an efficient instruction cache and data buffer for the code flash area.

Therefore, after using self-programming to program the code flash memory, clear the instruction cache and data buffer to ensure coherency. The instruction cache and data buffer can be cleared by using the ICCTRL register and the CDBCR register, respectively.

3.4.4 Overwriting Context when Acknowledging Multiple Exceptions

Acceptance of an exception depends on the type of exception source, regardless of the states of the ID and NP bits in the PSW register. When multiple exceptions are generated, the contents of the system register which hold the context information are overwritten. For the conditions for acceptance and whether correct return or recovery is possible for each exception source, see the List of Exception Sources in the *RH850G3M User's Manual: Software*.

3.4.5 Usage Notes on Prefetching

CPU executes speculative instruction fetching from locations later than the current value of the program counter to maintain the throughput of instruction fetches. Reading from memory due to such prefetching may proceed even from locations to which instruction codes have not been assigned (note 1 in **Figure 3.5**). Please note the following. The CPU does not execute values read in such cases.

These notes apply to instruction fetching from memory in general.

- Occurrence of ECC errors due to values in memory being undefined

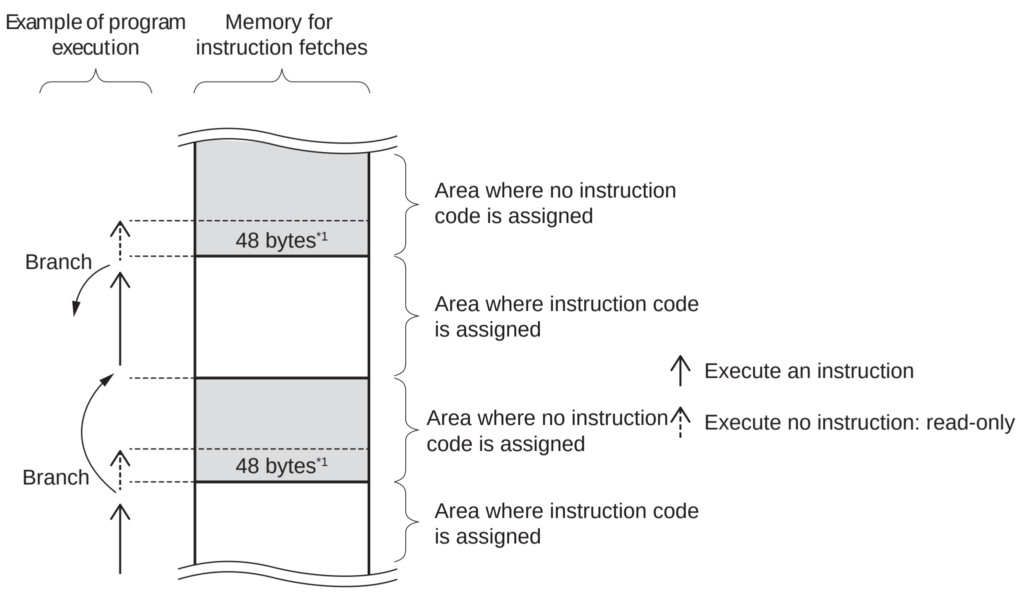
  This prefetching may lead to an ECC error in case of reading from the code flash memory after it has been erased or from the local RAM before initialization. When instruction codes are assigned to memory, initialize said area with values as desired (note 1 in **Figure 3.5**).

- Detection of illegal access by the IPG

  The IPG may detect such prefetching as illegal access. To prevent prefetching being detected as an illegal access, do not allow any region of overlap area with said areas (note 1 in **Figure 3.5**) and areas to which access is prohibited by the IPG. Reading from an area protected by the MPU does not cause a memory protection exception.

- Access to Access Prohibited Area

  Assign instruction codes to memory without allowing any overlap between said area (note 1 in **Figure 3.5**) and an access-prohibited area.



Note 1. Area from final address of instruction code to final address + 48 bytes. Even if instruction codes are not placed in this area, requests for prefetching may lead to reading from memory at the time of branching.

Figure 3.5 Area that Requires Attention Regarding Prefetching

3.4.6 Usage Note when Exception is Acknowledged

SYNCP instruction must be inserted in front of exception handler, depending on the exception sources.

For the details, see the *RH850G3M User's Manual: Software*.

Section 4 Address Space

Table 4.1 shows the address space of the RH850/P1M-E.

CAUTION

When making an access to the on-chip I/O register space, access the addresses shown in this manual. Do not access an address that is reserved or not specified in this manual. Otherwise, operation is not guaranteed.

4.1 Address Space

Table 4.1 Address Space

Address	Address Space Type	Size
0000 0000_H to *1	Code Flash (user area)	1 MB/2 MB
*1 to 00FF $FFFF_H$	Reserved	
0100 0000_H to 0100 $7FFF_H$	Code Flash (extended user area)	32 KB
0100 8000_H to 0100 $9FFF_H$	Reserved	
0100 $A000_H$ to 0100 $BFFF_H$	ECC test area	8 KB
0100 $C000_H$ to 0FFF $FFFF_H$	Reserved	
1000 0000_H to 1FFF $FFFF_H$	On-chip I/O register (H-Bus Area)	256 MB
2000 0000_H to FEBD $FFFF_H$	Reserved	
FEBE 0000_H to FEBF $FFFF_H$	Local RAM (PE1 area)	128 KB
FEC0 0000_H to FEDD $FFFF_H$	Reserved	
FEDE 0000_H to FEDF $FFFF_H$	Local RAM (self)	128 KB
FEE0 0000_H to FEEF $7FFF_H$	Reserved	
FEEF 8000_H to FEEF $FFFF_H$	Global RAM (Bank A)	32 KB
FEF0 0000_H to FEF0 $7FFF_H$	Global RAM (Bank B)	32 KB
FEF0 8000_H to FEFF $FFFF_H$	Reserved	
FF00 0000_H to FFFD $FFFF_H$ (FF20 0000_H to *3)	On-chip I/O register (P-Bus Area) (Data flash)	16 MB – 128 KB (32 KB/64 KB)
FFFE 0000_H to FFFE $DFFF_H$	Reserved	
FFFE $E000_H$ to FFFE $FFFF_H$	On-chip I/O register (LPB Area self*2)	8 KB
FFFF 0000_H to FFFF $4FFF_H$	Reserved	
FFFF 5000_H to FFFF $FFFF_H$	On-chip I/O register (P-Bus Area)	44 KB

Note 1. 1-MB device: 000F $FFFF_H$, 2-MB device: 001F $FFFF_H$

Note 2. The "self" on-chip I/O registers are in an area to which CPU-specific functions (SEG, PEG, IPG, INTC1) are allocated. This area can only be accessed by CPU1 (PE1).

Note 3. 1-MB device: FF20_$7FFF_H$, 2-MB device: FF20_$FFFF_H$

4.2 Address Space Viewed from Each Bus Master

Figure 4.1 shows address spaces viewed from each bus master.

4.2.1 Space in which instructions can be fetched

1. Instructions of PE1 can be fetched from the code flash, the local RAM (self) and the global RAM.
2. The reset vector (RBASE initial value) of PE1:
   - When the startup mat is the user mat, its head address is 0000 0000_H.

4.2.2 Data space accessible by PE1

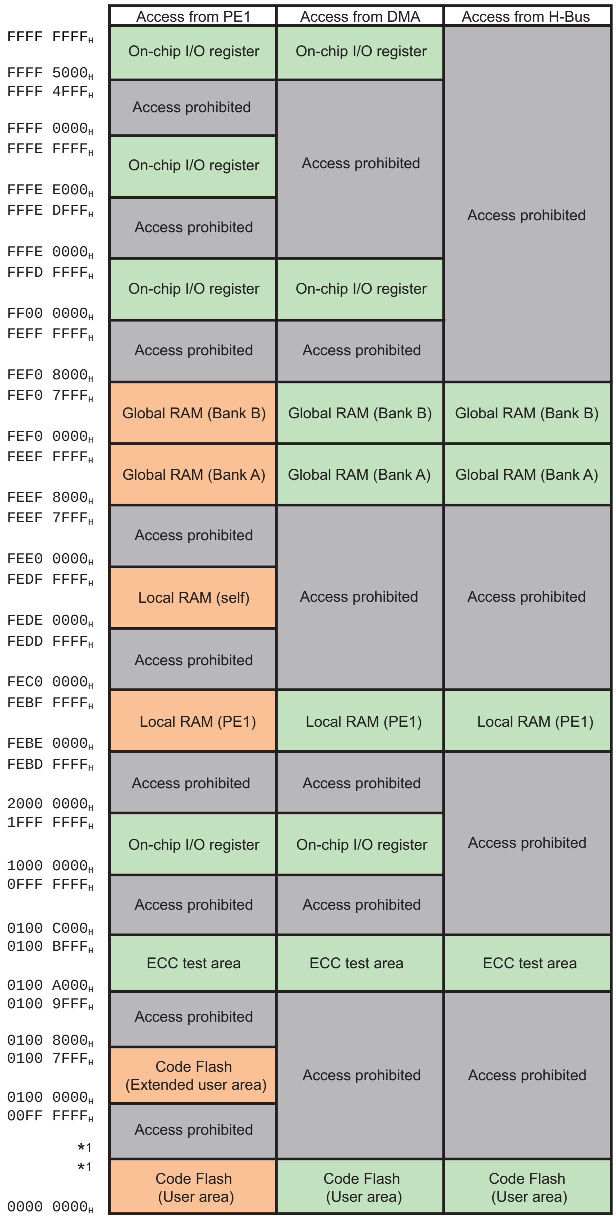
All spaces are accessible.

4.2.3 Data space accessible by DMA (DMAC, DTS)

See **Figure 4.1** for the accessible spaces from the DMA.

4.2.4 Data space accessible by H-Bus master

See **Figure 4.1** for the accessible spaces from the H-Bus.



Note: The following color coding is used in the address space above.

Fetch and data access available
Data access available
Access prohibited

Note 1. The capacity of the code flash differs between products. For details, see **Section 4.1, Address Space**.

Figure 4.1 Address Space Viewed from Each Bus Master

4.3 Guard Function

The following table shows the guard function for each of memory area. In addition to these guard functions, each PE has MPU function in itself.

Table 4.2 Guard function

Memory Area	Access from	Guard function
P-Bus Area	All bus masters	P-Bus Guard (PBG)
LPB Area	Own PE	Internal Peripheral Guard (IPG)
	Other bus masters	PE Guard (PEG)
Local RAM Area	All bus masters (except own PE)	PE Guard (PEG)
H-Bus Area	All bus masters	H-Bus Guard (HBG)
Global RAM Area	All bus masters	GRAM Guard (GRG)

Section 5 Operating Modes

5.1 Features

The device supports 2 operating modes.
Operating modes are selected by the FLMD0 and FLMD1 pins, and decided when pin reset is released.
Table 5.1 shows the list of the operating modes.

Table 5.1 Selection of Operating Modes

Pins		Operating Mode
FLMD0	**FLMD1 (P3_14)**	
0	x	Normal operating mode
1	0	Serial programming mode
Other than above		Settings are prohibited

5.1.1 Normal Operating Mode

This mode is for execution of the user program. The on-chip debug capabilities also use this mode. After release from the reset state, instruction fetch is carried out from the user area. For reset vector of a CPU, see **Section 35, Flash Memory**.

5.1.2 Serial Programming mode

The dedicated flash memory programmer enables erasing/writing to the flash memory. After release from the reset state, this device boots up from the on-chip boot program and starts connection in the specified transmission method. For details, see **Section 35, Flash Memory**.

5.2 External Input Pins

Table 5.2 shows the list of external input pins. Pin levels latched from the FLMD0 and FLMD1 pins are reflected to the mode register (MODE). FLMD1 can be used as GPIO. The level on the FLMD0 pin can be set to prohibit programming and erasure of the code flash memory. When the FLMD0 pin is at the high level, programming and erasure of the flash memory are permitted; when it is at the low level it is prohibited to program or erase the flash memory. For details, see **Section 35, Flash Memory**.

Table 5.2 External Input Pins

Pin Name	I/O	Function
FLMD0	input	Primary operating mode select pin
FLMD1	input	Secondary operating mode select pin

5.3 Register Description

5.3.1 List of Registers

Table 5.3 Register Configuration

Register Name	Description	Access Width	Initial Value	Address
MODE	Mode Register	32	0000 $000X_H$	FFF8 0104_H

Table 5.4 Register Reset Condition

	Reset Condition			
Register Name	Power On Reset	System Reset 1	System Reset 2	Application Reset 1
MODE	—	√*1	—	—

Note 1. Pin reset only

5.3.2 MODE — Mode Register

This register indicates the operating mode of the device.

The pin levels to be latched from FLMD0 and FLMD1 pins when pin reset is released, are reflected.

Access: This register can only be read in 32-bit units.

Address: FFF8 0104_H

Value after reset: 0000 $000X_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	FLMD1	FLMD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 5.5 MODE Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	FLMD1	This bit indicates the level of the latch for the FLMD1 pin 0: Low-level detection 1: High-level detection **Note:** This bit is always read “0” in normal operating mode.
0	FLMD0	This bit indicates the level of the latch for the FLMD0 pin 0: Low-level detection 1: High-level detection

Section 6 Interrupt

The interrupt controller (INTC) determines priority of interrupt sources and controls interrupt requests to the CPU. The INTC has a register to set priority of each interrupt. Interrupt requests are processed according to the priority set in this register by the user.

6.1 Overview

- Interrupt sources
  - One non-maskable interrupt (FENMI): FE level interrupt from ECM
  - One FE level maskable interrupt (FEINT): Pin NMI, OSTM3 to OSTM7
  - 384 EI level maskable interrupts (EIINT)
    32 high-speed interrupts
    - DMAC
    - ECM
    - Window watchdog timer
    352 low-speed interrupts
    - Timer
    - Communication
    - External interrupt
    - A/D interrupts
    - DTS
    - Flash

For details of FENMI, FEINT, and EIINT, refer to *the RH850G3M User's Manual: Software*.

- Sixteen interrupt priority levels can be set for the EI level interrupts.
  Up to 16 priority levels of the EI level interrupts can be set in EI level interrupt control registers.
- Three detection methods
  A method of detecting the pin NMI interrupt and external interrupt can be selected from rising edge, falling edge, and both edges.
- Direct branching method or table referencing method is selectable by setting two types of interrupt handler address setting registers.
- Software interrupts
  Interrupts of desired priority can be generated from the program by setting software interrupt registers.

6.1.1 Reset Sources

Please refer to **Section 8, Reset Controller**.

6.2 Register Specifications

The INTC has registers listed in tables below. These registers are mainly used to set interrupt priority and to control detection of external interrupt input signals.

6.2.1 Register Configuration

Table 6.1 Interrupt Control

Address	Register Symbol	Register Name	R/W	Value after Reset	Access Size
FFFE EA00$_H$ - FFFE EA3E$_H$ (EIC0 to EIC31) FFFF B040$_H$ - FFFF B2FE$_H$ (EIC32 to EIC383)	EICn*[1]	EI level interrupt control register	R/W	008F$_H$*[4] 808F$_H$*[5]	1/8/16
FFFE EAF0$_H$ (IMR0) FFFF B404$_H$ - FFFF B42C$_H$ (IMR1 to IMR11)	IMRn*[2]	EI level interrupt mask register	R/W	FFFF FFFF$_H$	1/8/16/32
FFFE EB00$_H$ - FFFE EB7C$_H$ (EIBD0 to EIBD31) FFFF B880$_H$ - FFFF BDFC$_H$ (EIBD32 to EIBD383)	EIBDn*[3]	EI level interrupt bind register	R/W	0000 0001$_H$	32
FFFE EA78$_H$	FNC	FE level NMI control register	R	0000$_H$	1/8/16
FFFE EA7A$_H$	FIC	FE level interrupt control register	R	0000$_H$	1/8/16
FFD6 7000$_H$	FEINTF	FEINT factor register	R	0000 0000$_H$	32
FFD6 7008$_H$	FEINTFC	FEINT factor clear register	W	0000 0000$_H$	32

Note 1. n = 0 to 383
Note 2. n = 0 to 11
Note 3. n = 0 to 383
Note 4. Synchronous edge detection
Note 5. High-level detection

Among the registers shown in **Table 6.1**, the EIC0 to 31, IMR0, EIBD0 to 31, FNC, and FIC are located in INTC1 of the CPU-specific Peripheral. Each of these registers only can be accessed from the CPU which includes it. Writing is only possible in supervisor mode (PSW.UM = 0).

Of the registers listed in **Table 6.1**, EIC32 to EIC383, IMR1 to IMR11, and EIBD32 to EIBD383 are located in INTC2, the controller for interrupts from peripheral IP group 0. Writing to these registers is only possible for CPU1 in supervisor mode (PSW.UM = 0).

Table 6.2 Software Interrupts

Address	Register Symbol	Register Name	R/W	Value after Reset	Access Size
FFC0 0000_H	SINTR0	Software interrupt register 0	R/W	00_H	8
FFC0 0004_H	SINTR1	Software interrupt register 1	R/W	00_H	8
FFC0 0008_H	SINTR2	Software interrupt register 2	R/W	00_H	8
FFC0 $000C_H$	SINTR3	Software interrupt register 3	R/W	00_H	8
FFC0 0010_H	SINTR4	Software interrupt register 4	R/W	00_H	8

Table 6.3 Interrupt Merge Function

Address	Register Symbol	Register Name	R/W	Value after Reset	Access Size
FFF9 8000_H	PINT0	Peripheral interrupt status register 0	R	0000 0000_H	32
FFF9 8004_H	PINT1	Peripheral interrupt status register 1	R	0000 0000_H	32
FFF9 8008_H	PINT2	Peripheral interrupt status register 2	R	0000 0000_H	32
FFF9 $800C_H$	PINT3	Peripheral interrupt status register 3	R	0000 0000_H	32
FFF9 8010_H	PINT4	Peripheral interrupt status register 4	R	0000 0000_H	32
FFF9 8014_H	PINT5	Peripheral interrupt status register 5	R	0000 0000_H	32
FFF9 8018_H	PINT6	Peripheral interrupt status register 6	R	0000 0000_H	32
FFF9 $801C_H$	PINT7	Peripheral interrupt status register 7	R	0000 0000_H	32
FFF9 8020_H	PINTCLR0	Interrupt clear register 0	W	0000 0000_H	32
FFF9 8024_H	PINTCLR1	Interrupt clear register 1	W	0000 0000_H	32
FFF9 8028_H	PINTCLR2	Interrupt clear register 2	W	0000 0000_H	32
FFF9 $802C_H$	PINTCLR3	Interrupt clear register 3	W	0000 0000_H	32
FFF9 8030_H	PINTCLR4	Interrupt clear register 4	W	0000 0000_H	32
FFF9 8034_H	PINTCLR5	Interrupt clear register 5	W	0000 0000_H	32
FFF9 8038_H	PINTCLR6	Interrupt clear register 6	W	0000 0000_H	32
FFF9 $803C_H$	PINTCLR7	Interrupt clear register 7	W	0000 0000_H	32

6.2.2 EIC0 - EIC383 — EI Level Interrupt Control Registers 0 to 383

These registers are used to set interrupt control conditions for each EI level interrupt source, and one register is provided for each source of this type. Writing to these registers requires care when a register is set for detection in synchronous edge detection mode. If 0 is written to the EIRFn bit immediately after a peripheral module generates the corresponding interrupt request, the request may be inadvertently lost. On the other hand, writing 1 to the EIRFn bit immediately after an interrupt is accepted by the CPU may lead to incorrect re-issuing of the request. Writing to any of these registers, therefore, should only proceed while peripheral modules are not generating interrupt requests and the CPU has not accepted any interrupt.

Writing to an EICn register includes writing by using the bit operation instructions (set1, clr1, and not1). The bit operation instructions proceed in the following sequence (1) reading the register, (2) processing the specified bit, and (3) writing the new value back to the register. When a bit operation instruction has a bit other than EIRFn as the operand, the value read in step (1) will be written back in step (3). Accordingly, the issuance of interrupt requests from peripheral modules or the acceptance of an interrupt request by the CPU between steps (1) and (3) may lead to the problems described above. Note that access to bits 15 to 13, 11 to 8, 5, and 4 using bit-manipulation instructions is prohibited.

Access: EICn can be read/written in 16-bit units.
EICnH and EICnL can be read/written in 8- or 1-bit units.

Address: FFFE EA00$_H$ - FFFE EA3E$_H$ (EIC0-31)
FFFF B040$_H$ - FFFF B2FE$_H$ (EIC32-383)

Value after reset: 008F$_H$ (edge detection), 808F$_H$ (high level detection)
This register is initialized by any reset source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Note 1. 0: Synchronous edge detection, 1: High-level detection

Table 6.4 EIC0 - EIC383 Register Contents (1/2)

Bit Position	Bit Name	Function
15	EICTn	Interrupt Channel Type The following values are read according to the interrupt input interface. This is a read-only bit. 0: Synchronous edge detection 1: High-level detection When writing to this bit, write the value after reset.
14, 13	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
12	EIRFn	Interrupt Request Flag Operation varies with the interrupt input interface. 0: No interrupt request (Value after reset) 1: Interrupt request present • Synchronous edge detection This flag is automatically cleared to 0 when an interrupt request of the self-channel is accepted by the CPU core. This bit can be set or cleared by the software. • High level detection This bit cannot be set or cleared by the software. This is a read-only bit.
11 to 8	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.

Table 6.4 EIC0 - EIC383 Register Contents (2/2)

Bit Position	Bit Name	Function
7	EIMKn	Interrupt Mask While this bit is set to 1, interrupt requests set in the interrupt request flag (EIRFn) are masked to inhibit interrupt requests from the channel to the CPU core. Notification of presence of unprocessed interrupts is not made and the PMEI bit in ICSR is not set from channels for which this bit is set to 1. Even when interrupt processing is disabled by the setting of this bit, an input of interrupt signal is not masked and the interrupt request flag is set. Setting this bit is also reflected in the setting of corresponding bit of the interrupt mask register (IMR). 0: Interrupt processing is enabled. 1: Interrupt processing is disabled. (Value after reset)
6	EITBn	Interrupt Vector Method Select 0: Direct branching method based on priority 1: Table referencing method
5, 4	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
3 to 0	EIP3n-0n	These bits specify 16 interrupt priority levels (0: highest priority, 15: lowest priority). If two or more EI level interrupt requests are generated simultaneously, a source with higher priority specified by these bits is selected and is sent to the CPU core. If the priority specified by these bits is equal, a source of smaller channel number is selected as fixed priority.

Note: n = 0 to 383

NOTE

The addresses of the registers corresponding to the interrupt channels that are listed as reserved in **Table 6.11, Interrupt Exception Handler and Priority**, are also reserved. Therefore, access to these addresses is prohibited. Operation cannot be guaranteed if they are accessed.

6.2.3 IMR0 - IMR11 — EI Level Interrupt Mask Registers 0 to 11

These registers are aggregation of the EIMK bit in the EIC register. Setting of the corresponding EIMK bit is reflected in each bit in the IMRn register. Furthermore, setting of the IMRn register is reflected in the corresponding EIMK bit.

Access: IMRm can be read/written in 32-bit units.
IMRmH and IMRmL can be read/written in 16-bit units.
IMRmHH, IMRmHL, IMRmLH, and IMRmLL can be read/written in 8- or 1-bit units.

Address: IMR0: FFFE EAF0$_H$, IMR1: FFFF B404$_H$, IMR2: FFFF B408$_H$, IMR3: FFFF B40C$_H$,
IMR4: FFFF B410$_H$, IMR5: FFFF B414$_H$, IMR6: FFFF B418$_H$, IMR7: FFFF B41C$_H$,
IMR8: FFFF B420$_H$, IMR9: FFFF B424$_H$, IMR10: FFFF B428$_H$, IMR11: FFFF B42C$_H$

Value after reset: FFFF FFFF$_H$ This register is initialized by any reset.

NOTE

The bits corresponding to the interrupt channels that are listed as reserved in **Table 6.11, Interrupt Exception Handler and Priority**, are also reserved. When read, the value after reset is read. When writing, write the value after reset.

6.2.4 EIBD0 - EIBD383 — EI Level Interrupt Bind Registers 0 to 383

These registers are provided for each EI level interrupt source to make correspondence between each source and PE.

Access: These registers can be read/written in 32-bit units.

Address: FFFE EB00$_H$ - FFFE EB7C$_H$ (EIBD0 to EIBD31)
FFFF B880$_H$ - FFFF BDFC$_H$ (EIBD32 to EIBD383)

Value after reset: 0000 0001$_H$ This register is initialized by any reset.

Table 6.5 EIBD0 - EIBD383 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
17, 16	GPID	These bits are provided only in EIBD32 to EIBD383. Be sure to set these bits to 00 in this product. These bits are reserved for EIBD0 to EIBD31. When read, the value after reset is returned. When writing to these bits, write the value after reset.
15 to 3	Reserved	When read, the value after reset is returned. When writing to these bits, write the value after reset.
2 to 0	PEID	These bits specify an interrupt bind (request) destination. These bits are fixed to 001 in EIBD0 to EIBD31 and cannot be modified. Be sure to set these bits in EIBD32 to EIBD383 to 001 in this product.

NOTE

The addresses of the registers corresponding to the interrupt channels that are listed as reserved in **Table 6.11, Interrupt Exception Handler and Priority**, are also reserved. Therefore, access to these addresses is prohibited. Operation cannot be guaranteed if they are accessed.

CAUTION

Changing the corresponding EIBDn register during the processing of an EIINT request is prohibited.

6.2.5 FNC — FE Level NMI Control Register

This register is used to set FE level NMI control conditions.

Access: FNC can be read in 16-bit units.
FNCH and FNCL can be read in 8- or 1-bit units.

Address: FFFE $EA78_H$

Value after reset: 0000_H (synchronous edge detection), This register is initialized by any reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FNRF	—	—	—	—	—	—	—	—	—	—	—	—

Table 6.6 FNC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FNRF	Interrupt Request Flag 0: No interrupt request (Value after reset) 1: An interrupt request present This bit is automatically cleared to 0 when an FE level NMI interrupt request is accepted by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

6.2.6 FIC — FE Level Interrupt Control Register

This register is used to set FE level interrupt control conditions.

Access: FIC can be read in 16-bit units.
FICH and FICL can be read in 8- or 1-bit units.

Address: FFFE $EA7A_H$

Value after reset: 0000_H (synchronous edge detection), This register is initialized by any reset.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	FIRF	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 6.7 FIC Register Contents

Bit Position	Bit Name	Function
15 to 13	Reserved	When read, the value after reset is returned.
12	FIRF	Interrupt Request Flag 0: No interrupt request (Value after reset) 1: An interrupt request present This bit is automatically cleared to 0 when an FE level interrupt request is accepted by the CPU core.
11 to 0	Reserved	When read, the value after reset is returned.

6.2.7 SINTR0 - SINTR4 — Software Interrupt Registers

SINTR0 to SINTR4 are 8-bit registers to control software interrupts 0 to 4 (SINT0 to SINT4).

Writing 01_H to any of these registers increments the counter value by 1. Writing 00_H to any of the registers decrements the counter value by 1. When the values of these registers are 1 or larger, a software interrupt (SINT0 to SINT4) is generated. The value read from any of these registers is the current value of the register.

Access: These registers can be read/written in 8- or 1-bit units.

Address: SINT0: FFC0 0000_H, SINT1: FFC0 0004_H, SINT2: FFC0 0008_H,
SINT3: FFC0 $000C_H$, SINT4: FFC0 0010_H

Value after reset: 00_H This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	SINTCn7	SINTCn6	SINTCn5	SINTCn4	SINTCn3	SINTCn2	SINTCn1	SINTCn0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 6.8 SINTR0 - SINTR4 Register Contents

Bit Position	Bit Name	Function
7 to 0	SINTCn[7:0]	Software Interrupt Request These bits generate a software interrupt. [Reading operation] The counter value of the SINTn interrupt request count is read. [Writing operation] Writing 01_H: The counter value is incremented.*1 Writing 00_H: The counter value is decremented.*2 Other than the above: Forbidden (No guarantee of operation)

Note 1. When 01_H is written while the value of the counter is FF_H, the value is not incremented, but remains at FF_H.
Note 2. When 00_H is written while the value of the counter is 00_H, the value is not decremented, but remains at 00_H.

6.2.8 PINT0 — PINT7 — Peripheral Interrupt Status Registers PINTCLR0 - PINTCLR7 — Peripheral Interrupt Status Clear Registers

The DTS transfer completion interrupt and transfer count match interrupt are merged in 32-channel units. PINT0 to PINT7 contain the interrupt status flags to indicate the originating channels for these interrupts.

Writing the interrupt status register value to the interrupt status clear register (PINTCLR0 to PINTCLR7) of the same channel in the interrupt handler clears interrupts. Interrupts on the lower-bits side take precedence to support multiplex interrupts.

PINT0 to PINT7 are initialized to 0000 0000_H by any reset source.

Access: PINTn can be read in 32-bit units.
PINTCLRn can be written in 32-bit units.

Address: PINT0: FFF9 8000_H, PINT1: FFF9 8004_H, PINT2: FFF9 8008_H, PINT3: FFF9 $800C_H$
PINT4: FFF9 8010_H, PINT5: FFF9 8014_H, PINT6: FFF9 8018_H, PINT7: FFF9 $801C_H$
PINTCLR0: FFF9 8020_H, PINTCLR1: FFF9 8024_H
PINTCLR2: FFF9 8028_H, PINTCLR3: FFF9 $802C_H$
PINTCLR4: FFF9 8030_H, PINTCLR5: FFF9 8034_H
PINTCLR6: FFF9 8038_H, PINTCLR7: FFF9 $803C_H$

Value after reset: 0000 0000_H

PINT0

Bit Position	Bit Name	Function
31 to 0	INTDTS[31:0]	DTS transfer completion interrupt status on ch31 to ch0

PINT1

Bit Position	Bit Name	Function
31 to 0	INTDTS[63:32]	DTS transfer completion interrupt status on ch63 to ch32

PINT2

Bit Position	Bit Name	Function
31 to 0	INTDTS[95:64]	DTS transfer completion interrupt status on ch95 to ch64

PINT3

Bit Position	Bit Name	Function
31 to 0	INTDTS[127:96]	DTS transfer completion interrupt status on ch127 to ch96

PINT4

Bit Position	Bit Name	Function
31 to 0	INTCTDTS[31:0]	DTS transfer count match interrupt status on ch31 to ch0

PINT5

Bit Position	Bit Name	Function
31 to 0	INTCTDTS [63:32]	DTS transfer count match interrupt status on ch63 to ch32

PINT6

Bit Position	Bit Name	Function
31 to 0	INTCTDTS [95:64]	DTS transfer count match interrupt status on ch95 to ch64

PINT7

Bit Position	Bit Name	Function
31 to 0	INTCTDTS [127:96]	DTS transfer count match interrupt status on ch127 to ch96

PINTCLR0

Bit Position	Bit Name	Function
31 to 0	INTCLR[31:0]	These bits clear the DTS transfer completion interrupt status on ch31 to ch0. Within the interrupt handler, these bits write the value read from PINT0.

PINTCLR1

Bit Position	Bit Name	Function
31 to 0	INTCLR[63:32]	These bits clear the DTS transfer completion interrupt status on ch63 to ch32. Within the interrupt handler, these bits write the value read from PINT1.

PINTCLR2

Bit Position	Bit Name	Function
31 to 0	INTCLR[95:64]	These bits clear the DTS transfer completion interrupt status on ch95 to ch64. Within the interrupt handler, these bits write the value read from PINT2.

PINTCLR3

Bit Position	Bit Name	Function
31 to 0	INTCLR[127:96]	These bits clear the DTS transfer completion interrupt status on ch127 to ch96. Within the interrupt handler, these bits write the value read from PINT3.

PINTCLR4

Bit Position	Bit Name	Function
31 to 0	INTCTCLR[31:0]	These bits clear the DTS transfer count match interrupt status on ch31 to ch0. Within the interrupt handler, these bits write the value read from PINT4.

PINTCLR5

Bit Position	Bit Name	Function
31 to 0	INTCTCLR [63:32]	These bits clear the DTS transfer count match interrupt status on ch63 to ch32. Within the interrupt handler, these bits write the value read from PINT5.

PINTCLR6

Bit Position	Bit Name	Function
31 to 0	INTCTCLR [95:64]	These bits clear the DTS transfer count match interrupt status on ch95 to ch64. Within the interrupt handler, these bits write the value read from PINT6.

PINTCLR7

Bit Position	Bit Name	Function
31 to 0	INTCTCLR [127:96]	These bits clear the DTS transfer count match interrupt status on ch127 to ch96. Within the interrupt handler, these bits write the value read from PINT7.

CAUTIONS

1. **Peripheral Interrupt Status Clear Registers (PINTCLR0 - PINTCLR7) are always read as 0.**
2. **There is some delay between writing the INTCLRn (n=0 to 127) bit or INTCTCLRn (n=0 to 127) bit and clearing the INTDTSn (n=0 to 127) flag or the INTCTDTSn (n=0 to 127) flag. It is recommended to read Peripheral Interrupt Status Registers (PINT0 to PINT7) twice after clearing one of its bits. The second read operation will read the correct status.**

6.2.9 FEINTF — FEINT Factor Register

The FE level interrupt (FEINT) factor register is used in common by the OSTM3 to OSTM7 interrupts and the pin NMI interrupt. When an FE level interrupt occurs, check the interrupt source by referring to this register.

Access: This register can be read in 32-bit units.

Address: FFD6 7000_H

Value after reset: 0000 0000_H This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 6.10 FEINTFC Register Contents

Bit Position	Bit Name	Function
31 to 6	Reserved	When writing, always write 0.
5	OSTM7FEIFC	INTOSTM7FEIF Clear 0: The INTOSTM7FEIF bit is not cleared. 1: The INTOSTM7FEIF bit is cleared.
4	OSTM6FEIFC	INTOSTM6FEIF Clear 0: The INTOSTM6FEIF bit is not cleared. 1: The INTOSTM6FEIF bit is cleared.
3	OSTM5FEIFC	INTOSTM5FEIF Clear 0: The INTOSTM5FEIF bit is not cleared. 1: The INTOSTM5FEIF bit is cleared.
2	OSTM4FEIFC	INTOSTM4FEIF Clear 0: The INTOSTM4FEIF bit is not cleared. 1: The INTOSTM4FEIF bit is cleared.
1	OSTM3FEIFC	INTOSTM3FEIF Clear 0: The INTOSTM3FEIF bit is not cleared. 1: The INTOSTM3FEIF bit is cleared.
0	NMIFEIFC	NMIFEIF Clear 0: The NMIFEIF bit is not cleared. 1: The NMIFEIF bit is cleared.

6.3 Interrupt Sources

There are five groups of interrupt sources: NMI, INTPn, ECM interrupt, software interrupts (SINT), and interrupts from the on-chip peripheral modules. The priority level of each interrupt is represented by an interrupt priority value between 0 (the highest level) and 15 (the lowest level).

6.3.1 NMI Interrupts

NMI interrupts are input from the NMI pin. A method of detecting the NMI interrupt can be selected from rising edge, falling edge, and both edges. For details on the detection method, see **Section 2, Pin Functions**.

6.3.2 INTPn Interrupts

INTPn interrupts are input from INTPn pins. A method of detecting the INTPn interrupt can be selected from rising edge, falling edge, and both edges. For details on the detection method, see **Section 2, Pin Functions**.

Furthermore, interrupt priority levels 0 to 15 can be set for each pin in the interrupt control register (EICm).

When an interrupt request is detected by a change in the INTPn pin, and an interrupt request signal is sent to the INTC. The INTPn interrupt request detection result is retained until the interrupt request is accepted. Whether an INTPn interrupt request has been detected or not can be checked by reading the EIRFn bit in the corresponding EI level interrupt control register n (EICn) for INTPn. Writing 0 clears the INTPn interrupt request detection result.

When exiting the INTPn interrupt exception handler, confirm that the EIRFn bit has been cleared in the corresponding EI level interrupt control register n (EICn) for INTPn to prevent re-acceptance by mistake, and then issue an instruction to return from interrupt.

6.3.3 ECM Interrupts

The Error Control Module (ECM) generates ECM interrupt requests by merging error interrupts from multiple sources. For details, see **Section 32, Error Control Module (ECM)** and **Section 31, Functional Safety**.

6.3.4 Software Interrupts

Software interrupt (SINT) priority can be set within priority levels 0 to 15 for each interrupt source.

6.3.5 On-Chip Peripheral Module Interrupts

For the on-chip peripheral module that generates an interrupt, see **Table 6.11, Interrupt Exception Handler and Priority**.

Since different interrupt vectors are assigned to each source, the interrupt exception handler need not decide sources. Priority can be set within priority levels 0 to 15 for each interrupt source.

6.4 Interrupt Exception Handler and Priority Operations

Table 6.11 lists interrupt sources, source codes, exception handler offset addresses, and interrupt priority.

There are two specifications for exception handler addresses: (1) standard specifications where exception handler addresses are determined by the PSW.EBV bit in the CPU core, RBASE register, and EBASE register and (2) extended specifications where exception handler addresses for interrupts are specified individually for each channel.

In the standard specifications, an offset address is added to the base address (RBASE register /EBASE register) in the CPU core to generate an exception handler address. The following two methods are provided for giving an interrupt offset address. For channels other than the interrupt channel, the specified offset address is given.

- An offset address is determined within a range of +100H to +1F0H according to the priority level (0 to 15) specified for each channel, regardless of interrupt channels (offset address, direct branch, RINT = 0 in **Table 6.11**).
- Every offset address is +100H regardless of the priority level. This is a function to reduce the memory occupation size of the exception handler (offset address, direct branch, RINT = 1 in **Table 6.11**).

In the extended specifications, a table for reading exception handler addresses for each interrupt channel is provided. The handler address is extracted by referencing the table. The table reference position is obtained by the following calculation formula (offset address, table reference in **Table 6.11**). The INTBP register exists in the CPU core.

Exception handler address read position = INTBP + channel number * 4-byte

For details of handler addresses, see *the RH850G3M User's Manual: Software*.

Priority levels 0 to 15 (0: highest) of INTPn (external interrupts) and on-chip peripheral module interrupts can be set for each channel. If specified priority levels are equal, an interrupt source of smaller channel number is selected as fixed priority.

CAUTION

FENMI, FEINT, EIINT (direct vector method), SYSERR, FPI need insertion of SYNCP instruction before the exception handler.

For details, see. the *RH850G3M User's Manual: Software*.

Table 6.11 Interrupt Exception Handler and Priority (1/9)

Functional Module	Interrupt Source Name	Level Interrupt[*1]	Number of Interrupt Channel (EIINT)	Source Code	Offset Address: Direct Branch: RINT = 0	Offset Address: Direct Branch: RINT = 1	Offset Address: Table Reference	Interrupt Priority (Value after reset)	Default Priority	1 MB	2 MB

Note 1. The table indicates whether interrupts from each source are detected by level or edge. If a cell in this column is checked, the interrupt from that source is detected when the signal is at the high level. If it is blank, detection is of the selected edge. For interrupts from sources detected by the signal being at the high level, use software in the interrupt handler to clear the status register in the given module.

Note 2. For a level interrupt, the status register in each module should be cleared during interrupt processing by software.

Note 3. For details of interrupt generation factors, see *the RH850/P1M-E Flash Memory User’s Manual: Hardware Interface*.

6.5 Operation

6.5.1 External Interrupts (NMI / INTP)

The external interrupts INTPm and NMI can be configured to generate an interrupt request upon a rising or falling edge or upon both edges of the external pin.

For the interrupt detection flow, see **Section 6.5.4, Interrupt Processing Flow**.

6.5.2 Software Interrupt

For the operation of software interrupts, see **Section 6.2.7, SINTR0 - SINTR4 — Software Interrupt Registers** and **Section 6.5.4, Interrupt Processing Flow**.

6.5.3 DTS Interrupt Merge Function

Up to 128 transfer end interrupts and up to 128 transfer count match interrupts are aggregated into one interrupt in units of 32 interrupts.

When multiplex interrupts have occurred, bits of only accepted interrupt sources are set to 1 in status registers (PINT0 to PINT7) so that accepted interrupts can be recognized. For the interrupt request flow by merging DTS interrupts, see **Section 6.5.4, Interrupt Processing Flow**.

Table 6.12 DTS Interrupt-related Registers

Interrupt Source	CH	Status Register	Clear Register
DTS transfer end interrupt	0 to 31	PINT0	PINTCLR0
	32 to 63	PINT1	PINTCLR1
	64 to 95	PINT2	PINTCLR2
	96 to 127	PINT3	PINTCLR3
DTS transfer count match interrupt	0 to 31	PINT4	PINTCLR4
	32 to 63	PINT5	PINTCLR5
	64 to 95	PINT6	PINTCLR6
	96 to 127	PINT7	PINTCLR7

6.5.4 Interrupt Processing Flow

6.5.4.1 NMI Processing Flow

Figure 6.1 shows an NMI detection flow.

- Select an NMI detecting method (rising edge, falling edge, and both edges) by setting the FCLA0CTL0 register.
- After an NMI has been detected, an interrupt request is sent to the INTC.
- When the interrupt processing in the INTC has been completed, the INTC enters the NMI detection waiting state again.

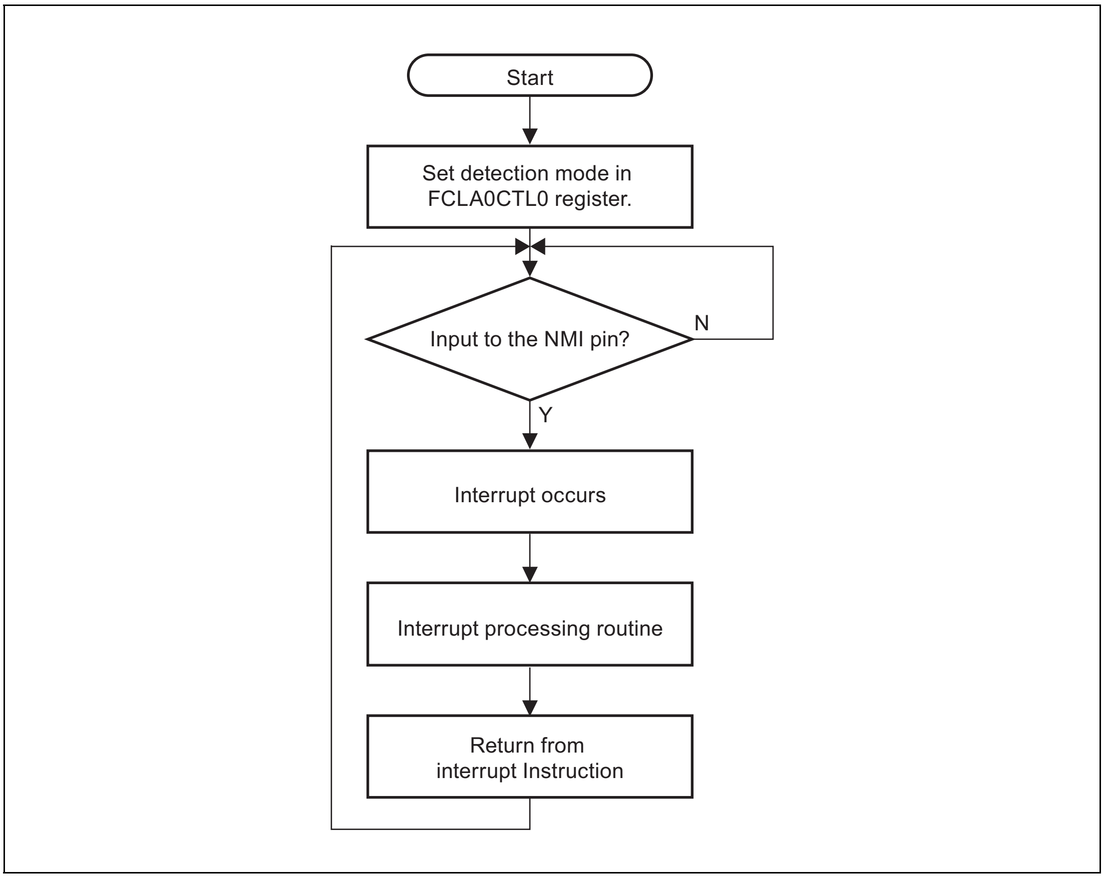

Figure 6.1 NMI Processing Flow

6.5.4.2 External Interrupt Processing Flow

Figure 6.2 shows an INTP (external interrupt) detection flow.

- Select an INTP detecting method (rising edge, falling edge, and both edges) by setting the FCLAnCTLm register.
- After an INTP has been detected, an interrupt request is sent to the INTC.

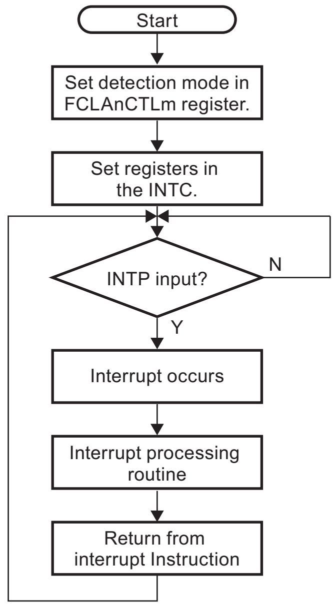

Figure 6.2 External Interrupt Processing Flow

6.5.4.3 Software Interrupt Processing Flow

Figure 6.3 shows the flow of software interrupt requests.

- Software interrupt requests are controlled by writing 00_H or 01_H to the counter bits SINTCn[7:0] in the software interrupt registers (SINTR0 to SINTR4).
- Writing 01_H increments the counter value by 1.
- Writing 00_H decrements the counter value by 1.
- If an incremented counter value is larger than 1, an interrupt request is issued to the INTC.
- On completion of other interrupt processing in the INTC, if SINTRn is 00_H, normal processing resumes.

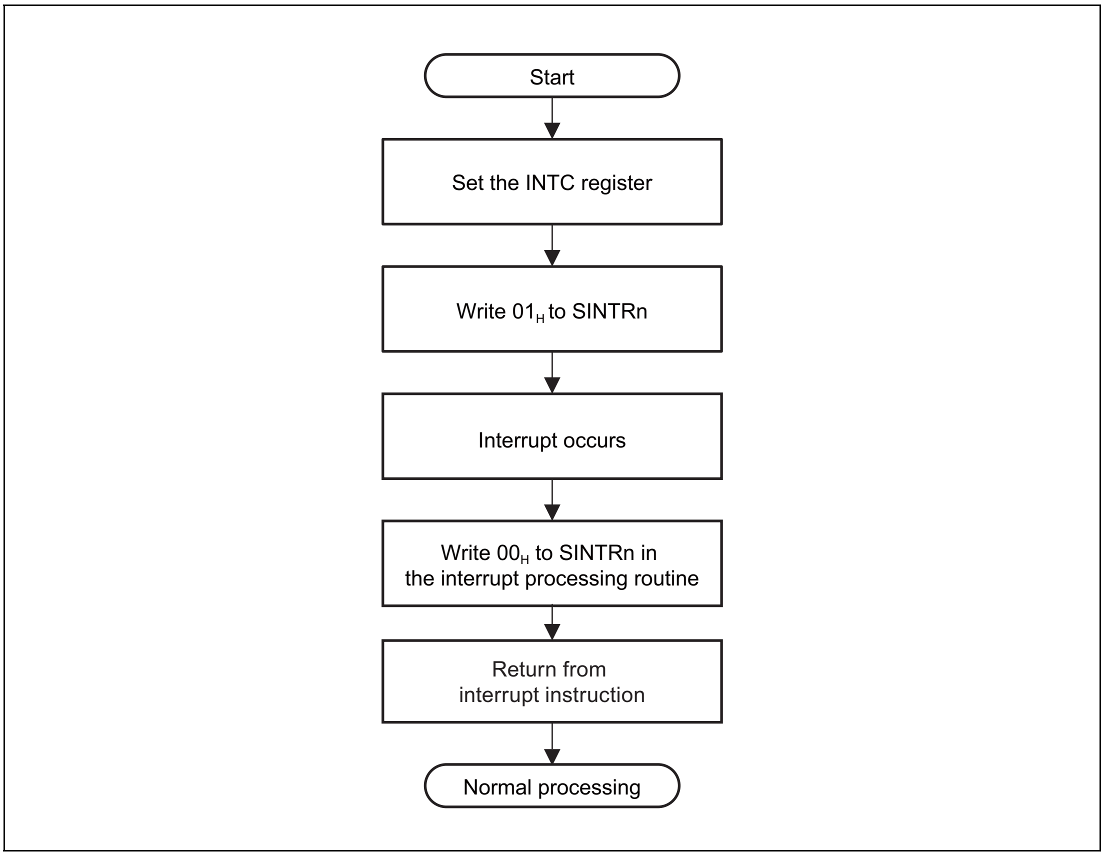

Figure 6.3 Software Interrupt Processing Flow

6.5.4.4 DTS Interrupt Processing Flow

Figure 6.4 shows a DTS interrupt request flow.

- When only one interrupt request is generated out of bundled 32 interrupt sources
  - The bit corresponding to the interrupt request in the PINTn register is set to 1 and an interrupt request is output.
  - On completion of other interrupt processing, write 1 to the interrupt clear register (PINTCLRn) to clear the interrupt request before issuing the return from interrupt instruction, then wait for the next one.
- When multiplex interrupt requests are generated out of bundled 32 interrupt sources
  - The highest-priority bit (interrupts on the lower-bits side take precedence) out of bits with interrupt request is extracted and only the extracted bit in the PINTn register is set to 1, and an interrupt request is output.
  - On completion of other interrupt processing, write 1 to the interrupt clear register (PINTCLRn) to clear the highest-priority interrupt request, then issue the return from interrupt instruction.
  - After the highest-priority interrupt request has been cleared, the second highest-priority interrupt request is accepted. The corresponding bit in the PINTn register is set to 1 in the same way as before, and an interrupt request is output.
  - These steps are repeated until all interrupt sources bundled into 32 bits are cleared.

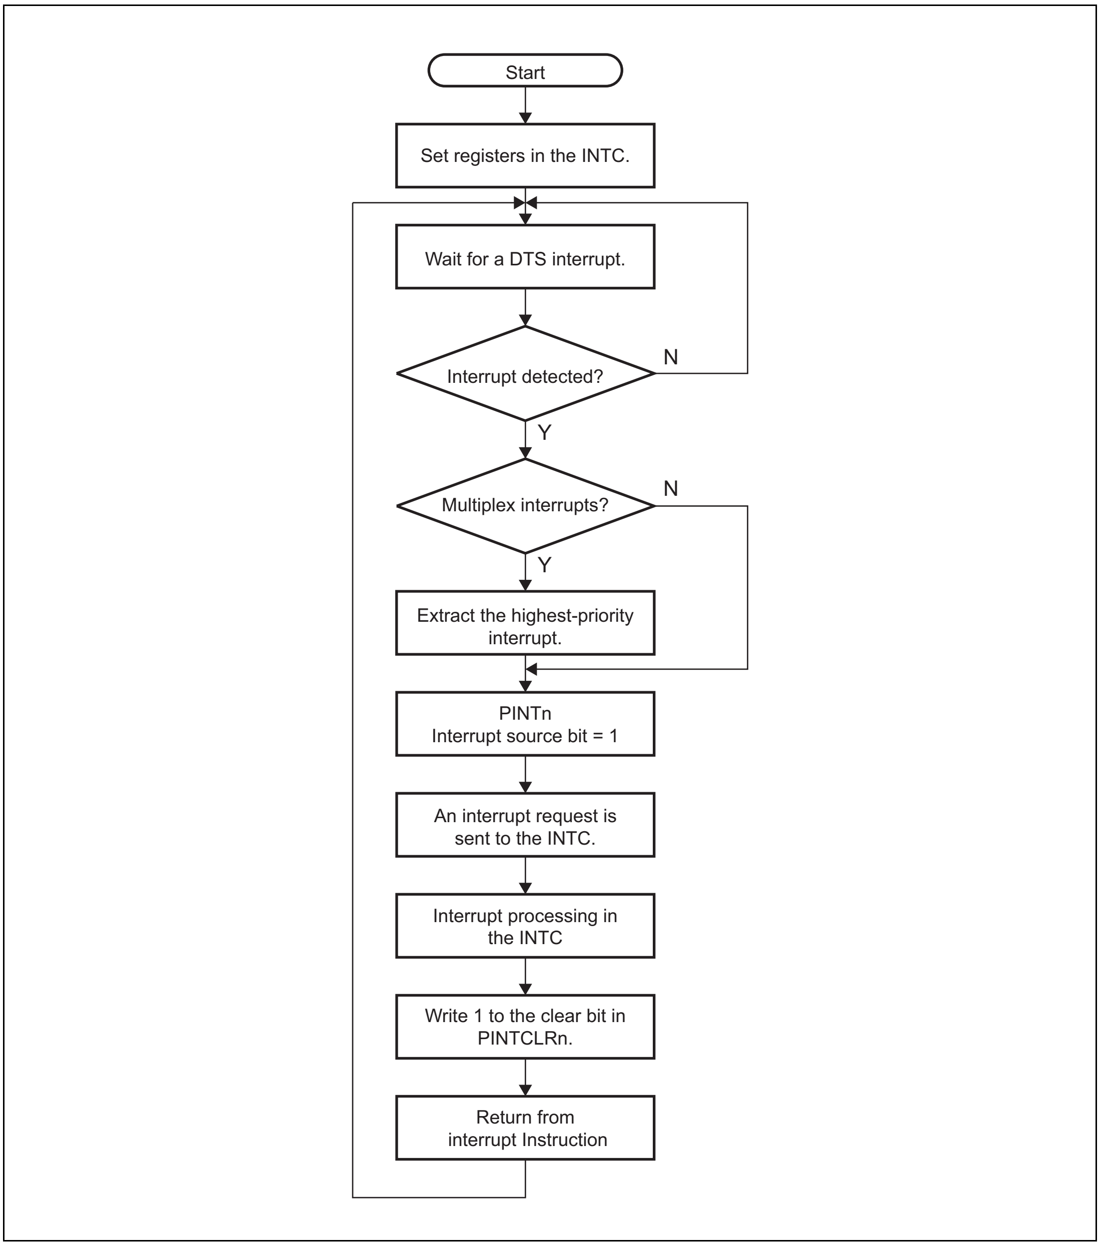

Figure 6.4 DTS Interrupt Processing Flow

6.6 Interrupt latency

The interrupt latency is summarized in **Table 6.13, Interrupt Latency**. The given values describe the response time from the assertion of the interrupt trigger at the INTC module and the instruction fetch of the first instruction inside the interrupt handling routine. The response time is the typical time for the given scenario. However, it is assumed that no other bus master accesses the code flash in case of an instruction cache miss. The unit of the response time is CPU1 clock cycle.

Table 6.13 Interrupt Latency

Instruction cache	Interrupt detection	Exception handler addressing method	Address reference table location	Latency (CPU1)	
				INTC1	INTC2
hit	edge	direct vector	NA	7	12
miss	edge	direct vector	NA	10	15
hit	level	direct vector	NA	6	10
miss	level	direct vector	NA	9	13
hit	edge	table reference	Local RAM	11	16
miss	edge	table reference	Local RAM	14	19
hit	level	table reference	Local RAM	10	14
miss	level	table reference	Local RAM	13	17

6.7 Using Interrupt Request Signals to Initiate Data Transfer

An interrupt request signal activates the DMAC/DTS to perform data transfer. For details, see **Section 7, DMA**.

Section 7 DMA

7.1 Features of RH850/P1M-E DMA

7.1.1 Number of Channels

The products of the RH850/P1M-E series incorporate a DMA with the number of channels indicated below.

Table 7.1 Number of Channels

Product Name		RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of channels	DMA	16ch Redundant	
	DTS	128ch Redundant	

Table 7.2 Indices

Index	Description
n	In this section, the DMA unit are identified with an index “n” (n = 0 to 15), for example, as DMACn.*1
m	In this section, the DTS channels are identified with an index “m” (m = 000 to 127).
k	In this section, the DMA hardware transfer resource are identified with an index “k” (k = 0 to 127).

Note 1. The correspondence between the channel number “n” and the channel is as follows.

Channel Number n	Channel
0	DMAC0 channel 0
1	DMAC0 channel 1
2	DMAC0 channel 2
3	DMAC0 channel 3
4	DMAC0 channel 4
5	DMAC0 channel 5
6	DMAC0 channel 6
7	DMAC0 channel 7
8	DMAC1 channel 0
9	DMAC1 channel 1
10	DMAC1 channel 2
11	DMAC1 channel 3
12	DMAC1 channel 4
13	DMAC1 channel 5
14	DMAC1 channel 6
15	DMAC1 channel 7

7.1.2 Register Base Address

The DMA/DTS base address is indicated in the following table.

The DMA/DTS register address is expressed as an offset of the base address.

Table 7.3 Register Base Address

Base Address Name	Base Address
<DMAC_base>	FFFF 8000_H
<DTS_base>	FFFF 9000_H
<DMATRG_base>	FFF9 9000_H

7.1.3 Interrupt Requests

The DMA/DTS interrupt requests are listed in the following table.

Table 7.4 Interrupt Requests (1/2)

Unit Interrupt Name	Description	Interrupt Number	ECM*1
INTDMA0	DMA00 transfer end/count match	16	—
INTDMA1	DMA01 transfer end/count match	17	—
INTDMA2	DMA02 transfer end/count match	18	—
INTDMA3	DMA03 transfer end/count match	19	—
INTDMA4	DMA04 transfer end/count match	20	—
INTDMA5	DMA05 transfer end/count match	21	—
INTDMA6	DMA06 transfer end/count match	22	—
INTDMA7	DMA07 transfer end/count match	23	—
INTDMA8	DMA08 transfer end/count match	24	—
INTDMA9	DMA09 transfer end/count match	25	—
INTDMA10	DMA10 transfer end/count match	26	—
INTDMA11	DMA11 transfer end/count match	27	—
INTDMA12	DMA12 transfer end/count match	28	—
INTDMA13	DMA13 transfer end/count match	29	—
INTDMA14	DMA14 transfer end/count match	30	—
INTDMA15	DMA15 transfer end/count match	31	—
INTDTSTC0	DTS transfer end interrupt CH0-CH31	244	—
INTDTSTC1	DTS transfer end interrupt CH32-CH63	245	—
INTDTSTC2	DTS transfer end interrupt CH64-CH95	246	—
INTDTSTC3	DTS transfer end interrupt CH96-CH127	247	—
INTDTSCM0	DTS count match interrupt CH0-CH31	248	—
INTDTSCM1	DTS count match interrupt CH32-CH63	249	—
INTDTSCM2	DTS count match interrupt CH64-CH95	250	—

Table 7.4 Interrupt Requests (2/2)

Unit Interrupt Name	Description	Interrupt Number	ECM*1
INTDTSCM3	DTS count match interrupt CH96-CH127	251	—
DMAERR	DMA transfer error	—	○
DMAVIOL	DMA illegal access error	—	○

Note 1. For detail of the error input to ECM, see **Section 32, Error Control Module (ECM)**.

7.1.4 DMA Trigger Source

The table below shows the assignment of trigger sources to DMAC inputs.

The DMA trigger source assignment for each DMAC channel is set in the DTFR register.

Table 7.5 List of DMA Trigger Sources (1/4)

Channel	Interrupt Name	DMA Trigger Source
DMACTRG[0]	INTP9	External interrupt
DMACTRG[1]	INTTAUJ0I0	TAUJ0 CH0 interrupt
DMACTRG[2]	INTTAUJ0I1	TAUJ0 CH1 interrupt
DMACTRG[3]	INTTAUJ0I2	TAUJ0 CH2 interrupt
DMACTRG[4]	INTTAUJ0I3	TAUJ0 CH3 interrupt
DMACTRG[5]	INTTAUJ1I0	TAUJ1 CH0 interrupt
DMACTRG[6]	INTTAUJ1I1	TAUJ1 CH1 interrupt
DMACTRG[7]	INTTAUJ1I2	TAUJ1 CH2 interrupt
DMACTRG[8]	INTTAUJ1I3	TAUJ1 CH3 interrupt
DMACTRG[9]	INTTAUJ2I0	TAUJ2 CH0 interrupt
DMACTRG[10]	INTTAUJ2I1	TAUJ2 CH1 interrupt
DMACTRG[11]	INTTAUJ2I2	TAUJ2 CH2 interrupt
DMACTRG[12]	INTTAUJ2I3	TAUJ2 CH3 interrupt
DMACTRG[13]	INTTAUD0I0	TAUD0 CH0 interrupt if DMACSEL000 = 0 RX FIFO DMA request 0 if DMACSEL000 = 1
DMACTRG[14]	INTTAUD0I1	TAUD0 CH1 interrupt if DMACSEL001 = 0 RX FIFO DMA request 1 if DMACSEL001 = 1
DMACTRG[15]	INTTAUD0I2	TAUD0 CH2 interrupt if DMACSEL002 = 0 RX FIFO DMA request 2 if DMACSEL002 = 1
DMACTRG[16]	INTTAUD0I3	TAUD0 CH3 interrupt if DMACSEL003 = 0 RX FIFO DMA request 3 if DMACSEL003 = 1
DMACTRG[17]	INTTAUD0I4	TAUD0 CH4 interrupt if DMACSEL004 = 0 RX FIFO DMA request 4 if DMACSEL004 = 1
DMACTRG[18]	INTTAUD0I5	TAUD0 CH5 interrupt if DMACSEL005 = 0 RX FIFO DMA request 5 if DMACSEL005 = 1
DMACTRG[19]	INTTAUD0I6	TAUD0 CH6 interrupt if DMACSEL006 = 0 RX FIFO DMA request 6 if DMACSEL006 = 1
DMACTRG[20]	INTTAUD0I7	TAUD0 CH7 interrupt if DMACSEL007 = 0 RX FIFO DMA request 7 if DMACSEL007 = 1
DMACTRG[21]	INTTAUD0I8	TAUD0 CH8 interrupt if DMACSEL008 = 0 COM FIFO DMA request 0 if DMACSEL008 = 1
DMACTRG[22]	INTTAUD0I9	TAUD0 CH9 interrupt if DMACSEL009 = 0 COM FIFO DMA request 1 if DMACSEL009 = 1

Table 7.5 List of DMA Trigger Sources (2/4)

Channel	Interrupt Name	DMA Trigger Source
DMACTRG[23]	INTTAUD0I10	TAUD0 CH10 interrupt if DMACSEL010 = 0 COM FIFO DMA request 2 if DMACSEL010 = 1
DMACTRG[24]	INTTAUD0I11	TAUD0 CH11 interrupt
DMACTRG[25]	INTTAUD0I12	TAUD0 CH12 interrupt
DMACTRG[26]	INTTAUD0I13	TAUD0 CH13 interrupt
DMACTRG[27]	INTTAUD0I14	TAUD0 CH14 interrupt
DMACTRG[28]	INTTAUD0I15	TAUD0 CH15 interrupt

DMACTRG[124]	INTSENT5RI	SETN5 receive interrupt
DMACTRG[125]	Reserved	—
DMACTRG[126]	Reserved	—
DMACTRG[127]	INTDMAFL	Signal for DMA program command*[1]

Note 1. For details, see the *RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

7.1.5 DTS Trigger Source

The table below shows the assignment of trigger sources to DTS inputs. Some of the trigger sources are selected from two sources (primary and secondary). After reset, the primary trigger source is selected. The secondary source is software selectable by writing a configuration register. The request status of selected trigger source is maintained in DTSFSL register.

Table 7.6 List of DTS Trigger Sources (1/4)

Channel	Interrupt Name	DTS Trigger Source
DTSTRG[0]	INTP9	External interrupt
DTSTRG[1]	INTTAUJ0I0	TAUJ0 CH0 interrupt
DTSTRG[2]	INTTAUJ0I1	TAUJ0 CH1 interrupt
DTSTRG[3]	INTTAUJ0I2	TAUJ0 CH2 interrupt
DTSTRG[4]	INTTAUJ0I3	TAUJ0 CH3 interrupt

7.2 Overview

7.2.1 Overview

Direct memory access (DMA) is used to access data without going through the CPU.

DMA consists of two types of DMA transfer modules: DMAC and DTS. A DMAC includes registers for storing transfer information, and a DTS stores transfer information in the dedicated RAM (DTSRAM). DMA has two 8-channel DMAC modules and one 128-channel DTS module.

In this manual, DTFR denotes the function to select among hardware DMA transfer sources for a DMAC and retain the DMA transfer request, and DTSFSL denotes the function to retain a DMA transfer request for each DTS channel. The DTFR can handle 128 types of hardware DMA transfer sources, and the DTSFSL can handle 128 types of them.

The address space that can be used for DMA transfer is a 4 GB address space represented by a 32-bit address. For information about which resource is assigned to a particular area in the 4 GB address space and which area is accessible from DMA, see **Section 4, Address Space**.

7.2.2 Term Definition

Table 7.7 shows the terms used in this section.

Table 7.7 Definition of Terms

Term	Meaning
DMA transfer	A general term for data transfer carried out by DMA.
DMA cycle	A series of actions that consist of reading an amount of data specified by the transfer size (8/16/32/64/128 bits) from the address specified by the source address and writing it to the address specified by the destination address. The first half of the DMA cycle (reading part) is called a read cycle, and the second half (writing part) is called a write cycle.
Hardware DMA transfer source	A trigger for a DMA transfer request given by an internal peripheral circuit.
Hardware DMA transfer request	A DMA transfer request generated by a hardware DMA transfer source
Software DMA transfer request	A DMA transfer request generated by software writing to a register.
DMA transfer request	A trigger to start DMA transfer with a DMAC or DTS.
Transfer information (TI)	The information required for DMA transfer, including the source address, destination address, transfer data size, and transfer count. The transfer information for a DTS is specifically termed as TI.
DTSRAM	RAM used by a DTS to store the transfer information.
Single transfer	DMA transfer consisting of one DMA cycle started by one DMA transfer request.
Block transfer 1	DMA transfer consisting of a number of DMA cycles specified by the transfer count in the transfer information, started by one DMA transfer request.
Block transfer 2	DMA transfer consisting of a number of DMA cycles specified by the address reload count in the transfer information, started by one DMA transfer request.
Block transfer	A general term for both block transfer 1 and block transfer 2.
Last transfer	The DMA cycle carried out when the transfer count in the transfer information is 1.
Address reload transfer	The DMA cycle carried out when the address reload count in the transfer information is 1 if the reload function 2 is used.
Suspension	An action of pausing DMA transfer during block transfer. You can resume DMA transfer after suspension.
Resume	An action of resuming suspended DMA transfer.
Transfer abort	An action of aborting DMA transfer in the middle. You cannot resume DMA transfer after that.

7.3 DMA Function

7.3.1 Basic Operation of DMA Transfer

7.3.1.1 Transfer Mode

DMA has three transfer modes.

Single Transfer

One DMA cycle is executed when a DMA transfer request is accepted.

Block Transfer 1

A number of DMA cycles specified in the transfer count register are executed when a DMA transfer request is accepted.

Block Transfer 2

A number of DMA cycles specified by the address reload count are executed when a DMA transfer request is accepted. If the address reload count is larger than the value in the transfer count register, a number of DMA cycles specified in the transfer count register are executed.

7.3.1.2 Executing a DMA Cycle

DMA always executes a write cycle after a read cycle is complete. For example, if the transfer data size is 128 bits, a write cycle is executed after a read cycle for the 128-bit data is finished. A write cycle never starts in the middle of a read cycle.

7.3.1.3 Updating Transfer Information

When a DMA cycle is executed, DMA updates transfer information as follows.

Source Address and Destination Address

Transfer information will be updated as described in **Table 7.8** according to the settings for the source address and destination address and the settings in the transfer control register such as the count directions of source address and destination address and transfer data size.

Table 7.8 Updating the Source Address and the Destination Address

Direction of Count	Transfer Data Size	Address after Update
Increment	8 bit	(address before update) + 0000_0001_H
	16 bit	(address before update) + 0000_0002_H
	32 bit	(address before update) + 0000_0004_H
	64 bit	(address before update) + 0000_0008_H
	128 bit	(address before update) + 0000_0010_H
Decrement	8 bit	(address before update) – 0000_0001_H
	16 bit	(address before update) – 0000_0002_H
	32 bit	(address before update) – 0000_0004_H
	64 bit	(address before update) – 0000_0008_H
	128 bit	(address before update) – 0000_0010_H
Fixed	—	Same as the address before update.

When you use the reload function, a special update rule is applied other than the one described in **Table 7.8** is applied for the last transfer and the address reload transfer. For details, see **7.3.3, Reload Function**.

Transfer Count/Address Reload Count

The transfer count is decremented by one for every DMA cycle.

The address reload count is decremented by one for every DMA cycle when the reload function 2 or block transfer 2 is used. When the reload function 2 or block transfer 2 is not used, it is not updated.

When you use the reload function, a special update rule is applied for the last transfer and the address reload transfer. For details, see **7.3.3, Reload Function**.

Other Transfer Information

Other transfer information is not updated during execution of a DMA cycle.

7.3.1.4 Last Transfer and Address Reload Transfer

The last transfer means a DMA cycle executed when the value in the transfer count register, which shows the remaining number of transfers, is one. The last transfer differs in operation compared to other DMA cycles as follows.

- The transfer completion flag (DCSTn.TC) is set when the last transfer is complete. (Only applicable for a DMAC)
- The channel operation enable (DCENn.DTE) bit is cleared when the last transfer is complete. (Only applicable for a DMAC. When the continuous transfer is disabled.)
- When the transfer completion interrupt output enable is set, a transfer completion interrupt is output when the last transfer is complete.
- When the reload function 1 is enabled, the reload function 1 is executed at the timing of the last transfer. For details, see **7.3.3, Reload Function**.

The address reload transfer means a DMA cycle executed when the reload function 2 is enabled and the address reload count is one. The reload function 2 is executed during the address reload transfer. For details, see **7.3.3, Reload Function**.

7.3.1.5 Transfer Completion Interrupt and Transfer Count Match Interrupt Outputs

DMA can output a transfer completion interrupt and a transfer count match interrupt.

Transfer Completion Interrupt Output

When the transfer completion interrupt output enable (DTCTn.TCE) is set in the transfer control register, a DMAC requests a DMAC transfer completion interrupt when the last transfer is complete.

When the transfer completion interrupt output enable (DTTCTm.TCE) is set in the transfer control register, a DTS requests a DTS transfer completion interrupt when the last transfer is complete.

Transfer Count Match Interrupt Output

When the transfer count match interrupt enable (DTCTn.CCE) is set in the transfer control register, a DMAC requests a DMAC transfer count match interrupt when the DMA cycle in which the transfer count compare register and the transfer count have the same value is complete.

When the transfer count match interrupt enable (DTTCTm.CCE) is set in the transfer control register, a DTS requests a DTS transfer count match interrupt at the completion of the DMA cycle in which the transfer count compare register and the transfer count have the same value.

Figure 7.1 shows the operation of the transfer completion interrupt and the transfer count match interrupt.

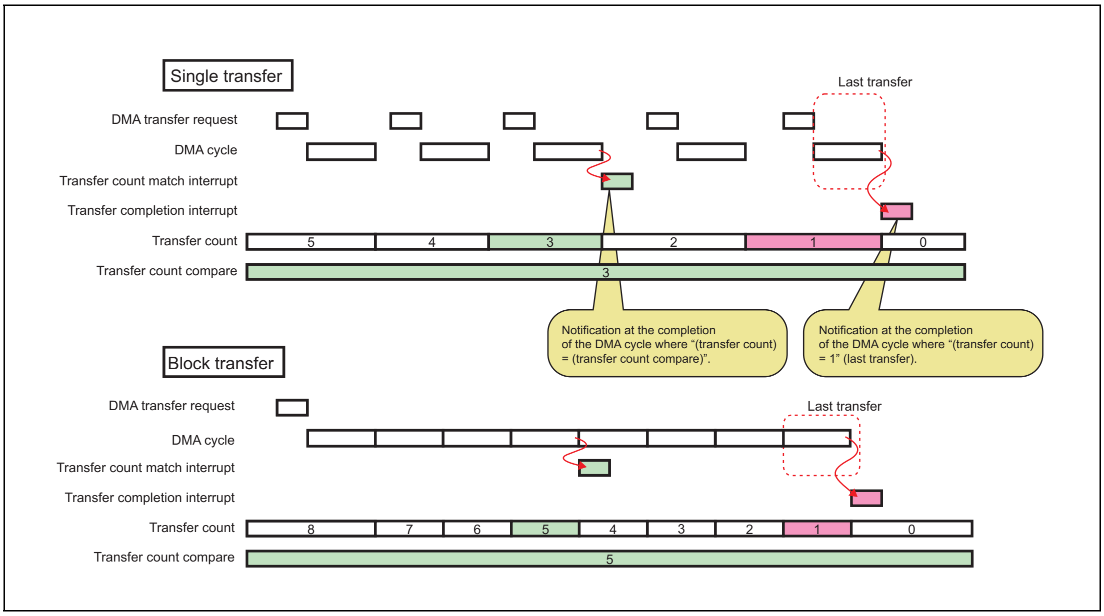

Figure 7.1 Transfer Completion Interrupt and Transfer Count Match Interrupt

7.3.1.6 Continuous Transfer

If the continuous transfer is not used, a DMAC sets the transfer completion flag (DCSTn.TC) and clears the channel operation enable (DCENn.DTE) bit when the last transfer is complete. In this case, a DMA transfer request is not accepted when the request is generated after the completion of the last transfer.

If the continuous transfer is used, the channel operation enable (DCENn.DTE) bit is not cleared when the last transfer is complete, and a DMA transfer request can be accepted even when the transfer completion flag is set. If DMA is used for a case where a specified number of DMA transfers are executed repetitively, software overhead associated with clearing the transfer completion flag and setting the channel operation enable bit after the completion of the last transfer can be reduced by using the continuous transfer.

The continuous transfer is enabled by setting the continuous transfer enable (DTCTn.MLE) in the DMAC transfer control register.

The continuous transfer is designed to work with the reload function 1. The continuous transfer function itself does not update the source address register, destination address register, and transfer count register. If, after the last transfer is complete, you want to restore the source address register, destination address register, and transfer count register to the state before the DMA transfer starts, set the values of source address register, destination address register, and transfer count register before the DMA transfer starts to the reload source address register, reload destination address register, and reload transfer count register respectively, and use reload function 1.

A DTS does not have a setting corresponding to the continuous transfer enable (DTCTn.MLE) for a DMAC. This is because a DTS does not have bits like the transfer completion flag (DCSTn.TC) and the channel operation enable (DCENn.DTE) a DMAC has.

A DTS does not start DMA transfer when a DMA transfer request is generated while the transfer count is 0. (This corresponds to the case for a DMAC where the continuous transfer is not used.)

If the reload function 1 is used for a DTS and the value other than 0 is reloaded to the transfer count when the last transfer is complete, DMA transfer can start when the next DMA transfer request is accepted. (This corresponds to the case for a DMAC where the continuous transfer is used.)

Figure 7.2 shows an operation of continuous transfer by a DMAC.

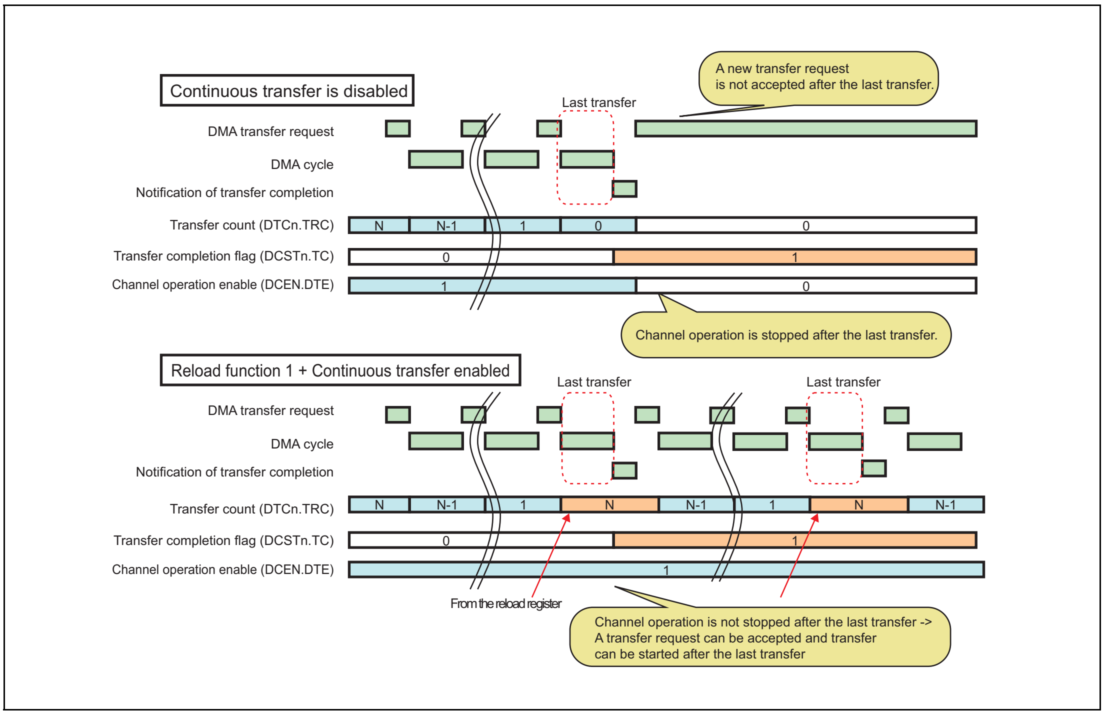

Figure 7.2 Operation of Continuous Transfer by a DMAC

7.3.2 Channel Priority Order

This subsection explains arbitration between multiple DMA channels.

7.3.2.1 DMAC Channel Arbitration

A DMAC select one channel out of eight channels with arbitration.

Arbitration is done according to the fixed priority order. The priority order is “channel 0 > channel 1 > channel 2 > channel 3 > channel 4 > channel 5 > channel 6 > channel 7” for DMAC0, and “channel 8 > channel 9 > channel 10 > channel 11 > channel 12 > channel 13 > channel 14 > channel 15” for DMAC1.

Arbitration is done for every DMA cycle. No arbitration occurs between the read and write of a DMA cycle.

If, at the timing when one DMA cycle in the middle of a block transfer of a channel is complete, there is a DMA transfer request from a channel with a higher priority than the channel, a DMA cycle of the channel with the higher priority will be executed next as the result of arbitration.

If a DMAC executes the block transfer 1 or block transfer 2, DMAC channel arbitration is done for every DMA cycle, and possibly a DMA cycle of another DMAC channel with a higher priority can cut in.

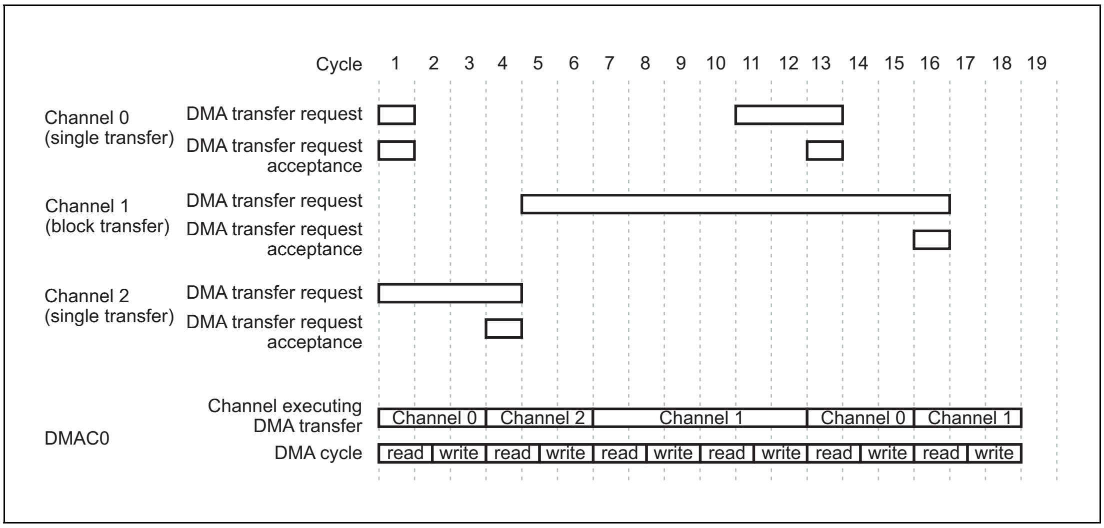

Figure 7.3 DMAC Channel Arbitration

Cycle numbers shown in **Figure 7.3** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.3**, DMA transfer requests for channels 0 and 2 are generated at Cycle 1. As a result of arbitration, a DMA cycle for channel 0 starts because its priority is higher. At Cycle 4, a DMA cycle for channel 2 starts. At Cycle 5, a DMA transfer request for channel 1 is generated. The DMA cycle for channel 2 is still ongoing and no arbitration is done at this point. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done at this point. At Cycle 12, the DMA cycle for channel 1 is complete. At Cycle 13, a DMA cycle for channel 0 starts as a result of arbitration between DMA channels 0 and 1.

It should be noted that, even though a block transfer of channel 1 has been already started, a DMA cycle of not channel 1 but channel 0 is executed at Cycle 13 because the priority of the latter is higher. At Cycle 15, the DMA cycle for channel 0 is complete. At Cycle 16, a DMA cycle for channel 1 starts again. At Cycle 18, the last DMA cycle of the block transfer of channel 1 is complete.

7.3.2.2 DTS Channel Arbitration

If there are DMA transfer requests from multiple DTS channels, the DTSFSL arbitrates those DTS channels. For each DTS channel, a priority can be selected from four levels using DTS channel priority setting registers.

If there are DMA transfer request from multiple DTS channels, the arbitration is done as follows.

1. A channel with a higher priority level in the setting of DTS channel priority setting registers has a priority.
2. If two channels have the same priority level in the setting of DTS channel priority setting registers, a channel with a lower channel number has a priority.

The DTSFSL sends the DTS a DMA transfer request for the channel selected by arbitration. The DTS executes DMA transfer when it accepts the DMA transfer request.

Unlike DMA transfer with a DMAC, DMA transfer with a DTS does not allow arbitration between DTS channels in the middle of a block transfer. That means, even if a DMA transfer request with a higher priority comes during a block transfer for a channel with a lower priority, the DMA transfer with a higher priority does not start until the current block transfer for the channel with a lower priority is complete*1.

Note 1. Block transfer is complete when the last transfer for the block transfer 1 or the last transfer or address reload transfer for the block transfer 2 occurs.

When a DTS executes the block transfer 1 or block transfer 2, a DMA cycle of a DTS channel with a higher priority does not take over the ongoing block transfer until the last transfer.

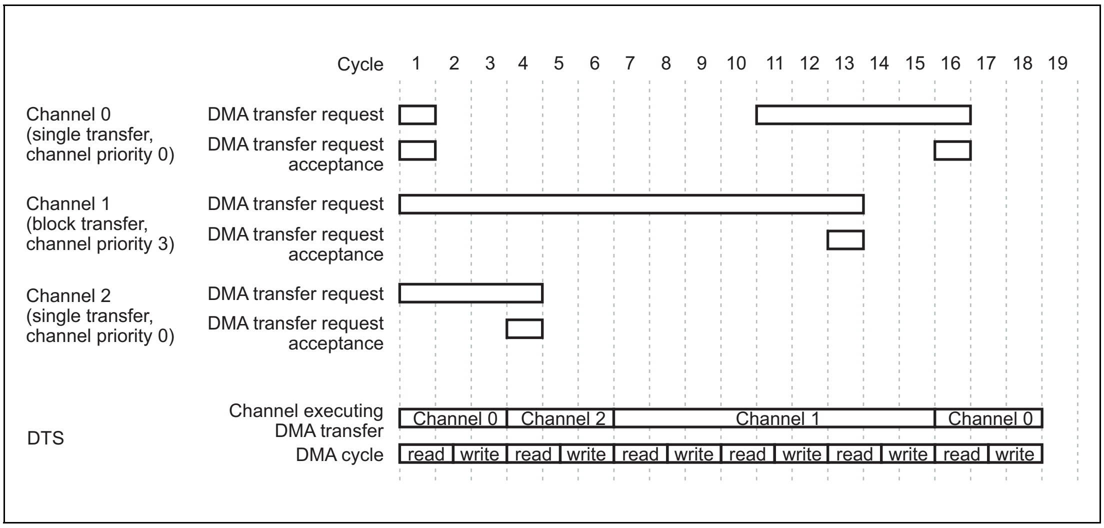

Figure 7.4 DTS Channel Arbitration

Cycle numbers shown in **Figure 7.4** are for explanation purpose only. They do not indicate an actual number of cycles necessary for executing DMA transfer.

In **Figure 7.4**, DMA transfer requests for channels 0, 1 and 2 are generated at Cycle 1. The channel priority for channels 0 and 2 is 0 and is higher than the channel priority for channel 1, which is 3. In addition, if two channels have the same priority, the channel with the smaller channel number has a higher priority. Consequently, the priority order for arbitration is "channel 0 > channel 2 > channel 1", and a DMA cycle for channel 0 starts because its priority is the highest. At Cycle 4, as a result of arbitration between channels 1 and 2, a DMA cycle for channel 2 starts. At Cycle 7, a DMA cycle for channel 1 starts. Channel 1 uses block transfer. Another DMA cycle continues at Cycle 10 because there are no DMA transfer requests from other channels. At Cycle 11, a DMA transfer request for channel 0 is generated. The DMA cycle for channel 1 is still ongoing and no arbitration is done until the block transfer of channel 1 is complete.

At Cycle 15, the block transfer of channel 1 is complete. At Cycle 16, a DMA cycle for channel 0 starts.

7.3.2.3 Interface Arbitration

The interface between the DMA and the System Interconnect is shown in **Figure 7.5**. DMAC0, DMAC1 and DTS operate independently and they can request bus transfers via the interface arbiter to the system interconnect. As the system interconnect performs non-blocking data transfers, multiple DMA transfers can be active coincidentally.

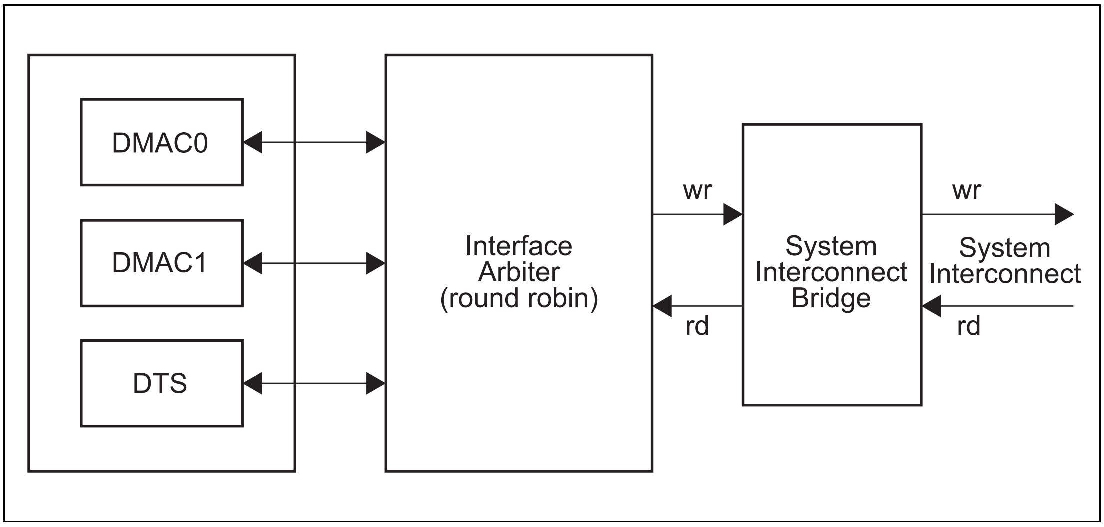

Figure 7.5 Interface Arbitration

Read and write busses are separated and they operate independently. In case of conflicts, the arbitration is done in round robin. Issuing a read or write request takes one DMA clock cycle. While the issuer waits for the response, another active unit may issue its request in the subsequent clock cycle. Note that one DMA clock cycle may take two CPU cycles.

7.3.3 Reload Function

7.3.3.1 Overview of the Reload Function

The reload function updates a portion of transfer information, more specifically, the source address, destination address, transfer count, and address reload count, to the predefined values during DMA transfer.

The reload function has two types of functions: reload function 1 and reload function 2.

7.3.3.2 Operation of Reload Function 1

When the reload function 1 is enabled, actions described in **Table 7.9** are executed at the timing of the last transfer according to the reload function 1 setting.

Table 7.9 Operation of Reload Function 1

Reload Function 1 Setting (DTCTn.RLD1M[1:0])	Register	Action at the Last Transfer
00 (Reload function 1 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Transfer count	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 1 enabled. Reloading source address and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
10 (Reload function 1 enabled. Reloading destination address and transfer count.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded. • If the reload function 2 is enabled: The reload address reload count is copied to this.
11 (Reload function 1 enabled. Reloading source address, destination address, and transfer count.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Transfer count	The reload transfer count is copied to this.
	Address reload count	• If the reload function 2 is disable: Not reloaded • If the reload function 2 is enabled: The reload address reload count is copied to this.

Figure 7.6 shows an operation of the reload function 1.

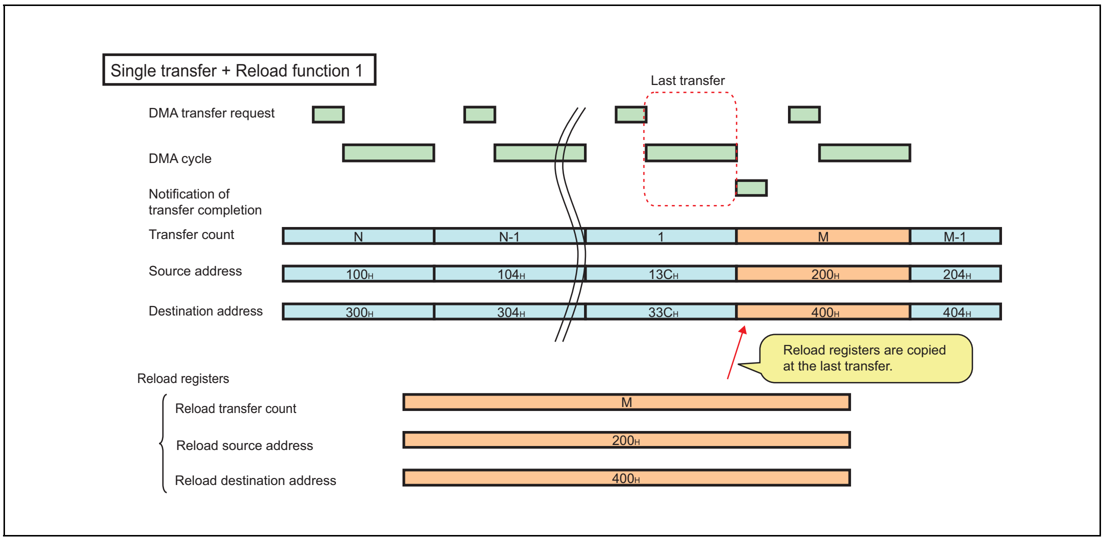

Figure 7.6 Operation of Reload Function 1

7.3.3.3 Reload Function 2

When the reload function 2 is enabled, actions described in **Table 7.10** are executed at the timing of the address reload transfer according to the reload function 2 setting.

Table 7.10 Operation of Reload Function 2

Reload Function 2 Setting (DTCTn.RLD2M[1:0])	Register	Action at the Address Reload Transfer
00 (Reload function 2 disabled.)	Source address	Not reloaded.
	Destination address	Not reloaded.
	Address reload count	Not reloaded.
01 (Reload function 2 enabled. Reloading source address.)	Source address	The reload source address is copied to this.
	Destination address	Not reloaded.
	Address reload count	The reload address reload count is copied to this.
10 (Reload function 2 enabled. Reloading destination address.)	Source address	Not reloaded.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.
11 (Reload function 2 enabled. Reloading source address and destination address.)	Source address	The reload source address is copied to this.
	Destination address	The reload destination address is copied to this.
	Address reload count	The reload address reload count is copied to this.

Figure 7.7 shows an operation of the reload function 2.

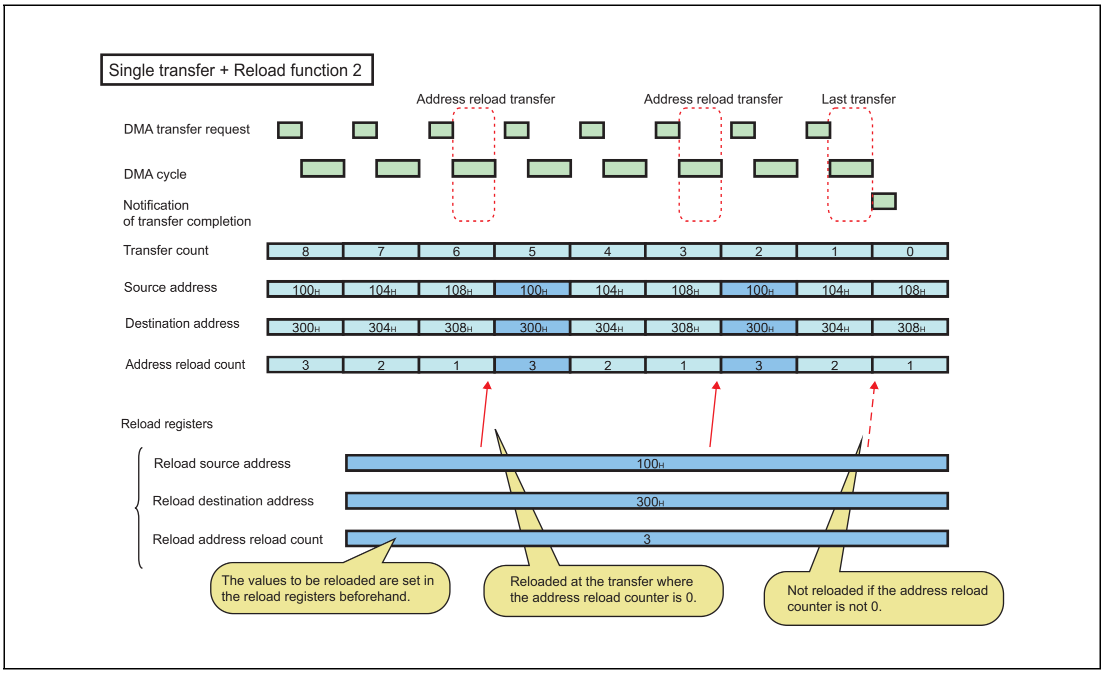

Figure 7.7 Operation of Reload Function 2

Figure 7.8 shows an operation when both the reload function 1 and the reload function 2 are used simultaneously.

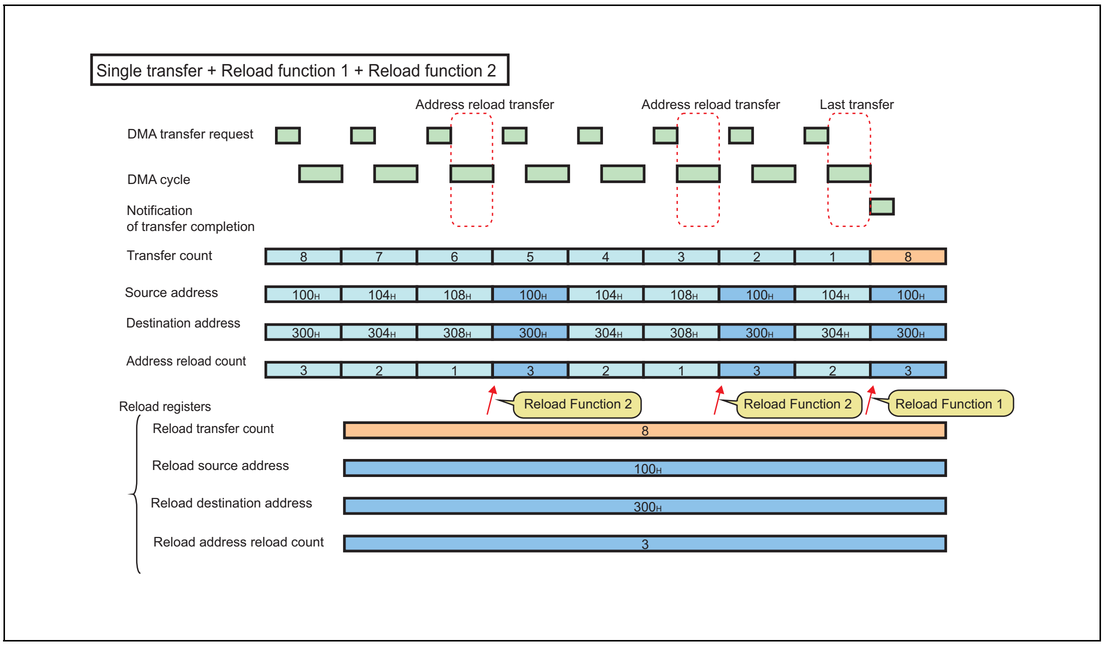

Figure 7.8 Operation when Combining the Reload Function 1 and the Reload Function 2

7.3.3.4 Timing of Setting DMAC Reload Registers

You can set up the reload source address register, reload destination address register, and reload transfer count register any time (even during DMA transfer). As an exception, if you update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, there may be a conflict between reloading at the last transfer or address reload transfer and updating the reload register. In order to avoid this conflict, setting up reload registers must be completed before the last transfer or address reload transfer starts.

If you need to update the reload source address register, reload destination address register, and reload transfer count register during DMA transfer, one way to know the right timing of update is to use a DMA transfer count match interrupt. In this case, you must set up the DMA transfer count compare register (DTCCn) so that you can have enough margin for the time necessary to update the reload registers.

7.3.3.5 Timing of Setting DTS Reload Registers

It should be noted that the right timing of setting up the reload source address information, reload destination address information, and reload transfer count information differs depending on the transfer mode.

In the single transfer mode, the TI fetched at the beginning of the last transfer or address reload transfer is used for reload at the completion of the DMA cycle. Therefore, if you use the reload function for single transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the last transfer or address reload transfer.

During block transfer, TI is fetched only at the beginning of DMA transfer. The TI fetched at the beginning of the DMA transfer is used for reload at the last transfer or address reload transfer. Therefore, if you use the reload function for block transfer, the reload source address information, reload destination address information, and reload transfer count information in the TI must be set up before the beginning of the DMA transfer. If you update the reload source address information, reload destination address information, and reload transfer count information in the TI in the middle of a block transfer, those new settings will not be used for reload at the completion of the block transfer.

7.3.4 Chain Function

7.3.4.1 Overview

DMA offers a function called chain function. If you use the chain function, the completion of the DMA cycle or last transfer for one channel can trigger a DMA transfer request for another channel.

A DMA transfer request for another channel initiated by the chain function is called a chain request.

You can select the condition for generating a chain request from the following two options.

- Always chain: A chain request is generated at the completion of every DMA cycle.
- Chain at the last transfer: A chain request is generated at the completion of the last transfer.

Figure 7.9 shows an operation of the case "always chain".

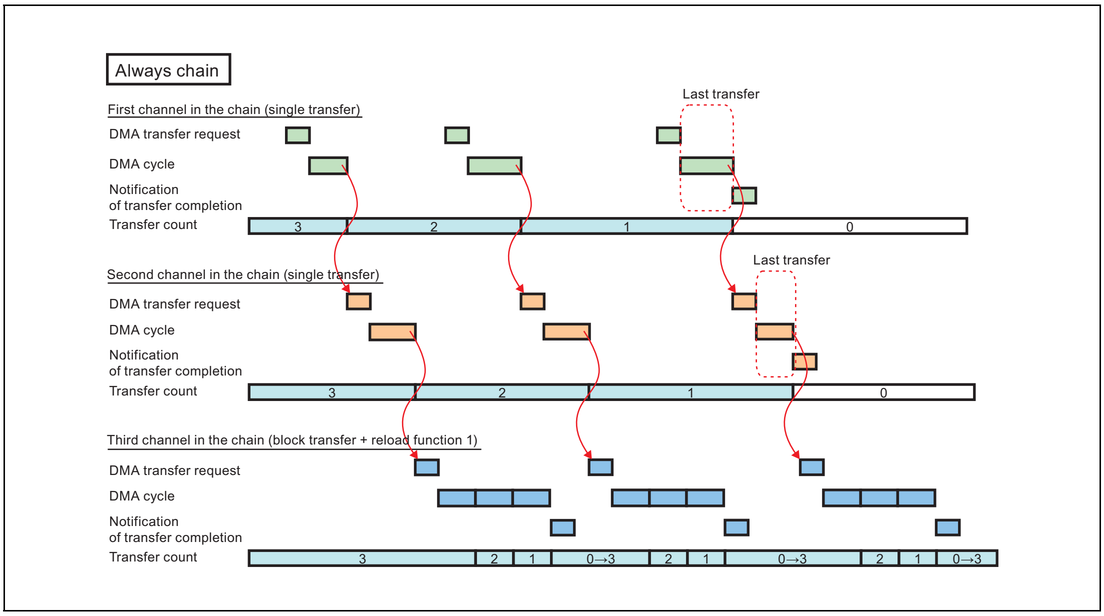

Figure 7.9 Operation of the Case "Always Chain"

Figure 7.10 shows an operation of the case "chain at the last transfer".

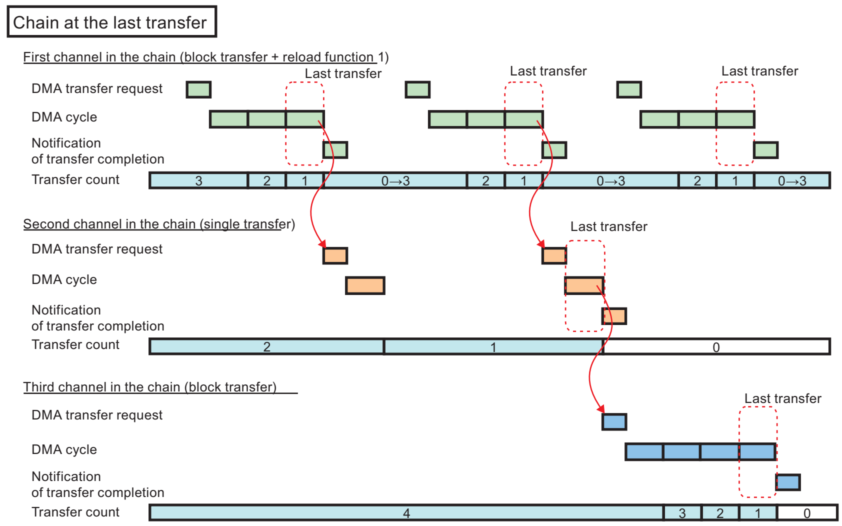

Figure 7.10 Operation of the Case "Chain at the Last Transfer"

7.3.4.2 Setting Up the Chain Function

For a DMAC, you need to write to the chain enable (DTCTn.CHNE) and the next channel in the chain selection (DTCTn.CHNSEL) in the DMAC transfer control register in order to set up the type of chain function and the next channel number in the chain.

For a DTS, you need to write to the chain enable (DTTCTm.CHNE) and the next channel in the chain selection (DTTCTm.CHNSEL) in the DTS transfer control register in order to set up the type of chain function and the next channel number in the chain.

7.3.4.3 Caution for Using the Chain Function

The chain function sets the software DMA transfer request flag of the next channel in the chain as a part of its function. Therefore, you need to set up the channel settings of the next channel in the chain in the same way as when the software DMA transfer request is used. If you specify a channel that is set up to use the hardware DMA transfer request for the next channel in the chain, the chain function does not work.

A channel and its next channel in the chain must belong to the same module (DMAC0, DMAC1, and DTS). You cannot specify a channel in another module for its next channel in the chain.

7.3.5 DMAC Operation

7.3.5.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DMAC starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request. The DMA transfer request selection assignment (DRS) bit in the DMAC transfer control register (DTCTn) determines whether a hardware DMA transfer request or a software DMA transfer request is used.

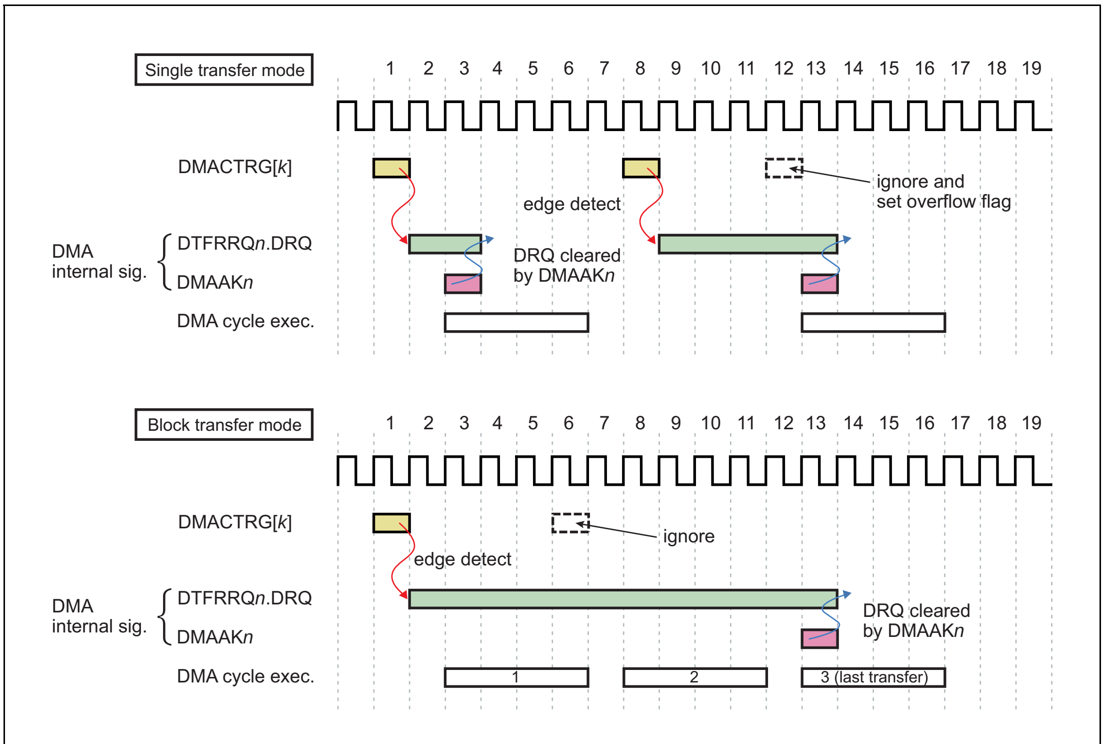
In the case of a hardware DMA transfer request for a DMAC, one out of 128 hardware DMA transfer sources is selected and assigned for each channel of the DMAC in the DTFR. This assignment is configured in the DTFR setting registers.

7.3.5.2 Generating and Accepting a Hardware DMA Transfer Request

DMAC can handle an edge-detection type of hardware DMA transfer source.

(1) Edge-detection type

In case of using edge-detection type, DTFR detects a rising edge of hardware DMA transfer source input and keeps it as a hardware DMA transfer request. DTFR also notifies DMAC of the existence of hardware DMA transfer request. When DTFR receives acknowledgement of hardware DMA transfer request from DMAC, DTFR clears hardware DMA transfer request.



k = 0 to 127 (Hardware transfer source)
n = 0 to 15 (DMAC channel)

Figure 7.11 Operation of Hardware DMA Transfer Request by DMAC (Edge-detection Type)

In case of edge-detection type, DTFR can keep one hardware DMA transfer request per channel. If DTFR keeps a hardware DMA transfer request for a channel and additional rising edge of hardware

DMA transfer source is inputted for the same channel, DTFR set the hardware DMA transfer request overflow flag of corresponding channel.

(2) The Timing of Hardware DMA Transfer Acknowledgement Notification

CAUTION

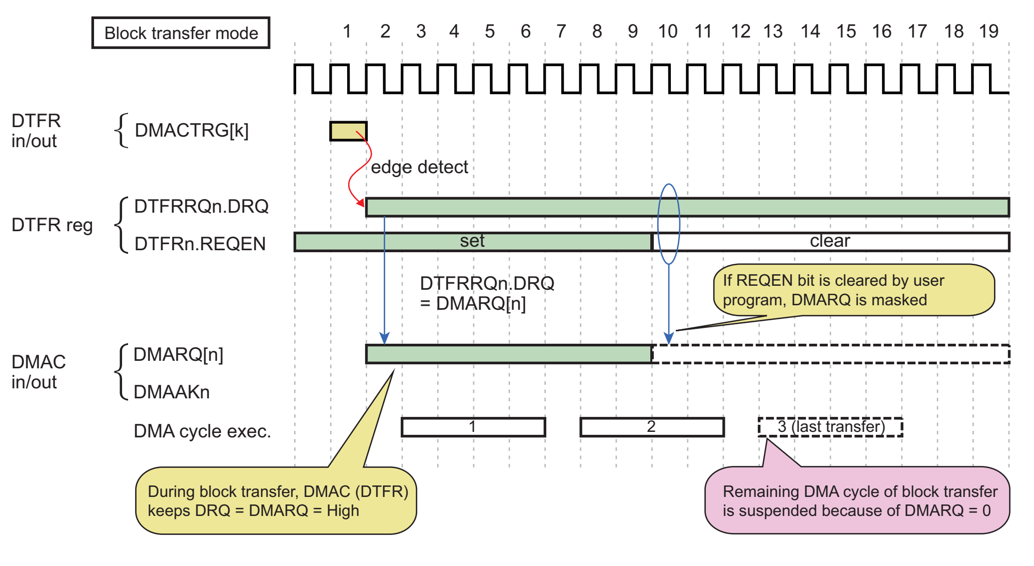
Caution about the operation of DTFR hardware DMA transfer source selection enable bit during block transfer.

Be careful about the following operation when DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode.

If DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended.

When DMAC is used both with hardware DMA transfer request and with block transfer (1 or 2) mode, it is recommended not to modify DTFR hardware DMA transfer source selection enable bit (DTFRn.REQEN) by software while DMAC is executing block transfer. It is also recommended to use DTCT.MLE bit to control the acknowledgement of succeeding hardware DMA transfer requests.

DTFR hardware DMA transfer request bit (DTFRRQn.DRQ) is kept set during block transfer and is cleared at the start of last transfer.(see the bottom figure of **Figure 7.12**). If DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the hardware DMA transfer request is going to be masked and as a result DMAC cannot recognize the existence of hardware DMA transfer request.



DTFRRQn.DRQ: Hardware DMA transfer request status (1: exist, 0: non-exist)
DTFRn.REQEN: Hardware DMA transfer source select enable bit (1: enable, 0: disable)

Figure 7.12 Caution about the Operation of DTFR Hardware DMA Transfer Source Selection Enable Bit during Block Transfer

This caution does not apply to the following situations.

- The case that DMAC is used both with hardware DMA transfer request and with single transfer.
- The case that DMAC is used with software DMA transfer request.
- The case that DTS is used.

7.3.5.3 Generating and Accepting a Software DMA Transfer Request

By setting the software DMA transfer request flag (SR) in the DMAC transfer status register (DCSTn) using the DMAC transfer status set register (DCSTSn), a software DMA transfer request can be generated.

The software DMA transfer request flag is automatically cleared when the DMAC processes the DMA transfer request. The timing when the software DMA transfer request flag is automatically cleared differs depending on the transfer mode of the DMA transfer to be executed.

- In the single transfer mode, the software DMA transfer request flag is cleared whenever the software DMA transfer request is accepted.
- In the block transfer 1 mode, the software DMA transfer request flag is cleared when the last transfer starts.
- In the block transfer 2 mode, the software DMA transfer request flag is cleared when the last transfer or address reload transfer starts.

The software DMA transfer request flag can also be cleared by software using the DMAC transfer status clear register (DCSTCn). When you abort a DMA transfer of a DMAC channel, you must clear the software DMA transfer request flag.

7.3.5.4 Execution of DMA transfer

The DMAC block executes the DMA transfer of the accepted channel. DMAC arbitration is done, when two or more channels request transfers at the same time.

Figure 7.13 shows one example of the DMAC transfer timing in single transfer mode, starting with a transfer count of 2.

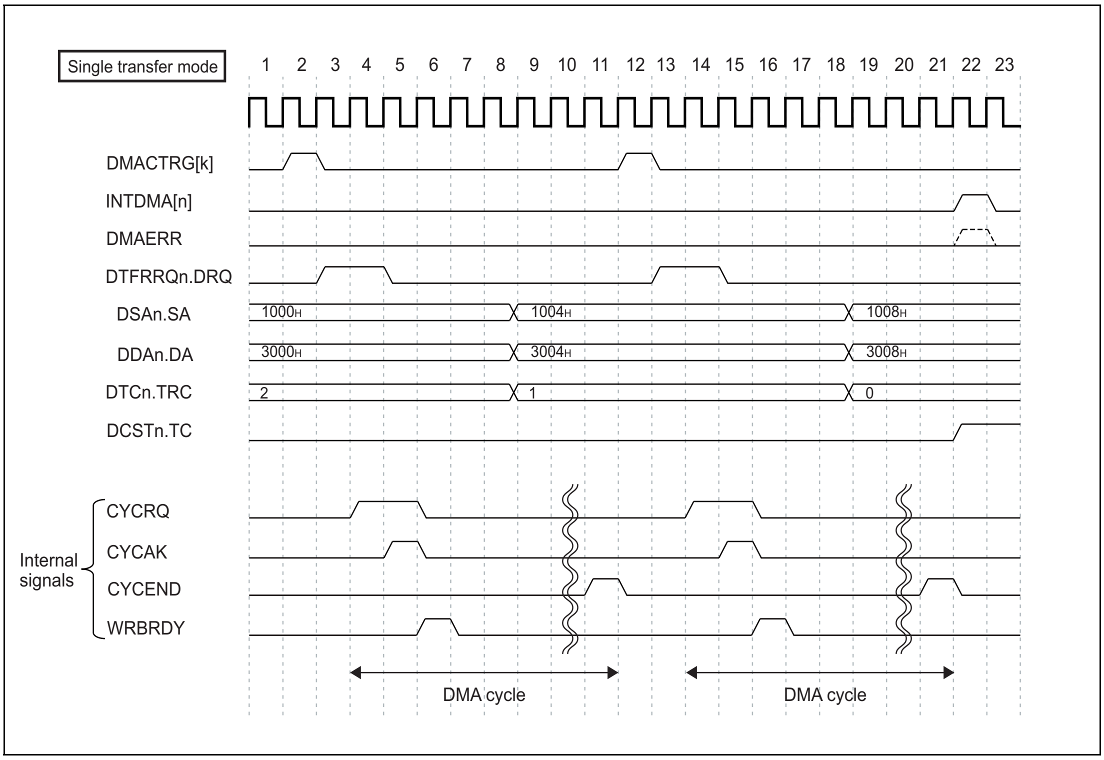


Figure 7.13 Example of DMA Transfer Timing in Single Transfer Mode

Figure 7.14 shows an example of the DMAC transfer timing in block transfer mode, starting with a transfer count of 2.

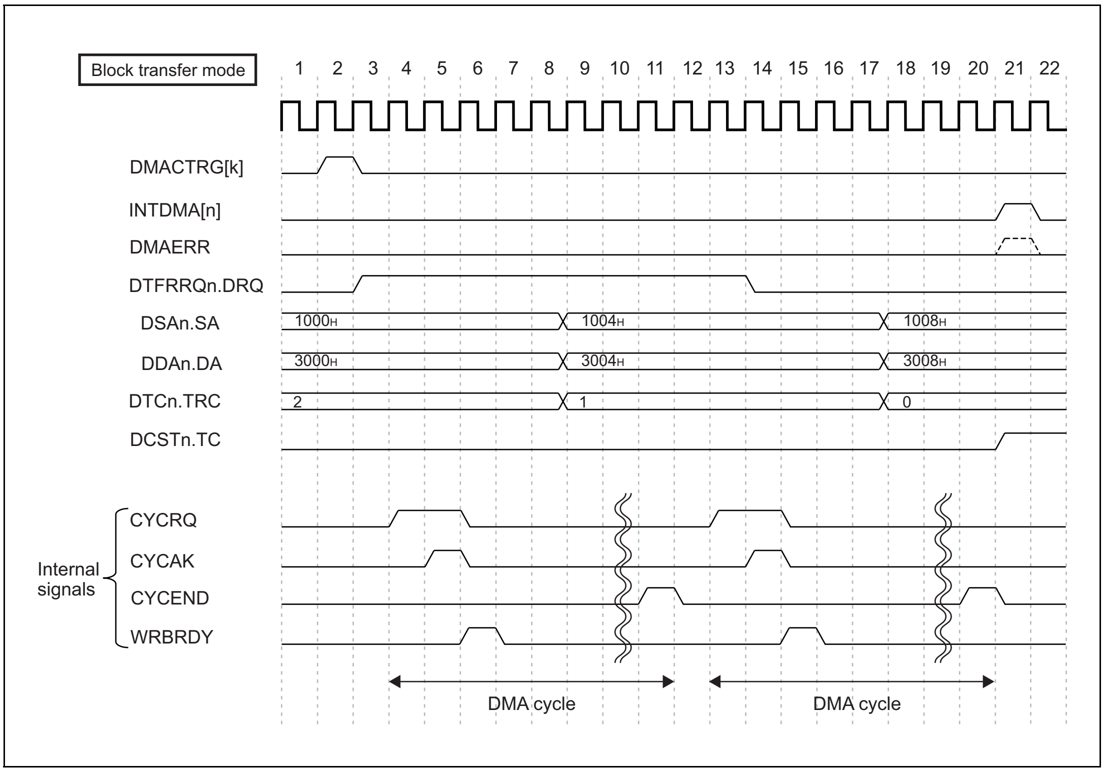

Figure 7.14 Example of DMA Transfer Timing in Block Transfer Mode

Figure 7.15 shows the timing, in which the source address register, the destination address register, the transfer count register and the transfer completion flag are updated.

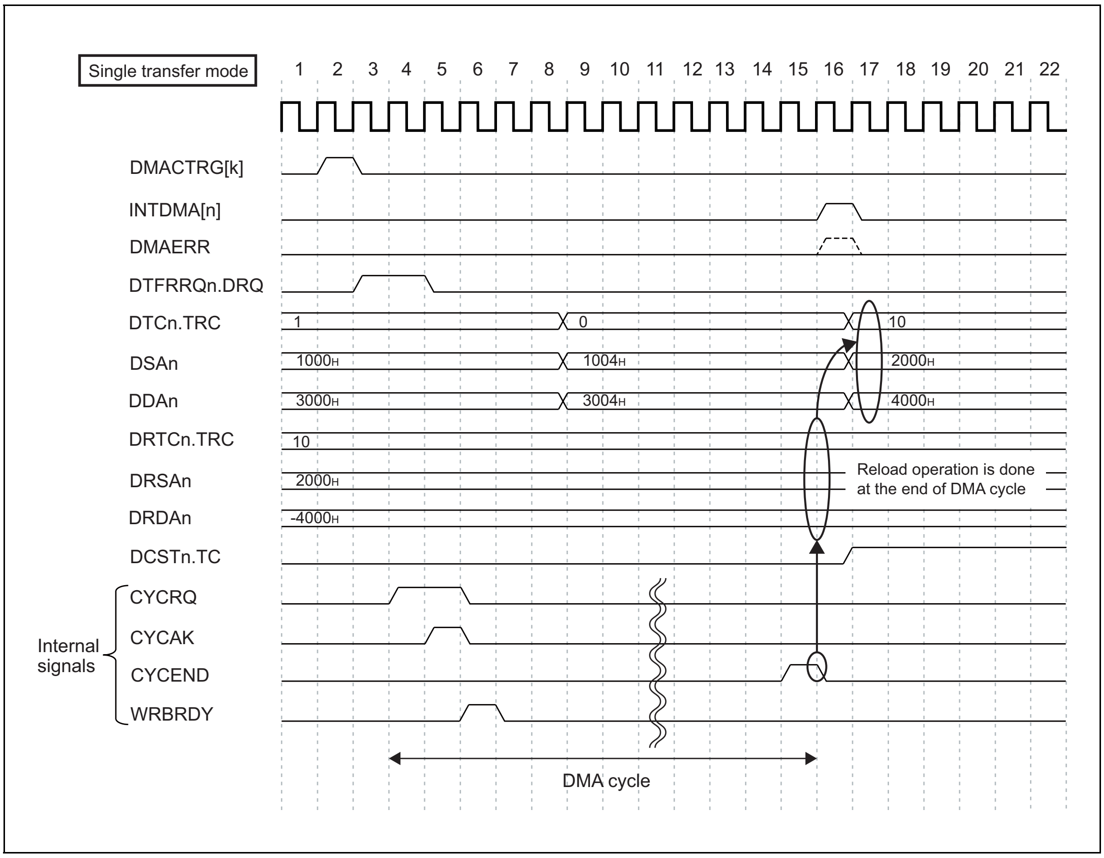

Figure 7.15 Example of DMA Transfer Timing with Reload Function 1

7.3.6 DTS Operation

7.3.6.1 Types of DMA Transfer Requests and Assigning DMA Transfer Requests

A DTS starts DMA transfer by accepting a hardware DMA transfer request or software DMA transfer request.

A transfer request for a DTS is retained in the transfer request pending bit of the DTSFSL for each channel.

As for the DTSFSL, both a hardware DMA transfer request and a software DMA transfer request are retained in the same transfer request pending bit. When executing DMA transfer, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request.

In the case of a hardware DMA transfer request for a DTS, each of 128 hardware DMA transfer sources is assigned to one of 128 channels in the DTSFSL in the fixed manner. You cannot change this assignment by, for example, register settings.

7.3.6.2 Generating and Accepting a DMA Transfer Request

When the DTSFSL detects a hardware DMA transfer source input, the DTSFSL sets the transfer request pending bit and retains the hardware DMA transfer source as a DMA transfer request. If the transfer request pending bit is set and the transfer request enable bit (DTFSLm.REQEN) in the DTSFSL operation setting register is set, the DTSFSL notifies the DTS of the DMA transfer request.

Software can also generate a DMA transfer request by setting the transfer request pending bit (DTFSTm.DRQ) of the DTSFSL transfer request status register using the DTSFSL transfer request set register (DTFSSm).

The DTSFSL can retain only one DMA transfer request per channel. If, while the transfer request pending bit for a channel is set, a new hardware DMA transfer source input for the same channel comes, DTSFSL sets request overflow flag of corresponding channel.

When the DTS accepts a DMA transfer request, it notifies of the acceptance of the DMA transfer request.

The transfer request pending bit is automatically cleared when the DTS accepts the DMA transfer request. The DTSFSL clears the transfer request pending bit automatically when the DTS accepts the DMA transfer request regardless of the type of the DMA transfer to be executed by the DTS.

The transfer request pending bit can also be cleared using the DTSFSL transfer request clear register (DTFSCm). If the transfer request pending bit of a channel is cleared before the DTS accepts the DMA transfer request, DMA transfer of the channel is not executed.

7.3.6.3 Executing DMA Transfer

When the DTS accepts a DMA transfer request for a channel, the DTS executes DMA transfer of the channel.

If there are DMA transfer requests from multiple channels, the DTSFSL arbitrates the DTS channels and picks up one channel for a DMA transfer request.

While the DTS is executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is set. In addition, the channel number of the currently ongoing DMA transfer is set in the DTS transfer channel (DTSSTS.DTSACH).

When the DMA transfer is complete or aborted because of DMA transfer error or writing to registers and no channel is currently executing DMA transfer, the DTS transfer status (DTSSTS.DTSACT) bit is cleared.

Figure 7.16 shows an example of a single DTS transfer. Note that the drawing shows also internal states, which are not reflected in registers. The DTS transfer is accepted in cycle 5 (ACK status), which causes fetching the transfer information (TI) in cycles 6 to 14 (TIFETCH status). The DMA cycle is executed in cycles 15 to 23 (TRANSFER status) and the TI information is written back in cycles 24 to 28 (TIWRITE status). The interval cycle is asserted in cycle 29 (FIN status). The state changes to idle (IDLE state) and the DTS waits for the next DMA request. This picture is an example and the clock cycles of each phase may differ from the depicted flow.

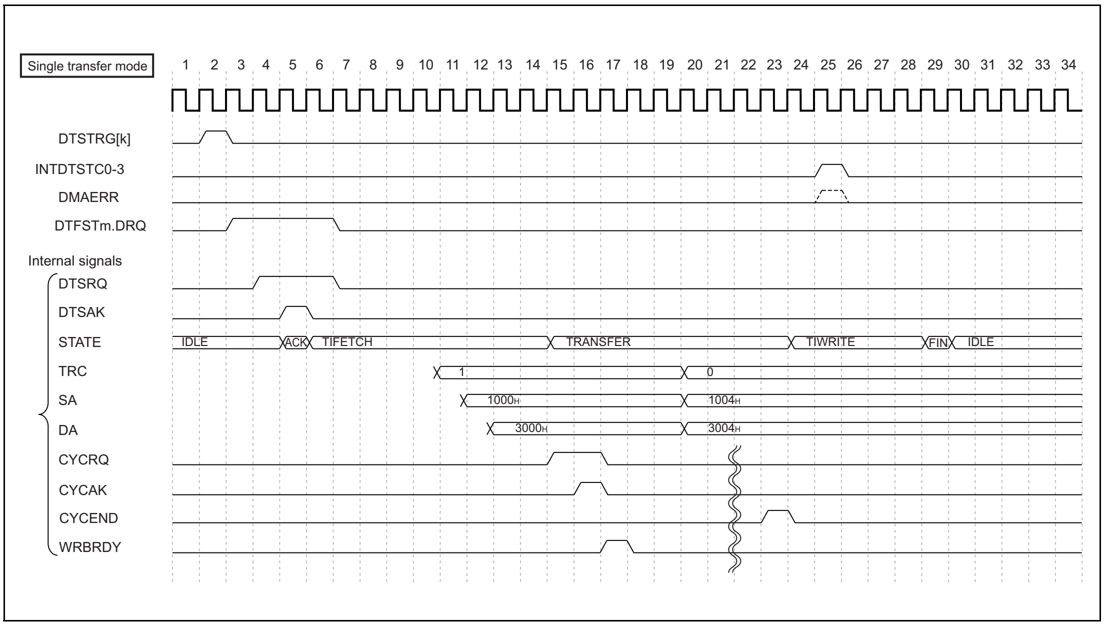

Figure 7.16 DTS Single Transfer Timing

Figure 7.17 shows an example of a DTS block transfer. The DTS transfer is accepted in cycle 5 (ACK status), which causes fetching the transfer information (TI) in cycles 6 to 10 (TIFETCH status). Three transfers are executed in cycles 11 to 25 (TRANSFER status) and the TI information is written back in cycles 26 to 30 (TIWRITE status). The interval cycle is asserted in cycle 31 (FIN status). In cycle 32, the state changes to idle (IDLE state) and the next DMA transfer can be executed.

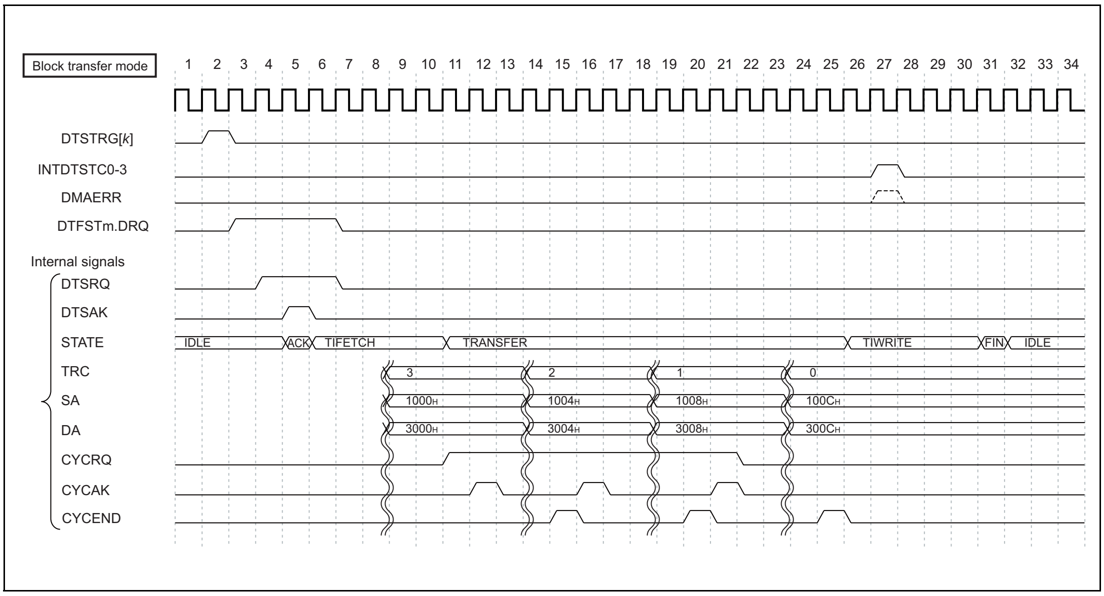

Figure 7.17 DTS Block Transfer Timing

7.3.6.4 DTSRAM Access

A DTS accesses the DTSRAM when DMA transfer starts and finishes.

A DTS's action of reading transfer information from the DTSRAM when DMA transfer starts is called TI fetch.

A DTS's action of updating the transfer information on the DTSRAM when DMA transfer finishes is called TI write back.

A single transfer performs a TI fetch at the beginning of a DMA cycle and a TI write back at the end of a DMA cycle.

A block transfer performs a TI fetch at the beginning of the first DMA cycle and a TI write back at the end of the DMA cycle that satisfies the block transfer completion condition (the last transfer or address reload transfer).

Therefore, in the case of single transfer, the transfer information on the DTSRAM is updated for each DMA cycle. In the case of block transfer, the transfer information on the DTSRAM is updated after the completion of the block transfer. If software reads the transfer information on the DTSRAM during execution of a block transfer, the transfer information at the beginning of the block transfer is read.

Table 7.11 Number of TI Fetch Cycles when not using the Chain Function

Transfer Mode	Reload Function 1	Reload Function 2	Transfer Count	Address Reload Count	TI Fetch Cycles
Single transfer	disabled	enabled	—	1	12 cycles
	enabled	disabled	1	—	
		enabled	>1	1	
			1	—	
Block transfer 1	disabled	enabled	—	Not zero	
	enabled	—	—	—	
Block transfer 2	disabled	enabled	—	Not zero	
	enabled	—	—	—	
All other transfers					9 cycles

7.3.6.5 Execution Time of DTS Transfers

As shown in **Figure 7.16**, a DTS cycle is triggered by the DTSTRG signal, sampled with the rising edge of phase 3. The DTS cycle (CYCRQ) starts after TI fetch is completed. The DMAC needs two more clock cycles to issue a read and write request. The complete DTS cycle is completed after TI write back is done. TI fetch takes 9 DMA clock cycles, TI write back takes 5 DMA clock cycles.

Another two DMA clock cycles are needed to switch from write to read between the individual transfers.

In case of DTS block transfer of five words, when the DMA clock is m times slower than CPU clock, the total transfer time tfr_clk for reading and writing the data by DTS is therefore:

tfr_clk [CPU clock cycle]= $(m \times 9) + (m \times 2) + 4 \times$ (read latency + $(m \times 2)$ + write latency + $(m \times 2)$) + read latency + $(m \times 2)$ + write latency + $(m \times 1) + (m \times 5)$

Note that the setup time for the DTS transfer (phase 3) is not considered in this example.

Note that the number of read and write latency is dependent on bus contention.

7.4 Temporarily Suspending DMA Transfers

DMA transfers can be temporarily suspended by disabling individual channels or the whole DMA controller. All DMA transfers are suspended, by setting the DMACTL.DMASPD bit. Setting the DTSCTL1.DTSUST bit suspends DTS transfers. Each DMAC and DTS channel can hold one DMA request during executing DMA cycle, even if transfers are suspended or if the respective channel is disabled. Any additional transfer request is lost if a channel has already held a DMA request. Lost transfers due to such overflows are reported by the DTFRRQn.OVF and DTFSTm.OVF flags, again also during suspend and disable states.

7.4.1 Suspension, Restart and Abortion of a DMA Channel

DMA transfers for individual channels can be suspended by clearing the DCENn.DTE bit of that channel. A DMA cycle, which is ongoing while DTE is cleared, will be finished. DMA transfers resume, when DTE is set. As one DMA transfer request is stored during suspension, it is recommended to clear the hardware DMA transfer request in the DTFR in the case of a hardware DMA transfer request, the software DMA request flag DCSTn.SR by writing the register flag clear command into DCSTCn.SRC in the case of a software DMA transfer request, if the DMA transfer shall be entirely stopped.

Figure 7.18 shows an example of suspending, restarting and aborting DMA transfers. Both channels 0 and 1 execute block transfers. Channel 1 begins its transfer at t1 and is interrupted by the higher priority channel 0 at t2. The channel 0 transfers end at t3 and channel 1 resumes its transfer, which ends at t4. At t5, channel 1 starts the next block transfer, which is again interrupted at t6 due to the higher priority of channel 0. At t7, channel 0 is suspended and therefore channel 1 can finish its block transfer at t8. At t9, channel 0 has been restarted and it resumes its block transfer until it is again suspended at t10. At t11, the DMA channel 0 is stopped and the ongoing block transfer is aborted. Therefore, no further transfer is started at t12.

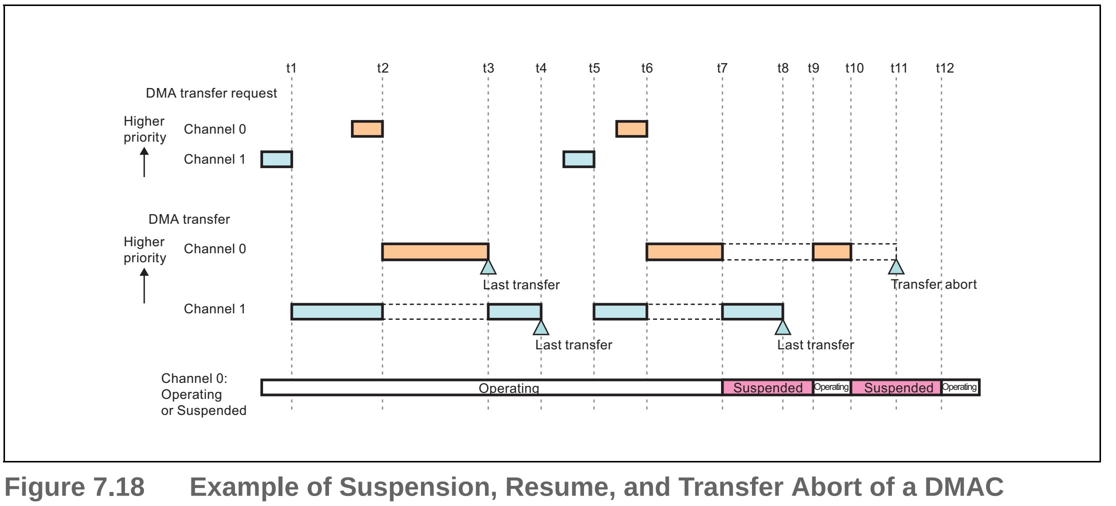

Figure 7.18 Example of Suspension, Resume, and Transfer Abort of a DMAC Channel

7.4.2 Suspension, Resume, and Transfer Abort of a DTS

You can suspend the DMA transfer executed by a DTS by setting the DTS suspend bit (DTSCTL1.DTSUST) in the DTS control register 1. If a DMA cycle is ongoing, the DMA transfer is suspended at the timing when the DMA cycle is finished. If the ongoing DMA cycle is a single transfer or a transfer that completes a block transfer (the last transfer or address reload transfer), the DMA transfer is suspended after a TI write back after the completion of the DMA cycle. If the ongoing DMA cycle is a type other than the above, the DMA transfer is suspended after the completion of the DMA cycle without a TI write back. If you resume the DMA transfer while the DMA transfer is suspended, clear the DTS suspend bit in the DTS control register 1.

If you want to abort the currently ongoing DMA transfer executed by a DTS, suspend the DTS as described above, and then set the DTS transfer abort request bit (DTSCTL2.DTSTIT) in the DTS control register 2 to abort the currently suspended DMA transfer. If transfer is aborted, no TI write back is executed. In addition, aborting the DMA transfer does not change the value of the DTS suspend bit (DTSCTL1.DTSUST). If you want the DTS to accept another DMA transfer request after the abort, clear the DTS suspend bit.

Figure 7.19 shows an example of suspension, resume, and transfer abort of a DTS.

In **Figure 7.19**, channels 0, 1, and 2 are executing block transfer. At t1, a DMA transfer request for channel 1 is accepted and DMA transfer starts. At t2, DMA transfer requests for channels 0 and 2 are generated. At t3, the last transfer of channel 1 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted, and DMA transfer of channel 0 starts because channel 0 has a higher priority than channel 2. At t4, the last transfer of channel 0 is complete, and DMA transfer of channel 2 starts. At t5, the DTS is put into the suspended state, and the DMA transfer of channel 2 is suspended. At t6, DMA transfer requests for channels 0 and 1 are generated. At t7, the suspended state for the DTS is cleared, and the DMA transfer of channel 2, which has been suspended in the middle of a block transfer, is resumed. If DMA transfer is suspended in the middle of a block transfer, no DTS channel arbitration is done when it is resumed. At t8, the last transfer of channel 2 is complete, and as a result of DTS channel arbitration, a DMA transfer request for channel 0 is accepted and the DMA transfer starts because channel 0 has a higher priority than channel 2. At t9, the DTS is put into the suspended state, and at t10, the suspended DMA transfer of channel 0 is aborted. When the suspended state of the DTS 0 is cleared at t11, DMA transfer of channel 1 starts because there is no currently ongoing DMA transfer and channel 1 is the only channel with a DMA transfer request.

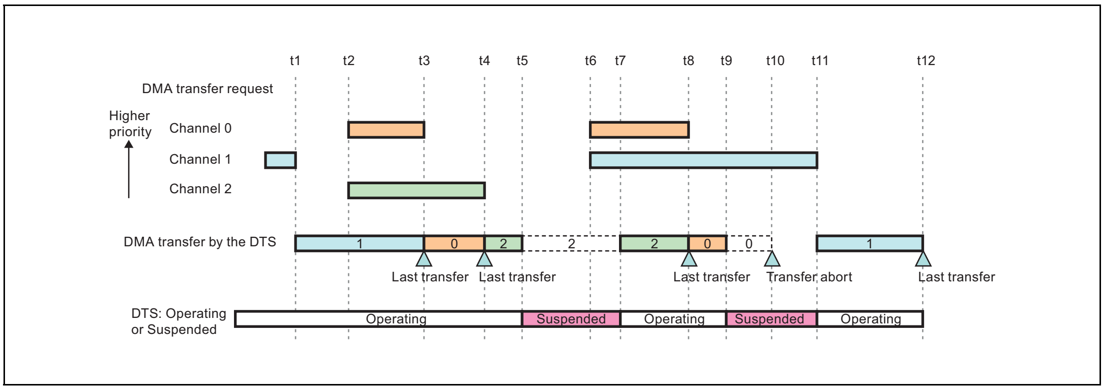

Figure 7.19 Example of Suspension, Resume, and Transfer Abort of a DTS

7.4.3 Masking and Clearing a Hardware DMA Transfer Request by the DTFR

If a DMAC uses a hardware DMA transfer request, you can temporarily disable (mask) the hardware DMA transfer request output from the DTFR to the DMAC by clearing the hardware DMA transfer source selection enable bit (DTFRn.REQEN) in the DTFR setting register.

Also, if a hardware DMA transfer source is used, you can clear a hardware DMA transfer request retained in the DTFR by using the hardware DMA transfer request clear (DTFRRQCn.DRQC) bit in the DTFR transfer request clear register.

Even if you suspend or abort DMA transfer of a DMAC channel, the hardware DMA transfer request selection/hold circuit of the DTFR is still running, and consequently, the DTFR may retain a hardware DMA transfer request that came to the DTFR during the suspension or transfer abort period of the DMAC channel. When you resume or start DMA transfer of a DMAC channel, clear the hardware DMA transfer request retained in the DTFR as required.

Be careful that if DTFR hardware DMA transfer source selection enable bit is set to disable (DTFRn.REQEN = 0) by software while DMAC is executing block transfer, the ongoing block transfer is suspended. (refer to **7.3.5.2, Generating and Accepting a Hardware DMA Transfer Request**)

7.4.4 Masking and Clearing a Hardware DMA Transfer Request by the DTSFSL

As for a DTS, you can temporarily disable (mask) a DMA transfer request from a channel to the DTS by clearing the transfer request enable bit (DTFSLm.REQEN) in the DTSFSL operation setting register. (The masking is actually done by excluding the channel from the candidates in DTS channel arbitration in the DTSFSL.)

Also, you can clear a DMA transfer request retained in the DTSFSL by using the transfer request clear (DTFSCm.DRQC) bit in the DTSFSL transfer request clear register.

Regardless of the state of the DTS and the transfer request enable bit (DTFSLm.REQEN) of the DTSFSL, the DTSFSL always monitors the hardware transfer source input from outside, and a DMA transfer request for a channel is set when a hardware transfer source for the channel is input to the DTSFSL. When you resume or start DTS transfer, clear the hardware DMA transfer request retained in the DTSFSL as required.

7.4.5 List of Suspend, Resume, and Transfer Abort Functions

Table 7.12 List of Suspend, Resume, and Transfer Abort Functions

Function	How to execute the function	Operation	Possibility of DMA transfer abort	Master that can execute the function (See 7.6, Reliability Function.)
DMA suspension and resume by software control	Setting and clearing the DMACCTL.DMASPD.	All channels are in the suspended state.	Not possible*1	Special master
Suspension and resume of a DMAC channel	Clearing and setting the DCENn.DTE in each channel register.*2	DMA transfer of a channel is suspended.	Possible (by clearing the DMA transfer request flag during suspension)	Special master, and general master assigned to the channel.
Suspension and resume of a DTS	Setting and clearing the DTSCTL1.DTSUST.	DMA transfer of a DTS is suspended.	Possible (by setting the DTSCTL2.DTSTIT during suspension)	Special master

Note 1. In order to abort DMA transfer, you need to either abort transfer for the DMAC channel or abort transfer for the DTS.

Note 2. In case that the continuous transfer enable bit (DTCTn.MLE) is set, please clear (or set) the continuous transfer enable bit (DTCTn.MLE) first.

7.5 Error Control

7.5.1 Type of Error

DMA can generate the following two types of errors.

- DMA Transfer Error
  This error is generated when error is detected in the read cycle or write cycle in a DMA cycle or when error is detected by checking ECC at read cycle. This error can be generated in all DMAC and DTS channels during execution of DMA transfer.
- DTSRAM Error
  This error is generated when ECC error is detected in the DTSRAM read access by a DTS.
  This error can be generated in the TI fetch during execution of DMA transfer for a DTS or while software is accessing the DTS channel registers.

7.5.2 DMA Transfer Error

7.5.2.1 Operation of a DMAC When DMA Transfer Error Occurs

When DMA transfer error occurs in a DMAC, the transfer error flag (DCSTn.ER) in the DMAC transfer status register of the channel with the DMA transfer error is set. The DMAC error register (DMACER) shows the transfer error flags of all 16 DMAC channels.

In a channel where the transfer error flag is set, a new DMA cycle is not executed if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is set. On the other hand, a DMA cycle is executed regardless of the value of the transfer error flag if the transfer error case DMA transfer disable setting (DTCTn.ESE) bit is cleared.

If you want to abort the DMA transfer of a channel with DMA transfer error, follow the procedure to abort DMA transfer of the DMAC channel.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated.

7.5.2.2 Operation of a DTS When DMA Transfer Error Occurs

When DMA transfer error occurs in a DTS, the DTS error flag (DTSER1.DTSER) in the DTS error register is set, and the DTS channel number with the DMA transfer error is stored in the DTS error channel (DTSER1.DTSERCH) in the same register.

If DMA transfer error occurs in a single transfer, a TI write back is executed to finish the DMA cycle.

If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTm.ESE) is set, the remaining DMA cycles in the block transfer are not executed, but a TI write back is executed to finish the DMA cycle. At the same time, the DTS transfer status (DTSSTS.DTSACT) bit in the DTS status register is cleared. If DMA transfer error occurs in the middle of a block transfer and the transfer error case DMA transfer abort setting (DTTCTm.ESE) is cleared, the block transfer continues regardless of the DMA transfer error.

If DMA transfer error occurs during the read cycle of a DMA cycle, the write cycle is not executed. If DMA transfer error occurs during the write cycle of a DMA cycle, the validity of the write is not guaranteed.

Regardless of whether DMA transfer error occurs in the read cycle or write cycle of a DMA cycle, the source address, destination address, transfer count, and address reload count registers are updated, and the TI is updated by a TI write back.

If the DTS error flag in the DTS error register is set, a TI fetch is executed when the DTS accepts a DMA transfer request for the channel with the same channel number as the one stored in the DTS error channel. If, as a result of the TI fetch, the transfer error case DMA transfer abort setting (DTTCTm.ESE) is found to be set, a DMA cycle and a TI write back are not executed. If the transfer error case DMA transfer abort setting (DTTCTm.ESE) is cleared, DMA transfer is executed.

If the DTS error flag in the DTS error register is set, DMA transfer is executed when the DTS accepts a DMA transfer request for a channel with a channel number other than the one stored in the DTS error channel.

7.5.3 DTSRAM Error

There are two types of DTSRAM errors detected in the DTSRAM read access: ECC 1-bit error and ECC 2-bit error.

If an ECC 1-bit error is detected during a TI fetch, error corrected data is used, and DMA transfer continues. If an ECC 1-bit error is detected during DTS channel register access from software, error corrected data is returned as read data. In either case, the DTSRAM SEC error flag (DTSER2.RAMSED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM SEC error address (DTSER2.RAMSEDAD).

In addition, the error is notified to the ECM according to DTSRAM error notification control register (DTRERINT.SEDIE).

If an ECC 2-bit error is detected during a TI fetch, handling of the DMA transfer request is terminated without executing a DMA cycle and TI write back. If an ECC 2-bit error is detected during DTS channel register access from software, peripheral bus error is notified. In either case, the DTSRAM DED error flag (DTSER2.RAMDED) in the DTS error register 2 is set, and the address of the error location in the DTSRAM is stored to the DTSRAM DED error address (DTSER2.RAMDEDAD).

In addition, the error is notified to the ECM according to DTSRAM error notification control register (DTRERINT.DEDIE).

7.5.3.1 DTSRAM ECC Test

The proper generation of the error correction code of the DTS RAM can be tested with the following algorithm:

1. Make sure that the RAM location to be tested is not modified by any ongoing DTS transfer.
   It is recommended to disable DTS entirely.
2. Write 0x4000_0002 to DTSRAM Test Control Register (DTRTSCTL).
   Enable ECC Test Mode, encode ECC from write data.
3. Write data to any DTSRAM location.
4. Read data from the same DTSRAM location.
5. Check ECC data in DTSRAM Test Reading Data Register (DTRTRDAT).
6. Restore DTS activity as required.

7.5.3.2 Stimulation of DTSRAM ECC Error

DTSRAM ECC errors can be stimulated to test the proper operation of the error control module. The following algorithm can be used to stimulate such an ECC error:

1. Make sure that the RAM location to be tested is not modified by any ongoing DTS transfer.
   It is recommended to disable DTS entirely.
2. Write 0x4000_0003 to DTSRAM Test Control Register (DTRTSCTL).
   Enable ECC Test Mode, write ECC from DTRTWDAT.TWDAT[6:0].
3. Write good or faulty ECC into DTRTWDAT.TWDAT[6:0].
4. Write data to any DTSRAM location.
5. Read data from the same DTSRAM location.
   good ECC should not generate an ECC error.
   faulty ECC should generate an ECC error.
6. Restore DTS activity as required.

7.6 Reliability Function

7.6.1 Overview

In this product, DMA is a resource used by multiple masters (PE). In order for DMA to support multi-core configuration, the following reliability functions are offered.

- Register access protection function
- Master information inherit function

7.6.2 Register Access Protection Function

This product is designed to assign each DMA channel to a CPU1 (PE).

The register access protection function allows access to the transfer information of each DMA channel from the master (PE) assigned to the channel but prohibits access from other masters.

The register access protection function prevent the channel settings from being updated by masters other than the one assigned to the channel. Please note that any master can always read all registers and that the DMAC/DTS controller cannot read or write its own registers.

7.6.2.1 Identifying the Accessing Master

DMA identifies a master based on the ID of the accessing CPU (PEID), the system protection ID configured by the accessing CPU (SPID), and the state of PSW.UM.

7.6.2.2 Special Master Access

DMA treats access from the CPU1 supervisor mode as special master access.

7.6.2.3 General Master Access

In master access, access to the following registers is allowed.

- Channel registers of the channels assigned by the channel assignment. (For details, see **7.6.2.4, Channel Assignment**.)

In general master access, write access to registers other than the above is not allowed.

7.6.2.4 Channel Assignment

To each channel, DMA can assign a master (PE) so that the master is allowed to use the channel. Channel assignment is configured in the channel master setting register (DMxCM (x = 00 to 07, 10 to 17) in the case of a DMAC and DTSmCM in the case of a DTS) by the CPU in the supervisor mode.

In general master access, the master assigned to a channel by channel assignment is allowed to access the channel registers of the channel. If the channel registers of a channel is write accessed by a master other than the master assigned to the channel, the access is called illegal access. For information about illegal access, see **7.6.2.5, Illegal Access**.

7.6.2.5 Illegal Access

DMA handles the following access as illegal access.

(a) General master write access to the global registers

(b) General master write access to the channel registers of a channel by a master other than the master assigned to the channel

DMA's actions against illegal access are as follows.

For both cases (a) and (b),

- Write access is ignored.

Only for the case (b),

- The information about the illegal access is stored in a register access protection violation register.
- The DMAC0, DMAC1, and DTS have their own register access protection violation registers (DM0CMV, DM1CMV, and DTSCMV respectively).
- DMA assert illegal access notification to ECM.

Only the special master can access the register access protection violation registers. The special master can check whether illegal access has occurred by checking the register access protection violation registers periodically or checking DMA illegal access error of ECM.

In addition, it is recommended that, when a master tries to use DMA and configures transfer information in the channel registers, the master should check whether the configuration has been successfully completed without illegal access by, for example, reading back the settings.

7.6.3 Master Information Inherit Function

In this product, DMA access inherits master information that is equivalent to the master information of the master assigned to the DMA channel.

The master information that is output from DMA is as in **Table 7.13**.

Table 7.13 Master Information That Is Output from DMA

Meaning	Value that is output from DMA
UM	UM bit value in the channel master setting register
SPID*1	Same as the SPID bit value in the channel master setting register as long as it is between 2 and 31.
PEID	Fixed to 4

Note 1. In case that register value is 0 or 1, DMA outputs 2 instead of register value.

7.6.4 Other Reliability Functions

7.6.4.1 Restriction on the Next Channel in the Chain

The reliability function limits the channels you can select as the next channel in the chain.

When you use the chain function, the channel master settings of a channel and its next channel in the chain must be the same.

The chain function is designed so that a channel and its next channel in the chain are managed by the same master.

When DMA detects that different masters are assigned to a channel and its next channel in the chain, it is deemed illegal and the chain function is suppressed. More specifically, when DMA tries to execute the chain function, DMA compares the chain master settings of the channel and its next channel in the chain, and if the settings are the same for both PEID and UM, the chain function is allowed and a chain request is sent to the next channel. If the settings are not the same for either PEID or UM, a chain request is not sent.

7.7 Setting Up DMA Transfer

7.7.1 Overview of Setting Up DMA

Table 7.14 Channel Assignment

No.	Master that configures the setting	Description	Register		Necessity of the setting
1	Special master (CPU in the supervisor mode)	Overall DMA operation setting	DTSPR0 to DTSPR7	DTS channel priority setting	Mandatory (if a DTS is used)
2			DM00CM to DM17CM	DMAC channel master setting	Mandatory (if a DMAC is used)
3			DTS000CM to DTS127CM	DTS channel master setting	Mandatory (if a DTS is used)
4		Status clear	DTSERC	DTS error clear register	Recommended
5			CMVC	Channel protection violation clear register	Recommended
6	Master assigned to the DMAC channel	Channel setting	DSAn	DMAC source address	Mandatory
7			DDAn	DMAC destination address	Mandatory
8			DTCn	DMAC transfer count	Mandatory
9			DTCTn	DMAC transfer control	Mandatory
10			DRSAn	DMAC reload source address	Mandatory if the reload function is used
11			DRDAn	DMAC reload destination address	Mandatory if the reload function is used
12			DRTCn	DMAC reload transfer count	Mandatory if the reload function is used
13			DTCCn	DMAC transfer count compare	Mandatory if the transfer count match interrupt is used
14			DTFRn	DTFR setting register	Mandatory
15		Status clear	DCSTCn	DMAC transfer status clear	Mandatory
16			DTFRRQCn	DTFR transfer request clear	Recommended
17		Channel operation enable	DCENn	DMAC channel operation enable setting	Mandatory
18	Master assigned to the DTS channel	Channel setting	DTSAm	DTS source address	Mandatory
19			DTDAm	DTS destination address	Mandatory
20			DTTCm	DTS transfer count	Mandatory
21			DTTCTm	DTS transfer control	Mandatory
22			DTRSAm	DTS reload source address	Mandatory if the reload function is used
23			DTRDAm	DTS reload destination address	Mandatory if the reload function is used
24			DTRTCm	DTS reload transfer count	Mandatory if the reload function is used
25			DTTCCm	DTS transfer count compare	Mandatory if the transfer count match interrupt is used
26		Status clear	DTFSCm	DTSFSL transfer request clear	Recommended
27		Transfer request enable	DTFSLm	DTSFSL operation setting	Mandatory

7.7.2 Setting Up the Overall DMA Operation

You need to set up the overall DMA operation before you start using DMA.

To configure the overall DMA operation, the special master (a CPU in the supervisor mode) needs to set up global registers. Global registers can be set up only by special master access. For details, see **7.6, Reliability Function**.

The following registers must be set up to configure the overall DMA operation.

- DTS channel priority setting registers (DTSPRy, y = 0 to 7)
  Those registers configure the priority level of each DTS channel used for DTS channel arbitration.
- DMAC channel master setting registers (DMxCM, x = 00 to 07, 10 to 17)
- DTS channel master setting registers (DTSmCM)

Those registers configure channel assignment. (For details, see **7.6, Reliability Function**.)

If the DMAC channel master setting registers and the DTS channel master setting registers are not properly set, DMA channel setting and DMA transfer cannot be executed properly.

Also, if errors are detected in the following registers while the overall DMA operation is set up, clearing the errors is recommended.

- DTS error register 1 (DTSER1)
- DTS error register 2 (DTSER2)
- DMAC0 register access protection violation register (DM0CMV)
- DMAC1 register access protection violation register (DM1CMV)
- DTS register access protection violation register (DTSCMV)

7.7.3 Setting Up the DMA Channel Setting

The DMA channel setting defines the transfer information and transfer source for each DMAC and DTS channel.

To configure the DMA channel setting, the master assigned to each channel by the channel assignment needs to set up channel registers.

7.7.3.1 Setting Up the DMAC Channel Setting

Follow the procedure below to set up the DMAC channel setting and use the DMAC.

(1) Disabling the DMAC Channel Operation

If the channel operation enable (DTE) in the DMAC channel operation enable setting register (DCENn) is set, clear the DTE bit to disable the channel operation.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DMAC, the following registers need to be set up.

- DMAC source address register (DSAn)
- DMAC destination address register (DDAn)
- DMAC transfer count register (DTCn)
- DMAC transfer control register (DTCTn)
- DMAC reload source address register (DRSAn)
- DMAC reload destination address register (DRDAn)
- DMAC reload transfer count register (DRTCn)
- DMAC transfer count compare register (DTCCn)

(3) Setting Up the DMA Transfer Request

While setting the transfer information, you need to set up the DMA transfer request selection assignment (DTCTn.DRS) bit in the DMAC transfer control register (DTCTn) to define whether the hardware or software DMA transfer request is used.

You cannot use both the hardware and software DMA transfer requests for the same channel at the same time.

If you use the hardware DMA transfer request, you need to select one source used as the hardware DMA transfer request out of 128 hardware DMA transfer sources using the hardware DMA transfer source selection (DTFRn.REQSEL) in the DTFR setting register. Also, you need to enable the hardware DMA transfer source selection (DTFRn.REQEN) in the same register.

The DTFR may retain a hardware DMA transfer request that came before the hardware DMA transfer source is selected. Clear the hardware DMA transfer request (DTFRRQn.DRQ) retained in the DTFR using the DTFR transfer request clear register (DTFRRQCn) if necessary.

If you use the software DMA transfer request, disable the hardware DMA transfer source selection (DTFRn.REQEN) in the DTFR setting register.

(4) Clearing the Transfer Status

The DMAC transfer status register (DCSTn) may retain the result of the previous DMA transfer. You need to clear the flags in the DMAC transfer status register using the DMAC transfer status clear register (DCSTCn).

(5) Enabling the DMAC Channel Operation

Set the channel operation enable (DCENn.DTE) bit in the DMAC channel operation enable setting register to enable the channel operation.

After the channel operation enable bit is set, the DMAC can accept a DMA transfer request and start DMA transfer.

7.7.3.2 Setting Up the DTS Channel Setting

Follow the procedure below to set up the DTS channel setting and use the DTS.

(1) Disabling the Transfer Request by the DTSFSL

Clear the transfer request enable (DTFSLm.REQEN) bit in the DTSFSL operation setting register of the DTS channel you want to set up the channel setting for. This procedure is not mandatory but recommended in order to prevent a DMA transfer request from being sent mistakenly to the DTS channel currently being configured.

It is also recommended to check the DTS status register (DTSSTS) and confirm that DMA transfer is not ongoing for the DTS channel currently being configured.

(2) Setting Up the Transfer Information

When you set up the transfer information of the DTS, the following registers need to be set up to configure the transfer information.

- DTS source address register (DTSAm)
- DTS destination address register (DTDAm)
- DTS transfer count register (DTTCm)
- DTS transfer control register (DTTCTm)
- DTS reload source address register (DTRSAm)
- DTS reload destination address register (DTRDAm)
- DTS reload transfer count register (DTRTCm)
- DTS transfer count compare register (DTTCCm)

(3) Setting Up the DMA Transfer Request

Unlike a DMAC, a DTS does not care whether a DMA transfer request is a hardware DMA transfer request or software DMA transfer request. A DTS has a transfer request pending bit for each channel in the DTSFSL, and both a hardware and software DMA transfer requests are retained in the same transfer request pending bit (DTFSTm.DRQ). Therefore, a DTS has no setting for selecting whether the hardware or software transfer request is used.

The DTSFSL may retain a DMA transfer request that came before the transfer information is set up. Clear the DMA transfer request (DTFSTm.DRQ) retained in the DTSFSL if necessary, using the DTSFSL transfer request clear register (DTFSCm).

(4) Enabling the Transfer Request by the DTSFSL

Set the transfer request enable (DTFSLm.REQEN) bit in the DTSFSL operation setting register to enable the DMA transfer request for the DTS channel.

After the transfer request enable bit for the DTSFSL is set, the DTS can accept a DMA transfer request and start DMA transfer.

7.8 Global Register

7.8.1 List of Global Register Address

Address = <DMAC_base> “FFFF 8000_H” + Offset address

Table 7.15 List of Global Register Address (1/2)

0200_H + 4 × [DTS channel number] *1 (0200_H - $03FC_H$)	DTSmCM*1	DTS channel m channel master setting*1	√	×

Note 1. [DTS channel number] and "m" in the register symbols and meanings are numbers in the range from 000 to 127.

Note 2. √: supported ×: not supported

CAUTION

- **It is forbidden to write to the following registers when operation of DMA is enabled (DTE bit = 1 for each DMA channel). If you do, the correct operation is not guaranteed.**
  - **DMxCM**
- **It is forbidden to write to the following registers when operation of DTS is enabled (DTSACT bit = 1). If you do, the correct operation is not guaranteed.**
  - **DTSPRy**
  - **DTRECCTL**
  - **DTRERINT**
  - **DTRTSCTL**
  - **DTRTWDAT**
  - **DTSmCM**

7.8.2 Details of Global Registers

7.8.2.1 DMACTL — DMA Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DMA SPD
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.16 DMACTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DMASPD	DMA suspension This bit shows whether DMA transfer for all channels is suspended. If a user writes 1 to this bit, DMA transfer for all channels can be suspended. If a user writes 0 to this bit, suspension of DMA transfer for all channels can be cleared. The suspension controlled by this bit is independent from the suspension controlled by the transfer enable bit (DCENn.DTE) of each DMAC channel and the suspension setting bit (DTSUST) for a DTS. That means, if this bit is 1, all DMA transfers are suspended regardless of the values of the DTE bit of each channel and the DTSUST bit of the DTS. Writing to this bit does not affect the DTE bit of each channel and the DTSUST bit of the DTS. 0: DMA suspension cleared 1: DMA suspension request/DMA suspension ongoing

7.8.2.2 DTSCTL1 — DTS Control Register 1

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTS UST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.17 DTSCTL1 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTSUST	DTS suspension This bit shows whether DMA transfer of a DTS is suspended. If a user writes 1 to this bit, DMA transfer of a DTS can be suspended. 0: DTS suspension cleared 1: DTS suspension request/DTS suspension ongoing

7.8.2.3 DTSCTL2 — DTS Control Register 2

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0014_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSTIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.18 DTSCTL2 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTSTIT	DTS transfer abort request While the DTS is suspended, a user can write 1 to this bit to abort the suspended DMA transfer. When the suspended DMA transfer of a DTS is aborted, the DTSSTS.DTSACT bit is cleared to 0. The read value is always 0.

7.8.2.4 DTSSTS — DTS Status Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	DTS CYC	DTSA CH6	DTSA CH5	DTSA CH4	DTSA CH3	DTSA CH2	DTSA CH1	DTSA CH0	DTSA CT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.19 DTSSTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is read.
8	DTSCYC	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in the DTS. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending DTS transfers, DTSCYC may be polled to assure that any possibly ongoing DTS cycle has finished.
7 to 1	DTSACH[6:0]	DTS transfer channel If there is a channel in the DTS executing DMA transfer, the channel number is shown. If there is no channel in the DTS executing DMA transfer, the channel number of the last DMA transfer is shown.
0	DTSACT	DTS transfer status This bit shows whether there is a channel in the DTS executing DMA transfer. 0: There is a channel in the DTS executing DMA transfer. 1: There is no channel in the DTS executing DMA transfer. DTSACT is asserted during TI fetch, all DMA cycles and TI write-back. It is cleared after the last cycle of the TI write back is completed. If the DTS is put into the suspended state while there is a channel executing DMA transfer, this bit remains 1. If a DTS transfer abort request is made using the DTSCTL2.DTSTIT bit, the suspended DTS transfer is aborted, and this bit is cleared to 0. When DMA transfer error occurs and the DMA transfer is aborted, this bit is cleared.

7.8.2.5 DMACER — DMAC Error Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DM1ER7	DM1ER6	DM1ER5	DM1ER4	DM1ER3	DM1ER2	DM1ER1	DM1ER0	DM0ER7	DM0ER6	DM0ER5	DM0ER4	DM0ER3	DM0ER2	DM0ER1	DM0ER0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.20 DMACER Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read.
15 to 8	DM1ER[7:0]	DMAC1 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC1. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC1 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated
7 to 0	DM0ER[7:0]	DMAC0 DMA transfer error status These bits show the DMA transfer error status of channels 0 through 7 of the DMAC0. Each bit is mapped from the DCSTn.ER bit of each channel of the DMAC0 and is read-only. 0: DMA transfer error is not generated 1: DMA transfer error is generated

7.8.2.6 DTSER1 — DTS Error Register 1

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0024_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	DTSER CH6	DTSER CH5	DTSER CH4	DTSER CH3	DTSER CH2	DTSER CH1	DTSER CH0	—	—	—	—	—	—	DTSER WR	DTSER
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.21 DTSER1 Register Contents

Bit Position	Bit Name	Function
31 to 15	Reserved	When read, the value after reset is read.
14 to 8	DTSERCH[6:0]	DTS error channel These bits show the DTS channel number of the first DMA transfer error after the DTSER bit is cleared to 0. These bits are read-only and cannot be cleared.
7 to 2	Reserved	When read, the value after reset is read.
1	DTSERWR	DTS DMA transfer error occurring cycle This bit is updated at the same time as setting of the DTS DMA transfer error flag (DTSER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the DTSER bit has been set. If the DTSER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle.
0	DTSER	DTS DMA transfer error flag This bit shows whether DMA transfer error is generated in the DTS. 0: DMA transfer error is not generated 1: DMA transfer error is generated If DMA transfer error is generated in the DTS while this bit is 0, this bit is set, and DTSERCH6-0 retains the DTS channel number of the DMA transfer error. If DMA transfer error is generated in the DTS while this bit is 1, this bit remains 1, and DTSERCH6-0 does not change. This bit can be cleared by using the DTSERC register.

7.8.2.7 DTSER2 — DTS Error Register 2

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0028$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RAMDED	RAMDEDOV	—	—	RAMDEDAD11	RAMDEDAD10	RAMDEDAD9	RAMDEDAD8	RAMDEDAD7	RAMDEDAD6	RAMDEDAD5	RAMDEDAD4	RAMDEDAD3	RAMDEDAD2	RAMDEDAD1	RAMDEDAD0

	RAMSED	RAMSEDOV	—	—	RAMSEDAD11	RAMSEDAD10	RAMSEDAD9	RAMSEDAD8	RAMSEDAD7	RAMSEDAD6	RAMSEDAD5	RAMSEDAD4	RAMSEDAD3	RAMSEDAD2	RAMSEDAD1	RAMSEDAD0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.22 DTSER2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	RAMDED	DTSRAM DED error flag This bit shows whether the DED error is generated in the read access to the DTSRAM. 0: DED error is not generated in the DTSRAM 1: DED error is generated in the DTSRAM If DED error is generated in the DTSRAM while this bit is 0, this bit is set, and RAMDEDAD11-0 retains the DTSRAM address of the error. If DED error is generated in the DTSRAM while this bit is 1, this bit remains 1, and RAMDEDAD11-0 does not change. This bit can be cleared by using the DTSERC register.
30	RAMDEDOV	DTSRAM DED error overflow flag This bit is set when the RAMDED bit is 1 and the DED error occurs in DTSRAM read access whose address is different from that specified by the RAMDEDAD11-0 bit. This bit can be cleared by operation of the DTSERC register.
29, 28	Reserved	When read, the value after reset is read.
27 to 16	RAMDEDAD [11:0]	DTSRAM DED error address These bits show the DTSRAM address of the first DTSRAM DED error after the RAMDED bit is cleared to 0. These bits are read-only and cannot be cleared.
15	RAMSED	DTSRAM SED error flag This bit shows whether the SED error is generated in the read access to the DTSRAM. 0: SED error is not generated in the DTSRAM 1: SED error is generated in the DTSRAM If SED error is generated in the DTSRAM while this bit is 0, this bit is set, and RAMSEDAD11-0 retains the DTSRAM address of the error. If SED error is generated in the DTSRAM while this bit is 1, this bit remains 1, and RAMSEDAD11-0 does not change. This bit can be cleared by using the DTSERC register.
14	RAMSEDOV	DTSRAM SED error overflow flag This bit is set when the RAMSED bit is 1 and the SED error occurs in DTSRAM read access whose address is different from that specified by the RAMSEDAD11-0 bit. This bit can be cleared by operation of the DTSERC register.
13, 12	Reserved	When read, the value after reset is read.

Table 7.22 DTSER2 Register Contents (2/2)

Bit Position	Bit Name	Function
11 to 0	RAMSEDAD [11:0]	DTSRAM SED error address These bits show the DTSRAM address of the first DTSRAM SED error after the RAMSED bit is cleared to 0. These bits are read-only and cannot be cleared.

7.8.2.8 DTSERC — DTS Error Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + $002C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	RAMDEDC	RAMDEDOVC	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RAMSEDC	RAMSEDOVC	—	—	—	—	—	—	—	—	—	—	—	—	—	DTSERC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.23 DTSERC Register Contents

Bit Position	Bit Name	Function
31	RAMDEDC	DTSRAM DED error flag clear If a user writes 1 to this bit, the DTSRAM DED error flag (DTSER2.RAMDED) is cleared. The read value is always 0.
30	RAMDEDOVC	DTSRAM DED error overflow flag clear When the user writes 1 to this bit, the DTSRAM DED error overflow flag (DTSER2.RAMDEDOV) is cleared. The read value is always 0.
29 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15	RAMSEDC	DTSRAM SED error flag clear If a user writes 1 to this bit, the DTSRAM SED error flag (DTSER2.RAMSED) is cleared. The read value is always 0.
14	RAMSEDOVC	DTSRAM DED error overflow flag clear When the user writes 1 to this bit, the DTSRAM DED error overflow flag (DTSER2.RAMSEDOV) is cleared. The read value is always 0.
13 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTSERC	DTS error flag clear If a user writes 1 to this bit, the DTS DMA error flag (DTSER1.DTSER) is cleared. The read value is always 0.

7.8.2.9 DM0CMV — DMAC0 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0030_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.24 DM0CMV Register Contents

Bit Position	Bit Name	Function
31 to 29	PEID[2:0]	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
28 to 23	Reserved	When read, the value after reset is read.
22 to 18	SPID[4:0]	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
17	UM	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 7	Reserved	When read, the value after reset is read.
6 to 4	VCH[2:0]	Illegal access channel These bits show the channel number (0-7) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is read.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DMAC0. 0: No illegal access has occurred in the DMAC0 1: Illegal access has occurred in the DMAC0 If illegal access occurs in the DMAC0 while this bit is 0, this bit is set, and PEID, SPID, UM and VCH store their respective information. If illegal access occurs in the DMAC0 while this bit is 1, this bit remains 1, and PEID, SPID, UM and VCH do not change. This bit can be cleared by using the CMVC register.

7.8.2.10 DM1CMV — DMAC1 Register Access Protection Violation Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0034_H

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.26 DTSCMV Register Contents

Bit Position	Bit Name	Function
31 to 29	PEID[2:0]	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
28 to 23	Reserved	When read, the value after reset is read.
22 to 18	SPID[4:0]	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
17	UM	Illegal access master information These bits show the accessing master information of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
16 to 11	Reserved	When read, the value after reset is read.
10 to 4	VCH[6:0]	Illegal access channel These bits show the channel number (0-127) of the first illegal access after the VF bit is cleared to 0. If illegal access occurs while the VF bit is 1, these bits do not change. These bits are read-only and cannot be cleared.
3 to 1	Reserved	When read, the value after reset is read.
0	VF	Illegal access flag This bit shows whether illegal access occurs in the DTS. 0: No illegal access has occurred in the DTS 1: Illegal access has occurred in the DTS If illegal access occurs in the DTS while this bit is 0, this bit is set, and PEID[2:0], SPID[4:0], UM and VCH[6:0] store their respective information. If illegal access occurs in the DTS while this bit is 1, this bit remains 1, and PEID[2:0], SPID[4:0], UM and VCH[6:0] do not change. This bit can be cleared by using the CMVC register.

7.8.2.12 CMVC — Register Access Protection Violation Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + $003C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.28 TFRSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is read.
16	DTSCYC	DMA cycle state of DTS IP block: 0: No DTS-DMA cycle executing 1: DTS-DMA cycle is executing After suspending DTS transfers, DTSCYC may be polled to assure that any possibly ongoing DTS cycle has finished. This flag is a copy of DTSSTS.DTSCYC.
15 to 8	DMACY[17:10]	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished. These flags are copies from DCSTn.CY.
7 to 0	DMACY[07:00]	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished. These flags are copies from DCSTn.CY.

7.8.2.14 DTSPRy — DTS Channel Priority Setting (y = 0 to 7)

Table 7.36 DTSPR7 Register Contents

Bit Position	Bit Name	Function
31 to 0	DTS[127:112] PR[1:0]	DTS channel [127:112] priority setting These bits configure the priority level of each DTS channel used for DTS channel arbitration. 00 is the highest priority, and 11 is the lowest.

7.8.2.15 DTRECCTL — DTSRAM ECC Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0080_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SECDIS	ECCDIS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.37 DTRECCTL Register Contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	These bits enable or disable writing to the ECCDIS and SECDIS bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1).
29 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	SECDIS	DTSRAM SED error correction disable This bit enables or disables SED error correction when the ECCDIS bit is 0. ECC 1 bit error detection operation is always executed when ECCDIS bit is 0 regardless of the state of this bit. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error correction is enabled when the SED error is detected. 1: Error correction is disabled when the SED error is detected.
0	ECCDIS	DTSRAM ECC disable This bit enables or disables DTSRAM ECC error detection and correction. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: Error detection and correction are enabled. 1: Error detection and correction are disabled. The encoding function is effective when error detection and correction are disabled.

7.8.2.16 DTRERINT — DTSRAM Error Notification Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0084_H

Value after reset: $0000\ 0002_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DEDIE	SEDIE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.38 DTRERINT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	DEDIE	DTSRAM DED error external notification enable This bit enables or disables notification of DED error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of DED error to ECM is disabled. 1: Notification of DED error to ECM is enabled.
0	SEDIE	DTSRAM SED error external notification enable This bit enables or disables notification of SED error detection to the ECM when the ECCDIS bit in DTRECCTL is 0. 0: Notification of SED error to ECM is disabled. 1: Notification of SED error to ECM is enabled.

7.8.2.17 DTRTSCTL — DTSRAM Test Control Register

This register is used for ECC test (self-diagnosis). It enables setting of ECC test mode and selection of ECC data to be written to the DTSRAM.

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0094_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	DATSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.39 DTRTSCTL Register Contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	These bits enable or disable writing to the ECCTST and DATSEL bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1).
29 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	ECCTST	DTSRAM ECC Test Mode This bit enables or disables DTSRAM ECC test mode. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC test mode is disabled. 1: ECC test mode is enabled.
0	DATSEL	ECC Test Data Selection This bit is valid when ECCTST is 1 and selects ECC data to be written to the DTSRAM. Set (PROT1, PROT0) = (0, 1) at the same time as writing to this bit. 0: ECC encoded from the written data is used. 1: The value specified by the DTSRAM test data writing register (DTRTWDAT) is used.

7.8.2.18 DTRTWDAT — DTSRAM Test Write Data Register

This register is used for ECC test (self-diagnosis). It specifies ECC data to be written to the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0098$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	TWDAT6	TWDAT5	TWDAT4	TWDAT3	TWDAT2	TWDAT1	TWDAT0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.40 DTRTWDAT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	TWDAT[6:0]	ECC Test Write Data These bits specifies ECC data to be written to the DTSRAM when DTRTSCTL.ECCTST = 1 and DTRTSCTL.DATSEL = 1. Writing to this bit is enabled when DTRTSCTL.ECCTST = 1 When DTRTSCTL.ECCTST = 0, this bit cannot be written and its read value is 0.

7.8.2.19 DTRTRDAT — DTSRAM Test Read Data Register

This register is used for ECC test (self-diagnosis). It reads out ECC data of the DTSRAM after ECC test mode is enabled (ECCTST = 1).

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + $009C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.41 DTRTRDAT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	TRDAT[6:0]	ECC Test Read Data This bits retains the last ECC data read out from the DTSRAM when DTRTSCTL.ECCTST = 1. When DTRTSCTL.ECCTST = 0, the read value of this bit is 0.

7.8.2.20 ADECCTCL — ECC on BUS Address ECC Test Control Register

This register is used for ECC test (self-diagnosis). (refer **31.2.9.6, Test Function**)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + $00A0_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PROT1	PROT0	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	ECCTST	RWSEL
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.42 ADECCTCL Register Contents

Bit Position	Bit Name	Function
31, 30	PROT[1:0]	These bits enable or disable writing to the ECCTST and RWSEL bits. The written data is not retained. The read value is always 0. These bits should be written when (PROT1, PROT0) = (0, 1).
29 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	ECCTST	Address ECC test mode Configures ECConBUS address ECC test mode. To update this bit, (PROT1, PROT0) = (0, 1) must be written at the same time. 0: Address ECC test mode is disabled. 1: Address ECC test mode is enabled. Address ECC output is replaced with the value of ADECCTDT register.
0	RWSEL	Address ECC test cycle selection Selects either read cycle or write cycle to test address ECC. This bit is valid only at ECCTST = 1. To update this bit, (PROT1, PROT0) = (0, 1) must be written at the same time. 0: Address ECC output is replaced with test data at DMA read cycle. 1: Address ECC output is replaced with test data at DMA write cycle.

7.8.2.21 ADECCTDT — ECC on BUS Address ECC Test Data Register

This register is used for ECC test (self-diagnosis). (refer **31.2.9.6, Test Function**)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + $00A4_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.43 ADECCTDT Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	ECCDAT[6:0]	ECC test data Specifies ECC test data used at ADECCTCL.ECCTST = 1.

7.8.2.22 DMxCM — DMAC Channel Master Setting (x = 00 to 07, 10 to 17)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0100_H + 4_H × Ch. No. n (n = 0 to 7)
<DMAC_base> + 0120_H + 4_H × Ch. No. n - 10 (n = 10 to 17)

Value after reset: 0000 2008_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	1	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 7.44 DMxCM Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 13	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel.
12 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9 to 7	Reserved	When writing, always write 0.
6 to 2	SPID[4:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel. SPID = 0 and 1 are reserved and must not be used. If SPID = 0 or 1 is set, DMA will use SPID = 2.
1	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel.
0	Reserved	When writing, always write 0.

CAUTION

DM00CM to DM07CM configure the channel master information of the DMAC0 channel 0 to 7 respectively.

DM10CM to DM17CM configure the channel master information of the DMAC1 channel 0 to 7 respectively.

For information about the functions this register offers, see **7.6, Reliability Function**.

7.8.2.23 DTSmCM — DTS Channel Master Setting Register (m = 000 to 127)

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0200_H + 4_H × Ch. No. n (n = 0 to 127)

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	PEID2	PEID1	PEID0	—	—	—	—	—	—	SPID4	SPID3	SPID2	SPID1	SPID0	UM	—
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMC15	CMC14	CMC13	CMC12	CMC11	CMC10	CMC9	CMC8	CMC7	CMC6	CMC5	CMC4	CMC3	CM2C	CMC1	CMC0
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.45 DTSmCM Register Contents

Bit Position	Bit Name	Function
31 to 29	PEID[2:0]	Channel master PEID setting Specifies the PEID information of the master assigned to the channel.
28 to 23	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read.
22 to 18	SPID[4:0]	Channel master SPID setting Specifies the SPID information used by the master assigned to the channel. SPID = 0 and 1 are reserved and must not be used. If SPID = 0 or 1 is set, DMA will use SPID = 2.
17	UM	Channel master UM setting Specifies the UM information of the master assigned to the channel.
16	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read.
15 to 0	CMC[15:0]	Transfer count compare In terms of contents, this field is the same as the bit [15:0] of the **7.10.3.8, DTTCCm — DTS Transfer Count Compare Register**.

CAUTIONS

1. DTS000CM to DTS127CM configure the channel master information of the DTS channel 0 to 127 respectively.
2. Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

For information about the functions this register offers, see **7.6, Reliability Function**.

CAUTION

The lowest 16 bits of this register are shared with the DTS transfer count compare register, one of the DTS channel registers.
If you write to this register, the DTS transfer count compare register is updated as well.

Recommended setup procedure of the DTS channel master setting register

When the special master configures the overall DTS operation, the channel master setting must be configured in the bits 31 to 29, 22 to 16 in this register, and 0 must be specified in the bits 28 to 23, 15 to 0.

The bits 28 to 23 of this register are reserved, but you can read and write those bits.

7.9 DMAC Channel Register

7.9.1 DMAC Channel Register Address

Address = <DMAC_base> “FFFF 8000_H” + Offset address

Table 7.46 DMAC Channel Register Address

Offset Address	Register Symbol	Meaning	Accessed Permission*1	
			Special Master	General Master
$0400_H + 40_H$ × [channel number]	DSAn	DMAC source address	√	√
$0404_H + 40_H$ × [channel number]	DDAn	DMAC destination address	√	√

$0428_H + 40_H$ × [channel number]	DCSTSn	DMAC transfer status set	√	√
$042C_H + 40_H$ × [channel number]	DCSTCn	DMAC transfer status clear	√	√
$0430_H + 40_H$ × [channel number]	DTFRn	DTFR setting	√	√
$0434_H + 40_H$ × [channel number]	DTFRRQn	DTFR transfer request status	√	√
$0438_H + 40_H$ × [channel number]	DTFRRQCn	DTFR transfer request clear	√	√

Note: The [channel number] in the offset addresses and “n” in the register symbols are numbers in the range from 0 to 15, and the correspondence between the channel number n and the channel is as follows.

Channel number n	Channel
0	DMAC0 channel 0
1	DMAC0 channel 1
2	DMAC0 channel 2
3	DMAC0 channel 3
4	DMAC0 channel 4
5	DMAC0 channel 5
6	DMAC0 channel 6
7	DMAC0 channel 7
8	DMAC1 channel 0
9	DMAC1 channel 1
10	DMAC1 channel 2
11	DMAC1 channel 3
12	DMAC1 channel 4
13	DMAC1 channel 5
14	DMAC1 channel 6
15	DMAC1 channel 7

Note 1. √: supported ×: not supported

7.9.2 Details of DMAC Channel Registers

The "n" in the register symbols indicates the DMA channel number (n = 0 to 15).

7.9.2.1 DSAn — DMAC Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0400_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SA31	SA30	SA29	SA28	SA27	SA26	SA25	SA24	SA23	SA22	SA21	SA20	SA19	SA18	SA17	SA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SA15	SA14	SA13	SA12	SA11	SA10	SA9	SA8	SA7	SA6	SA5	SA4	SA3	SA2	SA1	SA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.47 DSAn Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer source address for the next DMA cycle is read.

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the source address is updated.
3. DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.)
   The correct operation is not guaranteed if you select other setting.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.9.2.2 DDAn — DMAC Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0404_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

	DA15	DA14	DA13	DA12	DA11	DA10	DA9	DA8	DA7	DA6	DA5	DA4	DA3	DA2	DA1	DA0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.48 DDAn Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. Those bits are updated whenever a DMA cycle is executed. If you read from those bits, the transfer destination address for the next DMA cycle is read.

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
3. DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.)
   The correct operation is not guaranteed if you select other setting.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.9.2.3 DTCn — DMAC Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0408_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ARC15	ARC14	ARC13	ARC12	ARC11	ARC10	ARC9	ARC8	ARC7	ARC6	ARC5	ARC4	ARC3	ARC2	ARC1	ARC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRC15	TRC14	TRC13	TRC12	TRC11	TRC10	TRC9	TRC8	TRC7	TRC6	TRC5	TRC4	TRC3	TRC2	TRC1	TRC0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.49 DTCn Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. If you read from those bits during DMA transfer, the address reload count for the next DMA cycle is read. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated. If the value is 0000_H, it means that the number of transfers until the address reload when the reload function 2 is used and the number of transfers when the block transfer 2 is used are 65536.
15 to 0	TRC[15:0]	Transfer count Configures the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. If you read from those bits, the remaining number of transfers for the next DMA cycle is read. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained.

TRC[15:0]	Operation
0000_H	The number of transfers is 65536, or the transfer is complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

CAUTIONS

1. It is forbidden to write to those bits when the channel operation is enabled (DCENn.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.

7.9.2.4 DTCTn — DMAC Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + $040C_H$ + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	ESE	DRS	—	—	—	—	—	CHNSEL2	CHNSEL1	SHNSEL0	CHNE1	CHNE0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 7.50 DTCTn Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the value after reset.
27	ESE	Transfer error case DMA transfer disable setting Configures whether a DMA cycle is executed when the DCSTn.ER bit is set due to DMA transfer error. If this bit is cleared to 0, even when the DCSTn.ER bit is set due to DMA transfer error, the following DMA cycles can be executed. If this bit is set to 1, the following DMA cycles are not executed when the DCSTn.ER bit is set due to DMA transfer error. 0: DMA cycles are executed while the DCSTn.ER bit is set. 1: DMA cycles are not executed while the DCSTn.ER bit is set.
26	DRS	DMA transfer request selection assignment Selects the type of DMA transfer requests to be accepted. 0: Software DMA transfer request 1: Hardware DMA transfer request
25 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20 to 18	CHNSEL[2:0]	Next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the same DMAC. You cannot specify a channel in the different DMAC or in the DTS. You cannot specify the same channel for the next channel. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE1, 0	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: (Forbidden. No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value.

Table 7.50 DTCTn Register Contents (2/3)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>14</td><td>TCE</td><td>Transfer completion interrupt enable
If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.
A transfer completion notification interrupt is also generated at the completion of the last transfer when DCSTn.TC = 1.</td></tr>
<tr><td>13</td><td>MLE</td><td>Continuous transfer enable
If this bit is set, the DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.
0: The DTE bit is cleared at the completion of DMA transfer. In addition, the next DMA transfer can start only after the TC bit is cleared.
1: The DTE bit is not cleared at the completion of DMA transfer. In addition, even if the TC bit is not cleared, DMA transfer starts when there is a DMA transfer request.</td></tr>

<tr><td>0</td><td>0</td><td>1</td><td>16 bits</td></tr>
<tr><td>0</td><td>1</td><td>0</td><td>32 bits</td></tr>
<tr><td>0</td><td>1</td><td>1</td><td>64 bits</td></tr>
<tr><td>1</td><td>0</td><td>0</td><td>128 bits</td></tr>
<tr><td colspan="3">Other than the above</td><td>Forbidden (No guarantee of operation)</td></tr>
</table></td></tr>
<tr><td>1, 0</td><td>TRM1, 0</td><td>Transfer mode
Specifies the DMA transfer mode.
00: Single transfer
01: Block transfer 1 (The number of transfers is specified by the transfer count.)
10: Block transfer 2 (The number of transfers is specified by the address reload count.)
11: Forbidden (No guarantee of operation)</td></tr>
</table>

CAUTIONS

1. Except for the case to clear DTCTn.MLE bit, it is forbidden to write to those bits when the channel operation is enabled (DCENn.DTE bit = 1). If you do, the correct operation is not guaranteed.
2. If forbidden settings are used for some of the bits, the correct operation is not guaranteed.

7.9.2.5 DRSAn — DMAC Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0410_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.54 DTCCn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare Configures the transfer count to be compared to the transfer count register. At the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register, the transfer count match flag (DCSTn.CC) in the DMAC transfer status register is set. Furthermore, if the transfer count match interrupt enable (DTCTn.CCE) bit is 1, a transfer count match interrupt is generated. If 0000_H is set, comparison with the transfer count is disabled. In this case, the transfer count match flag in the DMAC transfer status register is never set, and a transfer count match interrupt is never generated.

CAUTION

It is forbidden to write to those bits when the channel operation is enabled (DTE bit = 1). If you do, the correct operation is not guaranteed.

7.9.2.9 DCENn — DMAC Channel Operation Enable Setting Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0420_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DTE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.55 DCENn Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DTE	Channel operation enable Specifies whether to enable or disable the transfer operation of the channel. If the DTE bit is 1, DMA transfer starts when there is a DMA transfer request. If the MLE bit is 0, the DTE bit is cleared automatically at the completion of the DMA transfer. In addition, if 0 is written to the DTE bit during DMA transfer, the DMA transfer is suspended. If 1 is written to the DTE bit during suspension, the suspension is cleared and the DMA transfer resumes. 0: Channel operation is disabled/Channel suspended 1: Channel operation is enabled/Channel suspension cleared

7.9.2.10 DCSTn — DMAC Transfer Status Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0424_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	ERWR	—	—	CY	ER	—	CC	TC	—	—	DR	SR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.56 DCSTn Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is read.
11	ERWR	DMA Transfer Error occurring cycle This bit is updated at the same time as setting of the DMA transfer error flag (ER), indicating which cycle of read or write the DMA transfer error occurs in. This bit is not updated when a new DMA transfer error occurs after the ER bit has been set. If the ER bit is cleared, this bit is also cleared to 0. 0: DMA transfer error occurs in read cycle. 1: DMA transfer error occurs in write cycle.
10, 9	Reserved	When read, the value after reset is read.
8	CY	DMA cycle execution state This bit shows whether a DMA cycle is ongoing in this channel. 0: DMA cycle is not ongoing. 1: DMA cycle is ongoing. After suspending a DMA channel, CY may be polled to assure that any possibly ongoing DMA cycle has finished.
7	ER	Transfer error flag This bit is set when DMA transfer error is generated. If this bit is 1 and the DTCTn.ESE bit is set, a DMA cycle is not executed when a DMA transfer request is generated. 0: No DMA transfer error is generated 1: DMA transfer error is generated
6	Reserved	When read, the value after reset is read.
5	CC	Transfer count match flag This bit is set at the completion of the DMA cycle in which the remaining transfer count is the same as the value set in the transfer compare register. 0: No compare match has occurred with the transfer count compare register. 1: Compare match has occurred with the transfer count compare register.
4	TC	Transfer completion flag This bit is set at the completion of the last transfer and shows whether the DMA transfer is complete. If the MLE bit is 0 and this bit is 1, a DMA cycle is not executed when a DMA transfer request is generated. 0: DMA transfer incomplete 1: DMA transfer complete
3, 2	Reserved	When read, the value after reset is read.

Table 7.56 DCSTn Register Contents (2/2)

Bit Position	Bit Name	Function
1	DR	Hardware DMA transfer request status This bit shows whether there is a hardware DMA transfer request (DMARQ) from the DTFR. This bit changes regardless of the value of the DTE bit when a hardware DMA transfer request from the DTFR is generated. If the software DMA transfer request is selected by the transfer request selection bit (DTCTn.DRS) in the DMAC transfer control register, this bit is not set even when a hardware DMA transfer request is input from the DTFR. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request
0	SR	Software DMA transfer request flag This bit shows whether there is a software DMA transfer request (DMARQ). This bit is automatically cleared at the completion of the last transfer. A user can set this bit by writing 1 to the DCSTS.SRS bit in the DMAC transfer status set register. In addition, a user can clear this bit by writing 1 to the SRC bit in the DMAC transfer status clear register, but if this is done, the ongoing DMA transfer is aborted and cannot be resumed. 0: There is no software DMA transfer request 1: There is a software DMA transfer request

7.9.2.11 DCSTSn — DMAC Transfer Status Set Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0428_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	SRS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.57 DCSTSn Set Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SRS	Software DMA transfer request flag A user can set the software DMA transfer request flag (SR) by writing 1 to this bit. The read value is always 0.

7.9.2.12 DCSTCn — DMAC Transfer Status Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 042C$_H$ + 40$_H$ × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R	R	R/W

Table 7.58 DCSTCn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7	ERC	Transfer error flag clear The DMA transfer error flag (ER) can be cleared by writing 1 to this bit. The read value is always 0.
6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	CCC	Transfer count match flag clear The transfer count match flag (CC) can be cleared by writing 1 to this bit. The read value is always 0.
4	TCC	Transfer completion flag clear The transfer completion flag (TC) can be cleared by writing 1 to this bit. The read value is always 0.
3 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	SRC	Software DMA transfer request flag clear The software DMA transfer request flag (SR) can be cleared by writing 1 to this bit. The read value is always 0.

7.9.2.13 DTFRn — DTFR Setting Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0430_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	REQSEL6	REQSEL5	REQSEL4	REQSEL3	REQSEL2	REQSEL1	REQSEL0	REQEN
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.59 DTFRn Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7 to 1	REQSEL[6:0]	Hardware DMA transfer source selection Selects one out of 128 hardware DMA transfer sources as the hardware DMA transfer request. 000_0000: Selecting the DMACTRG[0] input : 111_1111: Selecting the DMACTRG[127] input
0	REQEN	Hardware DMA transfer source selection enable This bit enables/disables the hardware DMA transfer source selection. 0: Hardware DMA transfer source selection is disabled. 1: Hardware DMA transfer source selection is enabled. If this bit is 0, even when the hardware DMA transfer source selected by the REQSEL6 to 0 bits is activated, it is not recognized as a hardware DMA transfer request, and a hardware DMA transfer request is not generated.

CAUTIONS

1. When changing the DTFR.REQSEL bit, do so while DTFR.REQEN is 0.
2. If the hardware DMA transfer source selection enable bit (DTFRn.REQEN) is set to 0 while the DMAC is executing block transfer, transfer requests sent from the DTFR to the DMAC will be masked at the end of the currently executing DMA cycle and the block being transferred will be suspended.

7.9.2.14 DTFRRQn — DTFR Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: <DMAC_base> + 0434_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.60 DTFRRQn Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	OVF	DMA overflow flag If this bit is set, the DMA channel has received at least one more DMA requests than it can store or handle. One or more DMA requests are lost. OVF can only be read, not written. Write 1 to DTFRRQCn.OVFC to clear OVF.
0	DRQ	Hardware DMA transfer request status If this bit is set, it means that a hardware DMA transfer request exists or is retained. • If the hardware DMA transfer request is an edge detection type*[1] This bit shows whether a hardware DMA transfer request generated by edge detection is retained. When the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is automatically cleared. A user can clear this bit by writing 1 to the DTFRRQCn.DRQC bit. • If the hardware DMA transfer request is a level input type*[1] This bit shows whether there is a hardware DMA transfer request input from the outside. Even when the DMA transfer request acceptance signal (DMAAKn) from the DMAC is asserted, this bit is not automatically cleared. In addition, this bit is not cleared even when a user writes to the DTFRRQCn.DRQC bit. This bit changes regardless of the value of the DTFRn.REQEN bit when a hardware DMA transfer request from the outside is generated. 0: There is no hardware DMA transfer request 1: There is a hardware DMA transfer request

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. Note also that although the reception interrupts for the PSI50 and PSI51 DMA trigger sources (INTPSI50RI and INTPSI51RI) are level interrupts, a hardware DMA transfer request is acknowledged by the input of the edge detection signal to the DMAC.

7.9.2.15 DTFRRQCn — DTFR Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DMAC_base> + 0438_H + 40_H × Ch. No. n (n = 0 to 15)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVFC	DRQC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Table 7.61 DTFRRQCn Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	OVFC	DMA overflow flag clear Write 1 to OVFC to clear DTFRRQn.OVF. The read value is always 0.
0	DRQC	Hardware DMA transfer request clear If the hardware DMA transfer request is an edge detection type*[1], a user can clear the DTFRRQn.DRQ bit by writing 1 to this bit. If the hardware DMA transfer request is a level input type*[1], the DTFRRQn.DRQ bit cannot be cleared by writing to this bit. The read value is always 0.

Note 1. Whether the hardware DMA transfer request is an edge detection type or level input type depends on the hardware DMA transfer source selected by DTFRn.REQSEL. The hardware DMA transfer request is only an edge detection type in this device.

7.10 DTS Channel Register

7.10.1 Transfer information of the DTS (TI)

7.10.1.1 Structure of the TI

The transfer information of the DTS is called TI. One set of TI consists of 32 bits. 8 sets of TI are assigned for each channel. The 8 sets of TI is called TI-A, TI-B, TI-C, TI-D, TI- E, TI-F, TI-G, and TI-H.

Figure 7.20 shows the structure of the TI.

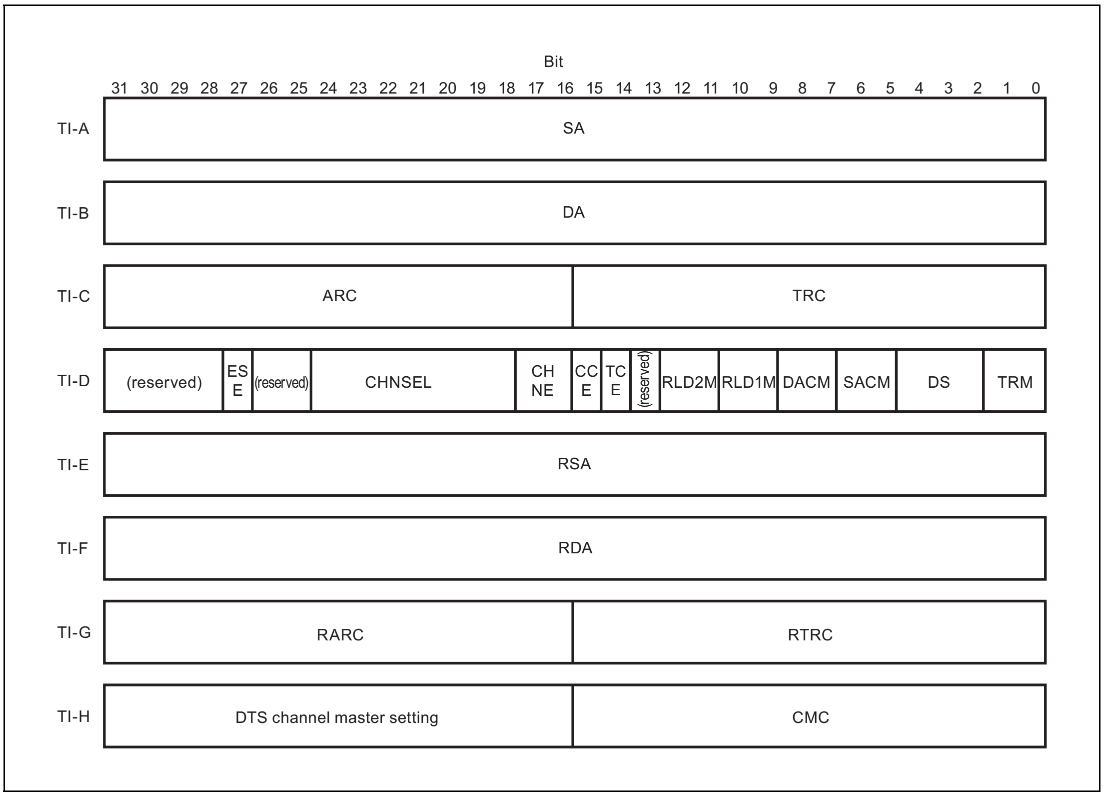

Figure 7.20 Structure of the TI

7.10.1.2 Organization of the TI in the DTSRAM

A user indirectly accesses the DTSRAM by way of the DTS channel registers for each channel and the DTS channel master setting registers.

Therefore, usually, a user does not have to think about the address organization of the TI in the DTSRAM.

As an exception, when ECC error occurs while the DTSRAM is read, the address of the ECC error in the DTSRAM is stored to the DTSRAM error register 2 (DTSER2), one of the global registers. In order to know which channel and TI have generated the error, you need to understand the address organization of the TI in the DTSRAM.

Figure 7.21 shows the address organization of the TI in the DTSRAM.

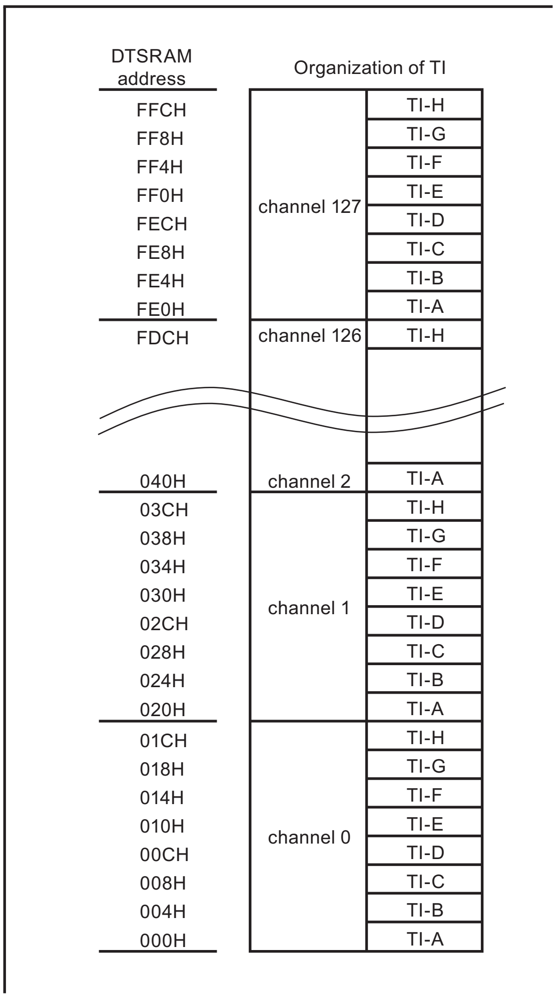

Figure 7.21 Organization of the TI in the DTSRAM

7.10.1.3 Accessing the TI

TI-A can be accessed by way of the DTS source address register (DTSAm) for each channel.

TI-B can be accessed by way of the DTS destination address register (DTDAm) for each channel.

TI-C can be accessed by way of the DTS transfer count register (DTTCm) for each channel.

TI-D can be accessed by way of the DTS transfer control register (DTTCTm) for each channel.

TI-E can be accessed by way of the DTS reload source address register (DTRSAm) for each channel.

TI-F can be accessed by way of the DTS reload destination address register (DTRDAm) for each channel.

TI-G can be accessed by way of the DTS reload transfer count register (DTRTCm) for each channel.

TI-H can be accessed by way of the channel master setting register (DTSmCM), which is a global register, and the transfer count compare register (DTTCCm) for each channel.

7.10.1.4 Caution about Accessing the TI

The data of the DTS channel master setting register and the data of the DTS transfer count compare register are stored to the same TI-H.

Access to the DTS channel master setting register (DTSmCM) is actually 32-bit access to the whole TI-H. Therefore, when you write to the DTS channel master setting register, the lower 16-bit data, which is the data for the DTS transfer count compare (CMC), is updated at the same time. When you read from the DTS channel master setting register, the value of the DTS transfer count compare (CMC) is read as the lower 16-bit data.

When you read from the DTS transfer count compare register (DTTCCm), 32-bit data is read from the TI-H, but only the lower 16-bit data is actually seen in the result of the register read. When you write to the DTS transfer count compare register (DTTCCm), lower 16-bit read/modify/write access to the 32-bit TI-H is used. Data in the TI immediately after the reset is undefined. It should be noted that, if you try to write to the DTS transfer count compare register (DTTCCm) before setting up the DTS channel master setting register, ECC error may be detected during the read of the read/modify/write access.

The bits 28 to 23 of the TI-H are not used, but you can read and write those bits by accessing the DTS channel master setting register. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value by software.

After the reset, the values of TI in DTSRAM are undefined. After the reset, if you read TI before you write to the TI, ECC error will occur.

Therefore, the first access to the following registers after the reset must be write access. The first access after the reset should never be read access.

- DTS source address register (DTSAm)
- DTS destination address register (DTDAm)
- DTS transfer count compare register (DTTCCm)
- DTS transfer control register (DTTCTm)
- DTS reload source address register (DTRSAm)
- DTS reload destination address register (DTRDAm)
- DTS reload transfer count register (DTRTCm)
- Channel master setting registers (DTSmCM)

In addition, the first access to DTS transfer count compare register (DTTCCm) after the reset must be done after write access to channel master setting register (DTSmCM).

You can access the TI from a CPU while the DTS is executing DMA transfer. But if you do so, the following should be noted.

- While a channel is executing DMA transfer, the TI of the channel should not be updated by TI access from CPU. If this situation happens, the result of the DMA transfer and the contents of the TI may mismatch.
- If TI access is requested from CPU while TI fetch or TI write back is executed, the TI access is executed after the completion of TI fetch or TI write back. If TI fetch or TI write back is requested while TI access request from CPU is processed, the TI fetch or TI write back is executed after the completion of TI access.

7.10.2 DTS Channel Register Address

Address = <DTS_base> "FFFF 9000$_H$" + Offset address

Table 7.62 DTS Channel Register Address

Offset Address	Register Symbol	Meaning	Accessed Permission	
			Special Master	General Master
$0000_H + 40_H$ × [channel number]	DTSAm	DTS source address	enable	enable
$0004_H + 40_H$ × [channel number]	DTDAm	DTS destination address	enable	enable
$0008_H + 40_H$ × [channel number]	DTTCm	DTS transfer count	enable	enable
$000C_H + 40_H$ × [channel number]	DTTCTm	DTS transfer control	enable	enable
$0010_H + 40_H$ × [channel number]	DTRSAm	DTS reload source address	enable	enable
$0014_H + 40_H$ × [channel number]	DTRDAm	DTS reload destination address	enable	enable
$0018_H + 40_H$ × [channel number]	DTRTCm	DTS reload transfer count	enable	enable
$001C_H + 40_H$ × [channel number]	DTTCCm	DTS transfer count compare	enable	enable
$0020_H + 40_H$ × [channel number]	DTFSLm	DTSFSL operation setting	enable	enable
$0024_H + 40_H$ × [channel number]	DTFSTm	DTSFSL transfer request status	enable	enable
$0028_H + 40_H$ × [channel number]	DTFSSm	DTSFSL transfer request set	enable	enable
$002C_H + 40_H$ × [channel number]	DTFSCm	DTSFSL transfer request clear	enable	enable

Note 1. The [channel number] in the offset addresses is a number in the range from 0 to 127.
The "m" in the register symbols is a 3-digit number in the range from 000 to 127.

Note 2. Register access to the channels indicated as "reserved" in **Table 7.6, List of DTS Trigger Sources** is prohibited.

7.10.3 Details of DTS Channel Registers

The “m” in the register symbols indicates the DTS channel number (m = 000 to 127).

7.10.3.1 DTSAm — DTS Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0000_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.63 DTSAm Register Contents

Bit Position	Bit Name	Function
31 to 0	SA[31:0]	Source address Specifies the DMA transfer source address. SA[31:0] is updated at the timing of the TI write back and retains the DMA transfer source address for the next DMA transfer.

CAUTION

DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

Data Size	SA3	SA2	SA1	SA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.3.2 DTDAm — DTS Destination Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0004_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DA31	DA30	DA29	DA28	DA27	DA26	DA25	DA24	DA23	DA22	DA21	DA20	DA19	DA18	DA17	DA16
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.64 DTDAm Register Contents

Bit Position	Bit Name	Function
31 to 0	DA[31:0]	Destination address Specifies the DMA transfer destination address. DA[31:0] is updated at the timing of the TI write back and retains the DMA transfer destination address for the next DMA transfer.

CAUTIONS

1. If DMA transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the destination address is updated.
2. DMA transfer for misaligned data is not supported. The possible lowest four bits of the address for each transfer data size is as follows. (× denotes an arbitrary one bit.) The correct operation is not guaranteed if you select other setting.

Data Size	DA3	DA2	DA1	DA0
8 bits	×	×	×	×
16 bits	×	×	×	0
32 bits	×	×	0	0
64 bits	×	0	0	0
128 bits	0	0	0	0

7.10.3.3 DTTCm — DTS Transfer Count Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0008_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

	TRC15	TRC14	TRC13	TRC12	TRC11	TRC10	TRC9	TRC8	TRC7	TRC6	TRC5	TRC4	TRC3	TRC2	TRC1	TRC0
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.65 DTTCm Register Contents

Bit Position	Bit Name	Function
31 to 16	ARC[15:0]	Address reload count Specifies the number of transfers until the address reload when the reload function 2 is used, and also specifies the number of transfers when the block transfer 2 is used. When the reload function 2 or block transfer 2 is used, ARC[15:0] is decremented by one for every DMA cycle and updated at the timing of the TI write back. When the reload function 2 or block transfer 2 is not used, ARC[15:0] is not updated. If 0000_H is set, address reload is disabled. If the value is 0000H at the start of the DMA cycle, the address reload count is not decremented even if a DMA cycle is generated.
15 to 0	TRC[15:0]	Transfer count Configures the number of transfers. TRC[15:0] is decremented by one whenever a DMA cycle is executed. It is updated at the timing of the TI write back. If the reload function is not used, after the last transfer is complete, the value at the completion (0000_H) is retained. If 0000_H is set, DMA transfer is not executed even when a DMA transfer request is accepted.

TRC[15:0]	Operation
0000_H	Transfer is disabled or complete.
0001_H	The number of transfers or remaining transfers is 1.
:	:
$FFFF_H$	The number of transfers or remaining transfers is 65535.

CAUTIONS

1. If transfer error is generated in the read cycle of DMA transfer, the write cycle is not executed, but the transfer count and the address reload count are updated.
2. Unlike a DMAC, “0000_H” in the transfer count of the DTS does not mean “65536 transfers” but means that transfer is disabled or complete.

7.10.3.4 DTTCTm — DTS Transfer Control Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + $000C_H$ + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 7.66 DTTCTm Register Contents (1/3)

Bit Position	Bit Name	Function
31 to 28	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read.
27	ESE	Transfer error case DMA transfer abort setting Specifies whether to abort DMA transfer when DMA transfer error is generated. If this bit is cleared to 0, DMA transfer continues when DMA transfer error is generated. If this bit is set to 1, DMA transfer is aborted when DMA transfer error is generated. 0: DMA transfer continues when DMA transfer error is generated. 1: DMA transfer is aborted when DMA transfer error is generated.
26, 25	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read.
24 to 18	CHNSEL[6:0]	Next channel in the chain Specifies the next channel in the chain. The next channel must be another channel in the DTS. You cannot specify a channel in a DMAC. You cannot specify the same channel for the next channel. (If you do, the correct operation is not guaranteed.)
17, 16	CHNE1, 0	Chain enable Selects the chain function. 00: Disabled 01: Chain at the last transfer A chain request is generated at the completion of the DMA cycle in which the remaining transfer count is one. 10: (Forbidden. No guarantee of operation) 11: Always chain A chain request is generated at the completion of every DMA cycle.
15	CCE	Transfer count match interrupt enable If this bit is set, a transfer count match interrupt is generated at the completion of the DMA cycle in which the transfer count compare register and the remaining transfer count have the same value.
14	TCE	Transfer completion interrupt enable If this bit is set, a transfer completion interrupt is generated at the completion of the last transfer.
13	Reserved	When writing, write the value “0”. When read, the unfixed value after reset and “0” after write is read.

</table></td></tr>
</table>

Table 7.66 DTTCTm Register Contents (3/3)

Bit Position	Bit Name	Function
1, 0	TRM1, 0	Transfer mode Specifies the DMA transfer mode. 00: Single transfer 01: Block transfer 1 (The number of transfers is specified by the transfer count.) 10: Block transfer 2 (The number of transfers is specified by the address reload count.) 11: Forbidden (No guarantee of operation)

CAUTIONS

1. If forbidden settings are used for some of the bits, the correct operation is not guaranteed.
2. The bits 31-28, 26, 25, and bit 13 are reserved. Our recommendation is as follows. When you write to those bits, write 0. When you read from those bits, discard the read value.

7.10.3.5 DTRSAm — DTS Reload Source Address Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0010_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

0000_H	No DMA transfer
0001_H	1 transfer
:	:
$FFFF_H$	65535 transfers

7.10.3.8 DTTCCm — DTS Transfer Count Compare Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 001C$_H$ + 40$_H$ × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 7.70 DTTCCm Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	CMC[15:0]	Transfer count compare Configures the transfer count to be compared to the transfer count register. If the transfer count match interrupt enable (DTTCTm.CCE) bit in the DTS transfer control register is 1, a transfer count match interrupt is generated at the completion of the DMA cycle in which the remaining transfer count is the same as the value in this register. If 0000$_H$ is set, comparison with the transfer count is disabled. In this case, a transfer count match interrupt is not generated.

CAUTION

This register must be accessed after the DTS channel master setting register is set up.

If you access this register without setting up the DTS channel master setting register after the reset, ECC error may be generated during access to this register.

7.10.3.9 DTFSLm — DTSFSL Operation Setting Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0020_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.71 DTFSLm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	REQEN	DMA transfer request enable This bit selects whether a DMA transfer request from this channel retained in the DTSFSL is used as a candidate in DTS channel arbitration. 0: A DMA transfer request from this channel is not used as a candidate in DTS channel arbitration. 1: A DMA transfer request from this channel is used as a candidate in DTS channel arbitration. If this bit is 0, even if the DTSFSL retains a DMA transfer request, this channel is not a candidate in DTS channel arbitration inside the DTSFSL, and consequently a DMA transfer request from this channel is not generated.

7.10.3.10 DTFSTm — DTSFSL Transfer Request Status Register

Access: This register can be read in 32-bit units.

Address: <DTS_base> + 0024_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OVF	DRQ
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 7.72 DTFSTm Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	OVF	DTS overflow flag If this bit is set, the DTS channel has received at least one more DMA requests than it can store or handle. One or more DMA requests are lost. OVF can only be read, not written. Write 1 to DTFSCm.OVFC to clear OVF.
0	DRQ	DMA transfer request pending This bit shows whether a DMA transfer request of this channel is pending. This bit is set when a rising edge is detected in the hardware transfer source input from the DTSTRG pin, or when software writes “1” to the DTFSSm.DRQ bit. This bit is automatically cleared when the DMA transfer request acceptance signal (DTSAK) from the DTS is asserted while the DTSFSL is requesting DMA transfer of this channel. Alternatively, software can clear this bit by writing 1 to the DTFSCm.DRQC bit. 0: A DMA transfer request is not pending. 1: A DMA transfer request is pending.

7.10.3.11 DTFSSm — DTSFSL Transfer Request Set Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + 0028_H + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DRQS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 7.73 DTFSSm Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	DRQS	DMA transfer request set A user can set the DTFSTm.DRQ bit by writing 1 to this bit. The read value is always 0.

7.10.3.12 DTFSCm — DTSFSL Transfer Request Clear Register

Access: This register can be read/written in 32-bit units.

Address: <DTS_base> + $002C_H$ + 40_H × Ch. No. m (m = 0 to 127)
Register access for channels that are shown as reserved in **Table 7.6, List of DTS Trigger Sources** is prohibited.

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

4	DTSSEL104	DTSTRG[38] selector DTSSEL104 specifies the DTS trigger input for DTS channel 38 DTSSEL104 = 0: TAUD1 CH9 interrupt is selected. DTSSEL104 = 1: RX_FIFO_DMA_request_4 from RS-CANFD is selected.
3	DTSSEL103	DTSTRG[37] selector DTSSEL103 specifies the DTS trigger input for DTS channel 37 DTSSEL103 = 0: TAUD1 CH8 interrupt is selected. DTSSEL103 = 1: RX_FIFO_DMA_request_3 from RS-CANFD is selected.
2	DTSSEL102	DTSTRG[36] selector DTSSEL102 specifies the DTS trigger input for DTS channel 36 DTSSEL102 = 0: TAUD1 CH7 interrupt is selected. DTSSEL102 = 1: RX_FIFO_DMA_request_2 from RS-CANFD is selected.

Table 7.79 DTSTRGSEL1 Register Contents (2/2)

Bit Position	Bit Name	Function
1	DTSSEL101	DTSTRG[35] selector DTSSEL101 specifies the DTS trigger input for DTS channel 35 DTSSEL101 = 0: TAUD1 CH6 interrupt is selected. DTSSEL101 = 1: RX_FIFO_DMA_request_1 from RS-CANFD is selected.
0	DTSSEL100	DTSTRG[34] selector DTSSEL100 specifies the DTS trigger input for DTS channel 34 DTSSEL100 = 0: TAUD1 CH5 interrupt is selected. DTSSEL100 = 1: RX_FIFO_DMA_request_0 from RS-CANFD is selected.

Section 8 Reset Controller

8.1 Features

The Reset Controller controls all factors that have an influence on the reset behavior of the device.

The device has several kinds of reset categories depending on the areas that are reset. Each of reset categories is triggered by one or multiple reset sources.

The relation between reset categories and their sources is shown in **Table 8.1**. The relation between reset categories and initialized area is shown in **Table 8.2**.

Table 8.1 Reset Categories and Reset Sources

Reset Category	Source
Power On Reset	• Power On Reset*1 • Debug Initiated Reset
System Reset 1	• Pin Reset • CVM Reset • Debugger Disconnect Reset
System Reset 2	• Software Reset (by SWSRESA0) • ECM Reset (if RESC0 = 0)
Application Reset 1	• Software Reset (by SWARESA0) • ECM Reset (if RESC0 = 1: initial setting)

Note 1. Power On Reset is asserted when VCC supply voltage is under VPOC level and is released when VCC supply voltage is over VPOC level. About VPOC, please refer to **Section 9, Power Supply Circuit** and **Section 37, Electrical Specifications**.

Note 1. The execution of RAM initialization is configurable by a register setting.
Note 2. In case of Pin Reset, the execution of RAM initialization is configurable by a register setting.
Note 3. For details, please refer to **Section 32, Error Control Module (ECM)**.
Note 4. Pin Reset only.
Note 5. For details, please refer to **Section 10, Core Voltage Monitor**.
Note 6. CVM Reset only.
Note 7. Except Debug Initiated Reset.

8.2 Input/Output Pins

I/O pins related to reset are shown in **Table 8.3**.

Table 8.3 I/O Pins

Pin function name	Direction	Description
$\overline{\text{RESET}}$	Input	Reset Input
$\overline{\text{RESETOUT}}$	Output	Reset Output

8.3 Register Description

The register list related to reset is shown in **Table 8.4**.

Registers can be protected from inadvertent write access due to erroneous program execution, etc. by configuration of the P-Bus Guards. For details, see **Section 31, Functional Safety**.

Table 8.4 List of Registers

Address	Register Name	Description	Access Width	Value after Reset
FFF8 1000_H	RESF	Reset Factor Register	32	0000 $0XXX_H$
FFF8 1008_H	RESFC	Reset Factor Clear Register	32	0000 0000_H
FFF8 1100_H	SWSRESA0	Software System Reset Request Register 0	32	0000 0000_H
FFF8 1200_H	SWARESA0	Software Application Reset Request Register 0	32	0000 0000_H
FFF8 2800_H	RESC	Reset Configuration Register	32	0000 0001_H
FFF8 1320_H	STAC_DTSRAM	RAM Initialization Mode Control Register for DTS RAM	32	0000 0003_H
FFF8 1420_H	STAC_GRAM	RAM Initialization Mode Control Register for Global RAM	32	0000 0003_H
FFF8 1520_H	STAC_LM0	RAM Initialization Mode Control Register for Local RAM	32	0000 0003_H
FFF8 $1E20_H$	STAC_LM10	RAM Initialization Mode Control Register for CSIH	32	0000 0003_H

Register reset condition is shown in **Table 8.5**.

Table 8.5 Register Reset Condition

Register Name	Reset Condition			
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1
RESF	√	√*1		
RESFC	√	√	√	√
SWSRESA0	√	√	√	
SWARESA0	√	√	√

STAC_GRAM	√	√	√	
STAC_LM0	√	√*2		
STAC_LM10	√	√	√	

Note 1. The register is initialized in case of CVM Reset only. Each bit of RESF is cleared as described in **Table 8.6**.

Note 2. The registers are initialized in case of CVM reset only.

8.3.1 RESF — Reset Factor Register

This register determines the reset source.

All bits are cleared by Power On Reset, Debugger Initiated Reset, CVM Reset, or software, except it is described differently in **Table 8.6**.

Access: This register can be read in 32-bit units.

Address: FFF8 1000_H

Value after reset: 0000 $0XXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. The value differs with the reset factor.

Table 8.6 Reset Factor Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is read.
10	ARESF3	Filed BIST Execution Flag This flag is set to 1 after the Power On Reset, System Reset 1, or System Reset 2 If Field BIST is enabled. In this case the corresponding reset flag is asserted as well. This flag is only cleared by software. 0: Field BIST was not executed 1: Field BIST was executed
9	ARESF2	ECM Application Reset Flag 0: No reset occurred 1: Reset has occurred
8	Reserved	When read, the value after reset is read.
7	ARESF0	Software Application Reset 0 Flag 0: No reset occurred 1: Reset has occurred
6	Reserved	When read, an undefined value is returned.
5	SRESF4	ECM System Reset Flag 0: No reset occurred 1: Reset has occurred
4	Reserved	When read, the value after reset is read.
3	SRESF2	Software System Reset 0 Flag 0: No reset occurred 1: Reset has occurred
2	SRESF1	CVM Reset Flag This flag is only cleared by Power On Reset, Debugger Initiated Reset, or software. 0: No reset occurred 1: Reset has occurred

Table 8.6 Reset Factor Register Contents (2/2)

Bit Position	Bit Name	Function
1	SRESF0	Pin Reset Flag This flag is also set by Power On Reset and Debugger Initiated Reset. This flag is only cleared by software. 0: No reset occurred 1: Reset has occurred
0	PRESF0	Power On Reset Flag This flag is also set by Debugger Initiated Reset. This flag is only cleared by CVM Reset or software. 0: No reset occurred 1: Reset has occurred

8.3.2 RESFC — Reset Factor Clear Register

This register clears the reset flags of the RESF register.

This register is always read as 00_H.

Access: This register can be written in 32-bit units.

Address: FFF8 1008_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8.3.3 SWSRESA0 — Software System Reset Request Register 0

This register is used to generate a System Reset 2.

This register is always read as 00_H.

Access: This register can be written in 32-bit units.

Address: FFF8 1100_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

8.3.6 STAC_DTSRAM — RAM Initialization Mode Control Register for DTS RAM

This register is used to control the RAM initialization execution of the DTS RAM. In Application Reset 1, initialization of DTS RAM is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1320_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

8.3.7 STAC_GRAM — RAM Initialization Mode Control Register for Global RAM

This register is used to control the RAM initialization execution of the Global RAM. In Application Reset 1, initialization of Global RAM is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 1420_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

1, 0	RZEROMD[1:0]	RAM Initialization Mode for Local RAM x0: Disabled 01: Prohibied 11: Enabled

8.3.9 STAC_LM10 — RAM Initialization Mode Control Register for CSIH

This register is used to control the RAM Initialization execution of the CSIH. In Application Reset 1, initialization of RAM for CSIH is executed depending on this register.

Access: This register can be read/written in 32-bit units.

Address: FFF8 $1E20_H$

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

1, 0	RZEROMD[1:0]	RAM Initialization Mode for CSIH x0: Disabled 01: Prohibited 11: Enabled

8.4 Operation

8.4.1 Reset Categories

Power On Reset

The Power On Reset represents a Start-Up of the device during power up. This reset occurs when VCC supply voltage is under a specified level and is released when VCC supply voltage is over the specified level. In this case entire microcontroller is initialized. Power On Reset can also be triggered by Debugger.

System Reset 1

System Reset 1 is identical to the Power On Reset with the following exceptions. The Reset Factor Register of the Reset Controller and the Error Source Status Register of the Error Control Module and a part of Core Voltage Monitor registers are excluded from this reset. System Reset 1 sources are as follows.

- Pin Reset
- Core Voltage Monitor Reset
- Debugger Disconnect Reset

System Reset 2

System Reset 2 is identical to the System Reset 1 with the following exceptions. Reset Configuration register for ECM is excluded from reset. System Reset 2 sources are as follows.

- Software Reset by writing the SWSRESA0 register.
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)

Application Reset 1

Application Reset 1 is used for fast re-initialization of the application. This reset is basically identical to the System Reset 2 with the following exceptions. The Option bytes stored in the FLASH is not reloaded. Filed BIST is not executed too. Application Reset 1 sources are as follows.

- Software Reset by writing the SWARESA0 register.
- Error Control Module Reset (The Reset Category is configured by the Reset Configuration Register)

8.4.2 Reset Sources

Power On Reset

The Power On Reset refers to a Start-Up of the device during power up. The power up condition is detected by a Power-On-Clear circuit (POC). It continuously compares the power supply voltage VCC with an internal reference voltage (Vpoc). If VCC lowers below the internal reference voltage (VCC < Vpoc), Power On Reset is generated. For details, refer to **Section 37, Electrical Characteristics**.

Pin Reset (by $\overline{\text{RESET}}$)

A dedicated Reset Input pin ($\overline{\text{RESET}}$) is available for initialization.

The associated buffer has input hysteresis. Therefore, there is no restriction for the slew rate of the reset signal as defined in the Electrical Characteristics.

The Pin Reset is active low. Its status will propagate independently from clock activity.

In case of an open reset input, the device will be initialized via the internal pull-down of the Reset Input Buffer. This ensures that the device is always in a safe state.

A Reset glitch filter is provided. For details about the filter characteristics, please refer to **Section 37, Electrical Specifications**.

In case of Power-up and Power-down, $\overline{\text{RESET}}$ should be low level. In case of Power-up, $\overline{\text{RESET}}$ must be asserted until VDD exceeds the threshold and main oscillator is stabilized. Until VCC and VDD exceed the threshold, Internal reset is maintained. After Internal reset and $\overline{\text{RESET}}$ are released, Filed BIST and RAM initialization are executed. For details on the required $\overline{\text{RESET}}$ low level period (tDVDDPUR, tDVCCPUR) and the threshold of VCC and VDD please refer to **Section 37, Electrical Specifications**.

In case of Pin Reset excluding power-up/down, the low level pulse width of the $\overline{\text{RESET}}$ input must be greater than the value of noise-filter characteristic (tWRSL) to activate the reset. For details on the required $\overline{\text{RESET}}$ low level pulse width, please refer to **Section 37, Electrical Specifications**.

Core Voltage Monitor Reset

The Core Voltage Monitor reset can be asserted as soon as one of the core supply voltages is outside the operating range. The execution of the CVM reset can be masked as well. For details , refer to **Section 10, Core Voltage Monitor**.

The CVM operation is independent from the Pin Reset.

ECM Reset

No device failure (e.g. illegal access) will result in a reset. All failures which are detectable by the Error Control Module (ECM) generate dedicated internal reset or interrupts (FENMI or EINT) instead. The failure signals and system behavior can be configured in the ECM (see **Section 32, Error Control Module (ECM)**). Optionally the device failures can be configured to be used as a Reset Source.

The ECM Reset can generate a System Reset 2 or an Application Reset 1. The behavior can be configured by the Reset Configuration Register.

Software Reset

The device supports multiple software resets, and resets from different reset categories can be triggered.

- Software System Reset Request Register 0 (SWSRESA0) triggers a System Reset 2
- Software Application Reset Request Register 0 (SWARESA0) triggers an Application Reset 1

Debug Initiated Reset

Transits to the internal reset state when the microcontroller is connected with the debug tool and receives the reset command from the debugger. It can trigger a Power On Reset. For details, refer to the**Section 34, On-Chip Debugging Unit (OCD)**.

Debugger Disconnect Reset

System reset 1 is generated when the input level of debug reset pin ($\overline{\text{DCUTRST}}$ pin) is changed from high to low. (e.g. disconnecting of debug tool).

8.4.3 Reset Flags

Any reset source can be identified by software in the Reset Factor Register (RESF). Each reset source will be indicated by one bit when it occurs. The bit status can be read out after the reset has been executed.

The Power On Reset flag is set by Power On Reset or Debugger Initiated Reset, and can only be cleared by a CVM Reset or by software.

The reset factor which sets or clears all reset flags except the Power On Reset flag is different for each flag. For details, see **8.3.1, RESF — Reset Factor Register**.

8.4.4 Reading Option Bytes from FLASH

Reading Option Bytes from FLASH memory is executed by Power On Reset, System Reset 1 and System Reset 2.

8.4.5 Filed BIST

Filed BIST is executed by Power On Reset, System Reset 1 and System Reset 2. In System Reset 1 (Pin reset only) and System Reset 2, Filed BIST execution can be disabled by the Field BIST Control Register (BSEQ0CTL). For details of BSEQ0CTL register, see **Section 31.6, BIST**.

8.4.6 RAM initialization

RAM initialization to 0 is basically executed by all reset categories. For System Reset 1 (Pin reset only) , System Reset2 and Application Reset 1 , Initialization of Local RAM can be disabled by the RAM Initialization Mode Control Register.

For Application Reset 1, Initialization of DTS RAM, Global RAM, and CSIH RAM can be disabled by the RAM Initialization Mode Control Registers corresponding to the RAMs.

8.4.7 Reset Mask function

In debug mode, System Resets 1 and 2 and Application Reset 1 can be masked by debugger setting. For details, please refer to **Section 34, On-Chip Debugging Unit (OCD)**.

Masked reset sources are shown in **Table 8.15**.

Table 8.15 Masked Reset Sources

Reset Categories	Reset Sources
System Reset 1	Pin Reset
System Reset 2	ECM Reset (RESC0 = 0)
	Software Reset by SWSRESA0
Application Reset 1	ECM Reset (RESC0 = 1)
	Software Reset by SWARESA0

8.4.8 Reset Output (RESETOUT)

Any of the reset resources is generated, a reset output (RESETOUT) is externally output. A reset output can be used to reset the external device at the same timing of reset generation in the microcontroller.

The figure below shows RESETOUT output operation.

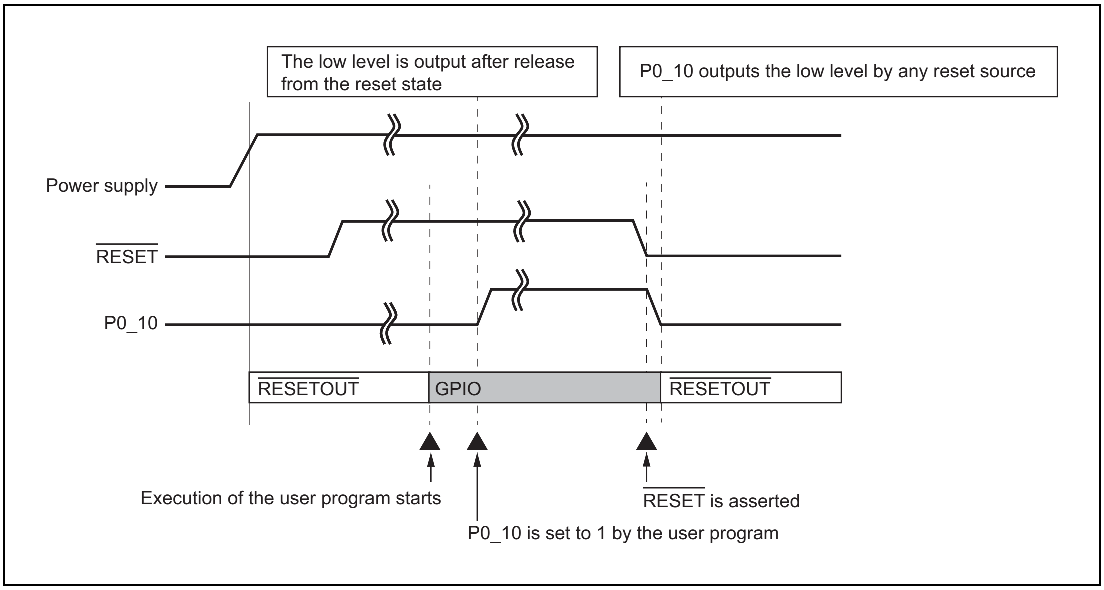

Figure 8.1 P0_10 Pin (RESETOUT Signal) Operation during Reset and after Release

Section 9 Power Supply Circuit

9.1 Features

This section describes the external voltage connection and internal voltage distribution required to operate the microcontroller. The power supply circuit has a POC (Power On Clear) circuit for safe startup.

The power supply construction of this device is classified into 2 categories.

Table 9.1 List of Power Type

Item	Type Name	P1M-E
Single power supply (with internal regulators)	embedded Voltage Regulator (eVR)	√
Dual Power Supply (DPS)	DPS	√

9.2 External Pin List

Table 9.2 shows the list of external pins

Table 9.2 List of External Pins

Pin Name	I/O	Range	Function	eVR	DPS

Section 10 Core Voltage Monitor

10.1 Overview

10.1.1 Functional Overview

Core voltage monitor (CVM) monitors the VDD electric potential supplied to the core logic.

Deviation from operating range of the core voltage is informed by:

- Outputs a low level from the $\overline{\text{CVMOUT}}$ pin.
- Sets flags independently in the CVMF register at events (high voltage detection and low voltage detection).
- Able to reset of core voltage operation area by CVM Reset.

The CVM function is independent of the resets except Power On Reset.

All writable CVM control registers are protected by P-Bus guard.

Diagnostic function:

- High voltage error and low voltage error can be generated without influencing core voltage itself by changing reference voltage.
- The signal path to the $\overline{\text{CVMOUT}}$ pin can optionally be masked at diagnostic.
- $\overline{\text{CVMOUT}}$ pin provides read back function to check pin level.

10.1.2 Block Diagram

The block diagram of CVM for DPS is shown in **Figure 10.1**.

The block diagram of CVM for eVR is shown in **Figure 10.2**.

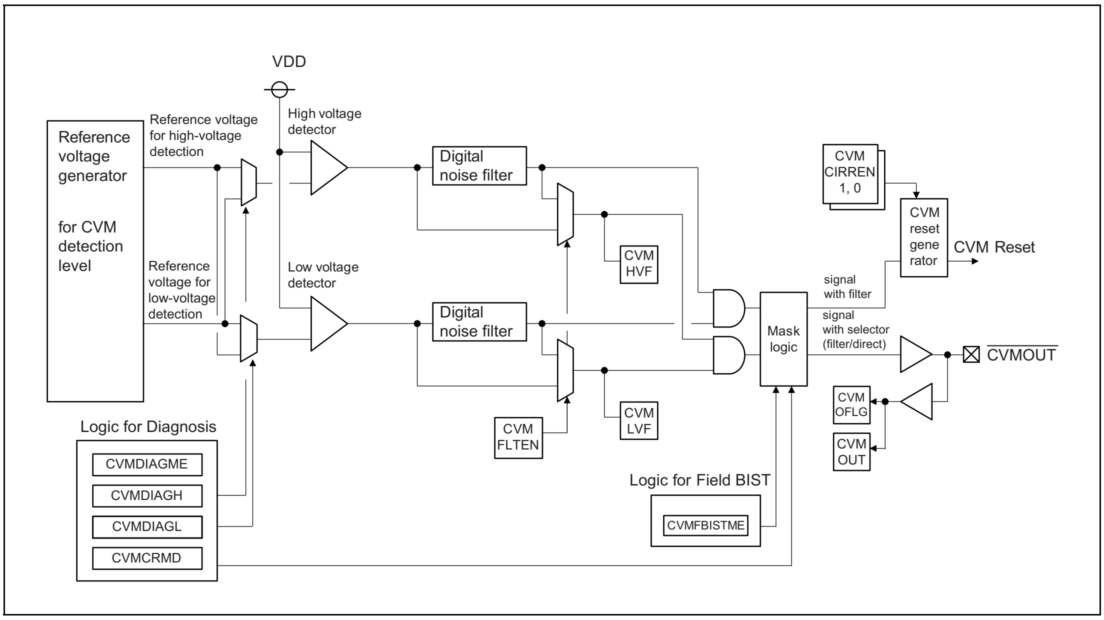

Figure 10.1 Block diagram of CVM for DPS

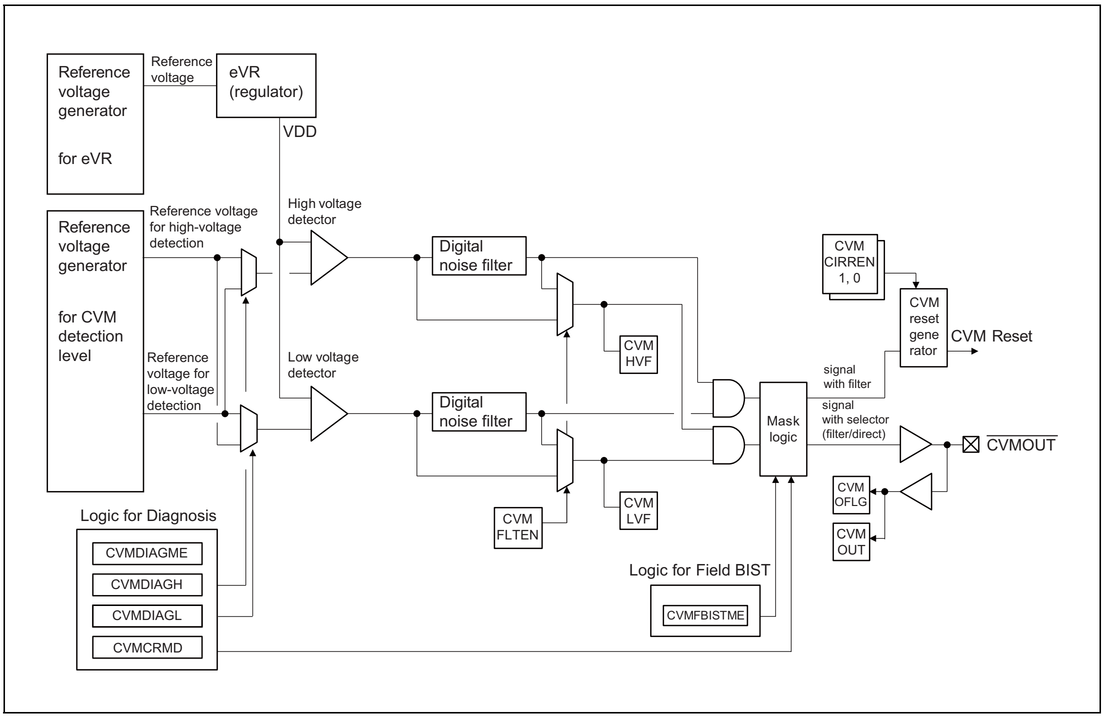

Figure 10.2 Block diagram of CVM for eVR

10.2 Input/Output Pins

I/O pin related to CVM is shown in **Table 10.1**.

Table 10.1 I/O Pins

Pin Function Name	Direction	Description
$\overline{\text{CVMOUT}}$	Output	CVM internal voltage error detection output signal

10.3 Registers

10.3.1 List of Registers

A register list related to CVM is shown in **Table 10.2**.

Table 10.2 List of Registers

Address	Register Name	Description	Access Width	Value after Reset
FFF8 $2C00_H$	CVMF	CVM Factor register	8	00_H
FFF8 $2C04_H$	CVMDE	CVM Detection Enable register	8	03_H
FFF8 $2C0C_H$	CVMDMASK	CVM Detection Output Mask Register	8	00_H
FFF8 $2C10_H$	CVMDIAG	CVM DIAG mode setting register	8	00_H
FFF8 $2C14_H$	CVMMON	CVM Monitor register	8	$0x_H$*2
FFF8 $2C18_H$	CVMFC	CVM Factor Clear Register	8	00_H
FFF8 $2C1C_H$	CVMDEW	CVM Detection Enable Set Register*1	8	00_H

Note 1. Writing is permitted only once after Power On Reset.

Note 2. This initial value depends on the status of $\overline{\text{CVMOUT}}$ pin.

Register reset conditions are shown in **Table 10.3**.

Table 10.3 Register Reset Conditions

CVMDEW				

Note 1. Pin Reset only.

10.3.2 CVMF — CVM Factor Register

The CVMF register indicates the state of $\overline{\text{CVMOUT}}$ pin output and the state of the detection of errors by the CVM.

This register is initialized only by Power On Reset.

Each flag of CVMF can be also cleared individually by writing “1” to the corresponding bit in CVMFC.

Access: This register can be read in 8-bit units.

Address: FFF8 $2C00_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CVMOFLG	—	—	—	—	—	CVMHVF	CVMLVF
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 10.4 CVMF Register Contents

Bit Position	Bit Name	Function
7	CVMOFLG	$\overline{\text{CVMOUT}}$ Flag When $\overline{\text{CVMOUT}}$ pin has changed to low level, this flag is set to 1. 0: $\overline{\text{CVMOUT}}$ pin has not changed to low level. 1: $\overline{\text{CVMOUT}}$ pin has changed to low level.
6 to 2	Reserved	When read, the value after reset is read.
1	CVMHVF	High Voltage Detection Flag 0: No high core voltage violation detected. 1: High core voltage violation occurred.
0	CVMLVF	Low Voltage Detection Flag 0: No low core voltage violation detected. 1: Low core voltage violation occurred.

10.3.3 CVMFC — CVM Factor Clear Register

CVMFC is a register to clear the corresponding bits in CVMF register.

The read value of this register is always 00_H.

Access: This register can be written in 8-bit units.

Address: FFF8 $2C18_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CVMOFLGC	—	—	—	—	—	CVMHVFC	CVMLVFC
Value after reset	0	0	0	0	0	0	0	0
R/W	W	R	R	R	R	R	W	W

Table 10.5 CVMFC Register Contents

Bit Position	Bit Name	Function
7	CVMOFLGC	Clears $\overline{\text{CVMOUT}}$ Flag 0: Writing 0 has no effect. 1: Writing 1 clears CVMOFLG.
6 to 2	Reserved	When writing, write the value after reset.
1	CVMHVFC	Clears High Voltage Detection Flag 0: Writing 0 has no effect. 1: Writing 1 clears CVMHVF.
0	CVMLVFC	Clears Low Voltage Detection Flag 0: Writing 0 has no effect. 1: Writing 1 clears CVMLVF.

10.3.4 CVMDE — CVM Detection Enable Register

CVMDE is a read-only register to control CVM reset, masking of the CVM signal, and filtering of the CVM signal.

This register is initialized by Power On Reset and reflect the settings written to the corresponding bits of CVMDEW.

Access: This register can be read in 8-bit units.

Address: FFF8 $2C04_H$

Value after reset: 03_H

Bit	7	6	5	4	3	2	1	0
	CVMCIRREN1	—	CVMCIRREN0	CVMFBISTME	CVMFLTEN	CVMDIAGME	—	—
Value after reset	0	0	0	0	0	0	1	1
R/W	R	R	R	R	R	R	R	R

Table 10.6 CVMDE Register Contents

Bit Position	Bit Name	Function
7	CVMCIRREN1	Enables CVM Reset. CVMCIRREN1, 0 11_B: CVM internal reset is enabled. Other than the above: CVM internal reset is disabled.
6	Reserved	When read, the value after reset is read.
5	CVMCIRREN0	Refer to bit 7 (CVMCIRREN1).
4	CVMFBISTME	$\overline{\text{CVMOUT}}$ output and CVM Reset Mask Control during Field BIST Operation 0: Masking of $\overline{\text{CVMOUT}}$ output and CVM reset during Field BIST Operation is enabled. 1: Masking of $\overline{\text{CVMOUT}}$ output and CVM reset during Field BIST Operation is disabled. **CAUTION** This bit setting is valid only for the Field BIST that started up from System Reset 1. $\overline{\text{CVMOUT}}$ output and CVM Reset are not masked if the Field BIST is started by System Reset 2, regardless of the setting of this bit.
3	CVMFLTEN	Enables Output Filter for $\overline{\text{CVMOUT}}$ 0: Output filter for $\overline{\text{CVMOUT}}$ is enabled. 1: Output filter for $\overline{\text{CVMOUT}}$ is disabled.
2	CVMDIAGME	Enables DIAG Function 0: DIAG function of the CVM is enabled. 1: DIAG function of the CVM is disabled.
1, 0	Reserved	When read, the value after reset is read.

10.3.5 CVMDEW — CVM Detection Enable Set Register

CVMDEW is a register to set values of CVMDE.

Writing is permitted only once after Power On Reset is released. Subsequent write operation is ignored. The read value of this register is always 00_H.

Access: This register can be written in 8-bit units.

Address: FFF8 $2C1C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CVM CIRREN1W	—	CVM CIRREN0W	CVM FBISTMEW	CVMFLTENW	CVMDIAGMEW	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	W	R	W	W	W	W	R	R

Table 10.7 CVMDEW Register Contents

Bit Position	Bit Name	Function
7	CVMCIRREN1W	The value written in this bit is set to CVMDE.CVMCIRREN1.
6	Reserved	When writing, write the value after reset.
5	CVMCIRREN0W	The value written in this bit is set to CVMDE.CVMCIRREN0.
4	CVMFBISTMEW	The value written in this bit is set to CVMDE.CVMFBISTME.
3	CVMFLTENW	The value written in this bit is set to CVMDE.CVMFLTEN.
2	CVMDIAGMEW	The value written in this bit is set to CVMDE.CVMDIAGME.
1, 0	Reserved	When writing, write the value after reset.

10.3.6 CVMDMASK — CVM Detection Output Mask Register

CVMDMASK is a register to mask $\overline{\text{CVMOUT}}$ output when CVMDE.CVMDIAGME = 0.

The setting of CVMDMASK is ignored when CVMDE.CVMDIAGME = 1. Writing is possible regardless of the CVMDIAGME setting.

This register is initialized by Power On Reset or System Reset 1 (Pin Reset only).

Access: This register can be read/written in 8-bit units.

Address: FFF8 $2C0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CVMCRMD
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 10.8 CVMDMASK Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	CVMCRMD	This bit masks $\overline{\text{CVMOUT}}$ when CVMDIAGME = 0. 0: $\overline{\text{CVMOUT}}$ output are not masked. 1: $\overline{\text{CVMOUT}}$ output are masked. $\overline{\text{CVMOUT}}$ becomes high level and the CVM Reset don't occur. **NOTE** The value of CVMDE.CVMCIRREN1, 0 is "00_B" while the CVM diagnosis application is carried out after Power On Reset. Therefore CVM reset has been already masked by CVMCIRREN1, 0 even if CVMCRMD isn't set to "1".

10.3.7 CVMDIAG — CVM DIAG Mode Setting Register

CVMDIAG forces CVM comparators to output errors.

This register is valid only when CVMDE.CVMDIAGME = 0. The setting of CVMDIAG is ignored when CVMDE.CVMDIAGME = 1. Writing is possible regardless of the CVMDIAGME setting.

This register is initialized by Power On Reset and System Reset 1.

Access: This register can be read/written in 8-bit units.

Address: FFF8 $2C10_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	CVMDIAGH	CVMDIAGL	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R

Table 10.9 CVMDIAG Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	CVMDIAGH	This bit controls the detection level of high voltage detector 0: CVM monitors at a reference for high-voltage detection. 1: High voltage violation is forcibly generated by changing the detection level to reference voltage for low-voltage detection.
2	CVMDIAGL	This bit controls the detection level of low voltage detector. 0: CVM monitors at a reference for low-voltage detection. 1: Low voltage violation is forcibly generated by changing the detection level to reference voltage for high-voltage detection.
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

10.3.8 CVMMON — CVM Monitor Register

CVMMON register reflects the status of $\overline{\text{CVMOUT}}$ pin.

Access: This register can be read in 8-bit units.

Address: FFF8 $2C14_H$

Value after reset: $0X_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CVMOUT
Value after reset	0	0	0	0	0	0	0	—
R/W	R	R	R	R	R	R	R	R

Table 10.10 CVMMON Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	CVMOUT	$\overline{\text{CVMOUT}}$ Pin Level 0: $\overline{\text{CVMOUT}}$ Output level is at low level. 1: $\overline{\text{CVMOUT}}$ Output level is at High level.

10.4 Operation

10.4.1 CVM Basic Function

CVM constantly monitors the VDD voltage except when VCC is not stable and Power On Reset occurs.

CVM has high and low voltage detection circuit. If it detects voltage error, it records the error to CVMF register and notifies the error to the outside via $\overline{\text{CVMOUT}}$ pin. It also generates internal reset (CVM reset) triggered by detection of voltage error.

(1) CVM detection flag

CVM sets “1” to CVMF.CVMHVF when VDD becomes higher than high voltage detection level of CVM. Similarly, CVM sets “1” to CVMF.CVMLVF when VDD becomes lower than low voltage detection level of CVM.

These flags can be cleared to “0” by writing in the corresponding bits of CVMFC (CVMHVFC for CVMHVF, CVMLVFC for CVMLVF). These flags are also cleared by Power On Reset (not cleared by other resets).

Figure 10.3 shows the operation example of CVMHVF and CVMLVF.

(2) $\overline{\text{CVMOUT}}$ pin

While VDD voltage is higher than high voltage detection level or lower than low voltage detection level of CVM, $\overline{\text{CVMOUT}}$ pin outputs a low level signal. If CVM does not detect a voltage error, the $\overline{\text{CVMOUT}}$ pin outputs a high level signal.

To avoid an unexpected operation of CVM circuit caused by instable power supply at power up, $\overline{\text{CVMOUT}}$ is fixed to low during Power On Reset period. $\overline{\text{CVMOUT}}$ outputs error detection result at all other times.

The status of $\overline{\text{CVMOUT}}$ can be read from CVMF.CVMOFLG or CVMMON.CVMOUT. CVMOFLG is set to “1” when $\overline{\text{CVMOUT}}$ pin becomes low. It is cleared to “0” when “1” is written to CVMFC.CVMOFLGC. It is also cleared by Power On Reset (not cleared by other resets).

Figure 10.3 shows the operation example of $\overline{\text{CVMOUT}}$ and CVMOFLG.

CVMMON.CVMOUT is used for self-diagnosis function. See **Section 10.4.3, CVM Diagnosis Function** for further information.

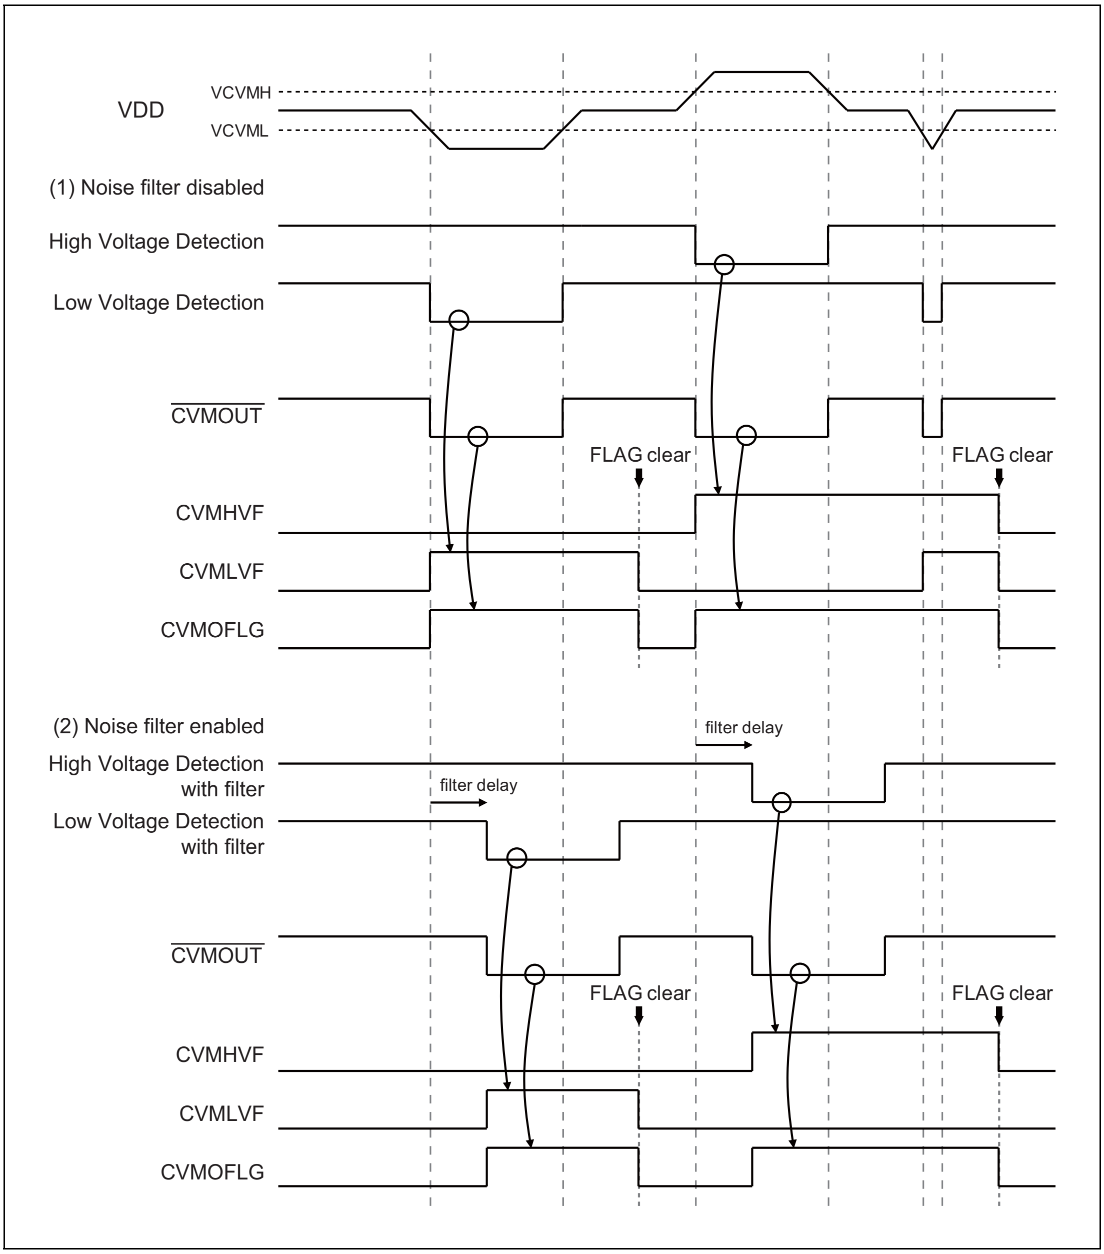

Figure 10.3 CVM Basic Operation

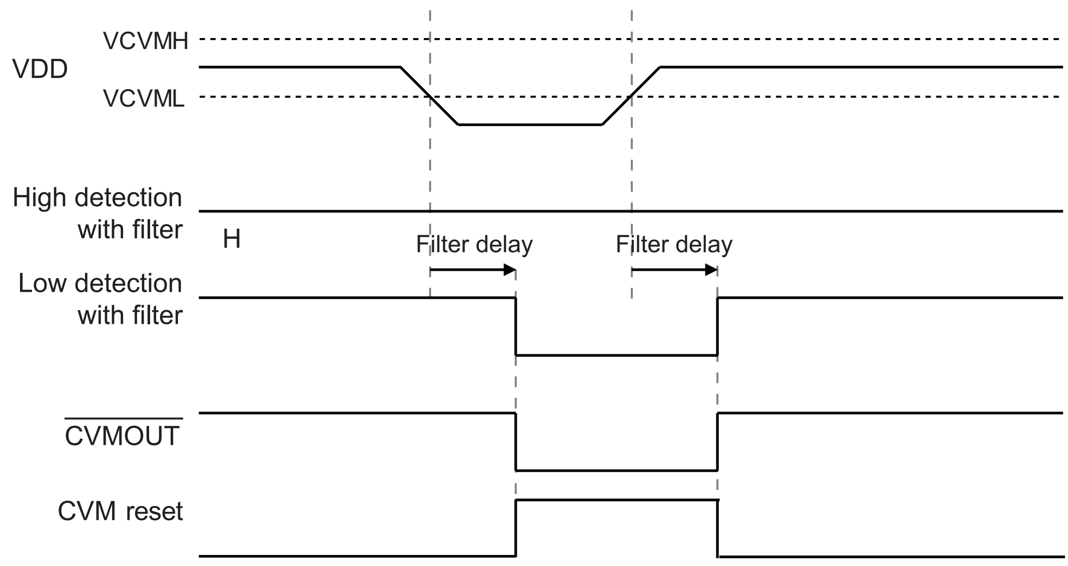
(3) CVM reset

If VDD voltage becomes higher than high voltage detection level or lower than low voltage detection level of CVM when CVM Reset is enable (CVMDE.CVMCIRREN1, 0 = "11_B") in advance, CVM reset occurs and the MCU is initialized. CVM reset is released since CVM detects the normal voltage.

Figure 10.4 shows the operation example of CVM reset.



Note: See **Section 37.11, Core Voltage Monitor Characteristics** for further information of response time.

Figure 10.4 CVM Reset Operation

(4) Digital noise filter

The output signals from the CVM comparators pass through a digital noise filter to remove temporary glitches. Whether to use filtered output or to bypass the filter can be selected by CVMDE.CVMFLTEN. This setting is applied to $\overline{\text{CVMOUT}}$, CVMHVF and CVMLVF. For CVM reset, filtered signals are always used.

10.4.2 CVM Function in Field BIST operation and Serial Programing Mode (Mask of CVMOUT Pin and CVM Reset)

It is possible to mask $\overline{\text{CVMOUT}}$ output and CVM reset while Field BIST is being carried out after Power On Reset and System Reset 1 if CVMDE.CVMFBISTME = 0. In this case, $\overline{\text{CVMOUT}}$ is fixed to high level and a CVM reset does not occur. $\overline{\text{CVMOUT}}$ output is fixed to high level in serial programing mode as well.

10.4.3 CVM Diagnosis Function

(1) Change of CVM detection level for forcibly generating CVM error

When CVMDE.CVMDIAGME is “0”, CVM detection level can be changed by CVMDIAG.CVMDIAGH or CVMDIAG.CVMDIAGL. CVM error detection signal can be intentionally generated by setting these registers even when VDD voltage is in the operating range.

(2) Mask of $\overline{\text{CVMOUT}}$ pin and CVM Reset

$\overline{\text{CVMOUT}}$ output can be masked by setting CVMDMASK.CVMCRMD to “1” if CVMDE.CVMDIAGME is "0". With this setting, $\overline{\text{CVMOUT}}$ is fixed to high level even when a CVM error is generated by CVMDIAGH or CVMDIAGL.

The value of CVMDE.CVMCIRREN1, 0 is “00_B” while the CVM diagnosis application is carried out after Power On Reset. Therefore, CVM reset is already masked by CVMCIRREN1, 0 even if CVMCRMD isn’t set to “1”.

(3) Monitor of $\overline{\text{CVMOUT}}$ pin

The status of $\overline{\text{CVMOUT}}$ pin can be monitored by CVMMON.CVMOUT. By reading this register, it can be checked whether $\overline{\text{CVMOUT}}$ is at low level when a CVM error is generated by CVMDIAGH or CVMDIAGL.

If VDD voltage is out of the operating range, the value read from the CVMMON register can’t be guaranteed.

(4) The flow of CVM diagnosis application

CVMDE.CVMDIAGME is initialized to “0” by Power On Reset. Thus, the CVM diagnosis function is enabled at start-up after Power On Reset. The diagnostic function can be controlled by the user application by using CVMDMASK and CVMDIAG.

Figure 10.5 shows an example of the diagnosis application.

After diagnosis application is over, write “1” to CVMDEW.CVMDIAGMEW*[1] and disable CVM diagnosis function immediately. This function protects each flag against erroneous operation when VDD is out of the operating range.

Note 1. Write to the other bits of CVMDEW as well at the same time because writing to CVMDEW is permitted only once after Power On Reset.

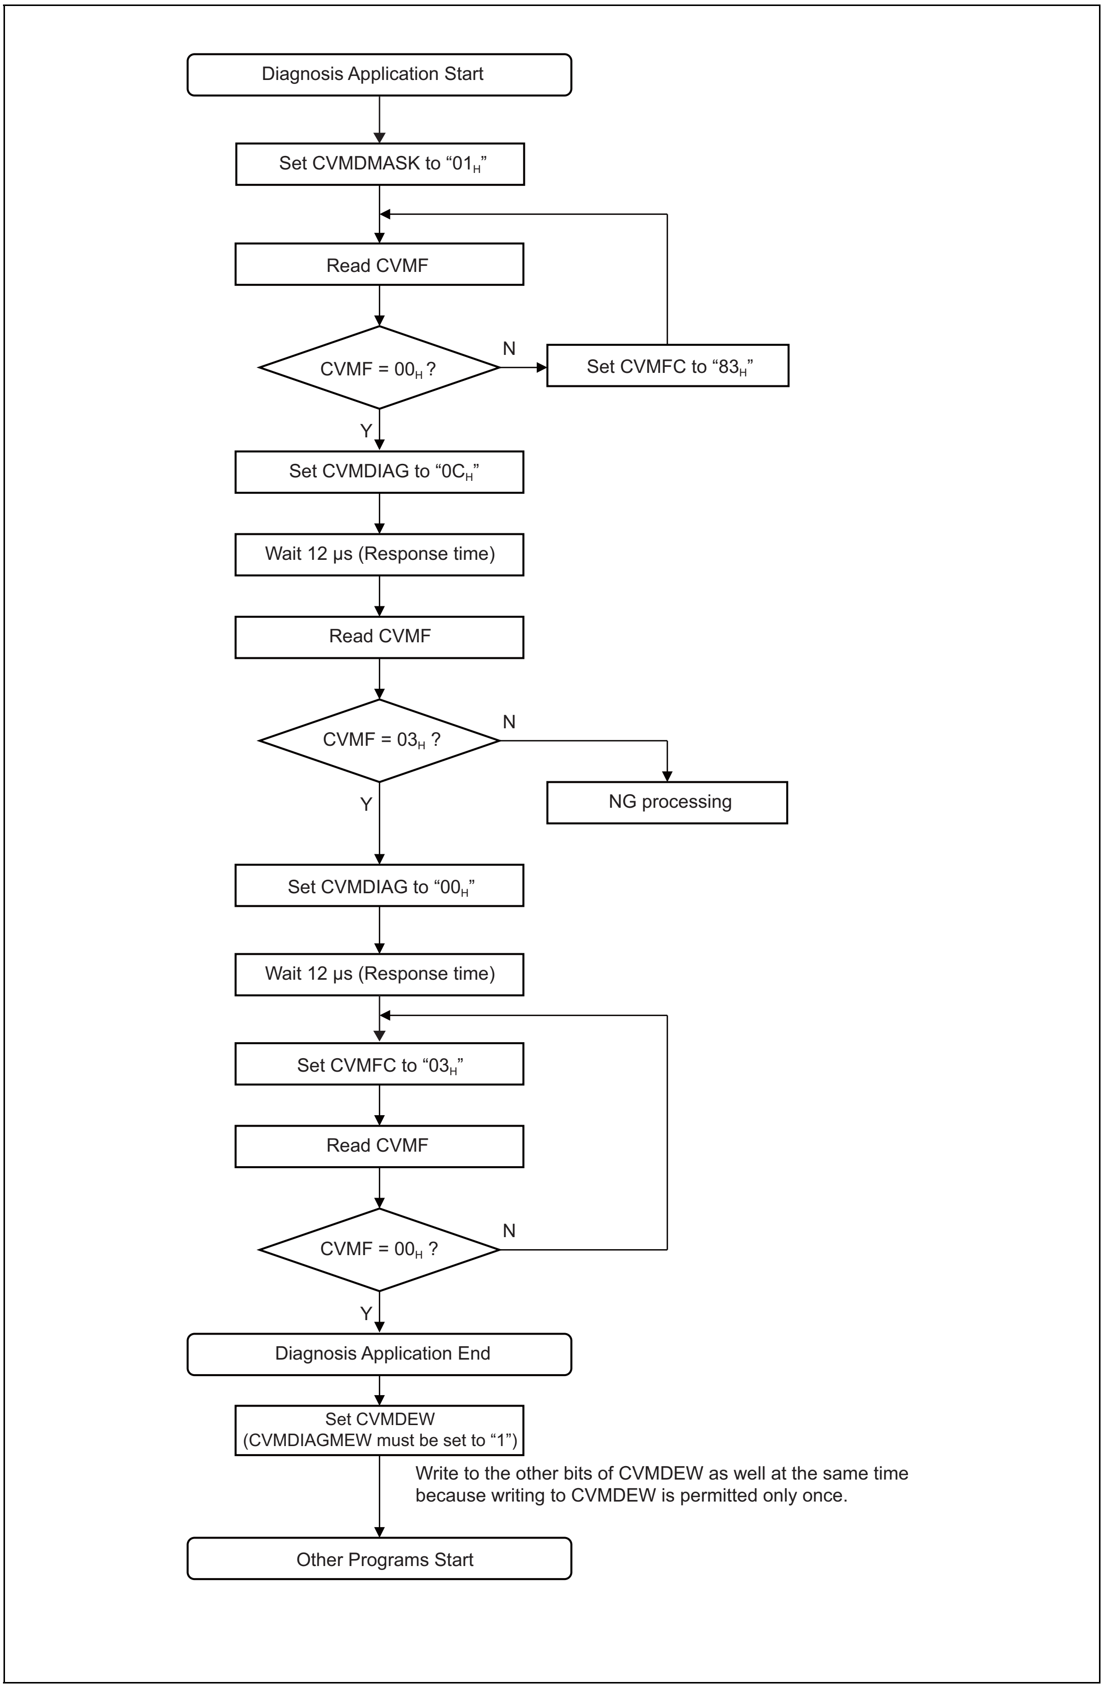


Figure 10.5 Example of Flowchart for CVM Diagnosis Application

10.5 Usage Notes

(1) Flag bits (CVMHVF, CVMLVF, CVMOFLG)

Setting 1 to CVMHVF by error detection has priority over clearing CVMHVF by CVMHVFC. Similarly, setting 1 to CVMLVF by error detection has priority over clearing CVMLVF by CVMLVFC. Furthermore, setting 1 to CVMOFLG by $\overline{\text{CVMOUT}}$ pin status has priority over clearing CVMOFLG by CVMOFLGC.

These functions protect each flag against erroneous operation when VDD is out of the operating range. When VDD is recovered to the operating range, the MCU needs to be initialized by Pin Reset or CVM Reset. Otherwise, the operation of the MCU may continue to be unstable and the flags may be unintentionally cleared.

(2) $\overline{\text{ERROROUT}}$ pin

Enable CVM Reset if you want to notify CVM error detection signal to outside of the MCU via the $\overline{\text{ERROROUT}}$ pin.

When CVM Reset occurs, $\overline{\text{ERROROUT}}$ pin becomes Hi-Z (high impedance) regardless of whether VDD is in the operating range or not.

Section 11 Temperature Sensor

The Temperature Sensor (TSN0) measures temperature by using one analog channel. TSN0 has one unit implemented.

11.1 Features of RH850/P1M-E Temperature Sensor

11.1.1 Number of Units

This product is provided with a temperature sensor with the following number of units.

Table 11.1 Number of Units

	Temperature Sensor
Number of units	1
Name	TSN0

11.1.2 Register Base Address

TSN0 register base addresses are listed in the following table.

The register addresses of the TSN0 are given as offsets from the base addresses.

Table 11.2 Register Base Address

Base address Name	Base Address
TSN0_base	FFF9 3000_H

11.1.3 Clock Supply

Clock supply by and to the temperature sensor is listed in the following table.

Table 11.3 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
TSN0	PCLK	Low-speed peripheral clock CLK_LSB

11.1.4 Interrupt Request

TSN0 has no interrupt request.

11.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

11.1.6 External Input/Output Signals

TSN0 has no external pin.

11.2 Overview

11.2.1 Functional Overview

TSN0 has the following functions and features.

- Temperature measurement
  TSN0 measures temperature by using analog channel 12 (AN112) of A/D converter unit 1 (ADCG1).
  Temperature measurement time (CLK_ADC = 40 MHz): 4 µs (A/D conversion time of 1 µs × 4 times)
  Temperature measurement time (CLK_ADC = 20 MHz): 45.2 µs (A/D conversion time of 11.3 µs × 4 times)
  Stabilization time: 200 µs
- Temperature Error notification
  A temperature error signal is sent to the ECM module when the temperature reaches an upper or lower limit.
- Temperature measurement modes
  One-shot: A/D conversion is executed four times consecutively.
  Continuous: Four consecutive virtual channels are configured for the temperature sensor and the corresponding scan group 4 is placed in multi-cycle scan mode.
- Self-diagnosis
  Self-diagnosis through the insertion of high-temperature errors is supported.

11.2.2 Block Diagram

Figure 11.1 shows the block diagram of temperature sensor.

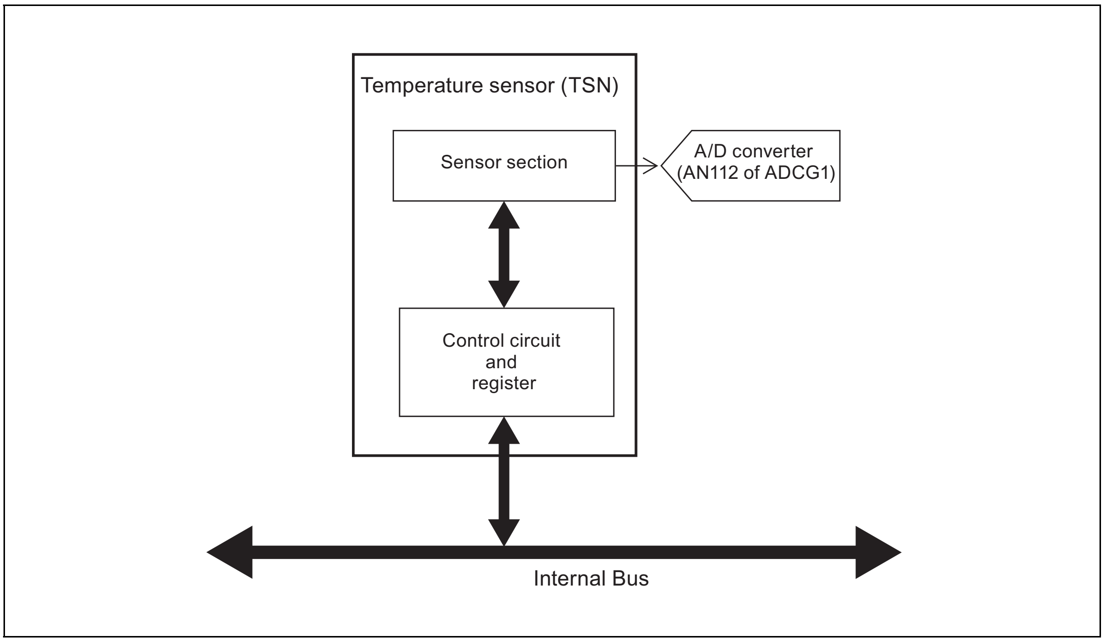

Figure 11.1 Block Diagram of Temperature Sensor

11.3 Register

11.3.1 Register List

The following table lists the registers.

For details about <TSN0_base>, see **Section 11.1.2, Register Base Address**.

Table 11.4 List of Registers

Register Name	Symbol Name	R/W	Value after reset	Address
Temperature sensor control register	TSN0CR	R/W	$0000\ 0000_H$	<TSNn_base> + 000_H
Temperature sensor status register	TSN0STAT	R	$0000\ 0000_H$	<TSNn_base> + 004_H
Temperature sensor diagnosis control register	TSN0DIAG	R/W	$0000\ 0000_H$	<TSNn_base> + 008_H
Temperature sensor reference temperature storage register	TSNREFD	R	Undefined*1	FFCD $019C_H$

Note 1. Fixed value is set at the time of shipping.

11.3.2 TSN0CR — Temperature Sensor Control Register

This register controls the temperature sensor. This register can be set up when the A/D converter is stopped.

Access: This register can be read/written in 32-bit units.

Address: <TSNn_base> + 000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 11.5 TSN0CR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TSNEN	This bit controls the temperature sensor 0: The temperature sensor is disabled. 1: The temperature sensor is enabled.

11.3.3 TSN0STAT — Temperature Sensor Status Register

This register indicates the status of the temperature sensor.

Access: This register can be read only in 32-bit units.

Address: <TSNn_base> + 004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11.6 TSN0STAT Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	TSNST	This bit indicates the status of the temperature sensor 0: The temperature sensor is disabled. (Temperature sensor stabilization time 200 µs has not elapsed.) 1: The temperature sensor is enabled. (Temperature sensor stabilization time 200 µs has elapsed.)

11.3.4 TSN0DIAG — Temperature Sensor Diagnosis Control Register

This register controls self-diagnosis of the temperature sensor. It can be configured when the A/D converter is stopped.

Access: This register can be read or written in 32-bit units.

Address: <TSNn_base> + 008_H

Value after reset: 0000 0000 $_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 11.7 TSN0DIAG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	TSNSELFDIAG	This bit controls self-diagnosis of the temperature sensor. 0: The temperature sensor self-diagnosis is disabled. 1: The temperature sensor self-diagnosis is enabled.

11.3.5 TSNREFD — Temperature Sensor Reference Temperature Storage Register

In this register, the measured value at the time of shipping is stored.

The reference temperature (at A1VREFH = 5.0 V, Tj = 150°C) is stored in TSNREFDH and the reference temperature (at A1VREFH = 5.0 V, Tj = 25°C) is stored in TSNREFDL.

Access: This register can be read only in 32-bit units.

Address: FFCD 019C$_H$

Value after reset: Undefined: (Fixed value is set at the time of shipping.)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	TSNREFDH[11:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 11.8 TSNREFD Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read.
27 to 16	TSNREFDH[11:0]	The value of the reference temperature measured at Tj = 150°C
15 to 12	Reserved	When read, the value after reset is read.
11 to 0	TSNREFDL[11:0]	The value of the reference temperature measured at Tj = 25°C

11.4 Functions

11.4.1 Temperature Measurement

TSN0 measures temperatures by using the AN112 channel of ADCG1. The AN112 channel is set for scan group 4 of the ADCG1 and four consecutive virtual channels must be set for A/D conversion of the signal from the temperature sensor.

Refer to **Figure 11.2** for an example. The result of measurement is stored in the data register corresponding to the fourth virtual channel.

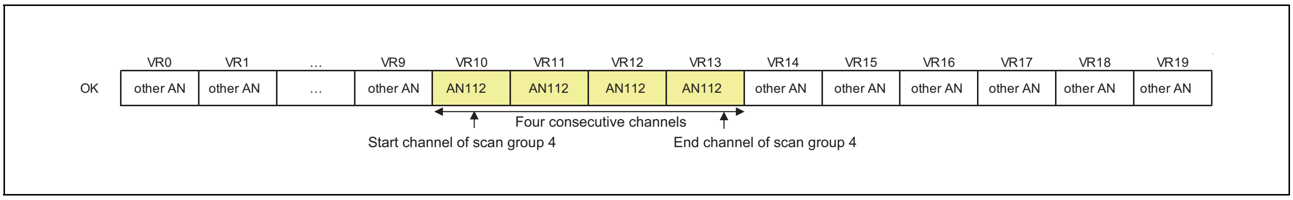

Figure 11.2 Example Setting for Temperature-Sensor-Dedicated Use of Conversion Channel AN112 of ADCG1

Set TSN0 up for measuring the temperature by making the register settings in the procedure below.

1. Set the TSN0-dedicated A/D conversion channel AN112 in four consecutive virtual channels of scan group 4.
2. Enable the temperature sensor by setting the TSNEN bit of the TSNCR register to “1”. This step can precede step 1 above.
3. Wait for TSN0 to start up. After setting the TSNEN bit of the TSNCR register to “1”, wait for 200 us before proceeding with the next step (step 4). This is the waiting time required for the temperature sensor to start up. Do not proceed with the next step until this time has elapsed. You can confirm that the sensor has started up by checking the TSNST bit of the TSNSTAT register.
4. TSN0 starts measuring temperature and a software or hardware trigger starts A/D conversion of scan group 4 of the ADCG1.
5. Check the result of measurement. The measurement of temperature is completed when A/D conversion of the fourth virtual channel is completed. The result of measuring the signal from the temperature sensor is stored in the data register corresponding to the fourth virtual channel. For conversion of the result to degrees Celsius, refer to **Section 11.5, Calculating the Temperature**.
6. When abnormal temperature notification by the temperature sensor is to be used, the upper and lower limit error bits of ADCG1 must be cleared. Since discharging proceeds in the first A/D conversion of temperature measurement, when this function is used, the ADCG1ULER upper/ lower limit error register is set as if a lower-limit error has occurred. The upper/lower limit error bits of the ADCG1 must thus be cleared after temperature measurement.

CAUTION

When AN112 inputs a hold trigger of T&H group A or B during conversion, the virtual channel operation is suspended and the correct temperature measurement result cannot be obtained. Do not input a hold trigger of T&H group A or B during temperature measurement.

11.4.2 Temperature Error Notification

- TCN0 can use the ADCG1 upper-and-lower limit checking function to send a limit error signal to the ECM module when the temperature exceeds the specified upper or lower limit.
- The following settings are required to use Temperature error notification.
  1. Set the upper and lower limits of the temperature in the ADCG1ULLMTBR0 to 2 registers of ADCG1.
  2. Select the upper and lower limits table for scan group 4 in the ADCG1ULLMSR4 register of ADCG1.
  3. Set the ULIEI bit of the ADCG1SFTCR safety control register of ADCG1 to “1” to enable upper/lower limit error interrupts. Set the OWEIE, PEIE, and IDEIE bits to “0” to disable overwrite error interrupts, parity error interrupts, and ID error interrupts. Disable the ADCG1 error interrupt (INTADCG1ERR) of the interrupt controller (INTC).

11.4.3 Self-Diagnosis Function

TSN0 supports the insertion of faulty values. Setting the TSNSELFDIAG bit of the TSN0DIAG register to “1” forces the TSN0 module to generate an error. TSN0 can then diagnose its own operation by comparing the change result from the AN112 channel of ADCG1 with the expected value (0).

TSN0 is set up for self-diagnosis by the following register settings.

1. Set up A/D conversion for the temperature sensor channel. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.
2. Enable the temperature sensor. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.
3. Configure the self-diagnosis register before starting A/D conversion. That is, set the TSNSELFDIAG bit of the TSN0DIAG register to “1”. TSOUT is fixed to the low level after this.
4. Start temperature measurement. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.
5. Check the result of measurement. The procedure is the same as for normal operation. Refer to **Section 11.4.1, Temperature Measurement**.

11.5 Calculating the Temperature

Use the following formula to convert results of temperature measurement into degrees Celsius.

$$T_{current} = \frac{150 - 25}{R_{150} - R_{25}} \times (R - R_{25}) + 25$$

$$R = \frac{A1VREFH}{5.0} \times R_{current}$$

Rcurrent: Result of A/D conversion at the current temperature

Tcurrent: Current temperature

R25: Reference result of A/D conversion at 25 °C.

R150: Reference result of A/D conversion at 150 °C.

R25 and R150 are stored in TSNREFD.

CAUTION

The values of R25 and R150 stored in TSNREFD are measured at A1VREFH = 5.0 V. Apply the formula after converting to the applicable voltage if A1VREFH has a different value.

Section 12 Clock Controller

The clock controller supplies clock pulses inside the chip and to the external devices. The clock controller consists of a main oscillator circuit (Main OSC), a high-speed internal oscillator (HS IntOSC), a Phase Locked Loop circuit (PLL), clock dividers and clock selectors.

12.1 Features

- Incorporates main oscillator circuit (Main OSC), which is used as a reference clock of the PLL.
- Incorporates PLL circuit to generate high speed internal clocks by multiplying the Main OSC input.
- Incorporates a high-speed internal oscillator (HS IntOSC).
- Generates clock pulses used inside the chip from HS IntOSC, Main OSC and PLL.
- A clock monitor (CLMA0 to CLMA3) is included. (See **Section 31, Functional Safety** for details.)
- The frequency divided clock set by the division circuit can be output from the EXTCLKnO (n = 0,1) pins. Furthermore, Main OSC, CLK_LSB, CLK_CPU, and CLK_IOSC can be selected with register settings.

12.1.1 External Input/Output Pins

Table 12.1 shows the pins related to the clock controller.

Table 12.1 Pins Related to the Clock Controller

Pin Function Name	Direction	Function
X1	Input	Connects a Main OSC crystal oscillator
X2	Output	Connects a Main OSC crystal oscillator
EXTCLK0O	Output	External clock out 0
EXTCLK1O	Output	External clock out 1

12.2 Overview

12.2.1 Type of Clocks

Table 12.2 shows the list of clocks, **Table 12.3** shows the operation clocks of each functional module.

Table 12.2 List of Clocks

Clock Name	Symbol	Clock Frequency (MHz)	Remarks
CPU clock	CLK_CPU	(CPU) 160 (Global RAM) 80 (1 wait) (CodeFlash) 80 (1 wait)	Clock source: PLL output
High speed peripheral clock	CLK_HSB	80	
Low speed peripheral clock	CLK_LSB	40	
Internal Oscillator clock	CLK_IOSC	8	High-speed internal oscillator(HS IntOSC) *1/2
WDTA counter clock	WDTACLKI	8/0.25	1/1 or 1/32 of CLK_IOSC (Configured by FLASH option)
External clock out 0	EXTCLK0O	1/1 to 1/1023 of CLK_CPU, CLK_LSB, CLK_IOSC or Main OSC	Configured by CKSC2C and CLK2DIV. Maximum output frequency: 20 MHz
External clock out 1	EXTCLK1O	1/1 to 1/1023 of CLK_CPU, CLK_LSB, CLK_IOSC or Main OSC	Configured by CKSC3C and CLK3DIV. Maximum output frequency: 20 MHz
Main OSC clock	CLK_MOSC	16	
ADC clock	CLK_ADC	40/20	Configured by CKSC8C register

Table 12.3 Clocks and Functional Modules

Clock Name	Functional Module Name
CPU clock	PE1 (Master, Checker, Local RAM, INTC1, etc.), Code Flash (1 wait), ERAM (1 wait), Global RAM (1 wait)
High speed peripheral clock	INTC2, DMAC, DTS, DCRA, PIC, CSIG, CSIH, SCI, FLXA, SENT, PSI5, RLIN, TAUD, TAUJ, TSG3, ENCA, TAPA, TPBA, OSTM
Low speed peripheral clock	Data Flash (from 4 cycle), RS-CANFD, Clock controller
Internal Oscillator clock	CVM (digital noise filter), CLMA (monitor clock), ECM (delay timer : CLK_IOSC/2)
WDTA counter clock	WDTA
ADC clock	ADCG, TSN
MainOSC clock	RS-CANFD (xin)

12.2.2 Block Diagram

Figure 12.1 shows the block diagram of the clock controller.

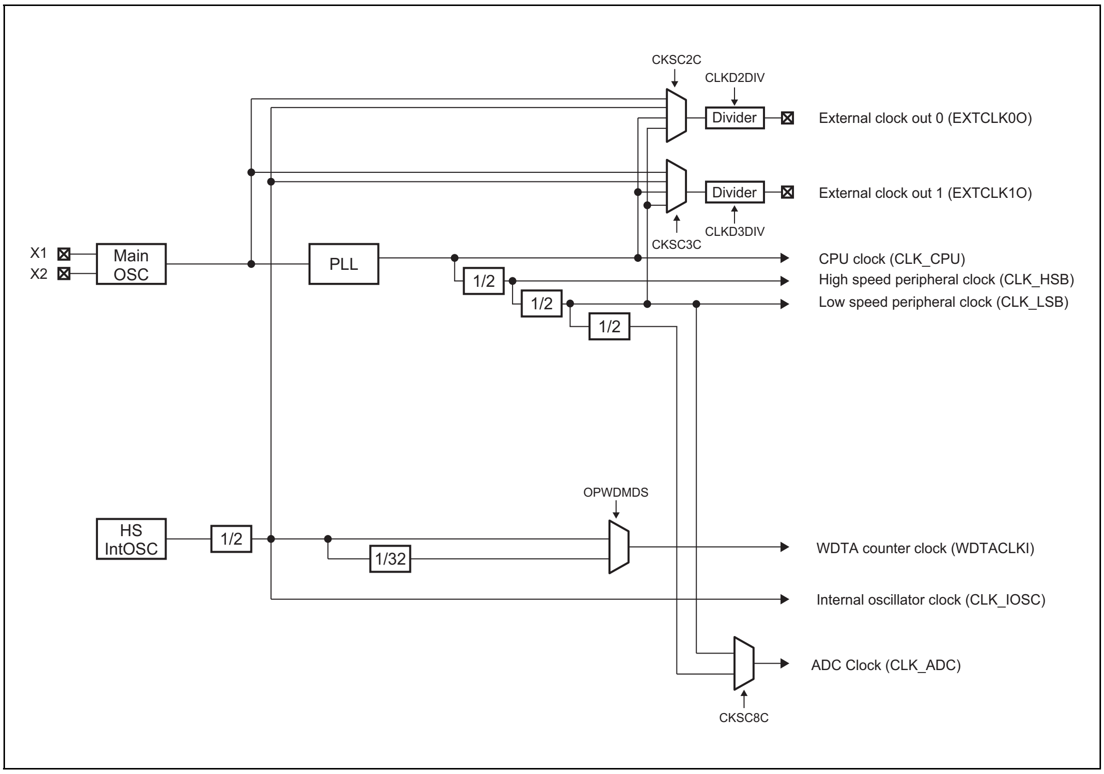

Figure 12.1 Block Diagram of Clock Controller

12.3 Register Description

12.3.1 Writing Protection to Registers

Registers can be protected from inadvertent write access due to erroneous program execution, etc. by configuration of the Slave Guards. For details, see **Section 31, Functional Safety**.

12.3.2 Register Overview

The Clock Controller is controlled and operated by the following registers:

Table 12.4 List of Registers

Address	Register Name	Description	Access Width	Value after Reset
FFF8 8810$_H$	CLKD2DIV	Clock divider 2 divisor register	32	0000 0000$_H$
FFF8 8814$_H$	CLKD2STAT	Clock divider 2 status register	32	0000 0002$_H$
FFF8 8818$_H$	CLKD3DIV	Clock divider 3 divisor register	32	0000 0000$_H$
FFF8 881C$_H$	CLKD3STAT	Clock divider 3 status register	32	0000 0002$_H$
FFF8 9080$_H$	CKSC2C	Clock selector 2 control register	32	0000 0004$_H$
FFF8 9088$_H$	CKSC2S	Clock selector 2 status register	32	0000 0004$_H$
FFF8 90C0$_H$	CKSC3C	Clock selector 3 control register	32	0000 0004$_H$
FFF8 90C8$_H$	CKSC3S	Clock selector 3 status register	32	0000 0004$_H$
FFF8 9110$_H$	CKSC8C	Clock selector 8 control register	32	0000 0002$_H$
FFF8 9114$_H$	CKSC8S	Clock selector 8 status register	32	0000 0003$_H$

12.3.3 CLKD2DIV — Clock Divider 2 Divisor Register

This register controls the division ratio of the external clock output 0 (EXTCLK0O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8810_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12.6 CLKD2DIV Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9 to 0	CLKD2DIV	Division Ratio 0: EXTCLK0O is stopped (low level). 1 to 1023: The source for the EXTCLK0O is divided by the CLKD2DIV.

CAUTION

Set the frequency of EXTCLK0O to a value less than 20 MHz.

Do not write to the CLKD2DIV register while the setting of the CLKD2SYNC bit is 0.

12.3.4 CLKD2STAT — Clock Divider 2 Status Register

This register indicates the status of the external clock output 0 (EXTCLK0O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 8814_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	CLKD2SYNC	Divider Clock Synchronized 0: EXTCLK0O output does not correspond to the division ratio setting in CLKD2DIV. 1: EXTCLK0O output corresponds to the division ratio setting in CLKD2DIV.
0	CLKD2CLKACT	Divider Clock Active 0: EXTCLK0O is inactive (EXTCLK0O = low level). 1: EXTCLK0O is active.

12.3.5 CLKD3DIV — Clock Divider 3 Divisor Register

This register controls the division ratio of the external clock output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 8818_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12.8 CLKD3DIV Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9 to 0	CLKD3DIV	Division Ratio 0: EXTCLK1O is stopped (low level). 1 to 1023: The source for the EXTCLK1O is divided by the CLKD3DIV.

CAUTION

Set the frequency of EXTCLK1O to a value less than 20 MHz.

Do not write to the CLKD3DIV register while the setting of the CLKD3SYNC bit is 0.

12.3.6 CLKD3STAT — Clock Divider 3 Status Register

This register indicates the status of the the external clock output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 $881C_H$

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12.9 CLKD3STAT Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1	CLKD3SYNC	Divider Clock Synchronized 0: EXTCLK1O output does not correspond to the division ratio setting in CLKD3DIV. 1: EXTCLK1O output corresponds to the division ratio setting in CLKD3DIV.
0	CLKD3CLKACT	Divider Clock Active 0: EXTCLK1O is inactive (EXTCLK1O = low level). 1: EXTCLK1O is active.

12.3.7 CKSC2C — Clock Selector 2 Control Register

This register selects the clock which drives the external clock output 0 (EXTCLK0O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 9080_H

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.10 CKSC2C Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	CKSC2	Clock Source Control These bits select the ID of a clock source for the EXTCLK0O. ID = 3_H: Main OSC ID = 4_H: CLK_LSB ID = 5_H: CLK_CPU ID = 6_H: CLK_IOSC Other than above: setting prohibited.

CAUTION

The CKSC2C register must not be modified when the CLKD2DIV register is not 0000 0000_H or the CLKD2STAT register is not 0000 0002_H.

While CLKD2DIV = 0000 0000H and CLKD2STAT = 0000 0002_H, EXTCLK0O output is stopped. Change the value of the register in this situation.

12.3.8 CKSC2S — Clock Selector 2 Status Register

The register indicates the state of a clock source for the external output 0 (EXTCLK0O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9088_H

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 12.11 CKSC2S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2 to 0	CLKACT2	Clock Source Status Indicates the ID of the selected clock source of EXTCLK0O. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. ID = 3_H: Main OSC ID = 4_H: CLK_LSB ID = 5_H: CLK_CPU ID = 6_H: CLK_IOSC

12.3.9 CKSC3C — Clock Selector 3 Control Register

This register selects the clock which drives the external clock output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read/write in 32-bit units.

Address: FFF8 $90C0_H$

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 12.12 CKSC3C Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	CKSC3	Clock Source Control These bits select the ID of a clock source for the EXTCLK1O. ID = 3_H: Main OSC ID = 4_H: CLK_LSB ID = 5_H: CLK_CPU ID = 6_H: CLK_IOSC Other than above: setting prohibited.

CAUTION

The CKSC3C register must not be modified when the CLKD3DIV register is not 0000 0000_H or the CLKD3STAT register is not 0000 0002_H.

While CLKD3DIV = 0000 0000H and CLKD3STAT = 0000 0002_H, EXTCLK1O output is stopped. Change the value of the register in this situation.

12.3.10 CKSC3S — Clock Selector 3 Status Register

The register indicates the state of a clock source for the external output 1 (EXTCLK1O).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 $90C8_H$

Value after reset: 0000 0004_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 12.13 CKSC3S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2 to 0	CLKACT3	Clock Source Status Indicates the ID of the selected clock source of EXTCLK1O. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. ID = 3_H: Main OSC ID = 4_H: CLK_LSB ID = 5_H: CLK_CPU ID = 6_H: CLK_IOSC

12.3.11 CKSC8C — Clock Selector 8 Control Register

This register selects the clock of ADCG.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9110_H

Value after reset: 0000 0002_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	CKSCID8[1]	CKSCID8[0]	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R

Table 12.14 CKSC8C Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2, 1	CKSCID8[1:0]	Clock Source Control These bits select the ID of a clock source for the ADCG. ID = 00_B: setting prohibited ID = 01_B: CLK_LSB (40 MHz, default) ID = 10_B: CLK_LSB /2 (20 MHz) ID = 11_B: setting prohibited
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CAUTION

Do not change the setting of the clock selection bits while the A/D converter is in use.

12.3.12 CKSC8S — Clock Selector 8 Status Register

This register indicates the status of a clock source of ADCG.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: This register can be read in 32-bit units.

Address: FFF8 9114_H

Value after reset: 0000 0003_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 12.15 CKSC8S Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2, 1	CLKSELID8[1:0]	Clock Source Status Indicates the ID of the selected clock source of ADCG. The value indicated by these bits shows the actual ID that is currently selected or currently waiting to be changed to another ID. ID = 00_B: setting prohibited ID = 01_B: CLK_LSB (40 MHz, default) ID = 10_B: CLK_LSB /2 (20 MHz) ID = 11_B: setting prohibited
0	CLKACT8	Clock Active Indicates that the clock of the corresponding clock domain is active and synchronized with the selected clock. 0: Non-active 1: Active

12.4 Operation

12.4.1 External Clock Output

The device provides 2 continuous external clock outputs that can be used as clock supply for external circuits. The clock selection can be configured by software. For details, see **Section 12.3.3, CLKD2DIV — Clock Divider 2 Divisor Register**, **Section 12.3.4, CLKD2STAT — Clock Divider 2 Status Register**, **Section 12.3.5, CLKD3DIV — Clock Divider 3 Divisor Register**, **Section 12.3.6, CLKD3STAT — Clock Divider 3 Status Register**, **Section 12.3.7, CKSC2C — Clock Selector 2 Control Register**, **Section 12.3.8, CKSC2S — Clock Selector 2 Status Register**, **Section 12.3.9, CKSC3C — Clock Selector 3 Control Register**, and **Section 12.3.10, CKSC3S — Clock Selector 3 Status Register**.

- Clock signals can be output from the EXTCLKnO (n = 0, 1) pins by using the clock output function.
- Output clock frequencies can be divided by the division circuit according to the register settings.
- Main OSC, CLK_LSB, CLK_CPU, and CLK_IOSC can be selected as the clock source by using register settings.

To produce an output on the EXTCLKnO pin at a specified value, follow the procedure below to make the settings to select the source clock and division ratio.

- Selecting the source clock

1. Check the following to confirm that EXTCLKnO output is stopped.
   - CLKDnDIV = 0000 0000_H and
   - CLKDnSTAT = 0000 0002_H
     (CLKDnSTAT.CLKDnCLKACT = 0, CLKDnSTAT.CLKDnSYNC = 1)
2. Set CKSCnC.CKSCn[2:0] to select the clock signal.
3. Read the CKSCnS register to confirm that the selected clock signal is active.
   - Confirm that the value of CKSCnS.CLKACTn[2:0] = the value of CKSCnC.CKSCn[2:0].

- Selecting the clock divisor

1. Confirm that CLKDnSTAT.CLKDnSYNC = 1.
2. Set CLKDnDIV to select the EXTCLKnO output division ratio.
3. Confirm that CLKDnSTAT.CLKDnSYNC = 1.

- Changing the setting of the clock selection bits

1. Follow the above procedure for selecting the clock divisor to set CLKDnDIV = 0000 0000_H (stopping output of clock signals).
2. Follow the above procedure for selecting the source clock to set CKSCnC.CKSCn[2:0] to select the changed clock signal.

12.5 Usage Notes

12.5.1 How to Connect a Crystal Oscillator

Figure 12.2 shows how to connect a Crystal Oscillator. When the resonator recommended by the company is used (contact us for details), external components such as a load capacitor and a damping resistor are not necessarily required for oscillation. Please evaluate the oscillation in your environment before use.

As shown in **Figure 12.2**, do not cross any other signal lines over the signal lines to the X1 and X2 pins. Induction may inhibit proper oscillation.

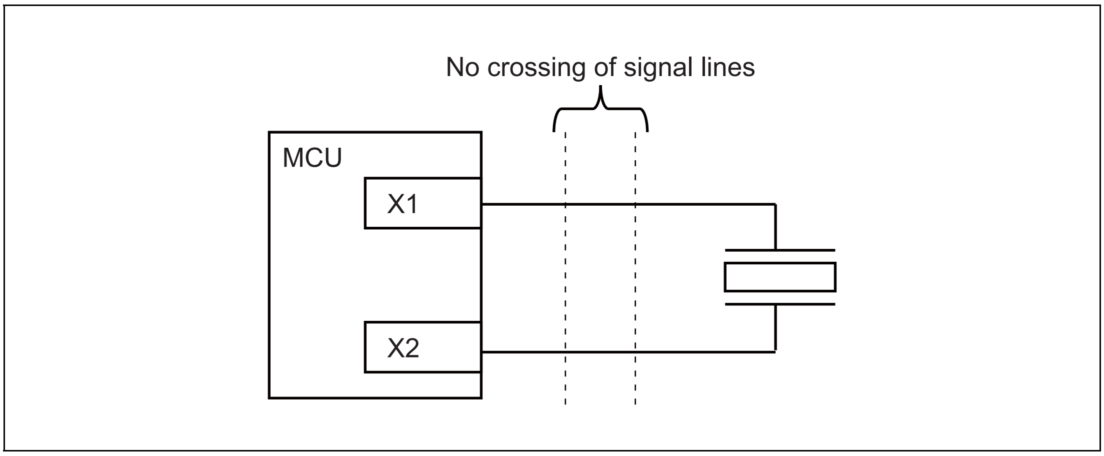

Figure 12.2 Connection Example of Crystal Oscillator

Section 13 Clocked Serial Interface G (CSIG)

The Clocked Serial Interface (CSI) module is a serial data link also well known as SPI, serial peripheral interface.
The CSI bus is a synchronous serial data link standard normally operating in full duplex mode via a 3-wire serial I/O.
Communication is set up in master/slave mode where the master initiates the data frame and provides the clock.
This microcontroller has one unit of CSIG.

13.1 Features of RH850/P1M-E CSIG

13.1.1 Number of Units

This microcontroller has the following number of CSIG units.

Each CSIG unit has one channel interface. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 13.1 Number of Units

Product Name	RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of Units	1	
Name	CSIGn (n = 0)	

Note: The channel names are same as those of the corresponding units.

Table 13.2 Index

Index	Description
n	Throughout this section, the individual CSIG units are identified by the index “n” (n = 0): for example, CSIGnCTL0 is the CSIGn control register 0.

13.1.2 Register Base Address

CSIG base addresses are listed in the following table.

CSIG register addresses are given as offsets from the base addresses throughout the section.

Table 13.3 Register Base Address

Base Address Name	Base Address
<CSIG0_base>	FFD8 $A000_H$

13.1.3 Clock Supply

Clock supply by and to CSIG is listed in the following table.

Table 13.4 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
CSIGn	PCLK	High-speed peripheral clock CLK_HSB

13.1.4 Interrupt Requests

CSIG interrupt requests are listed in the following table.

Table 13.5 Interrupt Requests

Unit Interrupt Name	Description	Interrupt Number	DMA/DTS Trigger Number
CSIG0			
INTCSIG0IC	CSIG transmit status interrupt	175	86
INTCSIG0IR	CSIG receive status interrupt	176	85
INTCSIG0IRE	CSIG communication error interrupt	174	—

13.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

13.1.6 External Input/Output Signals

External input/output signals of CSIG are listed below.

Table 13.6 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal Name
CSIG0			
CSIGTSCK	I	Serial clock signal input	CSIG0SCI
	O	Serial clock signal output	CSIG0SCO
CSIGTSI	I	Serial data input signal	CSIG0SI
CSIGTSO	O	Serial data output signal	CSIG0SO
CSIGTRYI	I	Ready/busy input signal	CSIG0RYI
CSIGTRYO	O	Ready/busy output signal	CSIG0RYO

13.1.7 Data Consistency Check

The following table lists the port pins on which CSIGnSO pin functions are multiplexed and whether or not the CSIGnSO pin functions support data consistency checking. See **Section 13.5.10, Error Detection** for details on data consistency checking.

Table 13.7 Data Consistency Checking and Target Port Pins

Unit Signal Name	Port Pin Name	Alternative Function	Data Consistency Checking
CSIG0			
CSIGTSO	P3_1*1	ALT-OUT6	Supported
	P5_1	ALT-OUT1	Supported

Note 1. Available in devices with 144-pin.

13.1.8 Combinations of Pins and Ports

Combinations of CSIG pins and ports are listed in the following table.

Table 13.8 Combinations of Pins and Ports

Function	Pin Name	Port Name		
		Group 1	Group 2	Group 3
CSIG0	CSIG0RYI	P3_5	—	—
	CSIG0RYO	P3_4	—	—
	CSIG0SCI/ CSIG0SCO	P3_2*1	P5_2*1	P5_4
	CSIG0SI	P3_0*1	P5_0	P5_0
	CSIG0SO	P3_1*1	P5_1	P5_1

Note 1. Available in devices with 144-pin.

13.2 Overview

13.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode and slave mode
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode. In slave mode, transfer clock frequency is determined by input clock.
- Maximum transmission speed:
  - in master mode: 8 MHz
  - in slave mode: 6.6 MHz
- Clock phase and data phase are selectable.
- Data transfer with MSB first or data transfer with LSB first is selectable.
- Transfer data length selectable from 7 to 16 bits in 1-bit units
- EDL (Extended Data Length) function for transferring data with more than 16 bits is incorporated.
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Handshake function is included.
- Built-in error detection (data consistency check, parity, overrun)
- Three different interrupt request signals (INTCSIG0IC, INTCSIG0IR, INTCSIG0IRE)
- Built-in LBM (Loop Back Mode) function for self-test

13.2.2 Functional Description

The CSIG uses three signals for communication:

- Transmission clock CSIGTSCK (output in master mode, input in slave mode)
- Serial data output signal CSIGTSO
- Serial data input signal CSIGTSI

CSIGnCTL2 is used to select the mode in which the CSIG should be operated: master mode or slave mode.

Other signals are available for external control and monitoring.

- CSIGTRYO: Ready/busy output signal (handshake signal)
- CSIGTRYI: Ready/busy input signal (handshake signal)

Data transmission is bit-wise and serial, and synchronous to the transmission clock.

The following table shows the most important registers for setting up CSIG.

Table 13.9 Main Registers of CSIG

Register	Function
CSIGnCTL0	Enables/disables operating clock, data transmission, and data reception
CSIGnCTL1	Controls options such as interrupt timing, extended data length, data consistency check, loop-back mode, handshake, etc.
CSIGnCTL2	Selects master or slave mode and also selects the transfer clock frequency of the on-chip baud rate generator (BRG) in master mode.
CSIGnCFG0	Configures the communication protocol

13.2.3 Block Diagram

The following block diagram shows the main components of the CSIG.

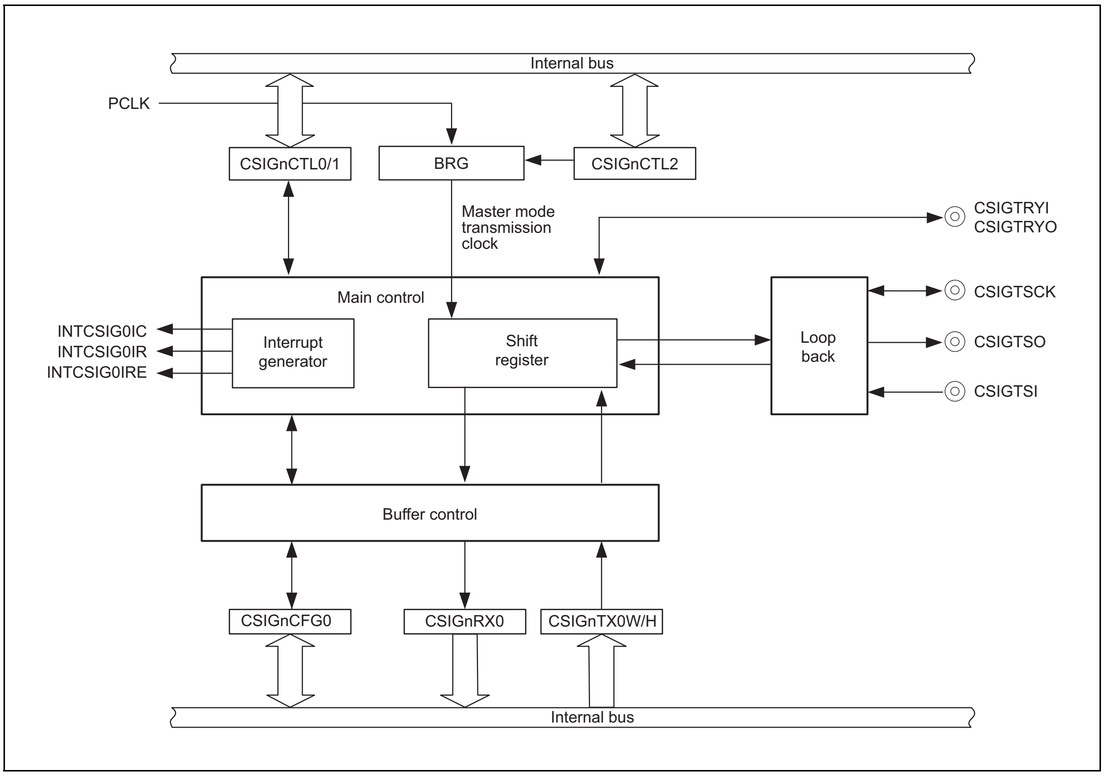

Figure 13.1 CSIG Block Diagram

In master mode, the transmission clock CSIGTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

13.3 Registers

13.3.1 List of Registers

CSIG registers are listed in the following table.

The base address <CSIGn_base> of the CSIGn is defined in **Section 13.1.2, Register Base Address**.

Table 13.10 Registers

Module	Register	Symbol	Address
CSIGn	CSIGn control register 0	CSIGnCTL0	<CSIGn_base> + 0000_H
CSIGn	CSIGn control register 1	CSIGnCTL1	<CSIGn_base> + 0010_H
CSIGn	CSIGn control register 2	CSIGnCTL2	<CSIGn_base> + 0014_H
CSIGn	CSIGn status register 0	CSIGnSTR0	<CSIGn_base> + 0004_H
CSIGn	CSIGn status clear register 0	CSIGnSTCR0	<CSIGn_base> + 0008_H
CSIGn	CSIGn Rx-only mode control register 0	CSIGnBCTL0	<CSIGn_base> + 1000_H
CSIGn	CSIGn configuration register 0	CSIGnCFG0	<CSIGn_base> + 1010_H
CSIGn	CSIGn transmission register 0 for word access	CSIGnTX0W	<CSIGn_base> + 1004_H
CSIGn	CSIGn transmission register 0 for half word access	CSIGnTX0H	<CSIGn_base> + 1008_H
CSIGn	CSIGn reception register 0	CSIGnRX0	<CSIGn_base> + $100C_H$

13.3.2 CSIGnCTL0 — CSIGn Control Register 0

This register controls the operation clock and enables or disables transmission/reception.

Access: This register can be read/written in 8-bit units.

Address: <CSIGn_base> + 0000_H

Value after reset: 00_H This register is initialized by a reset from any source.

Bit	7	6	5	4	3	2	1	0
	CSIGnPWR	CSIGnTXE	CSIGnRXE	—	—	—	—	CSIGnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R/W

Table 13.11 CSIGnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIGnPWR	Controls operation clock: 0: Stop operation clock 1: Supplies operation clock Clearing CSIGnPWR to 0 resets the internal circuits, stops operation, and sets the CSIG to standby state. Clock supply to internal circuits stops. If CSIGnPWR is cleared during communication, ongoing communication is aborted. In that case, communication settings must be made from the beginning.
6	CSIGnTXE	Enables/disables transmission: 0: Transmission disabled 1: Transmission enabled
5	CSIGnRXE	Enables/disables reception: 0: Reception disabled 1: Reception enabled
4 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	CSIGnMBS	To use CSIG, always write 1 to this bit. (The value after reset is “0”.)

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.3 CSIGnCTL1 — CSIGn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, and handshake function.

Access: This register can be read/written in 32-bit units.

Address: <CSIGn_base> + 0010_H

Value after reset: $0000\ 0000_H$ This register is initialized by a reset from any source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CSIGn CKR	CSIGn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CSIGn EDLE	—	CSIGn DCS	—	CSIGn LBM	CSIGn SIT	CSIGn HSE	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R/W	R	R/W	R/W	R/W	R

Table 13.12 CSIGnCTL1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is read. When writing, write the value after reset.
17	CSIGnCKR	CSIGTSCK clock inverting function 0: The default level of CSIGTSCK is high level. 1: The default level of CSIGTSCK is low level. The CSIGnCKR bit is used in combination with the CSIGnCFG0.CSIGnDAP bit. For details, refer to **Section 13.3.8, CSIGnCFG0 — CSIGn Configuration Register 0**.
16	CSIGnSLIT	Selects the timing of interrupt INTCSIG0IC: 0: Normal interrupt timing (interrupt is generated after the transfer) 1: Interrupt generation when CSIGnTX0W/H is ready to store the (next data.). For details, see **Section 13.4.2, INTCSIG0IC (Communication Status Interrupt)**
15 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7	CSIGnEDLE	Enables/disables extended data length (EDL) mode: 0: Extended data length mode disabled 1: Extended data length mode enabled For details, refer to **Section 13.5.5.2, Data Length Selection with Extended Data Length**.
6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	CSIGnDCS	Enables/disables data consistency check: 0: Data consistency check disabled 1: Data consistency check enabled For details, refer to **Section 13.5.10.1, Data Consistency Check**.
4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	CSIGnLBM	Controls loop-back mode (LBM): 0: Loop-back mode deactivated 1: Loop-back mode activated Loop-back mode can be set only in master mode. Set this bit to 0 in slave mode. For details, refer to **Section 13.5.9, Loop-Back Mode**.

Table 13.12 CSIGnCTL1 Register Contents (2/2)

Bit Position	Bit Name	Function
2	CSIGnSIT	Selects interrupt delay mode: 0: No delay 1: Half clock delay for all interrupts This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 13.4.1, Interrupt Delay**.
1	CSIGnHSE	Enables or disables the handshake function: 0: Handshake function disabled 1: Handshake function enabled For details refer to **Section 13.5.8, Handshake Function**.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.4 CSIGnCTL2 — CSIGn Control Register 2

This register selects the communication clock.

Access: This register can be read/written in 16-bit units.

Address: <CSIGn_base> + 0014_H

Value after reset: $E000_H$ This register is initialized by a reset from any source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.5 CSIGnSTR0 — CSIGn Status Register 0

This register indicates the status of the CSIG.

Access: This register can only be read in 32-bit units.

Address: <CSIGn_base> + 0004_H

Value after reset: $0000\ 0010_H$ This register is initialized by a reset from any source.

Table 13.14 CSIGnSTR0 Register Contents (2/2)

Bit Position	Bit Name	Function
1	CSIGnPE	Parity Error Flag 0: No parity error detected 1: Parity error detected This bit is cleared by writing 1 to CSIGnPEC in CSIGnSTCR0. However, if setting this bit to 1 due to detection of a parity error and clearing this bit to 0 by CSIGnPEC in CSIGnSTCR0 take place at the same time, setting this bit to 1 due to detection of a parity error takes precedence. This bit is initialized when CSIGnPWR in CSIGnCTL0 changes from 0 to 1 or from 1 to 0.
0	CSIGnOVE	Overrun Error Flag 0: No overrun error detected 1: Overrun error detected This bit is cleared by writing 1 to CSIGnOVEC in CSIGnSTCR0. However, if setting this bit to 1 due to detection of an overrun error and clearing this bit to 0 by CSIGnOVEC in CSIGnSTCR0 take place at the same time, setting this bit to 1 due to detection of an overrun error takes precedence. This bit is initialized when CSIGnPWR in CSIGnCTL0 changes from 0 to 1 or from 1 to 0.

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.6 CSIGnSTCR0 — CSIGn Status Clear Register 0

This register clears the status flags of the CSIGnSTR0 status register.

Access: This register can be read/written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIGn_base> + 0008_H

Value after reset: 0000_H This register is initialized by a reset from any source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit Position	Bit Name	Function
15 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	CSIGnDCEC	This bit controls the data consistency check error flag clear command. 0: No operation. 1: Clears the data consistency check error flag (CSIGnSTR0.CSIGnDCE) Read value is always 0.
2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CSIGnPEC	This bit controls the parity error flag clear command. 0: No operation. Read value is always 0. 1: Clears the parity error flag (CSIGnSTR0.CSIGnPE) Read value is always 0.
0	CSIGnOVEC	This bit controls the overrun error flag clear command. 0: No operation. Read value is always 0. 1: Clears the overrun error flag (CSIGnSTR0.CSIGnOVE) Read value is always 0.

13.3.7 CSIGnBCTL0 — CSIGn Rx-only Mode Control Register 0

This register enables/disables the data transfer in Rx-only mode.

Access: This register can be read/written in 8-bit units.

Address: <CSIGn_base> + 1000_H

Value after reset: 01_H This register is initialized by a reset from any source.

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CSIGnSCE

7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	CSIGnSCE	Disables/enables next data reception start by reading CSIGnRX0 0: Next reception disabled 1: Next reception enabled For details refer to **Section 13.5.4.2, Receive-Only Mode**.

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.8 CSIGnCFG0 — CSIGn Configuration Register 0

This register configures the communication protocol options such as data length, parity, transfer direction, clock phase, and data phase.

Access: This register can be read/written in 32-bit units.

Address: <CSIGn_base> + 1010_H

Value after reset: $0000\ 0000_H$ This register is initialized by a reset from any source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.9 CSIGnTX0W — CSIGn Transmission Register 0 for Word Access

This register stores the transmission data. This register also specifies extended data length.

Access: This register can be read/written in 32-bit units.

Address: <CSIGn_base> + 1004_H

Value after reset: $0000\ 0000_H$ This register is initialized by a reset from any source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29	CSIGnEDL	Specifies the extended data length configuration: 0: Normal operation 1: Extended data length enabled The associated data is transmitted as 16-bit data. This bit can only be set if CSIGnCTL1.CSIGnEDLE = 1.
28 to 16	Reserved	When read, the value after reset is read. When writing, write the value after reset.
15 to 0	CSIGnTX[15:0]	Data to be transmitted

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.10 CSIGnTX0H — CSIGn Transmission Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 in the CSIGnTX0W register.

The setting of 16 high-order bits in CSIGnTX0W is used for data transfer.

Access: This register can be read/written in 16-bit units.

Address: <CSIGn_base> + 1008_H

Value after reset: 0000_H This register is initialized by a reset from any source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 13.19 CSIGnTX0H Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGnTX[15:0]	Data to be transmitted

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.11 CSIGnRX0 — CSIGn Reception Register 0

This register stores the received data.

Access: This register can only be read in 16-bit units.

Address: <CSIGn_base> + $100C_H$

Value after reset: 0000_H This register is initialized by a reset from any source.

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIGnRX[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 13.20 CSIGnRX0 Register Contents

Bit Position	Bit Name	Function
15 to 0	CSIGnRX [15:0]	Received data

NOTE

This register stores the received data when an INTCSIG0IR interrupt is generated. Read the received data stored in this register before generation of an INTCSIG0IR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, refer to **Table 13.21, List of Cautions when Setting Registers**.

13.3.12 List of Caution

Table 13.21 List of Cautions when Setting Registers

Register Name	Bit Name	Contents
CSIGnCTL0	CSIGnPWR	If this bit is cleared during communication, ongoing communication is aborted. After communication is aborted, it is necessary to restart the communication.
CSIGnCTL0	CSIGnTXE CSIGnRXE	Do not modify any of these bits while CSIGnCTL0.CSIGnPWR = 0. (These bits can be modified at the same time as the CSIGnCTL0.CSIGnPWR bit.) Do not modify these bits while CSIGnSTR0.CSIGnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIGnCTL0	CSIGnMBS	When writing, be sure to set to this bit to 1. (The value after reset is “0”.) This bit must be modified simultaneously with CSIGnCTL0.CSIGnPWR bit.
CSIGnCTL1	CSIGnCKR	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnSLIT CSIGnEDLE CSIGnDCS CSIGnHSE	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnCTL1	CSIGnLBM	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting of this bit is prohibited in slave mode.
CSIGnCTL1	CSIGnSIT	Modification of this bit is only permitted while CSIGnCTL0.CSIGnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIGnCTL2	CSIGnPRS[2:0] CSIGnBRS[11:0]	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0. Setting of the maximum transfer clock frequency is as follows. • Master mode: 8 MHz or less • Slave mode: 6.6 MHz or less
CSIGnSTR0	CSIGnTSF	Writing to this bit is prohibited. Only reading this bit is enabled.
CSIGnSTR0	CSIGnDCE CSIGnPE CSIGnOVE	Writing to these bits is prohibited. Only reading these bits is enabled. These bits are initialized when CSIGnCTL0.CSIGnPWR changes from 0 to 1 or from 1 to 0.
CSIGnBCTL0	CSIGnSCE	To stop the next reception, this bit must be controlled at the following times. • When CSIGnSLIT is 0, clear this bit before reception of the last of the data (reading of that data from the CSIGnRX0 register). • When CSIGnSLIT is 1, clear this bit immediately after the second last data reception (reading of that data from the CSIGnRX0 register), up to 1 cycle of the CSIGnTSCK clock before the last CSIGnTIR (reception complete) interrupt.
CSIGnCFG0	CSIGnPS[1:0] CSIGnDLS[3:0] CSIGnDIR CSIGnDAP	Modification of these bits is only permitted while CSIGnCTL0.CSIGnPWR = 0.
CSIGnTX0W	CSIGnEDL	This bit is valid only when CSIGnCTL1.CSIGnEDLE = 1.
CSIGnTX0W CSIGnTX0H		Write access to these bits are prohibited when CSIGnCTL0.CSIGnTXE = CSIGnCTL0.CSIGnRXE = 0.
CSIGnRX0		These bits are initialized when CSIGnPWR in CSIGnCTL0 changes from 0 to 1 or from 1 to 0. It is prohibited to read these bits when CSIGnCTL0.CSIGnTXE = 0 and CSIGnCTL0.CSIGnRXE = 0.

13.4 Interrupt Sources

CSIG can generate the following interrupts:

- INTCSIG0IC (Communication status interrupt)
- INTCSIG0IR (Reception status interrupt)
- INTCSIG0IRE (Communication error interrupt)

13.4.1 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by a half cycle of the transmission clock CSIGTSCK. This function is not available in slave mode.

The delay is specified by setting bit CSIGnCTL1.CSIGnSIT = 1. (The setting of the CSIGnSIT bit is invalid in slave mode.)

The following example illustrates the interrupt delay function, assuming a setting of CSIGnCTL1.CSIGnSIT = 1 (interrupt delay enabled), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits).

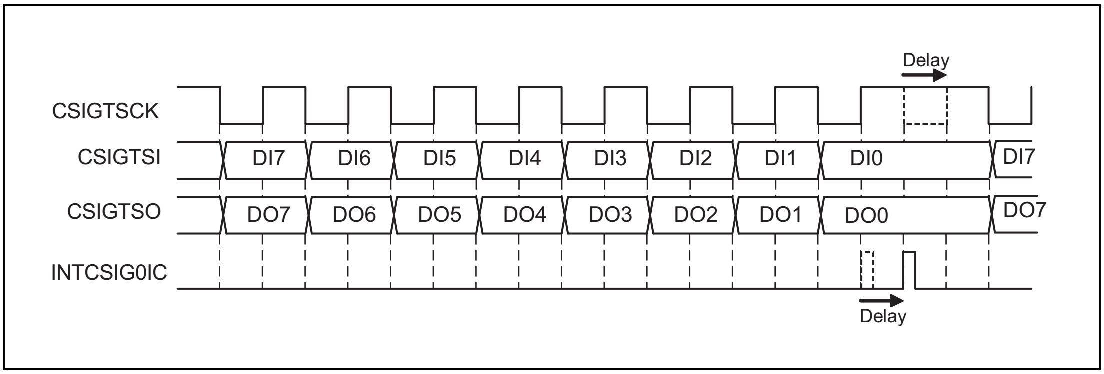

Figure 13.2 Interrupt Delay Function (CSIGnCTL1.CSIGnSIT = 1)

13.4.2 INTCSIG0IC (Communication Status Interrupt)

This interrupt is normally generated after every data transfer. It can be used to trigger a DMA for writing new transmission data to register CSIGnTX0W or CSIGnTX0H.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits), and CSIGnCTL1.CSIGnSLIT = 0 (normal interrupt timing).

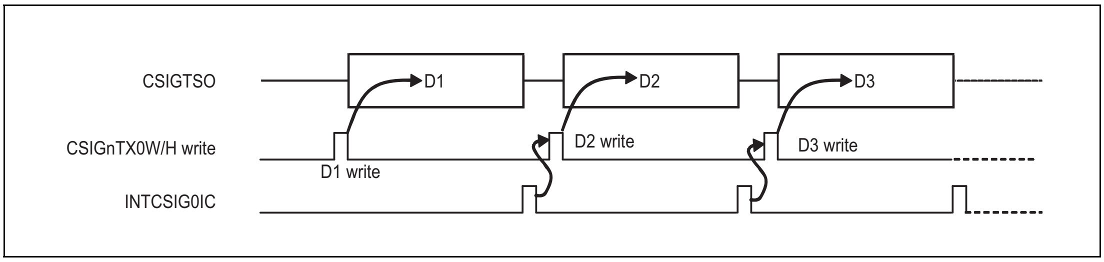

Figure 13.3 Generation of INTCSIG0IC after Communication (CSIGnCTL1.CSIGnSLIT = 0)

However, INTCSIG0IC can also be set up to occur when the CSIGnTX0W/H register is ready to store the next data. This is specified by setting CSIGnCTL1.CSIGnSLIT = 1.

This mode allows more efficient data transfers.

The effect is illustrated in the figure below.

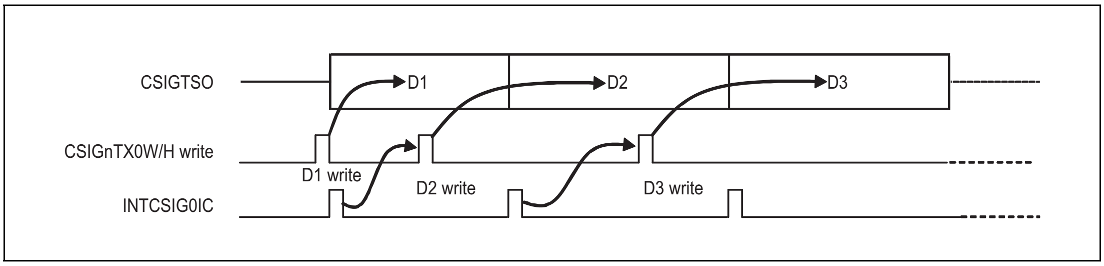

Figure 13.4 Generation of INTCSIG0IC at the Beginning of Communication

13.4.3 INTCSIG0IR (Reception Status Interrupt)

This interrupt is generated in receive-only and transmit/receive mode after data has been received and is available in the reception register. It can be used to trigger a DMA for reading the received data from register CSIGnRX0.

The following example assumes master mode and a setting of CSIGnCTL1.CSIGnSIT = 0 (no interrupt delay), CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0 (normal clock and data phase), and CSIGnCFG0.CSIGnDLS[3:0] = 1000_B (data length 8 bits).

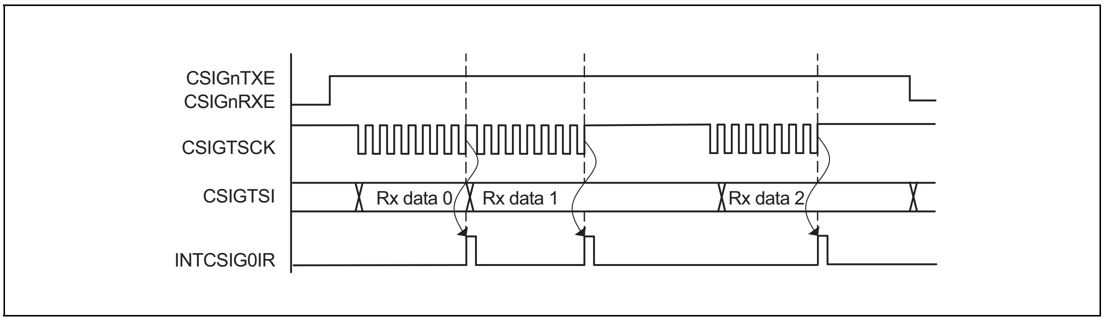

Figure 13.5 Generation of INTCSIG0IR

13.4.4 INTCSIG0IRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

Table 13.22 Data Error Types

Error type	Communication Status after Error Interrupt	Remarks
Parity error	Interrupt is generated and communication continues	—
Data consistency check error	Interrupt is generated and communication continues	—
Overrun error*[1]	When CSIGnCTL1.CSIGnHSE = 0 (handshake function disabled) in slave mode, communication continues even after an interrupt is generated.	When CSIGnCTL1.CSIGnHSE = 1 (handshake function enabled) in slave mode, communication stops due to handshake. No interrupt is generated and an overrun error does not occur.

Note 1. Overrun error does not occur in master mode. In slave mode, communication cannot be stopped.

The type of error that caused the generation of INTCSIG0IRE is indicated in register CSIGnSTR0.

For details about the various error types refer to **Section 13.5.10, Error Detection**.

13.5 Operation

13.5.1 Master/Slave Mode

Whether CSIG operates in master mode or in slave mode depends on the setting of CSIGnCTL2.CSIGnPRS[2:0]. If master mode is selected, the source of the transmission clock must be selected, too.

13.5.1.1 Master Mode

In master mode, the serial communication clock is generated by the internal baud rate generator (BRG) and supplied to the slave via signal CSIGTSCK.

Master mode is enabled by setting bits CSIGnCTL2.CSIGnPRS[2:0] to values other than 111_B. In master mode, the BRG frequency setting is enabled by setting bits CSIGnCTL2. CSIGnPRS[2:0] and bits CSIGnCTL2.CSIGnBRS[11:0].

The initial level of CSIGTSCK depends on the CSIGTSCK clock inversion function bit: it is high level when CSIGnCTL1.CSIGnCKR = 0, and is low level when CSIGnCTL1.CSIGnCKR = 1.

The example below shows the communication in master mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

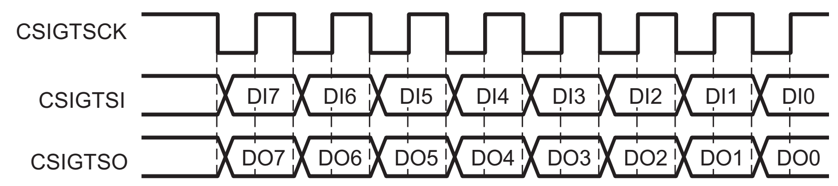

Figure 13.6 Transmit/Receive in Master Mode

13.5.1.2 Slave Mode

In slave mode, another device is the communication master. The external clock is supplied via the signal CSIGTSCK. Transmit/receive operation starts as soon as a clock signal is detected.

Slave mode is selected by setting CSIGnCTL2.CSIGnPRS[2:0] to 111_B.

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting the CSIGnCTL2.CSIGnBRS[11:0] bits to 000_H.

The example below shows the communication in slave mode for 8-bit data, CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0, and MSB first:

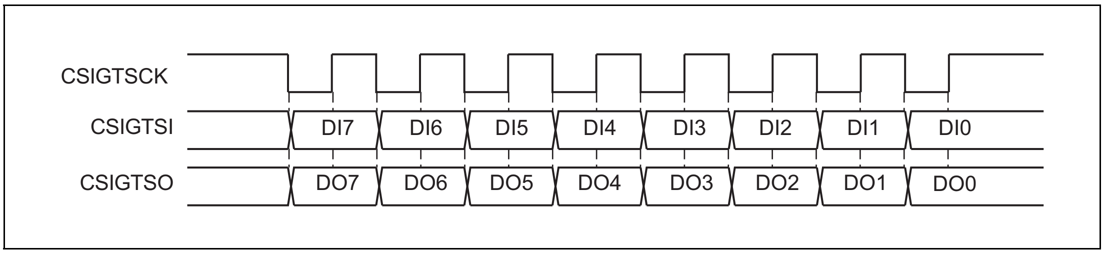

Figure 13.7 Transmit/Receive in Slave Mode

13.5.2 Master/Slave Connections

13.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

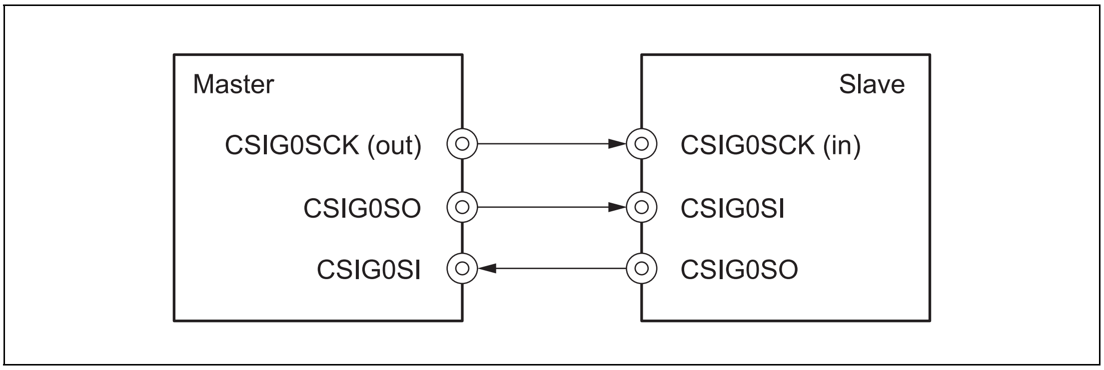

Figure 13.8 Direct Master/Slave Connection

13.5.3 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the CSIGnPRS[2:0] and CSIGnBRS[11:0] bits in the CSIGnCTL2 register.

The following figure shows a block diagram of the BRG.

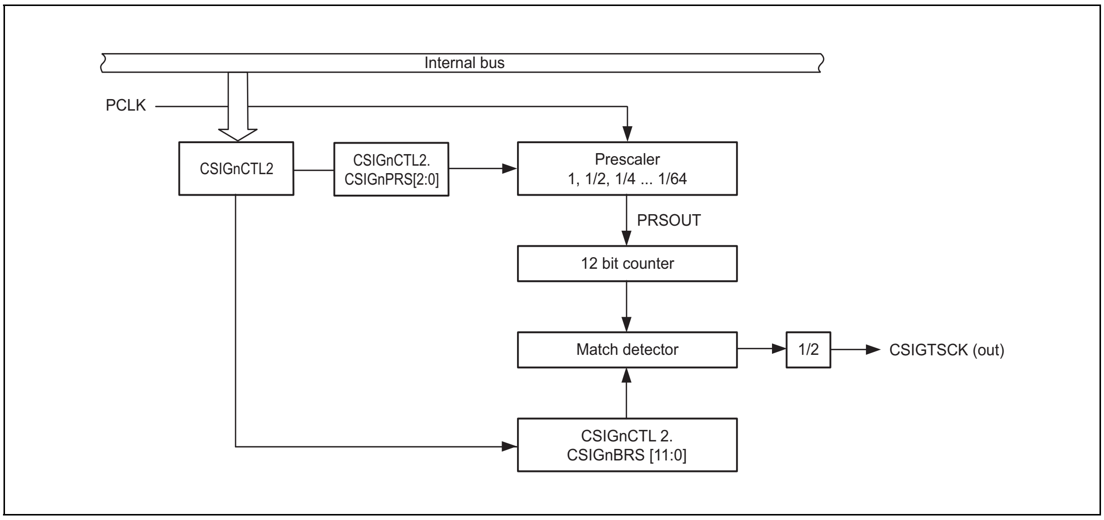

Figure 13.9 BRG Block Diagram

Clearing CSIGnCTL2.CSIGnBRS[11:0] to 000_H disables the BRG.

Calculation of transfer clock frequency

The transfer clock frequency in master mode is calculated by the following formula.

Transfer clock frequency (CSIGTSCK) = PCLK / (PCLK's division ratio) = PCLK / ($2^{\alpha} \times k \times 2$)
where:

α = CSIGnCTL2.CSIGnPRS[2:0] = 0 to 6

k = CSIGnCTL2.CSIGnBRS[11:0] = 1 to 4095

Upper limit and lower limit of transfer clock frequency

Note the following when setting the transfer clock frequency.

- The maximum acceptable transfer clock frequency in master mode is 8 MHz.
- The maximum acceptable transfer clock frequency in slave mode is 6.66 MHz. (It must be confirmed that the transfer clock frequency of the external master is within this range.)
- The minimum transfer clock frequency in both modes is PCLK / 524160.

13.5.4 Data Transfer Modes

13.5.4.1 Transmit-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 0 puts the CSIG in transmit-only mode. Transmission starts when transmit data is written in the CSIGnTX0W or CSIGnTX0H register.

CAUTION

In case transmit-only mode has been entered after any reception mode, the data in the CSIGnRX0 buffer becomes undefined after completion of the first transmission. Consequently the reception register CSIGnRX0 has to be read before changing to transmit-only mode.

13.5.4.2 Receive-Only Mode

Setting CSIGnCTL0.CSIGnTXE = 0 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in receive-only mode.

In master mode, reception starts when dummy data is read from the CSIGnRX0 register. Subsequent receptions are triggered by reads from the CSIGnRX0 register, as long as CSIGnBCTL0.CSIGnSCE = 1.

Moreover, CSIGnBCTL0.CSIGnSCE has to be set to 0 before reading the last received data from CSIGnRX0.

The recommended procedure is:

1. Set CSIGnBCTL0.CSIGnSCE = 1.
2. Before starting the first receive operation, read CSIGnRX0 (dummy data).
3. Wait for the reception interrupt INTCSIG0IR.
4. Read CSIGnRX0 (received data).
   In case more data receptions follow at step 4, continue to read until all data is received.
   Before reading the last received data from CSIGnRX0, set CSIGnBCTL0.CSIGnSCE = 0.

In slave mode, reception starts when the communication clock CSIGTSCK from the master is received. In this case, it is not necessary to read data to the CSIGnRX0 register of the slave.

NOTE

In slave mode, any previously received data must be read from the reception register CSIGnRX0 in order to avoid any overwrite situation.

13.5.4.3 Transmit/Receive Mode

Setting CSIGnCTL0.CSIGnTXE = 1 and CSIGnCTL0.CSIGnRXE = 1 puts the CSIG in transmit/receive mode.

Data transfer (transmission and reception) starts when transmit data is written to the CSIGnTX0W or CSIGnTX0H register.

13.5.5 Data Length Selection

13.5.5.1 Data Length Selection Without Extended Length

Transmission data length is selectable from 7 to 16 bits using the CSIGnDLS[3:0] bits in the CSIGnCFG0 register. The examples below show the communication with MSB first (CSIGnCFG0.CSIGnDIR = 0):

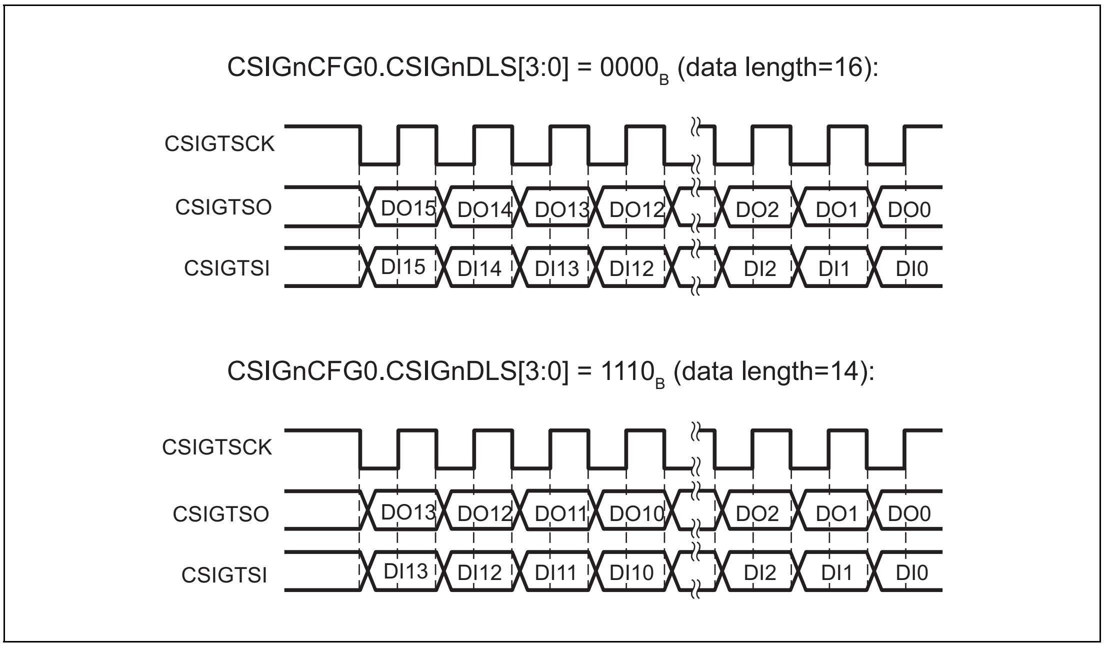

Figure 13.10 Data Length Selection Function

13.5.5.2 Data Length Selection with Extended Data Length

If the data to be sent/received exceeds 16 bits, the extended data length (EDL) feature can be used.

The EDL function is enabled by setting bit CSIGnCTL1.CSIGnEDLE to 1.

The EDL function works as follows:

- The data must be divided into 16-bit blocks and remainder. For example, 42-bit data is divided into two 16-bit blocks and 10 bits.
- The remainder bit length is set for CSIGnCFG0.CSIGnDLS[3:0] bits as “data length.”
- CSIGnTX0W.CSIGnEDL must be set to 1 to transmit 16-bit blocks. In this case, the data written to CSIGnTX0W is sent as a 16-bit data length regardless of the CSIGnCFG0.CSIGnDLS[3:0] bits.
- The transfer is complete after the data with the specified data length (the remainder with CSIGnTX0W.CSIGnEDL = 0) has been sent.

Example

Example of transmitting a 40-bit string 123456789A$_H$.

40 bits are split into 2 × 16 bits plus 8 bits.

- Initialize CSIGnCFG0.CSIGnDLS[3:0] = 8$_D$.
- To transmit 123456789A$_H$ with MSB first, write the following sequence to CSIGnTX0W.
  - 2000 1234$_H$ (CSIGnTX0W.CSIGnEDL = 1)
  - 2000 5678$_H$ (CSIGnTX0W.CSIGnEDL = 1)
  - 0000 009A$_H$ (CSIGnTX0W.CSIGnEDL = 0)

The following figure illustrates the timing.

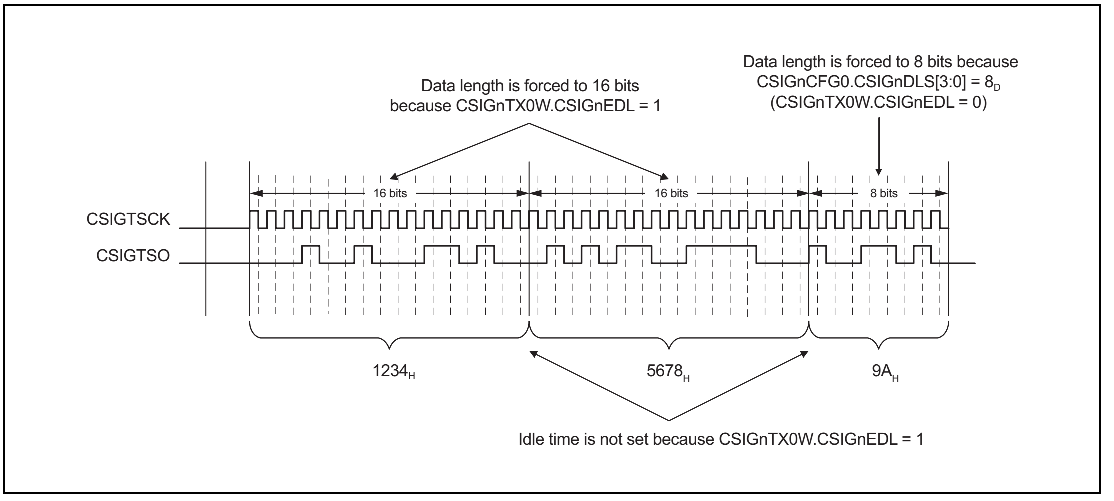

Figure 13.11 EDL Timing Diagram

NOTES

1. A data length of less than 7 bits can be set only when EDL mode is used.
2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. The following describes data direction using an example below.
   - Transmit data: 123456$_H$
   - MSB first:
     Set CSIGnCFG0.CSIGnDIR to 0.
     Write CSIGnTX0W = 2000 1234$_H$. (EDL bit = 1)
     Write CSIGnTX0W = 0000 0056$_H$. (EDL bit = 0)
   - LSB first:
     Set CSIGnCFG0.CSIGnDIR to 1.
     Write CSIGnTX0W = 2000 3456$_H$. (EDL bit = 1)
     Write CSIGnTX0W = 0000 0012$_H$. (EDL bit = 0)
5. EDL mode is not available in receive-only mode of slave mode.
   (CSIGnCTL2.CSIGnPRS[2:0] = 111$_B$, CSIGnCTL0.CSIGnTXE = 0,
   CSIGnCTL0.CSIGnRXE = 1)

13.5.6 Serial Data Direction Selection Function

The serial data direction is selectable using the CSIGnDIR bit in the CSIGnCFG0 register. The examples below show the communication for 8-bit data (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B):

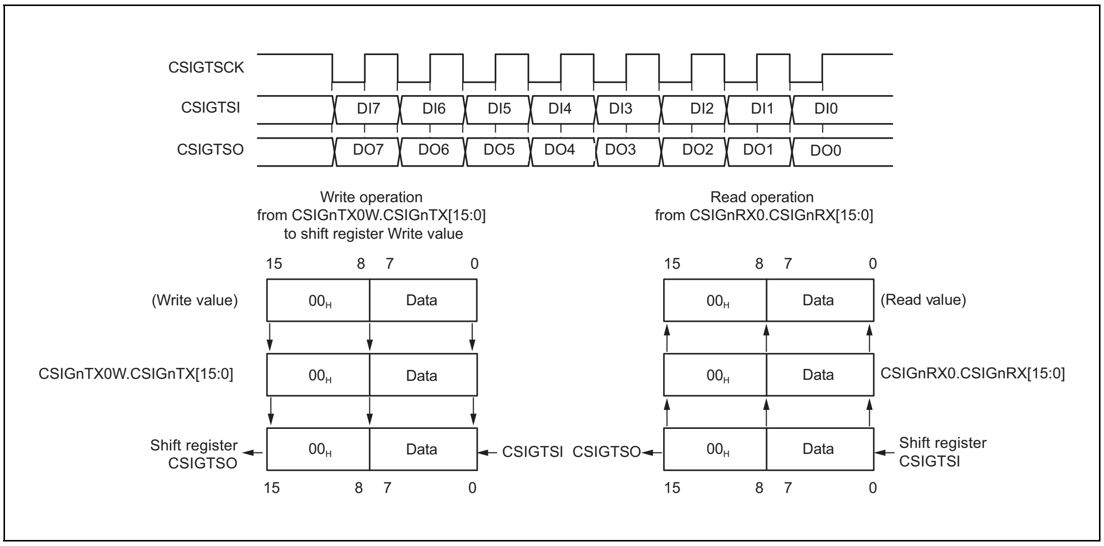

Figure 13.12 Serial Data Direction Select Function — MSB First (CSIGnDIR = 0)

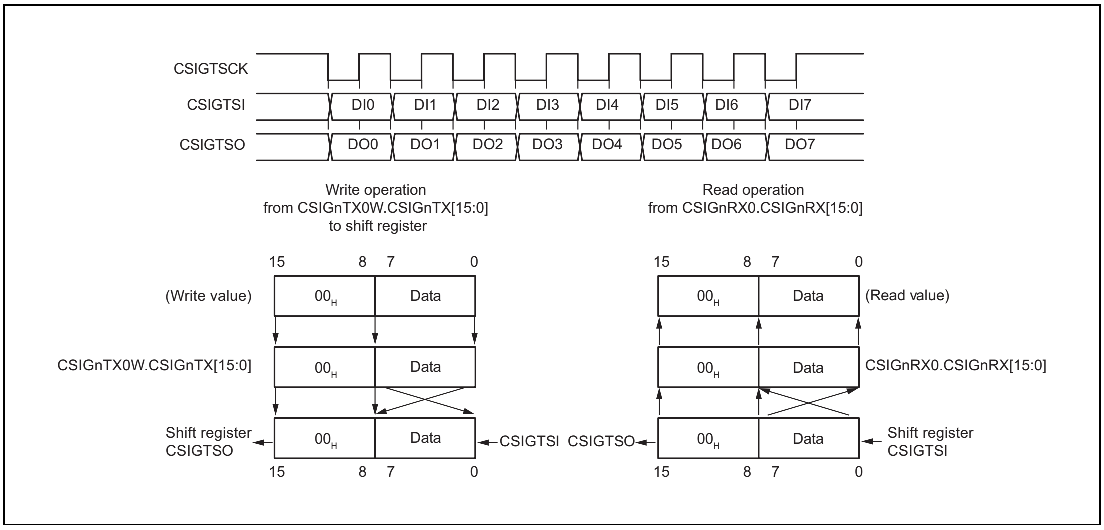

Figure 13.13 Serial Data Direction Select Function — LSB First (CSIGnDIR = 1)

13.5.7 Communication Timing in Slave Mode

The following figure illustrates the communication signals and timings in slave mode.

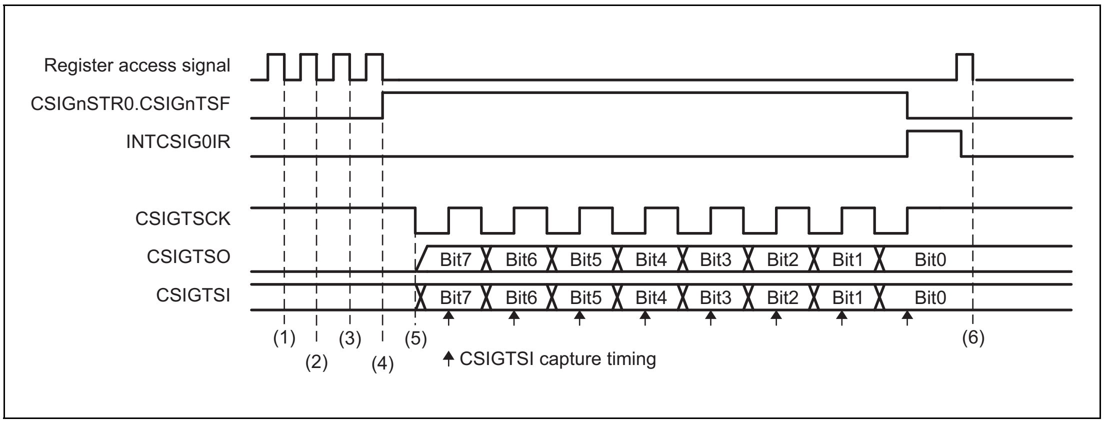

Figure 13.14 Transmit/Receive Communication Timing in Slave Mode

1. CSIG is put into slave mode (Set CSIGnCTL2.CSIGnPRS[2:0] to 111_B)
2. The data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B)
   The data direction is MSB first (CSIGnCFG0.CSIGnDIR = 0)
3. CSIG is set to transmit/receive mode (CSIGnCTL0.CSIGnPWR = 1, CSIGnCTL0.CSIGnTXE = 1, CSIGnCTL0.CSIGnRXE = 1)
4. When transfer data is written to the CSIGnTX0W transmission register or CSIGnTX0H register, the transfer status flag CSIGnSTR0.CSIGnTSF is automatically set.
5. When external clock signal is detected as CSIGTSCK signal, the slave immediately transmits the data to CISGTSO and, at the same time, captures the data transmitted from CSIGTSI.
6. The CSIGnRX0 register can be read.

13.5.8 Handshake Function

CSIG features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by bit CSIGnCTL1.CSIGnHSE. For handshake, the CSIGTRYI and CSIGTRYO signals are used.

The timing depends on the setting of the data phase selection bit CSIGnCFG0.CSIGnDAP.

13.5.8.1 Slave Mode

If CSIGnCTL1.CSIGnHSE = 1, a low-level CSIGTRYO signal is output when the slave becomes busy. This happens when previously received data is still in the CSIGnRX0 register, and new data cannot be copied from the shift register to CSIGnRX0 (CSIGnRX0 full condition).

The following examples assume a data length of 8 bits.

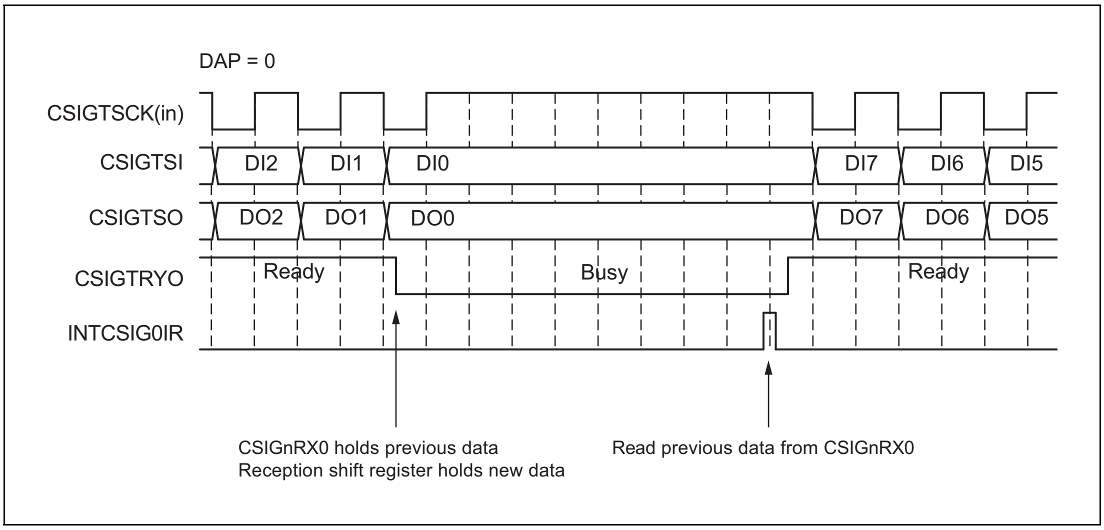

Figure 13.15 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 0)

While the slave is busy, the master has to wait (i.e. suspend the transmission clock). The slave sets CSIGTRYO to high (“ready”) as soon as the reception register CSIGnRX0 has been read.

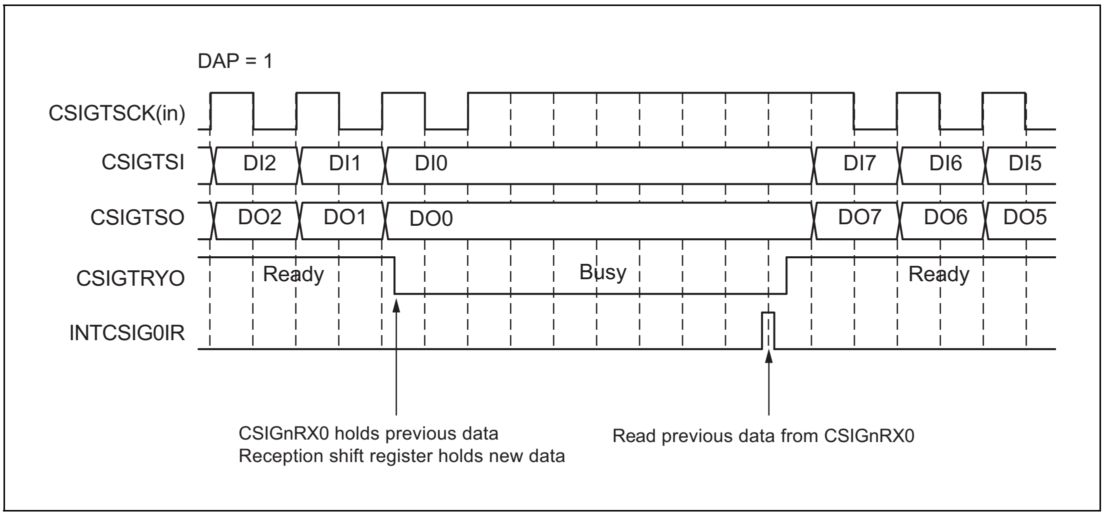

Figure 13.16 Ready/Busy Signal from Slave (CSIGnCFG0.CSIGnDAP = 1)

13.5.8.2 Master Mode

When the master detects low level of the CSIGTRYI while CSIGnCTL1.CSIGnHSE is 1, the subsequent transmission is put on hold, the master goes into wait state and suspends the clock at CSIGTSCK.

The CSIGTRYI level is checked at each half clock cycle of CSIGTSCK.

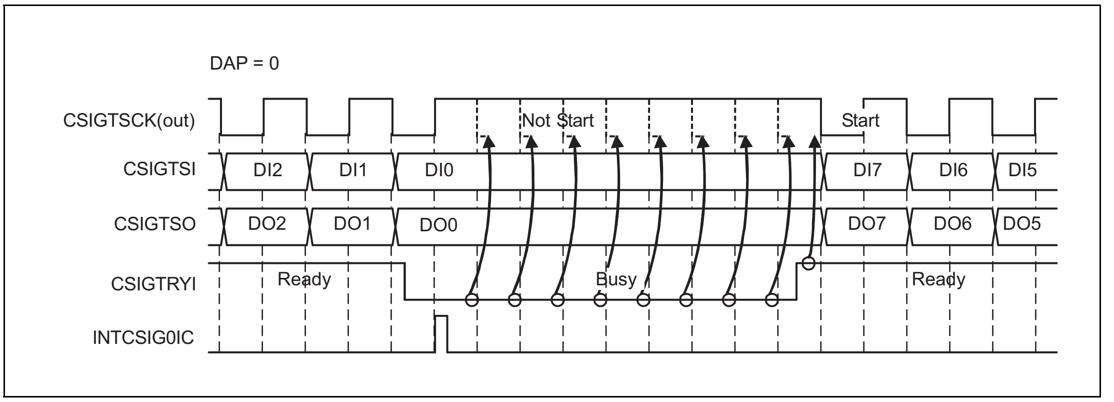

Figure 13.17 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 0)

If the CSIGTRYI low signal from the slave is received while data transfer is in progress, the serial clock is suspended after the transfer is complete.

The master resumes the communication as soon as CSIGTRYI becomes high (slave is "ready").

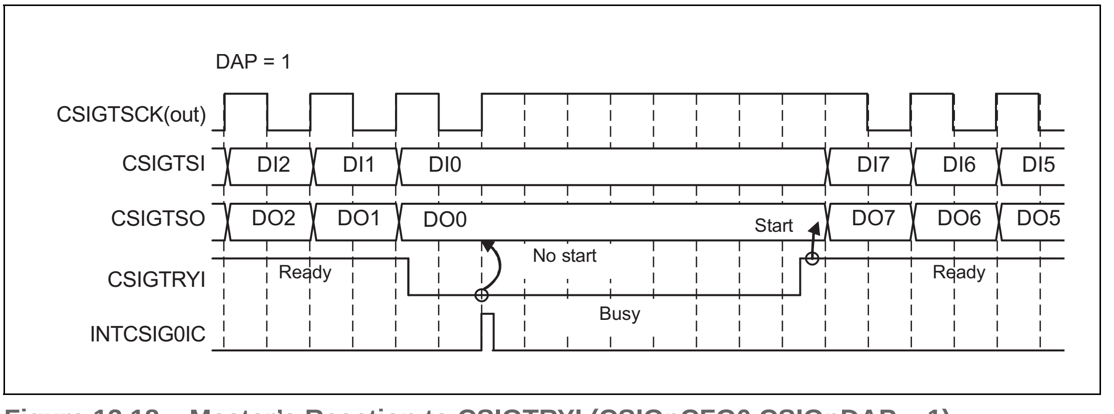

Figure 13.18 Master's Reaction to CSIGTRYI (CSIGnCFG0.CSIGnDAP = 1)

CAUTION

CSIGTRYI must be pulled down by the slave before the next transfer starts. Even if the signal is pulled down by the slave during the transfer, the transfer will continue until it is finished.

13.5.9 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIGnCTL1.CSIGnLBM = 1), the transmit and receive signals are internally connected, as shown in the figures below. The signals CSIGTSCK, CSIGTSO, and CSIGTSI are disconnected from the ports. In addition, the CSIGTSO output level is fixed to low, and CSIGTSCK is set to the reset level (high). The rest of CSIG works as in normal operation.

In order to test the CSIG, set operating mode to loop-back mode and carry out normal transfer operations.

Table 13.23 Output Level of Pins

Pin Name	Output Level
CSIGTSCK (out)	High level
CSIGTSO	Low level (independent of the last value)
Interrupt	Normal function
CSIGTRYO	Normal function (low level)

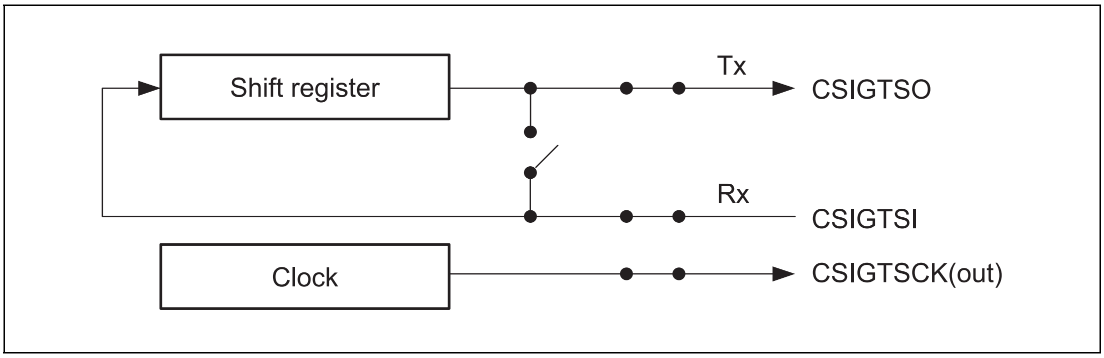

Figure 13.19 Normal Operation

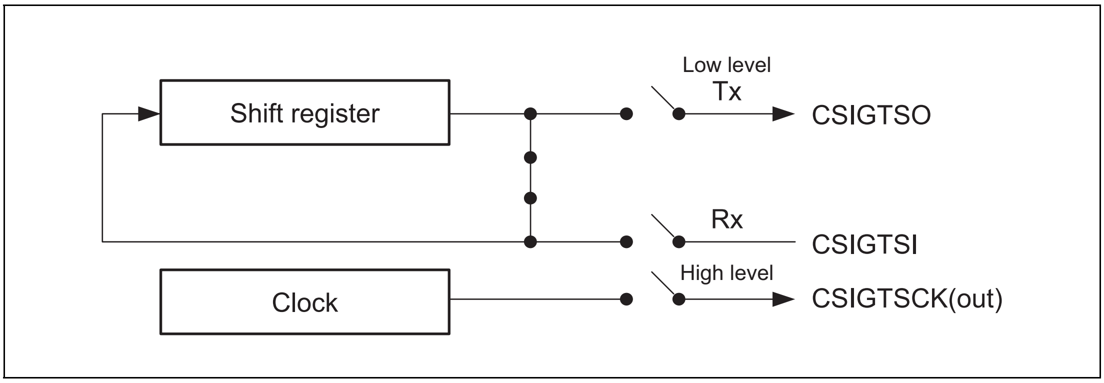

Figure 13.20 Operation in Loop-Back Mode

13.5.10 Error Detection

CSIG can detect three error types:

- Data consistency check error (transmission data)
- Parity error (reception data)
- Overrun error (reception data)

The data consistency check error/parity error check function can be individually enabled or disabled.

If one of these errors is detected, the interrupt INTCSIG0IRE is generated.

13.5.10.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically sent to the output pin is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by bit CSIGnCTL1.CSIGnDCS. (When executing a data consistency check, always set CSIGTSO to PIPCn.PIPCn_m = 1). It will not be enabled if data transmission is disabled (CSIGnCTL0.CSIGnTXE = 0).

When the data consistency check is enabled, the data transferred from CSIGnTX0W or CSIGnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIGTSO are captured and the logical interpretation is written to a separate shift register.

After completion of the transmission, the data sent is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIG0IRE is generated.
- Bit CSIGnSTR0.CSIGnDCE is set.

The data consistency check function is illustrated in the following block diagram.

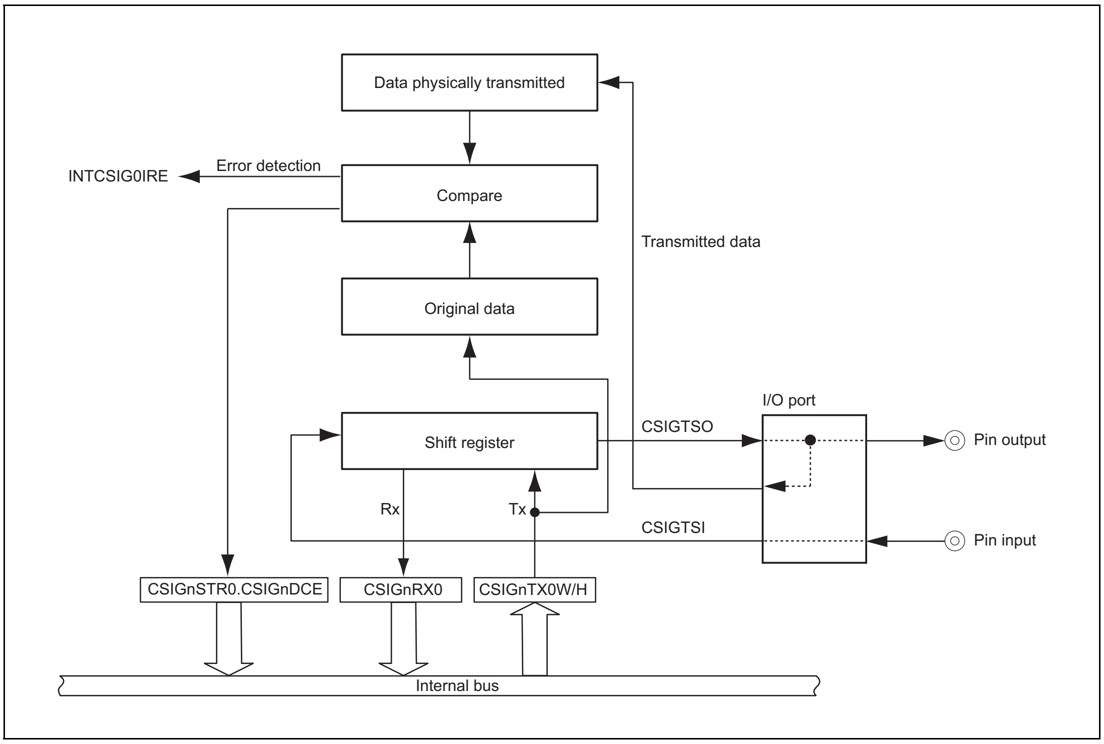

Figure 13.21 Functional Block Diagram of the Data Consistency Check

13.5.10.2 Parity Check

Parity is a common means to detect a single bit error during data transmission. CSIG can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified by CSIGnCFG0.CSIGnPS[1:0].

Parity check is enabled if CSIGnCFG0.CSIGnPS[1] = 1.

The parity bit is checked after reception is complete. If a parity error occurs:

- Interrupt INTCSIG0IRE is generated
- Bit CSIGnSTR0.CSIGnPE is set

The following figure shows an example.

Data length is 8 bits. The data transmitted is 05_H and 35_H. Parity type is odd.

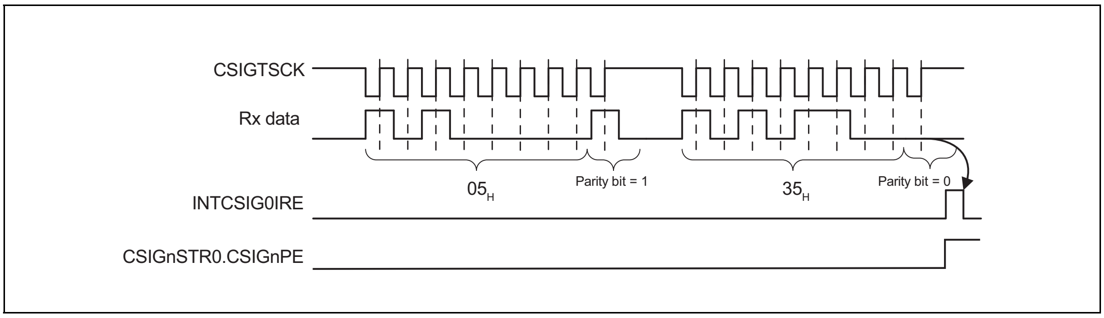

Figure 13.22 Parity Check Example

For the first 8 bits, the parity bit is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

For the second 8 bits, the parity bit is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

When the extended data length (EDL) feature is used, a parity bit is added after the last bit of the data.

13.5.10.3 Overrun Error

This error occurs when previously received data still resides in the reception register CSIGnRX0 because it has not been read and new data is received.

The overrun error is not generated if data reception is disabled (CSIGnCTL0.CSIGnRXE = 0).

If an overrun error occurs:

- Interrupt INTCSIG0IRE is generated.
- Bit CSIGnSTR0.CSIGnOVE is set.
- The data of the CSIGnRX0 register is overwritten and communication continues.

The following figure illustrates the overrun error detection function.

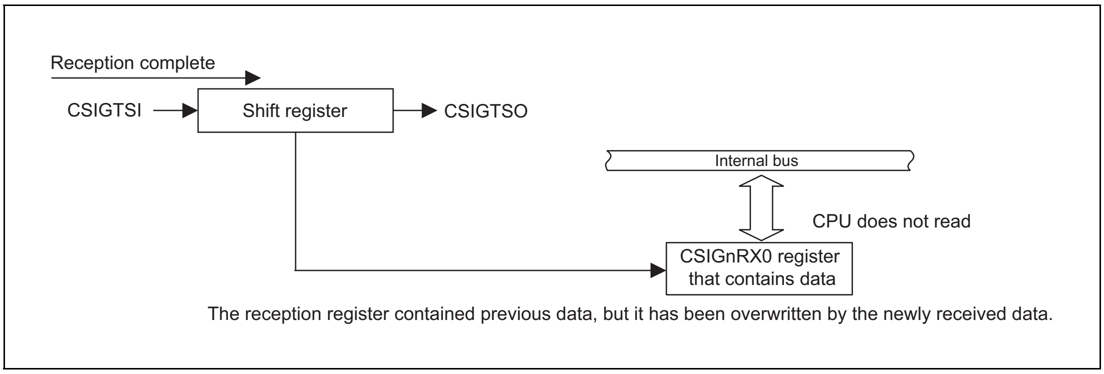

Figure 13.23 Overrun Error Detection

The following figure illustrates an example where:

- Rx data 3 is not read
- Rx data 4 is received and data is overwritten.

Thus an overrun error occurs.

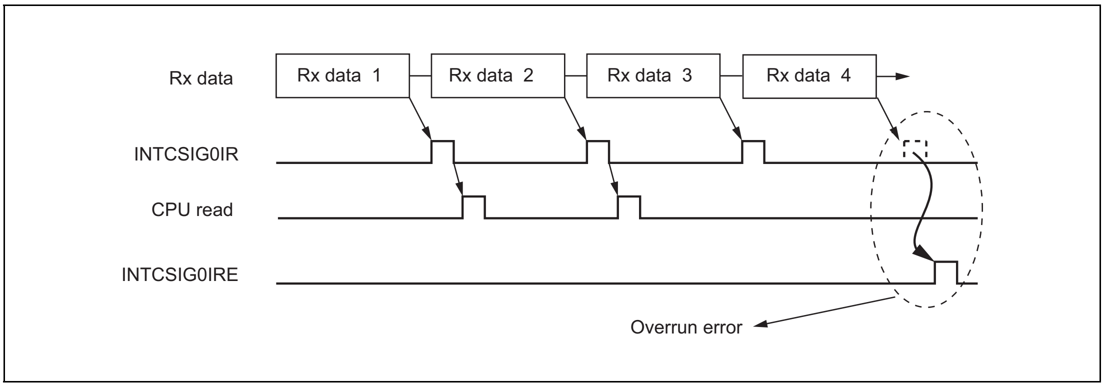

Figure 13.24 Overrun Error Detection - Example

NOTE

An Rx data overrun error can be avoided by using the handshake.

When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

For details see **Section 13.5.8, Handshake Function**.

13.6 Operating Procedures

13.6.1 Transmission/Reception by DMA in Master Mode

This section describes an example of performing the transmission/reception in master mode in combination with a DMA.

The following instructions are based on the assumption that:

- Transmission data length is 8 bits (CSIGnCFG0.CSIGnDLS[3:0] = 1000_B)
- MSB is transmitted first (CSIGnCFG0.CSIGnDIR = 0)
- INTCSIG0IC interrupt at the end of the transfer (CSIGnCTL1.CSIGnSLIT = 0)
- Normal clock and data phase (CSIGnCTL1.CSIGnCKR = 0, CSIGnCFG0.CSIGnDAP = 0)
- The number of data is 10 (0 to 9)

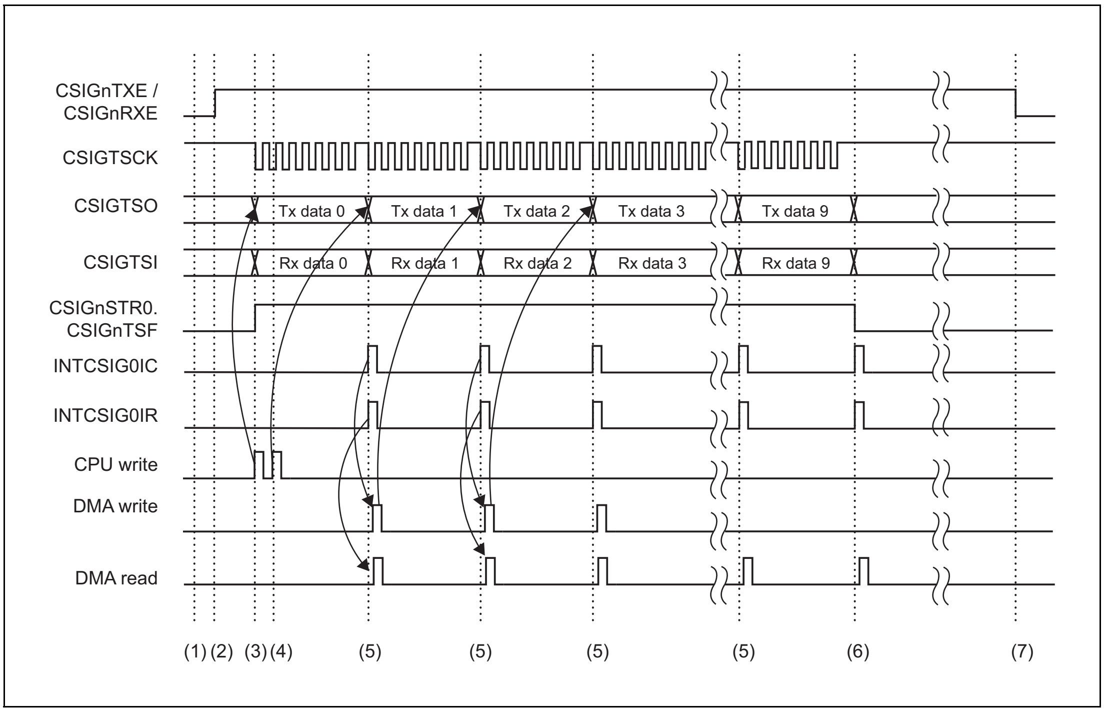

Figure 13.25 Communication in Master Mode

Procedure:

1. Set the communication protocol in the CSIGnCFG0 register. Specify interrupt timing, operating mode, etc. by setting corresponding bits in the CSIGnCTL1 register and the CSIGnCTL2 register.
2. In the CSIGnCTL0 register, set CSIGnPWR = 1 (enable clock), CSIGnTXE = 1 (enable transmission), and CSIGnRXE = 1 (enable reception).
3. Write the first transmit data to be sent to the transmission register CSIGnTX0H. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIGnTX0H. Writing the second data immediately after the first one avoids unnecessary delays between the data.

5. Each time one data block has been transmitted or received, interrupt INTCSIG0IC or INTCSIG0IR is generated. INTCSIG0IC indicates that the next data can be written to CSIGnTX0H.

6. No more write action is required after completion of transmission of data 8. Data 9 (the last data) has been written after transmission of data 7.
However, the reception register CSIGnRX0 must be read after data 8 and data 9 have been received.

7. Finally, to disable the transmit/receive operation, clear CSIGnCTL0.CSIGnTXE and CSIGnCTL0.CSIGnRXE. When no communication is taking place, set CSIGnCTL0.CSIGnPWR to “0” to minimize the power consumption of the CSIGn.

Section 14 Clocked Serial Interface H (CSIH)

The Clocked Serial Interface (CSI) module is a serial data link also well known as SPI, serial peripheral interface. The CSI bus is a synchronous serial data link standard normally operating in full duplex mode via a 3-wire serial I/O. Communication is set up in master/slave mode where the master initiates the data frame and provides the clock. Multiple slave communication is possible with additional individual chip select (slave select) lines. CSIH is implemented 4 units.

14.1 Features of RH850/P1M-E CSIH

14.1.1 Number of Units

This microcontroller has the following number of CSIH units.

Each CSIH unit has one channel interface.

Table 14.1 Number of Units

Product Name	RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of Units	4	
Name	CSIHn (n = 0 to 3)	

Table 14.2 CSIH Unit Configurations and Channels

Unit Name (Channel Name) CSIHn	Channels per Unit	RH850/P1M-E 100 pins (4 ch)	RH850/P1M-E 144 pins (4 ch)
CSIH0	1	√	
CSIH1	1	√	
CSIH2	1	√	
CSIH3	1	√	

Note: The channel names are same as those of the corresponding units.

The following table lists the values indicated by the index of each product.

Table 14.3 Index

Index	Description
n	Throughout this section, the individual CSIH units are identified by the index “n” (n = 0 to 3): for example, CSIHnCTL0 is the CSIHn control register0.
x	CSIHn has up to 8 chip select signals. Throughout this section, the individual chip select signals are identified by the index “x”: that is, CSx denotes a specified chip select signal. For the index “x”, refer to **Table 14.4, Number of Chip Select Signals**.
y	A variable used for explanation is identified by the index “y” (y=0 to 3): for example, CSIHnBRSy the baud rate setting register of CSIHn.

The numbers of chip select signals for each of the CSIH units are listed in the following table.

Table 14.4 Number of Chip Select Signals

Unit Name	Chip Select Index	
	100 pins	144 pins
CSIH0	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH1	CSx (x = 0 to 3)	CSx (x = 0 to 7)
CSIH2	CSx (x = 0 to 7)	CSx (x = 0 to 7)
CSIH3	CSx (x = 0 to 7)	CSx (x = 0 to 7)

14.1.2 Register Base Address

CSIH base addresses are listed in the following table.

CSIH register addresses are given as offsets from the base addresses throughout the section.

Table 14.5 Register Base Addresses

Base Address Name	Base Address
<CSIH0_base>	FFD8 0000_H
<CSIH1_base>	FFD8 2000_H
<CSIH2_base>	FFD8 4000_H
<CSIH3_base>	FFD8 6000_H

14.1.3 Clock Supply

Clock supply by and to CSIH is listed in the following table.

Table 14.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
CSIHn	PCLK	High-speed peripheral clock CLK_HSB

14.1.4 Interrupt Requests

CSIH interrupt requests are listed in the following table.

Table 14.7 Interrupt Requests

Unit Interrupt Name	Description	Interrupt Number	DMA/DTS Trigger Number
CSIH0			
INTCSIH0IRE	CSIH0 communication error interrupt	82	—
INTCSIH0IR0S	CSIH0 receive status/ CS0 receive status interrupt	83	65
INTCSIH0IC0S	CSIH0 communication status/ CS0 communication status interrupt	84	66
INTCSIH0IR1	CSIH0 CS1 receive status interrupt	85	67
INTCSIH0IC1	CSIH0 CS1 communication status interrupt	86	68
INTCSIH0IR2	CSIH0 CS2 receive status interrupt	87	69
INTCSIH0IC2	CSIH0 CS2 communication status interrupt	88	70
INTCSIH0IJC	CSIH0 job completion interrupt	89	71
CSIH1			
INTCSIH1IRE	CSIH1 communication error interrupt	90	—
INTCSIH1IR0S	CSIH1 receive status/CS0 receive status interrupt	91	72
INTCSIH1IC0S	CSIH1 communication status/CS0 communication status interrupt	92	73
INTCSIH1IR1	CSIH1 CS1 receive status interrupt	93	74
INTCSIH1IC1	CSIH1 CS1 communication status interrupt	94	75
INTCSIH1IR2	CSIH1 CS2 receive status interrupt	95	76
INTCSIH1IC2	CSIH1 CS2 communication status interrupt	96	77
INTCSIH1IJC	CSIH1 job completion interrupt	97	78
CSIH2			
INTCSIH2IRE	CSIH2 communication error interrupt	98	—
INTCSIH2IR	CSIH2 receive status interrupt	99	79
INTCSIH2IC	CSIH2 communication status interrupt	100	80
INTCSIH2IJC	CSIH2 job completion interrupt	101	81
CSIH3			
INTCSIH3IRE	CSIH3 communication error interrupt	102	—
INTCSIH3IR	CSIH3 receive status interrupt	103	82
INTCSIH3IC	CSIH3 communication status interrupt	104	83
INTCSIH3IJC	CSIH3 job completion interrupt	105	84

14.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

14.1.6 External Input/Output Signals

External input/output signals of CSIH are listed below.

Table 14.8 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal
CSIH0			
CSIHTSCK	I	Serial clock signal input	CSIH0SCI
	O	Serial clock signal output	CSIH0SCO
CSIHTSI	I	Serial data input signal	CSIH0SI
$\overline{\text{CSIHTSSI}}$	I	Slave select input signal	$\overline{\text{CSIH0SSI}}$
CSIHTRYI	I	Ready/busy input signal	CSIH0RYI
CSIHTSO	O	Serial data output signal	CSIH0SO
CSIHTRYO	O	Ready/busy output signal	CSIH0RYO
CSIHTCSS[7:0]*1	O	Chip select signal	CSIH0CSS[7:0]*1
CSIH1			
CSIHTSCK	I	Serial clock signal input	CSIH1SCI
	O	Serial clock signal output	CSIH1SCO
CSIHTSI	I	Serial data input signal	CSIH1SI
$\overline{\text{CSIHTSSI}}$	I	Slave select input signal	$\overline{\text{CSIH1SSI}}$
CSIHTRYI	I	Ready/busy input signal	CSIH1RYI
CSIHTSO	O	Serial data output signal	CSIH1SO
CSIHTRYO	O	Ready/busy output signal	CSIH1RYO

Note 1. Available in devices with 144-pin.

14.2 Overview

14.2.1 Functional Overview

- Three-wire serial synchronous data transfer
- Master mode and slave mode selectable
- Supports multiple slaves configuration and RCB (Recessive Configuration for Broadcasting) thanks to eight configurable chip select output signals
- Slave select input signal ($\overline{\text{CSIHTSSI}}$) is available.
- Built-in baud rate generator
- Transfer clock frequency is adjustable in master mode, and in slave mode, it is determined by input clock.
- Maximum transfer clock frequency:
  - in master mode: 10 MHz
  - in slave mode: 6.66 MHz
- Phase of clock and data selectable
- Data transfer with MSB or LSB first selectable
- Transfer data length selectable from 2 to 16 bits in 1-bit units
- Provided with on-chip EDL (Extended Data Length) function for transferring data with more than 16 bits.
- Three selectable transfer modes:
  - transmit-only mode
  - receive-only mode
  - transmit/receive mode
- Built-in handshake function
- Provided with on-chip error detection function (data consistency check, parity, timeout, overflow, and overrun).
- Supporting job concept
- 128 words I/O buffer memory
- Direct access mode and memory mode (FIFO, dual buffer, transmit-only buffer) is selectable.
- Four different interrupt request signals (INTCSIHnIC, INTCSIHnIR, INTCSIHnIRE, INTCSIHnIJC)
- Provided with on-chip LBM (Loop Back Mode) function for self-test.
- CPU-controlled high-priority communication function
- Enforced chip select idle setting
- Provided with RCB (Recessive Configuration for Broadcasting) bit for broadcasting.

14.2.2 Functional Overview Description

The CSIH uses three signals for communication:

- Transmission clock CSIHTSCK (output in master mode, input in slave mode)
- Data output signal CSIHTSO
- Data input signal CSIHTSI

Additional signals are available for external control and monitoring:

- $\overline{\text{CSIHTSSI}}$: Slave select input signal
- CSIHTRYO: Ready/busy output signal (handshake signal)
- CSIHTRYI: Ready/busy input signal (handshake signal)
- CSIHTCSS[7:0]: Chip select signals

Data transmission is bit-wise and serial, and synchronous to the transmission clock.

The following table shows the most important registers for setting up the CSIH.

Table 14.11 Main Registers of CSIH

Register	Function
CSIHnCTL0	Enables/disables serial clock, and permits/ prohibits data transmission and data reception. Defines end-of-job behavior and enables/disables buffering (bypass of the buffer).
CSIHnCTL1	Controls options such as interrupt timing, extended data length, job feature, data consistency check, loop-back mode, handshake, etc.
CSIHnCTL2	Selects master mode or slave mode, and selects transfer clock frequency for the on-chip baud rate generator (BRG) in master mode.
CSIHnBRSy	Sets transfer clock frequency for each chip select signal.
CSIHnMCTL0	Selects memory mode and specifies the time-out value.
CSIHnMCTL1	Controls the memory in FIFO mode.
CSIHnMCTL2	Controls the memory in dual buffer mode.
CSIHnCFGx	Registers to configure the communication protocol for each chip select signal.

14.2.3 Block Diagram

The following block diagram shows the main components of the CSIH.

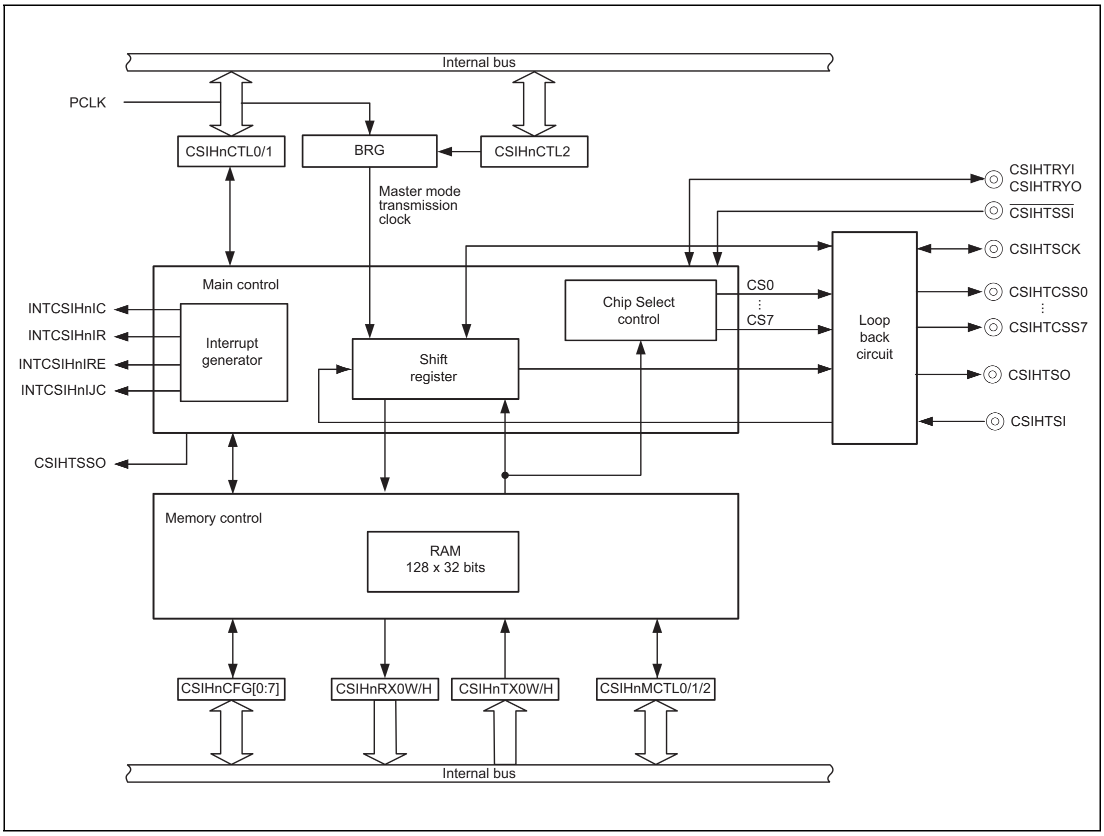

Figure 14.1 CSIH Block Diagram

In master mode, the transmission clock CSIHTSCK is generated by the built-in baud rate generator (BRG). In slave mode, the transmission clock is supplied by an external source.

The built-in memory can be configured as FIFO, dual buffer (separate transmit and receive buffers), or transmit-only buffer. It can also be bypassed for data transmission and reception without buffering.

The loop back circuit disconnects the CSIH completely from the ports and supports internal self-test.

NOTE

This chapter describes the following modes:

- The “operating mode” is either master mode or and slave mode. In this context, only a master can control and communicate with several slaves (for details, see **Section 14.5.1, Operating Modes (Master/Slave)**).
- The “job mode” is related to the AUTOSAR job concept (for details, see **Section 14.5.3.3, Job Concept**).
- The “memory mode” accords with the various configurations of the associated buffer memory (for details, see **Section 14.5.6, CSIH Buffer Memory**).
- The “data transfer mode” specifies the type of communication – transmit-only, receive only, or transmit/receive (for details, see **Section 14.5.7, Data Transfer Modes**).

14.3 Registers

14.3.1 List of Registers

CSIH registers are listed in the following table.

The base addresses <CSIH_base> of the CSIHn is defined in **Section 14.1.2, Register Base Address**.

Table 14.12 List of Registers

Module	Register Name	Symbol	Address
CSIHn	CSIHn control register 0	CSIHnCTL0	<CSIHn_base> + 0000_H
CSIHn	CSIHn control register 1	CSIHnCTL1	<CSIHn_base> + 0010_H
CSIHn	CSIHn control register 2	CSIHnCTL2	<CSIHn_base> + 0014_H
CSIHn	CSIHn status register 0	CSIHnSTR0	<CSIHn_base> + 0004_H
CSIHn	CSIHn status clear register 0	CSIHnSTCR0	<CSIHn_base> + 0008_H
CSIHn	CSIHn memory control register 0	CSIHnMCTL0	<CSIHn_base> + 1040_H
CSIHn	CSIHn memory control register 1	CSIHnMCTL1	<CSIHn_base> + 1000_H
CSIHn	CSIHn memory control register 2	CSIHnMCTL2	<CSIHn_base> + 1004_H
CSIHn	CSIHn memory read/write pointer register 0	CSIHnMRWP0	<CSIHn_base> + 1018_H
CSIHn	CSIHn configuration register 0	CSIHnCFG0	<CSIHn_base> + 1044_H
CSIHn	CSIHn configuration register 1	CSIHnCFG1	<CSIHn_base> + 1048_H
CSIHn	CSIHn configuration register 2	CSIHnCFG2	<CSIHn_base> + $104C_H$
CSIHn	CSIHn configuration register 3	CSIHnCFG3	<CSIHn_base> + 1050_H
CSIHn	CSIHn configuration register 4	CSIHnCFG4	<CSIHn_base> + 1054_H
CSIHn	CSIHn configuration register 5	CSIHnCFG5	<CSIHn_base> + 1058_H
CSIHn	CSIHn configuration register 6	CSIHnCFG6	<CSIHn_base> + $105C_H$
CSIHn	CSIHn configuration register 7	CSIHnCFG7	<CSIHn_base> + 1060_H
CSIHn	CSIHn transmit data register 0 for word access	CSIHnTX0W	<CSIHn_base> + 1008_H
CSIHn	CSIHn transmit data register 0 for half word access	CSIHnTX0H	<CSIHn_base> + $100C_H$
CSIHn	CSIHn receive data register 0 for word access	CSIHnRX0W	<CSIHn_base> + 1010_H
CSIHn	CSIHn receive data register 0 for half word access	CSIHnRX0H	<CSIHn_base> + 1014_H
CSIHn	CSIHn baud rate setting register 0	CSIHnBRS0	<CSIHn_base> + 1068_H
CSIHn	CSIHn baud rate setting register 1	CSIHnBRS1	<CSIHn_base> + $106C_H$
CSIHn	CSIHn baud rate setting register 2	CSIHnBRS2	<CSIHn_base> + 1070_H
CSIHn	CSIHn baud rate setting register 3	CSIHnBRS3	<CSIHn_base> + 1074_H
CSIH	CSIH DMA select register*1	SELCSIHDMA	<CSIH0_base> + $E000_H$

Note 1. Supported only for CSIH0 and CSIH1.

14.3.2 CSIHnCTL0 — CSIHn Control Register 0

This register controls the operation clock, enables/disables transmission/reception, and enables/disables the memory usage for transmission and/or reception. It forces the stop of communication at the end of the current job.

Access: This register can be read/written in 8- or 1-bit units.

Address: <CSIHn_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CSIHnPWR	CSIHnTXE	CSIHnRXE	—	—	—	CSIHnJOBE	CSIHnMBS
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Table 14.13 CSIHnCTL0 Register Contents

Bit Position	Bit Name	Function
7	CSIHnPWR	Controls the operation clock. 0: Stops operation clock. 1: Supplies operation clock. Clearing CSIHnPWR to 0 resets the internal circuits, stops operation, and sets CSIH to standby state. Clock supply to internal circuits stops. If CSIHnPWR is cleared to 0 during communication, ongoing communication is immediately aborted. In this case, communication settings must be made from the beginning.
6	CSIHnTXE	Permits or prohibits transmission. 0: Prohibits transmission. 1: Permits transmission.
5	CSIHnRXE	Permits or prohibits reception. 0: Prohibits reception. 1: Permits reception.
4 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CSIHnJOBE	Stops communication at the end of the current job. (Communication ends when data is written to the transmit buffer while CSIHnTX0W.CSIHnEOJ = 1 (job completion).) 0: Communication stop is not requested. 1: Stops communication. This bit can be used to abort an ongoing job. This bit is cleared to 0 automatically. Even if this bit is set to 1, the read value is always 0. In FIFO mode, the pointer must be cleared by setting CSIHnSTCR0.CSIHnPCT = 1 before the next communication is started
0	CSIHnMBS	Bypasses the memory for transmission and/or reception data. 0: Memory mode CSIH memory is used for transmission and/or reception data. 1: Direct access mode CSIH memory is bypassed.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.3 CSIHnCTL1 — CSIHn Control Register 1

This register specifies the interrupt timing and the interrupt delay mode. It also enables/disables extended data length control, data consistency check, loop-back mode, handshake functionality, and job mode. It selects the active output level of each chip select signal and the behavior of the chip select signals after the transfer of the final data.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 0010_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	CSIHn PHE	CSIHn CKR	CSIHn SLIT
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn CSL7	CSIHn CSL6	CSIHn CSL5	CSIHn CSL4	CSIHn CSL3	CSIHn CSL2	CSIHn CSL1	CSIHn CSL0	CSIHn EDLE	CSIHn JE	CSIHn DCS	CSIHn CSRI	CSIHn LBM	CSIHn SIT	CSIHn HSE	CSIHn SSE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.14 CSIHnCTL1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	CSIHnPHE	Sets the CPU-controlled priority-based communication function. 0: The CPU-controlled high-priority communication function is disabled. 1: The CPU-controlled high-priority communication function is enabled. To enable the CPU-controlled high-priority communication function, set this bit to 1 and set CSIHnJE = 1. This bit can only be set in transmit-only buffer mode.
17	CSIHnCKR	CSIHTSCK clock inversion function 0: The default level of CSIHTSCK is high 1: The default level of CSIHTSCK is low For details, see **Section 14.3.11, CSIHnCFGx — CSIHn Configuration Register x**.
16	CSIHnSLIT	Selects the timing of interrupt INTCSIHnIC. 0: Normal interrupt timing (interrupt is generated after the transfer) 1: As soon as the contents of the CSIHnTX0W/H register are transferred to the shift register, an interrupt is generated (this function is activated only in direct access mode and transmit-only buffer mode). For details, see **Section 14.4.3, INTCSIHnIC (Communication Status Interrupt)**.
15 to 8	CSIHnCSL[7:0]	Selects the active output level of chip select signal x (CSIHTCSSx). (x = 0 to 7) 0: Chip select signal is active low. 1: Chip select signal is active high. For details, see **Section 14.5.3, Chip Selection (CS) Features**.
7	CSIHnEDLE	Enables/disables extended data length (EDL) mode. 0: Disables extended data length mode. 1: Enables extended data length mode. For details, see **Section 14.5.8.2, Data Length Greater than 16 Bits**.

Table 14.14 CSIHnCTL1 Register Contents (2/2)

Bit Position	Bit Name	Function
6	CSIHnJE	Enables/disables job mode. 0: Disables job mode. 1: Enables job mode. For details, see **Section 14.5.3.3, Job Concept**. The CSIHnCTL0.CSIHnJOBE, CSIHnTX0W.CSIHnEOJ, and CSIHnTX0W. CSIHnCIRE bits are enabled only when CSIHnJE = 1. Setting this bit in slave mode is prohibited. In addition, to enable the CPU-controlled high-priority communication function, set this bit to 1 as well as CSIHnPHE = 1.
5	CSIHnDCS	Enables/disables data consistency check. 0: Disables data consistency check. 1: Enables data consistency check. For details, see **Section 14.5.12.1, Data Consistency Check**.
4	CSIHnCSRI	Defines chip select signal behavior after last data transfer. 0: Chip select signal holds the active level. 1: Chip select signal returns to the inactive level. The last data is judged at the following times. • INTCSIHnIC interrupt output timing when the next writing is not made at the end of communication in FIFO mode • INTCSIHnIC interrupt output timing while CSIHnCTL1.CSIHnSLIT is set to 0 in direct access mode
3	CSIHnLBM	Controls loop-back mode (LBM). 0: Deactivates loop-back mode. 1: Activates loop-back mode. For details, see **Section 14.5.13, Loop-Back Mode**.
2	CSIHnSIT	Selects interrupt delay mode. 0: No delay is generated. 1: Half clock delay is generated for all interrupts. This bit is only valid in master mode. In slave mode, no delay is generated. For details, see **Section 14.4.2, Interrupt Delay**.
1	CSIHnHSE	Enables/disables the handshake function. 0: Disables the handshake function. 1: Enables the handshake function. For details, refer to **Section 14.5.11, Handshake Function**.
0	CSIHnSSE	Enables/disables the slave select function. 0: Input signal $\overline{\text{CSIHTSSI}}$ is disabled. 1: Input signal $\overline{\text{CSIHTSSI}}$ is enabled. If the slave select function is not used, this bit must be set to 0 (see also **Section 14.5.2, Master/Slave Connections**).

Details about CSIHnCTL1.CSIHnSSE are shown in the following tables.

Table 14.15 Operation of the Slave Select Function during Reception

CSIHnCTL0. CSIHnRXE	CSIHnCTL1. CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Receive Operation
0	—	—	Reception is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

Table 14.16 Operation of the Slave Select Function during Transmission

CSIHnCTL0. CSIHnTXE	CSIHnCTL1. CSIHnSSE	$\overline{\text{CSIHTSSI}}$	Transmit Operation
0	—	—	Transmission is prohibited
1	0	—	Possible
1	1	0	Possible
1	1	1	Disabled

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.4 CSIHnCTL2 — CSIHn Control Register 2

This register selects operating mode and the reference clock value, and specifies the transfer clock frequency.

For details, see **Section 14.5.5, Transmission Clock Selection**.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + 0014_H

Value after reset: $E000_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnPRS[2:0]			—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.17 CSIHnCTL2 Register Contents

Bit Position	Bit Name	Function
15 to 13	CSIHnPRS[2:0]	These bits select the operation mode and the reference clock value.

CSIHnPRS2	CSIHnPRS1	CSIHnPRS0	Selection of Reference Clock (PRSOUT)
0	0	0	PCLK (Master mode)
0	0	1	PCLK/2 (Master mode)
0	1	0	PCLK/4 (Master mode)
0	1	1	PCLK/8 (Master mode)
1	0	0	PCLK/16 (Master mode)
1	0	1	PCLK/32 (Master mode)
1	1	0	PCLK/64 (Master mode)
1	1	1	External clock via CSIHTSCK(in) (Slave mode)

Bit Position	Bit Name	Function
12 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

In master mode, the following bits are used to set the transfer clock frequency:

- CSIHnCTL2.CSIHnPRS[2:0],
- CSIHnCFGx.CSIHnBRSS[1:0], and
- CSIHnBRSy.CSIHnBRS[11:0]

In addition, any of the four different transfer clock frequency settings that are specified by the CSIHnBRSy.CSIHnBRS[11:0] bits is selected for each chip select signal. To select the transfer clock frequency setting for each chip select signal, use the CSIHnCFGx.CSIHnBRSS[1:0] bits.

The following table shows the relationship between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSy.CSIHnBRS[11:0].

Table 14.18 Relationship Between CSIHnCFGx.CSIHnBRSS[1:0] and CSIHnBRSy.CSIHnBRS[11:0]

CSIHnCFGx (x = 0 to 7) CSIHnBRSS1, CSIHnBRSS0	Transfer Clock Frequency Setting Bit to be Selected
00	CSIHnBRS0.CSIHnBRS[11:0]
01	CSIHnBRS1.CSIHnBRS[11:0]
10	CSIHnBRS2.CSIHnBRS[11:0]
11	CSIHnBRS3.CSIHnBRS[11:0]

The following table shows the relationship between the transfer clock frequency setting (CSIHnBRSy[11:0]) and the transfer clock frequency selected by the CSIHnBRSS[1:0] bits when the CSIHnPRS[2:0] bit value is α.

Table 14.19 Relationship Between CSIHnBRSy[11:0] and Transfer Clock Frequency

CSIHnBRS[11:0]	Transfer Clock Frequency
0	BRG stopped
1	PCLK / (2^{α} × 1 × 2)
2	PCLK / (2^{α} × 2 × 2)
3	PCLK / (2^{α} × 3 × 2)
4	PCLK / (2^{α} × 4 × 2)
...	…
4095	PCLK / (2^{α} × 4095 × 2)

When time-out errors are being used in slave mode, the clock selected by this setting is used. When the clock is being used in slave mode, although the CSIHnPRS[2:0] bits are set to 111_B, this has the same effect on the prescaler as the CSIHnPRS[2:0] bits are being set to 000_B. Set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H to use time-out errors.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.5 CSIHnSTR0 — CSIHn Status Register 0

This register indicates the status of CSIH.

Access: This register can only be read in 32-bit units.

Address: <CSIHn_base> + 0004_H

Value after reset: $0000\ 0010_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHnSRP[7:0]								CSIHnSPF[7:0]

</table>
</td></tr>
<tr><td>6</td><td>Reserved</td><td>When read, the value after reset is read.</td></tr>
</table>

Table 14.20 CSIHnSTR0 Register Contents (3/3)

Bit Position	Bit Name	Function
5	CSIHnFLF	A flag indicating that the buffer is full in FIFO mode. 0: FIFO buffer is not full. 1: FIFO buffer is full. This bit is cleared by CSIHnSTCR0.CSIHnPCT. The FIFO buffer might be filled with untransmitted data or received data.
4	CSIHnEMF	A flag indicating that the buffer is empty in FIFO mode. 0: FIFO buffer is not empty. 1: FIFO buffer is empty. This bit is set to 1 by CSIHnSTCR0.CSIHnPCT. This bit is set to 1 when CSIHnSTR0.CSIHnSRP[7:0] + CSIHnSTR0.CSIHnSPF[7:0] = 00_H.
3	CSIHnDCE	Data consistency check error flag. 0: No data consistency check error is detected. 1: Data consistency check error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnDCEC. However, if this bit is set to 1 by the detection of a data consistency check error and cleared to 0 by CSIHnSTCR0.CSIHnDCEC simultaneously, setting to 1 due to the detection of a data consistency check error is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
2	Reserved	When read, the value after reset is read.
1	CSIHnPE	Parity error flag 0: No parity error is detected. 1: Parity error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnPEC. However, if this bit is set to 1 by the detection of parity error and cleared to 0 by CSIHnSTCR0.CSIHnPEC simultaneously, setting to 1 due to the detection of a parity error is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.
0	CSIHnOVE	Overrun error flag (Fixed to 0 in dual buffer mode). 0: No overrun error is detected. 1: Overrun error is detected. This bit is cleared by writing 1 to CSIHnSTCR0.CSIHnOVEC. However, if this bit is set to 1 by the detection of overrun error and cleared to 0 by CSIHnSTCR0.CSIHnOVEC simultaneously, setting to 1 due to the detection of an overrun error is prioritized. This bit is initialized when CSIHnCTL0.CSIHnPWR changes from 0 to 1 or from 1 to 0.

Table 14.21 Behaviors in Various Memory Modes

Bit Name	Bit Position	Direct Access Mode	FIFO Mode	Transmit-only Buffer Mode	Dual Buffer Mode
CSIHnSRP[7:0]	31 to 24	Fixed to 0	Number of received data	Fixed to 0	Fixed to 0
CSIHnSPF[7:0]	23 to 16	Fixed to 0	Number of untransmitted data	Fixed to 0	Fixed to 0

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.6 CSIHnSTCR0 — CSIHn Status Clear Register 0

This register clears the status flags of the CSIHnSTR0 status register.

Access: This register can be read/written in 16-bit units.
When read, the value 0000_H is always returned.

Address: <CSIHn_base> + 0008_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHn TMOEC	CSIHn OFEC	—	—	—	—	—	CSIHn PCT	—	—	—	—	CSIHn DCEC	—	CSIHn PEC	CSIHn OVEC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R	R/W	R	R	R	R	R/W	R	R/W	R/W

Table 14.22 CSIHnSTCR0 Register Contents

Bit Position	Bit Name	Function
15	CSIHnTMOEC	Controls the time-out error flag clear command. 0: No operation. 1: Clears the time out error flag (CSIHnSTR0.CSIHnTMOE). The read value is always 0.
14	CSIHnOFEC	Controls the overflow error flag clear command. 0: No operation. 1: Clears the overflow error flag (CSIHnSTR0.CSIHnOFE). The read value is always 0.
13 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	CSIHnPCT	Controls the FIFO pointer clear command. 0: No operation. 1: Clears the following FIFO buffer pointers (in FIFO mode, dual buffer mode, and transmit-only buffer mode) and the status bits below. The read value is always 0. **FIFO Buffer Pointer** / **Status Bit** CSIHnMRWP0.CSIHnTRWA[6:0] / CSIHnSTR0.CSIHnSPF[7:0] CSIHnMRWP0.CSIHnRRA[6:0] / CSIHnSTR0.CSIHnSRP[7:0] CSIHnMCTL2.CSIHnSOP[6:0] / CSIHnSTR0.CSIHnFLF CSIHnSTR0.CSIHnTSF
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	CSIHnDCEC	Controls the data consistency check error flag clear command. 0: No operation. 1: Clears the data consistency check error flag (CSIHnSTR0.CSIHnDCE). The read value is always 0.
2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	CSIHnPEC	Controls the parity error flag clear command. 0: No operation. 1: Clears the parity error flag (CSIHnSTR0.CSIHnPE). The read value is always 0.
0	CSIHnOVEC	Controls the overrun error flag clear command. 0: No operation. 1: Clears the overrun error flag (CSIHnSTR0.CSIHnOVE). The read value is always 0.

CAUTION

For the setting of this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.7 CSIHnMCTL0 — CSIHn Memory Control Register 0

This register selects the memory mode and the time-out setting.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + 1040_H

Value after reset: $001F_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	CSIHnMMS[1:0]		—	—	—	CSIHnTO[4:0]				
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 14.23 CSIHnMCTL0 Register Contents

Bit Position	Bit Name	Function
15 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9, 8	CSIHnMMS [1:0]	Selects the memory mode. CSIHnMMS1 / CSIHnMMS0 / Description: 0 / 0 / FIFO mode 0 / 1 / Dual buffer mode 1 / 0 / Transmit-only buffer mode 1 / 1 / Prohibited After a change of the memory mode, the respective buffer pointers must be cleared by setting the CSIHnSTCR0.CSIHnPCT bit to 1. In direct access mode, the setting of these bits is ignored.
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4 to 0	CSIHnTO[4:0]	Selects the time-out setting in FIFO mode. CSIHnTO[4:0] / Description: 00000_B / No time-out is detected 00001_B / Time-out is (1 × 8 × BRG output clocks) 00010_B / Time-out is (2 × 8 × BRG output clocks) ... 11111_B / Time-out is (31 × 8 × BRG output clocks) **CAUTION** Changing the time-out setting is only permitted when CSIHnCTL0.CSIHnPWR = 0. Set the CSIHnTO[4:0] bits to 00000_B in modes other than FIFO mode (direct access mode, dual buffer mode, and transmit-only buffer mode). For details about time-out detection, see also **Section 14.5.12.3, Time-Out Error**.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.8 CSIHnMCTL1 — CSIHn Memory Control Register 1

This register selects the conditions to generate the interrupt requests, INTCSIHnIC and INTCSIHnIR in FIFO mode.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnFES[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnFFS[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.24 CSIHnMCTL1 Register Contents

Bit position	Bit name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	CSIHnFES[6:0]	Selects the conditions to generate the INTCSIHnIC interrupt (transmit data empty) in FIFO mode. When the number of untransmitted data to be transmitted in FIFO (checked by the CSIHnSTR0.CSIHnSPF[7:0] bit) and CSIHnMCTL1.CSIHnFES[6:0] match, the INTCSIHnIC interrupt request is generated.
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	CSIHnFFS[6:0]	Selects the conditions to generate the INTCSIHnIR interrupt (receive data full) in FIFO mode. When the number of received data in FIFO (checked by the CSIHnSTR0.CSIHnSRP[7:0] bit) and (128 - CSIHnMCTL1.CSIHnFFS[6:0]) match, the INTCSIHnIR interrupt request is generated.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.9 CSIHnMCTL2 — CSIHn Memory Control Register 2

This register controls the operation of the memory in dual buffer or transmit-only buffer mode and triggers to start communication in these buffer modes.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	CSIHn BTST	—	—	—	—	—	—	—	CSIHnND[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnSOP[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.25 CSIHnMCTL2 Register Contents (1/2)

Bit Position	Bit Name	Function
31	CSIHnBTST	Provides a start trigger for buffer transfer. 0: No operation. 1: Issues the start transfer command. The read value is always 0. **CAUTION** This bit can only be used in dual buffer mode and transmit-only buffer mode.
30 to 24	Reserved	When read, the value after reset is read. When writing, write the value after reset.
23 to 16	CSIHnND[7:0]	Specifies the number of data for each memory mode. The read value indicates the number of remaining communication data.

CSIHn ND[7:0]	Dual Buffer Mode	Transmit-only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	Transmit 0 data	Transmit 0 data	No influence	No influence
01_H	Transmit 1 data	Transmit 1 data	No influence	No influence
...	...	...	No influence	No influence
$3F_H$	Transmit 63 data	Transmit 63 data	No influence	No influence
40_H	Transmit 64 data	Transmit 64 data	No influence	No influence
...	Prohibited	...	No influence	No influence
$7F_H$	Prohibited	Transmit 127 data	No influence	No influence
80_H	Prohibited	Transmit 128 data	No influence	No influence
Other than the above	Setting is prohibited.			

The values are automatically decremented after data transfer (not decremented in direct access mode).

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 14.25 CSIHnMCTL2 Register Contents (2/2)

Bit Position	Bit Name	Function
6 to 0	CSIHnSOP[6:0]	Selects the pointer of the data to be transmitted. If communication is forced to stop by setting CSIHnCTL0.CSIHnPWR to 0 or CSIHnSTCR0.CSIHnPCT to 1, these bits are cleared by the hardware. In FIFO mode, these bits indicate the transmitted address.

CSIHn SOP[6:0]	Dual Buffer Mode	Transmit-only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	0000_H	0000_H	No influence
01_H	0004_H	0004_H	0004_H	No influence
...	...	...	...	No influence
$3F_H$	$00FC_H$	$00FC_H$	$00FC_H$	No influence
40_H	Prohibited	0100_H	0100_H	No influence
...	Prohibited	...	...	No influence
$7F_H$	Prohibited	$01FC_H$	$01FC_H$	No influence

After the data transfer, the value increments automatically.

CAUTION

In direct access mode, these bits are not incremented.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.10 CSIHnMRWP0 — CSIHn Memory Read/Write Pointer Register 0

This register sets the pointers for reading from and writing to the dual or transmit-only buffer.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1018_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	CSIHnRRA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	CSIHnTRWA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.26 CSIHnMRWP0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	CSIHnRRA[6:0]	Selects the read pointer of the receive buffer.

CSIHn RRA[6:0]	Dual Buffer Mode	Transmit-only Buffer Mode	FIFO Mode	Direct Access Mode
00_H	0000_H	No influence	0000_H	No influence
01_H	0004_H	No influence	0004_H	No influence
...	...	No influence	...	No influence
$3F_H$	$00FC_H$	No influence	$00FC_H$	No influence
40_H	Prohibited	No influence	0100_H	No influence
...	Prohibited	No influence	...	No influence
$7F_H$	Prohibited	No influence	$01FC_H$	No influence

These bits are automatically incremented when received data is read.
When CSIHnRRA[6:0] is $7F_H$ and received data is read,CSIHnRRA[6:0] is 00_H.
If an overrun error is generated while reading the CSIHnRX0W or CSIHnRX0H register, the read pointer is not incremented.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode and transmit-only buffer mode, these bits are not incremented.
To perform write access in transmit-only buffer mode, set these bits to 0000_H.
In FIFO mode, these bits indicate the read address of the received data.

Bit Position	Bit Name	Function
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 14.26 CSIHnMRWP0 Register Contents (2/2)

<table>
<tr><th>Bit Position</th><th>Bit Name</th><th>Function</th></tr>
<tr><td>6 to 0</td><td>CSIHnTRWA [6:0]</td><td>Selects the read/write pointer of the transmit buffer.
<table><tr><th>CSIHn TRWA[6:0]</th><th>Dual Buffer Mode</th><th>Transmit-only Buffer Mode</th><th>FIFO Mode</th><th>Direct Access Mode</th></tr><tr><td>00_H</td><td>0000_H</td><td>0000_H</td><td>0000_H</td><td>No influence</td></tr><tr><td>01_H</td><td>0004_H</td><td>0004_H</td><td>0004_H</td><td>No influence</td></tr><tr><td>...</td><td>...</td><td>...</td><td>...</td><td>No influence</td></tr><tr><td>$3F_H$</td><td>$00FC_H$</td><td>$00FC_H$</td><td>$00FC_H$</td><td>No influence</td></tr><tr><td>40_H</td><td>Prohibited</td><td>0100_H</td><td>0100_H</td><td>No influence</td></tr><tr><td>...</td><td>Prohibited</td><td>...</td><td>...</td><td>No influence</td></tr><tr><td>$7F_H$</td><td>Prohibited</td><td>$01FC_H$</td><td>$01FC_H$</td><td>No influence</td></tr></table>These bits are automatically incremented when the transmission data is written or read.
When CSIHnTRWA[6:0] is $7F_H$ and received data is read, CSIHnTRWA[6:0] is 00_H.
These bits are cleared when CSIHnSTCR0.CSIHnPCT is set to 1.
In direct access mode, these bits are not incremented.
In FIFO mode, these bits indicate the read/write address of transmission data.</td></tr>
</table>

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.11 CSIHnCFGx — CSIHn Configuration Register x

These eight registers configure the chip select signal CSIHTCSSx baud rate, parity, data length, recessive configuration for broadcasting, serial data direction, clock phase, data phase, idle enforcement configuration, idle time, hold time, inter-data time and setup for each chip select signal, CSIHTCSSx.

Slave mode

In slave mode, the transmission protocol setting of the CSIHnCFG0 register is effective.

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx, CSIHnDAPx: clock and data phase

In slave mode, set all bits other than above in the CSIHnCFG0 register, and the CSIHnCFG1 to CSIHnCFG7 registers to 0.

Access: This register can be read/written in 32-bit units.

Address: CSIHnCFG0: <CSIHn_base> + 1044_H
CSIHnCFG1: <CSIHn_base> + 1048_H
CSIHnCFG2: <CSIHn_base> + $104C_H$
CSIHnCFG3: <CSIHn_base> + 1050_H
CSIHnCFG4: <CSIHn_base> + 1054_H
CSIHnCFG5: <CSIHn_base> + 1058_H
CSIHnCFG6: <CSIHn_base> + $105C_H$
CSIHnCFG7: <CSIHn_base> + 1060_H

Value after reset: $0000\ 0000_H$

1: Regardless of the CSIHnTX0W.CSIHnCSx settings of two consecutive transfers, an idle state is inserted between two transfers.
This bit is only available in master mode.
For details about the enforced idle state, see Section 14.5.15, Enforced Chip Select Idle Setting.</td></tr>
</table>

Table 14.27 CSIHnCFGx Register Contents (3/4)

Bit Position	Bit Name	Function
14 to 12	CSIHnIDx[2:0]	Selects the idle time for chip select signal x.

CSIHnIDx [2:0]	Idle Time
000_B	0.5 transmission clock a half cycle
001_B	1 transmission clock cycle
010_B	1.5 transmission clock cycles
011_B	2.5 transmission clock cycles
100_B	3.5 transmission clock cycles
101_B	4.5 transmission clock cycles
110_B	6.5 transmission clock cycles
111_B	8.5 transmission clock cycles

These bits are only available in master mode.

Bit Position	Bit Name	Function
11 to 8	CSIHnHDx[3:0]	Specifies the hold time for chip select signal x in transmission clock cycles.

CSIHnHDx [3:0]	Hold Time with CSIHnCTL1.CSIHnSIT = 0	Hold Time with CSIHnCTL1.CSIHnSIT = 1
0000_B	0.5 transmission clock a half cycle	1 transmission clock cycle
0001_B	1.0 transmission clock cycle	1.5 transmission clock cycle
0010_B	1.5 transmission clock cycles	2 transmission clock cycle
0011_B	2.5 transmission clock cycles	3.0 transmission clock cycle
0100_B	3.5 transmission clock cycles	4.0 transmission clock cycle
0101_B	4.5 transmission clock cycles	5.0 transmission clock cycle
0110_B	6.5 transmission clock cycles	7.0 transmission clock cycle
0111_B	8.5 transmission clock cycles	9.0 transmission clock cycle
1000_B	9.5 transmission clock cycles	10.0 transmission clock cycle
1001_B	10.5 transmission clock cycles	11.0 transmission clock cycle
1010_B	11.5 transmission clock cycles	12.0 transmission clock cycle
1011_B	12.5 transmission clock cycles	13.0 transmission clock cycle
1100_B	14.5 transmission clock cycles	15.0 transmission clock cycle
1101_B	16.5 transmission clock cycles	17.0 transmission clock cycle
1110_B	18.5 transmission clock cycles	19.0 transmission clock cycle
1111_B	20.5 transmission clock cycles	21 transmission clock cycle

These bits are only available in master mode.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.12 CSIHnTX0W — CSIHn Transmit Data Register 0 for Word Access

This register stores transmission data. In addition, it specifies the communication interrupt request, the end-of-job, the extended data length, and the chip select activation.

Access: This register can be read/written in 32-bit units.

Address: <CSIHn_base> + 1008_H

Value after reset: $X0XX\ XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 14.28 CSIHnTX0W Register Contents (1/2)

Bit position	Bit name	Function
31	CSIHnCIRE	Enables the communication interrupt request INTCSIHnIC in dual buffer or transmit-only buffer mode, or the job completion interrupt request INTCSIHnIJC in FIFO mode. 0: No interrupt is requested. 1: An interrupt is requested. Generates interrupt INTCSIHnIC or INTCSIHnIJC after transmission. For details, see **Section 14.4.3, INTCSIHnIC (Communication Status Interrupt)** and **Section 14.4.6, INTCSIHnIJC (Job Completion Interrupt)**. **CAUTION** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
30	CSIHnEOJ	Specifies the end of a job. 0: Indicates that it is not end-of-job data. The job continues. 1: Indicates end-of-job data. **CAUTION** This bit is only valid when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). This bit must be set to 0 in slave mode.
29	CSIHnEDL	Specifies whether the associated data requires the extended data length (EDL) option. 0: Normal operation 1: Enables the extended data length. The associated data is transmitted as a 16-bit packet. No inter-data time or idle time will be inserted after the data is transmitted. If CSIHnCTL1.CSIHnEDLE = 1 and CSIHnTX0W.CSIHnEDL = 1, the same CS must be selected for subsequent data. If CS is modified for the subsequent data, the correct operation is not guaranteed. **CAUTION** This bit is only available if CSIHnCTL1.CSIHnEDLE = 1.
28 to 24	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Table 14.28 CSIHnTX0W Register Contents (2/2)

Bit position	Bit name	Function
23 to 16	CSIHnCS[7:0]	Activates one or more chip select signals. 0: Activates chip select signal x for the associated transmission. 1: Deactivates chip select signal x for the associated transmission. Setting CSIHnTX0W.CSIHnCS[7:0] = FF_H is prohibited. **CAUTION** If several chip select signals are enabled for broadcasting, the configuration of one with CSIHnCFGx.CSIHnRCBx = 0 (dominant) is used. In this case, all dominant chip select signals must be set to precisely the same value. In slave mode, set the CSIHnCS[7:0] bit to FE_H.
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.13 CSIHnTX0H — CSIHn Transmit Data Register 0 for Half Word Access

This register stores the transmission data. This register is the same as bits 15 to 0 of register CSIHnTX0W.

The settings specified by the upper 16 bits of CSIHnTX0W are applied to the transmission. Set transmit data to CSIHnTX0W before using this register because the value of CSIHnTX0W is undefined after the reset.

Access: This register can be read/written in 16-bit units.

Address: <CSIHn_base> + $100C_H$

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnTX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 14.29 CSIHnTX0H Register Contents

Bit position	Bit name	Function
15 to 0	CSIHnTX[15:0]	Stores the transmission data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.14 CSIHnRX0W — CSIHn Receive Data Register 0 for Word Access

This register stores the received data.

Access: This register can only be read in 32-bit units.

Address: <CSIHn_base> + 1010_H

Value after reset: $0XXX\ XXXX_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	CSIHn RPE	CSIHn TDCE	CSIHn CS7	CSIHn CS6	CSIHn CS5	CSIHn CS4	CSIHn CS3	CSIHn CS2	CSIHn CS1	CSIHn CS0

	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.30 CSIHnRX0W Register Contents

Bit position	Bit name	Function
31 to 26	Reserved	When read, the value after reset is read.
25	CSIHnRPE	Indicates whether a reception data parity error was detected. 0: No parity error was detected on the associated reception data. 1: A parity error was detected on the associated reception data.
24	CSIHnTDCE	Indicates whether a transmission data consistency check error was detected. 0: No consistency check error was detected on the associated transmission data. 1: A consistency check error was detected on the associated transmission data.
23 to 16	CSIHnCSx (x = 7 to 0)	Indicates which chip select signal was activated. 0: Chip select signal x is active for the associated reception. 1: Chip select signal x is inactive for the associated reception.
15 to 0	CSIHnRX[15:0]	Stores the received data.

NOTE

This register stores the received data when an INTCSIHnIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHnIR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.15 CSIHnRX0H — CSIHn Receive Data Register 0 for Half Word Access

This register stores the received data. This register is the same as bits 15 to 0 of register CSIHnRX0W.

Access: This register can be read only in 16-bit units.

Address: <CSIHn_base> + 1014_H

Value after reset: Undefined

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CSIHnRX[15:0]															
Value after reset	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 14.31 CSIHnRX0H Register Contents

Bit position	Bit name	Function
15 to 0	CSIHnRX[15:0]	Stores the received data.

NOTE

This register stores the received data when an INTCSIHnIR interrupt is generated. Read the received data stored in this register before generation of an INTCSIHnIR interrupt. Otherwise the data is rewritten with the next received data.

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.16 CSIHnBRSy — CSIHn Baud Rate Setting Register y (y = 0 to 3)

This register sets the transfer clock frequency for each chip select signal.

With CSIHnCFG0-7.CSIHnBRSSx[1:0] bits, one of the four types of transfer clock frequency settings can be selected for each chip select signal. For details of transfer clock frequency settings, see **Section 14.5.5, Transmission Clock Selection**.

Access: This register can be read/written in 16-bit units.

Address: CSIHnBRS0: <CSIHn_base> + 1068_H
CSIHnBRS1: <CSIHn_base> + $106C_H$
CSIHnBRS2: <CSIHn_base> + 1070_H
CSIHnBRS3: <CSIHn_base> + 1074_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CSIHnBRS[11:0]											
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 14.32 CSIHnBRSy Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11 to 0	CSIHnBRS [11:0]	0: BRG stopped 1: PCLK / (2^{α} × 1 × 2) 2: PCLK / (2^{α} × 2 × 2) 3: PCLK / (2^{α} × 3 × 2) 4: PCLK / (2^{α} × 4 × 2) . . . 4095: PCLK / (2^{α} × 4095 × 2) α is the value of CSIHnCTL2.CSIHnPRS[2:0].

CAUTION

When setting this register, refer to **Table 14.34, Notes on Setting Registers**.

14.3.17 SELCSIHDMA — CSIH DMA Select Register

This register controls the generation condition for the interrupt and the DMA/DTS trigger.

Access: This register can be read/written in 8-bit units.

Address: <CSIH0_base> + $E000_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SELCSI1DR	SELCSI1DC	SELCSI0DR	SELCSI0DC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 14.33 SELCSIHDMA Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	SELCSI1DR	Controls the generation condition for the INTCSIH1IR0S interrupt and the DMA/DTS trigger. 0: INTCSIH1IR0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH1IR0S interrupt and DMA/DTS trigger can be generated only when CS0 is active.
2	SELCSI1DC	Controls the generation condition for the INTCSIH1IC0S interrupt and the DMA/DTS trigger. 0: INTCSIH1IC0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH1IC0S interrupt and DMA/DTS trigger can be generated only when CS0 is active.
1	SELCSI0DR	Controls the generation condition for the INTCSIH0IR0S interrupt and the DMA/DTS trigger. 0: INTCSIH0IR0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH0IR0S interrupt and DMA/DTS trigger can be generated only when CS0 is active.
0	SELCSI0DC	Controls the generation condition for the INTCSIH0IC0S interrupt and the DMA/DTS trigger. 0: INTCSIH0IC0S interrupt and DMA/DTS trigger can be generated regardless the CS0 setting. 1: INTCSIH0IC0S interrupt and DMA/DTS trigger can be generated only when CS0 is active.

Figure 14.2 shows a functional overview of the CSIHn (n = 0, 1) that is connected to the DMA/DTS and the interrupt controller.

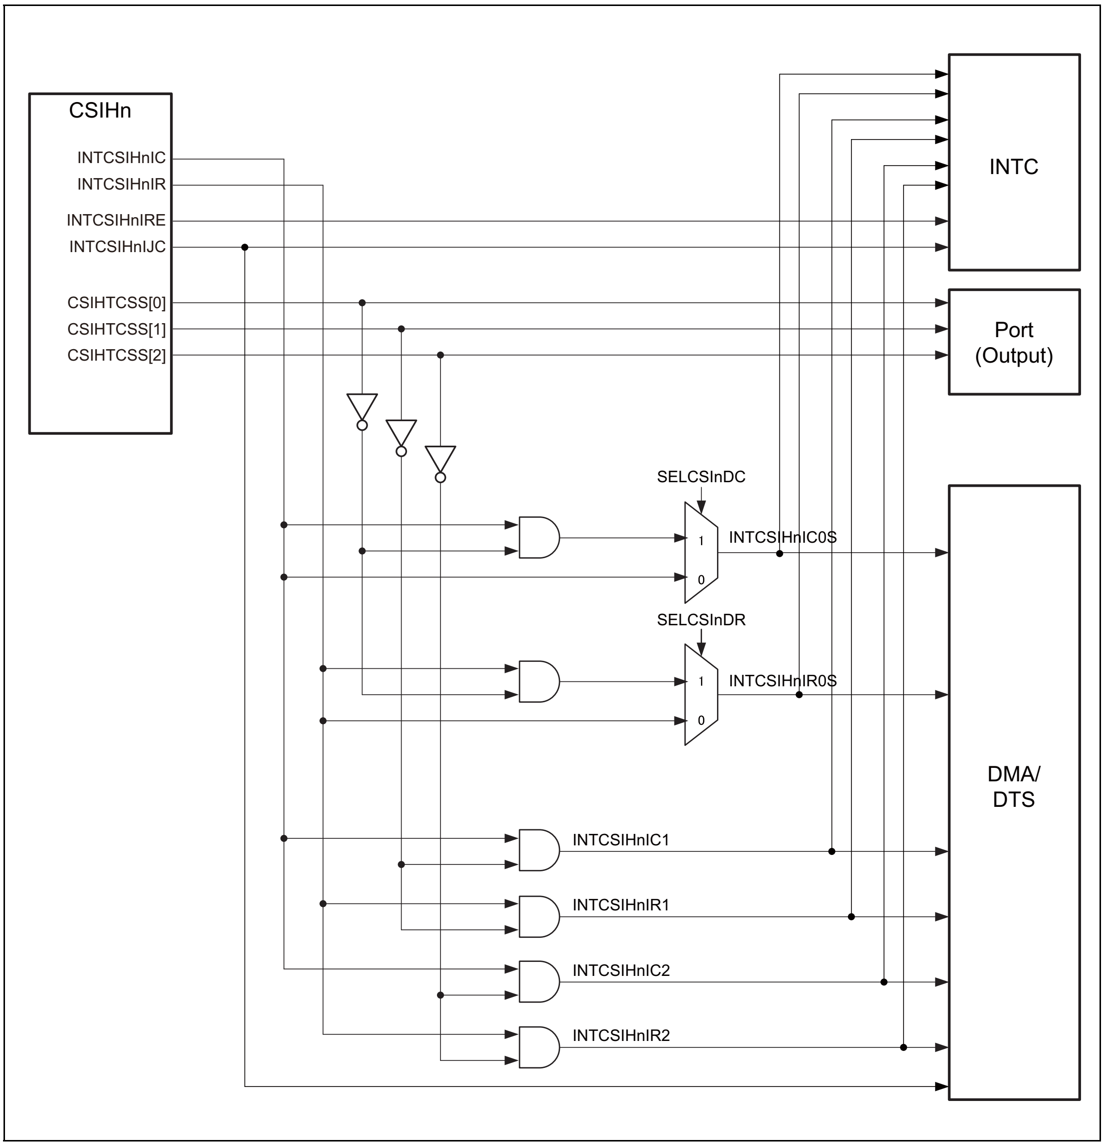

Figure 14.2 Block Diagram Showing the Connection of the Interrupt Controller, DMA/DTC, and CSIHn (n = 0, 1)

14.3.18 List of Cautions

Table 14.34 Notes on Setting Registers (1/3)

Register Name	Bit Name	Content
CSIHnCTL0	CSIHnPWR	If this bit is cleared during communication, ongoing communication is aborted. After the communication is aborted, the communication must be restarted.
CSIHnCTL0	CSIHnTXE CSIHnRXE	Do not modify any of these bits while CSIHnCTL0.CSIHnPWR = 0. (These bits can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Do not modify these bits while CSIHnSTR0.CSIHnTSF = 1, because the specified operation is not guaranteed if ongoing communication is aborted.
CSIHnCTL0	CSIHnJOBE	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid when CSIHnCTL1.CSIHnJE = 1. Setting this bit is prohibited in slave mode.
CSIHnCTL0	CSIHnMBS	Do not modify this bit while CSIHnCTL0.CSIHnPWR = 0. (This bit can be modified at the same time as the CSIHnCTL0.CSIHnPWR bit.) Modification of this bit is only allowed while CSIHnSTR0.CSIHnTSF = 0. Do not modify of "FIFO mode <-> Direct access mode" while CSIHnCTL0.CSIHnPWR = 1. When the CPU-controlled high-priority communication function is enabled, the operation is the same as that in direct access mode regardless of the CSIHnMBS bit setting.
CSIHnCTL1	CSIHnCKR	Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. If CS is not used, use this bit instead of the CSIHnCFGx.CSIHnCKPx bit and set CSIHnCFGx.CSIHnCKPx to 0. This bit must be used in slave mode.
CSIHnCTL1	CSIHnSLIT CSIHnCSL[7:0] CSIHnEDLE CSIHnDCS CSIHnCSRI CSIHnHSE	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.
CSIHnCTL1	CSIHnPHE CSIHnJE CSIHnLBM	Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of this bit is prohibited in slave mode.
CSIHnCTL1	CSIHnSSE	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting this bit to 1 is prohibited in master mode.
CSIHnCTL1	CSIHnSIT	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. This bit is only valid in master mode. In slave mode, no delay is generated.
CSIHnCTL2	CSIHnPRS[2:0]	Modification of this bit is only permitted while CSIHnCTL0.CSIHnPWR = 0. Setting of the maximum transfer clock frequency is shown below. • Master mode: 10 MHz • Slave mode: 6.66 MHz
CSIHnSTR0	CSIHnSRP[7:0] CSIHnSPF[7:0] CSIHnFLF CSIHnEMF CSIHnTSF	Writing to these bits is prohibited, and only reading is permitted.
CSIHnSTR0	CSIHnTMOE CSIHnOFE CSIHnDCE CSIHnPE CSIHnOVE	Writing to these bits is prohibited, and only reading is permitted. These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0.
CSIHnSTCR0	CSIHnPCT	Setting this bit to 1 during data transfer stops the transfer, and the interface waits for the next transfer. Setting this bit to 1 during waiting time (setup time, hold time, idle time, or inter-data time), insertion of the waiting time is cancelled and the interface waits for the next transfer.
CSIHnMCTL0	CSIHnMMS[1:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0 and CSIHnCTL0.CSIHnMBS = 0.

Table 14.34 Notes on Setting Registers (2/3)

Register Name	Bit Name	Content
CSIHnMCTL0	CSIHnTO[4:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. Set these bits to 0 in master mode. Set these bits to 0 in direct access, dual buffer, and transmit-only buffer mode.
CSIHnMCTL1	CSIHnFES[6:0] CSIHnFFS[6:0]	Writing to these bits while communication is ongoing is permitted.
CSIHnMCTL2	CSIHnBTST CSIHnND[7:0] CSIHnSOP[6:0]	Writing these bits is prohibited when CSIHnCTL0.CSIHnPWR = 0. Writing these bits is prohibited when CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0. Writing these bits is prohibited when CSIHnSTR0.CSIHnTSF = 1. Writing these bits is prohibited in direct access or FIFO mode.
CSIHnMRWP0	CSIHnRRA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing these bits is prohibited in direct access or FIFO mode. When writing is required in transmit-only buffer mode, set "0000_H" to these bits.
CSIHnMRWP0	CSIHnTRWA[6:0]	Writing to these bits while communication is ongoing is permitted. Writing these bits is prohibited in direct access or FIFO mode.
CSIHnCFGx x = 0 to 7	CSIHnBRSSx[1:0] CSIHnRCBx CSIHnIDLx CSIHnIDx[2:0] CSIHnHDx[3:0] CSIHnINx[3:0] CSIHnSPx[3:0]	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. These bits must be set to 0 in slave mode.
CSIHnCFGx x = 0 to 7	CSIHnPSx[1:0] CSIHnDLSx[3:0] CSIHnDIRx CSIHnDAPx	Modification of these bits is only allowed while CSIHnCTL0.CSIHnPWR = 0. In slave mode, the CSIHnCFG0 setting is used for the configuration. Therefore, all the bits in CSIHnCFG1 to CSIHnCFG7 must be set to 0.
CSIHnCFGx x = 0 to 7	CSIHnCKPx	Modification of this bit is only allowed while CSIHnCTL0.CSIHnPWR = 0. Set this bit to 0 as CSIHnCTL1.CSIHnCKR must be used in slave mode. If CS is not used, use the CSIHnCTL1.CSIHnCKR bit instead of this bit, and clear this bit to 0.
CSIHnTX0W	CSIHnEOJ CSIHnCIRE	These bits are only valid when CSIHnCTL1.CSIHnJE = 1. While CSIHnCTL1.CSIHnJE = 0, the value of this bit is ignored even if 1 is read. Set these bits to 0 in slave mode.
CSIHnTX0W	CSIHnEDL	This bit is only valid when CSIHnCTL1.CSIHnEDLE = 1. While CSIHnCTL1.CSIHnEDLE = 0, the value of this bit is ignored even if 1 is read.
CSIHnTX0W	CSIHnCS[7:0]	In master mode, setting these bits to "FF_H" is prohibited. In slave mode, setting these bits to "FE_H" is prohibited.
CSIHnTX0W CSIHnTX0H		Reading these bits while communication is ongoing is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0 in FIFO mode, reading these bits is prohibited. While CSIHnCTL0.CSIHnTXE = CSIHnCTL0.CSIHnRXE = 0, writing to these bits are prohibited in direct access mode.
CSIHnRX0W		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited and only reading these bits is permitted in FIFO mode. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is permitted except for FIFO mode (transmit-only buffer mode, dual buffer mode, and direct access mode). While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited and only reading these bits is permitted except for FIFO mode (transmit-only buffer mode, dual buffer mode, and direct access mode).

Table 14.34 Notes on Setting Registers (3/3)

Register Name	Bit Name	Content
CSIHnRX0H		These bits are initialized when CSIHnCTL0.CSIHnPWR = 0 → 1 or CSIHnCTL0.CSIHnPWR = 1 → 0. While CSIHnCTL0.CSIHnPWR = 0, reading and writing these bits is prohibited in FIFO mode. While CSIHnCTL0.CSIHnPWR = 1, writing these bits is prohibited and only reading these bits is permitted in FIFO mode. Writing these bits is prohibited and only reading these bits is permitted in spite of the value of CSIHnCTL0.CSIHnPWR except for FIFO mode (transmit-only buffer mode, dual buffer mode, and direct access mode).
CSIHnBRSy y = 0 to 3		Modification of these bits is only permitted while CSIHnCTL0.CSIHnPWR = 0.

14.4 Interrupt Sources

CSIH can generate the following interrupt requests:

- INTCSIHnIC (communication status interrupt)
- INTCSIHnIR (reception status interrupt)
- INTCSIHnIRE (communication error interrupt)
- INTCSIHnIJC (job completion interrupt)

14.4.1 Overview

The error interrupt INTCSIHnIRE is generated when an error is detected. The generation of the other interrupts depends on the memory mode, the job mode, and – in case of the job completion interrupt INTCSIHnIJC – also the operating mode.

The job completion interrupt INTCSIHnIJC is only generated when job mode is enabled (CSIHnCTL1.CSIHnJE = 1). It is not available in slave mode.

The following table gives an overview.

Table 14.35 Interrupt Generation

Memory mode	Interrupt	Interrupt Source	
		Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	**Job Mode Enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	INTCSIHnIC	Tx data empty*[1]	Tx data empty*[1] Excluding job abort*[4]
	INTCSIHnIR	Rx data full*[2] *and* CSIHnCTL0.CSIHnRXE = 1	Rx data full*[2] *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHnIRE	Error detected	Error detected
	INTCSIHnIJC*[3]	Not applicable	CSIHnTX0W.CSIHnCIRE = 1 (When Tx data is not empty), or job abort*[4]
Transmit-only buffer	INTCSIHnIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHnIR	Data received *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHnIRE	Error detected	Error detected
	INTCSIHnIJC*[3]	Not applicable	Job abort*[4]
Dual buffer	INTCSIHnIC	End of communication	CSIHnTX0W.CSIHnCIRE = 1 *and* (CSIHnCTL0.CSIHnJOBE = 0 *or* CSIHnTX0W.CSIHnEOJ = 0)
	INTCSIHnIR	End of communication and CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHnIRE	Error detected	Error detected
	INTCSIHnIJC*[3]	Not applicable	Job abort*[4]
Direct access	INTCSIHnIC	One data transfer	One data transfer (Excluding job abort*[4])
	INTCSIHnIR	Data received *and* CSIHnCTL0.CSIHnRXE = 1	Data received *and* CSIHnCTL0.CSIHnRXE = 1
	INTCSIHnIRE	Error detected	Error detected
	INTCSIHnIJC*[3]	Not applicable	Job abort*[4]

Note 1. “Tx data empty” refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFES[6:0].

Note 2. "Rx data full" refers to the FIFO fill level, defined by CSIHnMCTL1.CSIHnFFS[6:0].

Note 3. INTCSIHnIJC is not available in slave mode.

Note 4. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 *and* CSIHnCTL0.CSIHnJOBE = 1
Same operation as direct access mode is performed during high-priority communication in transmit-only buffer mode.

14.4.2 Interrupt Delay

In master mode, all interrupts generated by the master can be delayed by half a cycle of the transmission clock, CSIHTSCK. This is not possible in slave mode.

The delay is specified by setting CSIHnCTL1.CSIHnSIT = 1 (the setting of the CSIGnSIT bit is invalid in slave mode).

The following example illustrates the interrupt delay function, assuming a setting of CSIHnCTL1.CSIHnSIT = 1 (interrupt delay enabled), CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0 (clock and data phase), and CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B (data length 8 bits).

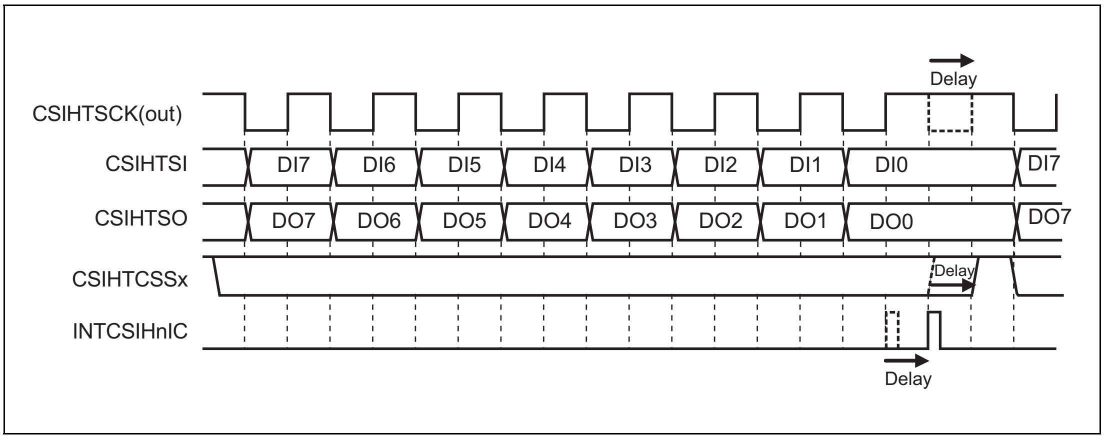

Figure 14.3 Interrupt Delay Function (CSIHnCTL1.CSIHnSIT = 1)

Setting CSIHnCTL1.CSIHnSIT = 1 adds a half cycle delay to the transmission clock. This also delays the end of the present chip select signal (CSIHTCSSx).

14.4.3 INTCSIHnIC (Communication Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions shown in the following table.

Table 14.36 INTCSIHnIC Interrupt Generation

Memory Mode	Cause of Interrupt	
	Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	**Job Mode Enabled CSIHnCTL1.CSIHnJE = 1**
FIFO	This interrupt is generated when transmit data FIFO is nearly empty and the application has to add new data to continue transmission. INTCSIHnIC is generated, if the number of data to be transmitted remaining in the FIFO (CSIHnSTR0.CSIHnSPF[7:0]) equals CSIHnMTCL1.CSIHnFES[6:0].	In the same way as when JE = 0, this interrupt is generated when the number of transmission data CSIHnSTR0.CSIHnSPF[7:0] remaining in the FIFO equals the CSIHnMCTL1.CSIHnFES[6:0] value, but this interrupt is not generated when job is aborted.
Transmit-only buffer, dual buffer	Generated at the end of communication. (Specified by the CSIHnMTLC2.CSIHnND[7:0] bit)	Generated when data with CSIHnTX0W.CSIHnCIRE = 1 is transmitted. Note that if data with CSIHnTX0W.CSIHnCIRE = 1 and job abort*[1] are transmitted, the INTCSIHnIJC interrupt is generated instead of INTCSIHnIC.
Direct access	Generated after every data transfer.	Generated after every data transfer, except when the communication was aborted.

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1.
Same operation as direct access mode is performed during high-priority communication in transmit-only buffer mode.

14.4.3.1 INTCSIHnIC in Direct Access Mode

The examples below show the INTCSIHnIC behavior in direct access mode.

The examples assume:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

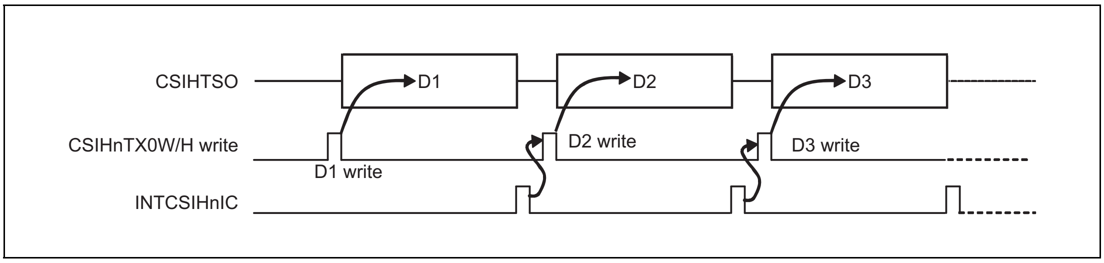

Figure 14.4 Generation of INTCSIHnIC after Transfer (CSIHnCTL1.CSIHnSLIT = 0)

If job mode is enabled (CSIHnCTL1.CSIHnJE = 1) and a job ends because data is transmitted with CSIHnTXOW.CSIHnEOJ= 1 and communication stop is requested (CSIHnCTL0.CSIHnJOBE = 1), then INTCSIHnIC is replaced by the job completion interrupt INTCSIHnIC.

INTCSIHnIC can also be set up to occur as soon as the CSIHnTX0W/H register ready to store the next data. This is specified by setting CSIHnCTL1.CSIHnSLIT = 1.

The effect is illustrated in the figure below.

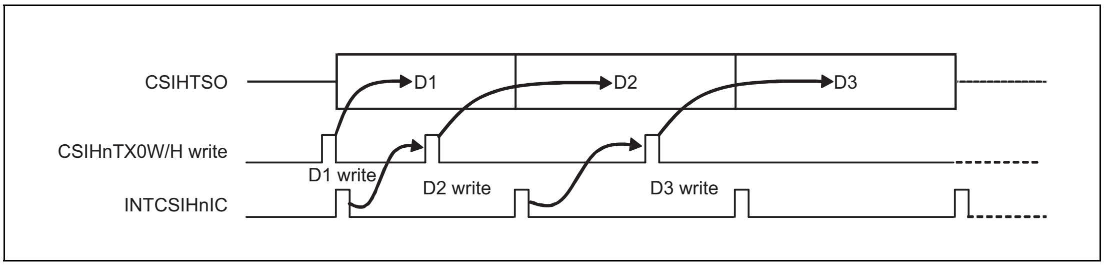

Figure 14.5 Immediate Generation of INTCSIHnIC (CSIHnCTL1.CSIHnSLIT = 1)

Thus, the new data can be written in advance.

NOTE

Same operation as direct access mode is performed during high-priority communication in transmit-only buffer mode.

14.4.3.2 INTCSIHnIC in FIFO Mode

The example below shows the INTCSIHnIC behavior in FIFO mode.

The example assumes:

- Master mode
- FIFO mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase
  (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

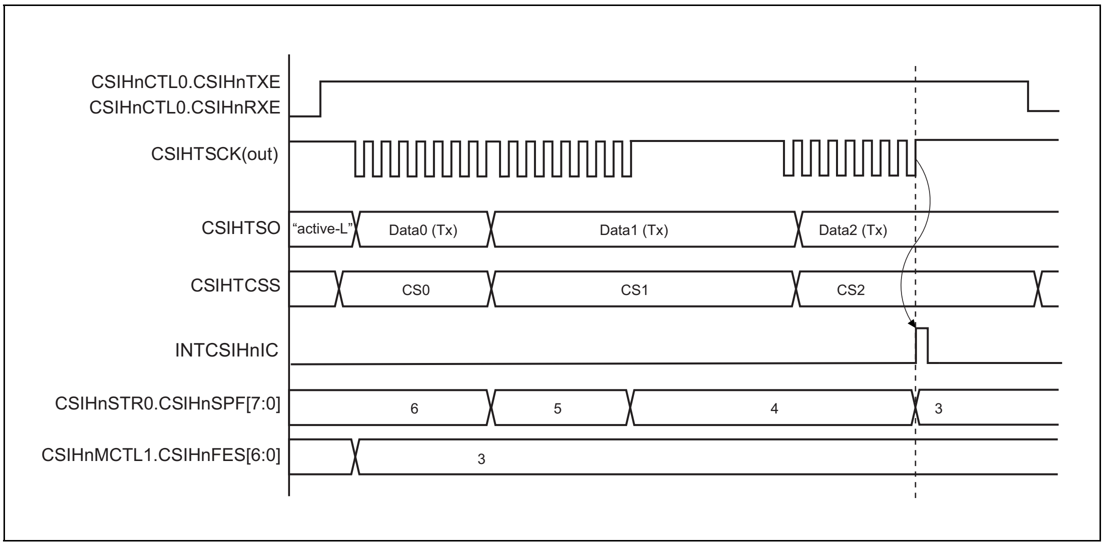

Figure 14.6 Generation of INTCSIHnIC in FIFO Memory Mode

The condition for "FIFO empty" is specified in CSIHnMCTL1.CSIHnFES[6:0]. In the example of the diagram above, the number of untransmitted data in FIFO is set to 3. CSIHnSTR0.CSIHnSPF[7:0] indicates the number of untransmitted data. When both match, the interrupt INTCSIHnIC occurs.

14.4.3.3 INTCSIHnIC in Job Mode

The example below shows the INTCSIHnIC behavior in job mode.

The example assumes:

- Master mode
- Job mode enabled (CSIHnCTL1.CSIHnJE = 1)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)

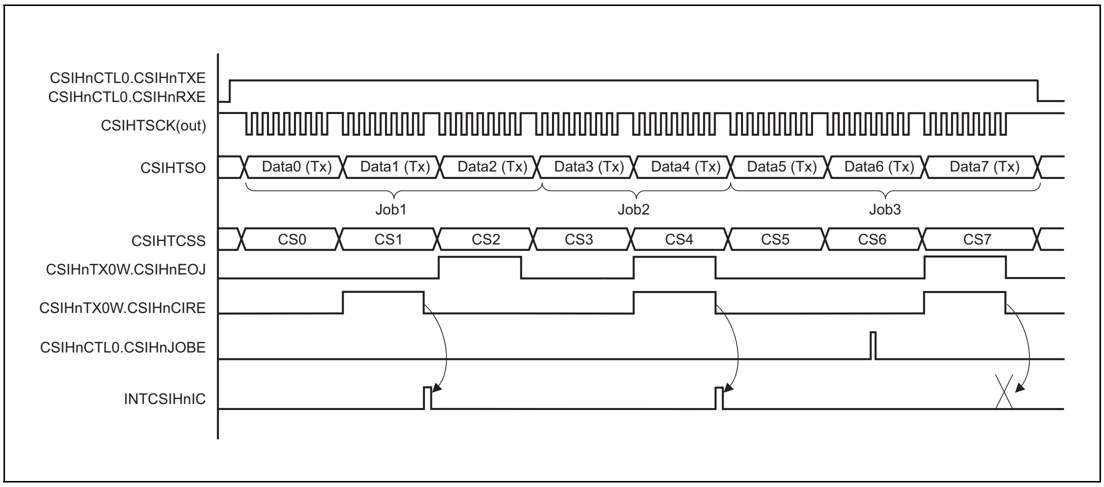

Figure 14.7 Generation of INTCSIHnIC in Job Mode

The rules for generating INTCSIHnIC in job mode are shown in the following table.

Table 14.37 Generation of INTCSIHnIC in Job Mode

CSIHnTX0W. CSIHnEOJ	CSIHnTX0W. CSIHnCIRE	INTCSIHnIC
0	0	Not generated
0	1	Generated
1	0	Not generated
1	1	CSIHnCTL0.CSIHnJOBE = 0: Generated
		CSIHnCTL0.CSIHnJOBE = 1: Not generated, replaced by interrupt INTCSIHnIJC

14.4.4 INTCSIHnIR (Receive Status Interrupt)

Depending on the memory mode and the job mode, this interrupt is generated according to the conditions below.

Table 14.38 INTCSIHnIR Interrupt Generation

Memory Mode	Cause of Interrupt CSIHnCTL0.CSIHnRXE = 1: Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Cause of Interrupt CSIHnCTL0.CSIHnRXE = 1: Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	This interrupt occurs when the FIFO buffer is almost full with received data while CSIHnCTL0.CSIHnRXE = 1, notifying the application that the FIFO must be emptied. INTCSIHnIR is generated, if the number of received data in the FIFO (CSIHnSTR0.CSIHnSRP[7:0]) equals (128-CSIHnMCTL1.CSIHnFFS[6:0])	
Dual buffer	An interrupt is generated at the end of communication (specified by CSIHnMCTL2.CSIHnND[7:0]) while CSIHnCTL0.CSIHnRXE = 1.	An interrupt is generated after every data transfer.
Transmit-only buffer, Direct access	An interrupt is generated after every data transfer.	

14.4.4.1 INTCSIHnIR in Direct Access Mode

The example below shows the INTCSIHnIR behavior in direct access mode.

The example below assumes:

- Master mode
- Direct access mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

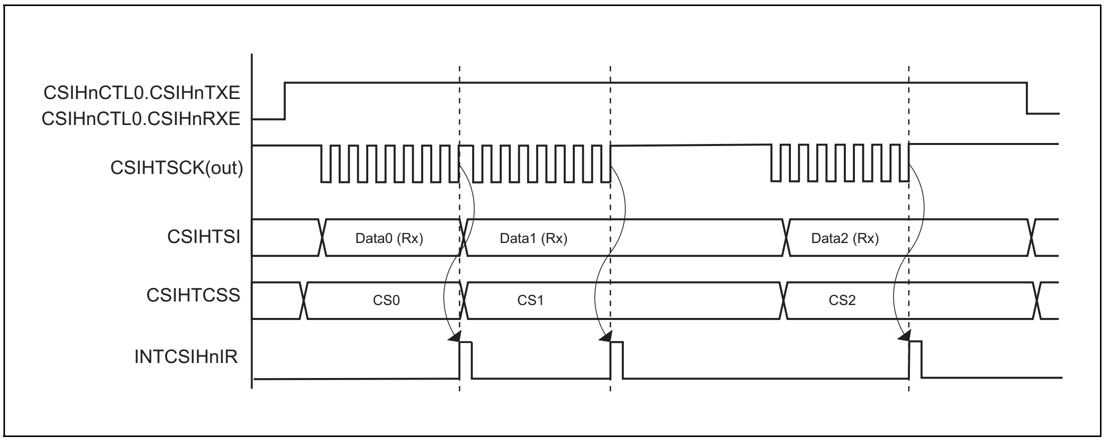

Figure 14.8 Generation of INTCSIHnIR in Direct Access Mode

14.4.4.2 INTCSIHnIR in Dual Buffer Mode

The example below shows the INTCSIHnIR behavior in dual buffer mode.

The example assumes:

- Master mode
- Dual buffer mode
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- Data length 8 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B)

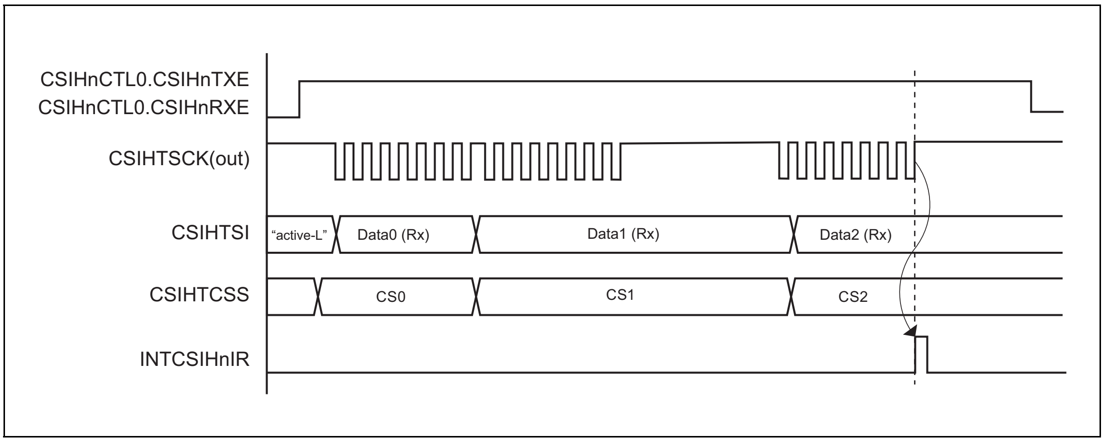

Figure 14.9 Generation of INTCSIHnIR in Dual Buffer Mode

14.4.5 INTCSIHnIRE (Communication Error Interrupt)

This interrupt is generated whenever an error is detected.

For details about interrupt generation timing, see **Section 14.5.12, Error Detection**.

Table 14.39 Data Error Types

Error Type	Communication Status after Error Interrupt	Note
FIFO overflow error	Communication continues even if an interrupt is generated.	Data that has not been written to the FIFO buffer and the data overflowed is lost, but communication started before the error is continued.
Parity error	Communication continues even if an interrupt is generated.	—
Data consistency check error	Communication continues even if an interrupt is generated.	—
Time-out error	Communication continues even if an interrupt is generated.	—
Overrun error	(Error occurrence condition 1) An interrupt is generated when the CPU reads the CSIHnRX0W/H register while no receive data is present in FIFO mode, but communication continues.	—
	(Error occurrence condition 2) When CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled) in slave mode [1] An interrupt is generated when reception is completed while the previous receive data remains in the CSIHnRX0W/H register in direct access mode or transmit-only buffer mode, but communication continues. [2] An interrupt is generated when reception is completed while the FIFO buffer is filled with received data in FIFO mode, but communication continues.	When CSIHnCTL1.CSIHnHSE = 1 (handshake function enabled) in slave mode, communication stops due to handshake and no overrun error occurs.

The type of error that caused the generation of INTCSIHnIRE is flagged in register CSIHnSTR0.

Additionally a parity error flag and a data consistency check error flag are attached to the received data in CSIHnRX0W.

For details about the various error types, see **Section 14.5.12, Error Detection**.

14.4.6 INTCSIHnIJC (Job Completion Interrupt)

This interrupt supports the handling of jobs, see **Section 14.5.3.3, Job Concept**. This interrupt is only available in master mode.

Job mode is enabled by setting CSIHnCTL1.CSIHnJE = 1. When CSIHnCTL1.CSIHnJE = 0, INTCSIHnIJC is not generated.

Depending on the memory mode, this interrupt is generated according to the condition shown in the following table.

Table 14.40 INTCSIHnIJC Interrupt Generation

Memory Mode	Cause of Interrupt: Job Mode Disabled CSIHnCTL1.CSIHnJE = 0	Cause of Interrupt: Job Mode Enabled CSIHnCTL1.CSIHnJE = 1
FIFO	Not applicable	• Indicates that communication stopped at the end of job after job abort*1 is triggered. • When FIFO empty is not detected, INTCSIHnIJC is generated when CSIHnCIRE = 1.
Transmit-only buffer		• Indicates that communication stopped at the end of job after job abort*1 was triggered.
Dual buffer		
Direct access		

Note 1. Job abort condition: CSIHnTX0W.CSIHnEOJ = 1 and CSIHnCTL0.CSIHnJOBE = 1

14.5 Operation

14.5.1 Operating Modes (Master/Slave)

Whether CSIH operates in the master or slave mode determines the source of the serial clock.

14.5.1.1 Master mode

In master mode, the serial transmission clock is generated by the internal built-in baud rate generator (BRG) and supplied to the slave(s) via CSIHTSCK signal.

Master mode is enabled by setting CSIHnCTL2.CSIHnPRS[2:0] to any value but 111_B. In master mode, the BRG frequency can be specified by setting the CSIHnCTL2.CSIHnPRS[2:0] bits in combination with the CSIHnBRSy.CSIHnBRS[11:0] bits.

(1) Chip select signals

In master mode, one or more chip select signals can be used. If several slaves are connected to the master, the chip select signals can be used to select one or more slaves. Only the selected slave is then enabled for communication.

The communication protocol as well as additional parameters are stored separately for each chip select signal. This makes it possible to adapt the data transfer individually to the requirements of each slave. For details see **Section 14.5.3, Chip Selection (CS) Features**.

(2) Clock defaults

The default level of CSIHTSCK depends on the clock phase selection bit: It is high when CSIHnCTL1.CSIHnCKR = 0, and is low when CSIHnCTL1.CSIHnCKR = 1.

The example below shows communication in master mode for 8-bit data, with CSIHnCTL1.CSIHnCKR = 0, CSIHnCFGx.CSIHnCKPx = 0, and CSIHnCFGx.CSIHnDAPx = 0, and MSB first.

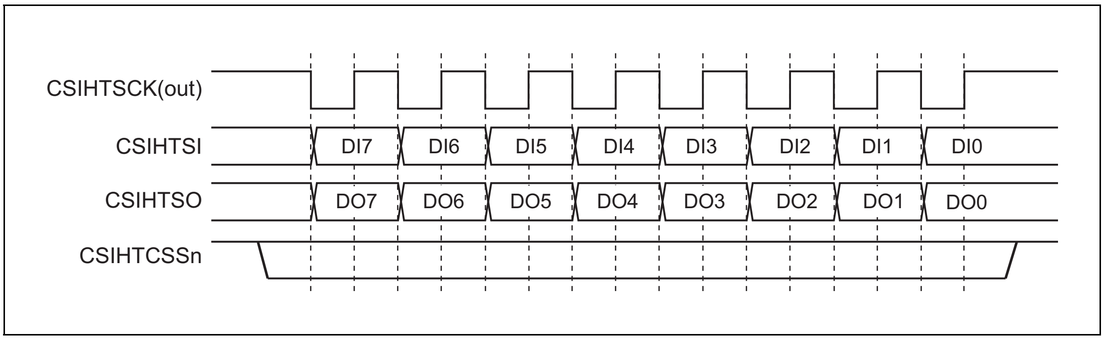

Figure 14.10 Transmission/Reception in Master Mode

14.5.1.2 Slave Mode

In slave mode, another device is the communication master and supplies the transmission clock. Usual transmit operation or receive operation starts immediately after a clock signal is detected.

Slave mode is selected by setting the CSIHnCTL2.CSIHnPRS[2:0] bits to 111_B.

In slave mode, the transmission protocol setting by the CSIHnCFG0 register is enabled (setting of the CSIHnCFG1-CSIHnCFG7 register is disabled).

- CSIHnPSx[1:0]: parity usage
- CSIHnDLSx[3:0]: data length selection
- CSIHnDIRx: data direction
- CSIHnCKPx,CSIHnDAPx: clock and data phase

NOTE

When using slave mode, disable the baud rate generator (BRG) by setting bits CSIHnBRSy.CSIHnBRS[11:0] to 000_H. Set the CSIHnBRSy.CSIHnBRS[11:0] bits to a value other than 000_H to use time-out errors.

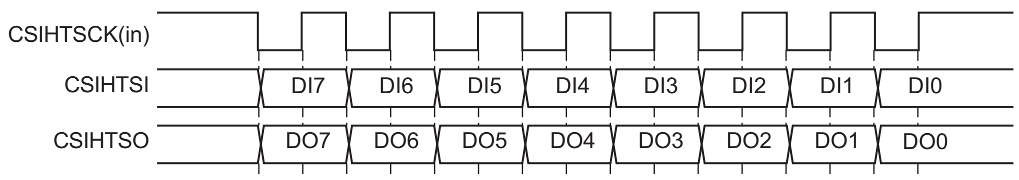

Figure 14.11 Transmission/Reception in Slave Mode

14.5.2 Master/Slave Connections

14.5.2.1 One Master and One Slave

The following figure illustrates the connections between one master and one slave.

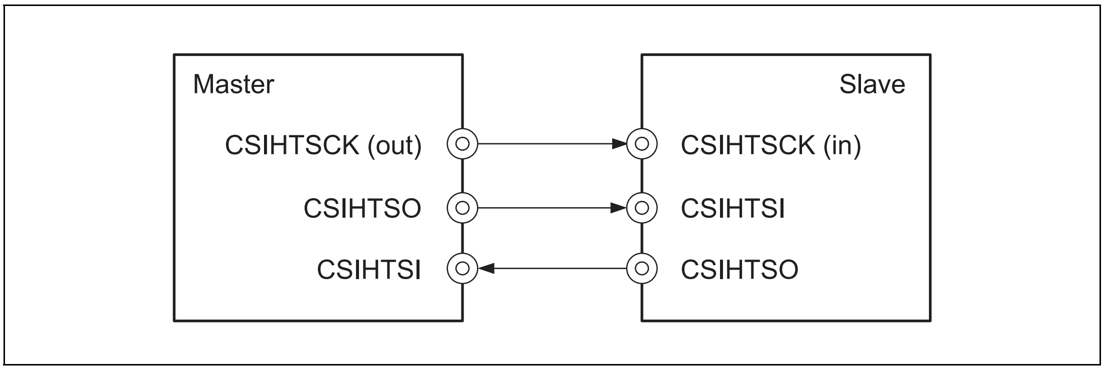

Figure 14.12 Direct Master/Slave Connection

14.5.2.2 One Master and Multiple Slaves

The following figure illustrates the connections between one master and multiple slaves. In this example, the master supplies one chip select (CS) signal to each of the slaves. This signal is connected to the slave select input $\overline{\text{CSIHTSSI}}$ of the slave.

The $\overline{\text{CSIHTSSI}}$ signal can be enabled or disabled by using the CSIHnCTL1.CSIHnSSE bit.

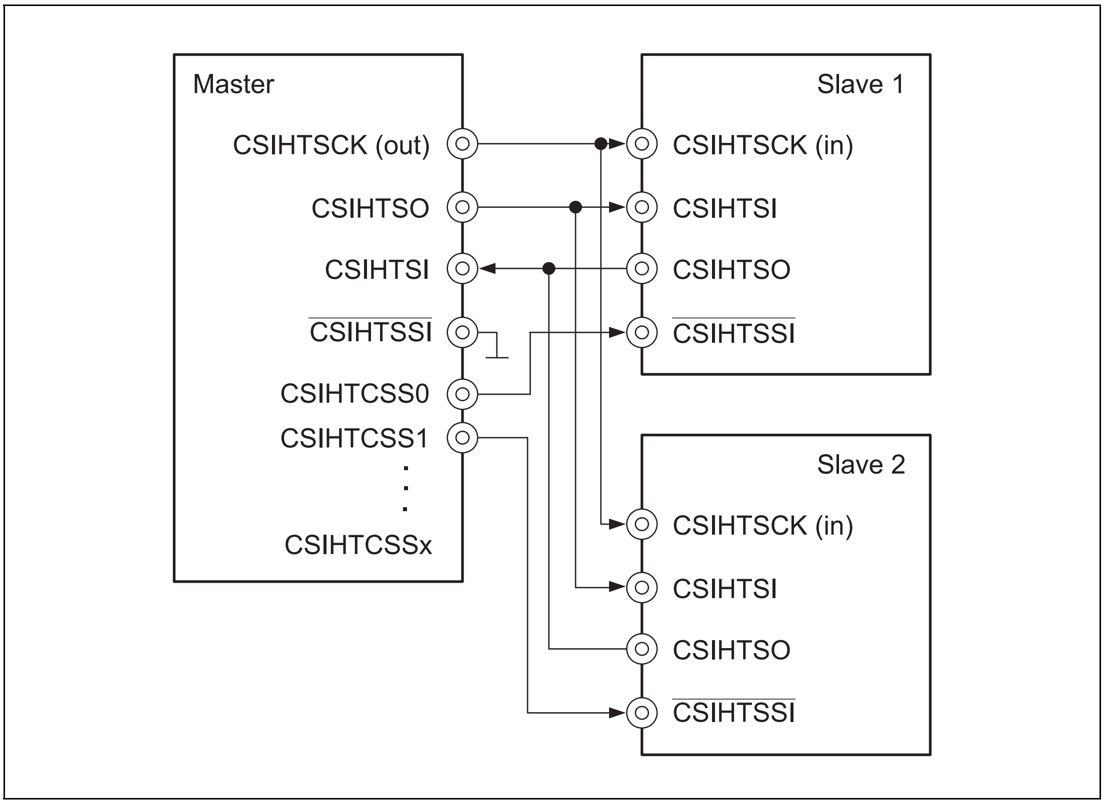

Figure 14.13 One Master to Multiple Slaves Connection

By default, the chip select level is active low. That means, a slave is selected (enabled) as a CSIH slave when its $\overline{\text{CSIHTSSI}}$ signal is at a low level. However, to adapt the CS to other devices, the output level of each chip select signal can also be programmed to be active high.

If a slave is not selected, it will neither receive nor transmit data. In addition, when transmit-only mode or transmit/receive mode is set (CSIHnCTL0.CSIHnTXE = 1), the CSIHTSO output of the slaves that are not selected is disabled and set to input mode in order to avoid interference with the output of the selected slave.

14.5.3 Chip Selection (CS) Features

The chip select signal, CSIHTCSSx can be used by the master to select one or more slaves for communication.

14.5.3.1 Configuration Registers

The parameters for each chip select signal CSIHTCSSx are defined in the corresponding configuration register CSIHnCFGx. The parameters include the communication protocol and additional CS parameters.

The communication protocol specifies:

- Data length: The number of bits to be transmitted or received. (CSIHnCFGx.CSIHnDLSx[3:0])
- Transfer direction: MSB or LSB first. (CSIHnCFGx.CSIHnDIRx)
- Parity usage: Odd, even, 0 parity or none. (CSIHnCFGx.CSIHnPSx[1:0])
- Clock phase and data phase. (CSIHnCFGx.CSIHnCKPx, CSIHnCFGx.CSIHnDAPx)

Additional parameters for each chip select signal that are only available in master mode are:

- Selection of prescaler of baud rate generator individually for each chip select signal (CSIHnCFGx.CSIHnBRSSx[1:0])
- Categorizes chip select signals into “dominant” and “recessive”. The priority applies if two or more chip select signals with different configurations are simultaneously activated for message broadcasting. In this case, the configuration specified for dominant chip select signals is used. (CSIHnCFGx.CSIHnRCBx)

The principle is also called “Recessive Configuration for Broadcasting” (RCB).

CAUTION

When specifying multiple chip select signals as dominant, be sure to configure the same settings for all dominant signals.

- Chip select timing:
  - Setup time T_{setup}: The time from “CS active” to “First data output”. (CSIHnCFGx.CSIHnSPx[3:0])
  - Inter-data time T_{inter}: The time between one data and the next data while the same CS signal is active. (CSIHnCFGx.CSIHnINx[3:0])
  - Hold time T_{hold}: The time from “the end of last data bit” to “CS inactive”. (CSIHnCFGx.CSIHnHDx[3:0])
  - Idle time T_{idle}: Inactive time after terminating a CS signal or after every data transfer to the same CSx. (CSIHnCFGx.CSIHnIDx[2:0])

The CS timings of the setup time, the inter-data time, the hold time, and the idle time are illustrated in the figure below. When the CSIHnCFGx.CSIHnIDLx bit is set to 1, idle time is inserted into each transfer regardless of the CS signal.

Figure 14.14 provides an example of a waveform when the default active low setting is specified for the CSIHTCSS1 and CSIHTCSS2 signals (CSIHnCTL1.CSIHnCSL1 bit = 0, CSIHnCTL1.CSIHnCSL2 bit = 0). The active level can be specified individually for each CS.

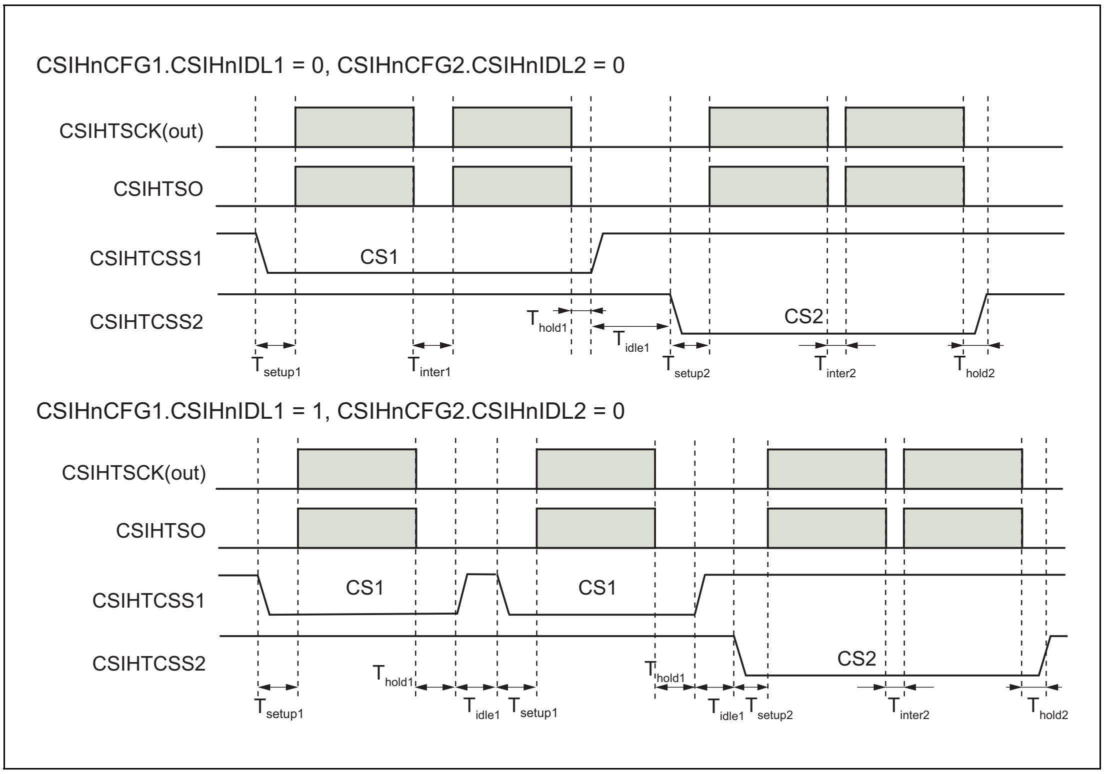

Figure 14.14 Chip Select Timings

Note that each CS signal can have a different value for the setup time, inter-data time, hold time, and idle time.

A particular chip select signal is activated by setting the appropriate bit in the transmission register CSIHnTX0W.CSIHnCSx.

CSIHnRX0W.CSIHnCSx in the reception register indicates the chip select signal associated with the received data.

CAUTION

When high-priority communication function using CPU control is enabled (CSIHnCTL1.CSIHnPHE = 1), idle state is inserted when low-priority communication mode changes to high-priority communication mode and when high-priority communication mode changes to low-priority communication mode regardless of the CSIHnCFGx.CSIHnIDLx bit setting.

14.5.3.2 CS Example

The following figure shows an example of two consecutive data transmissions.

The first communication uses CS0 to communicate with one slave. The second enables CS0 and CS1 to broadcast a message to two slaves. The priority of CS0 is set to “recessive: low priority” and the priority of CS1 to “dominant: high priority”.

Therefore, the second communication is performed by using the dominant CS1 setting.

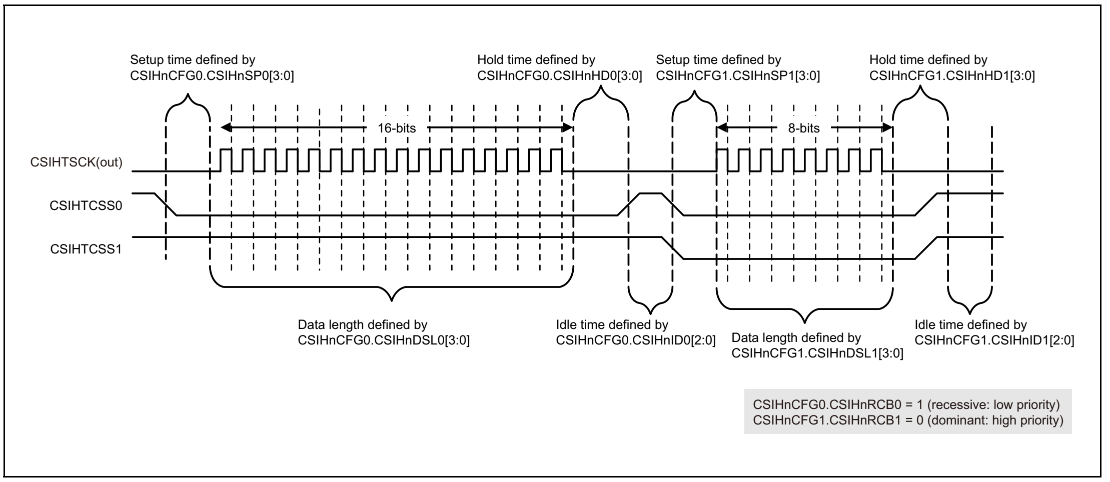

Figure 14.15 Chip Select and RCB Example

14.5.3.3 Job Concept

In CSIH, a job consists of the number of data that are transferred.

Job mode enable

The job mode can only be enabled in master mode. The job mode is enabled and disabled by CSIHnCTL1.CSIHnJE, while the CSIH is disabled by CSIHnCTL0.CSIHnPWR = 0.

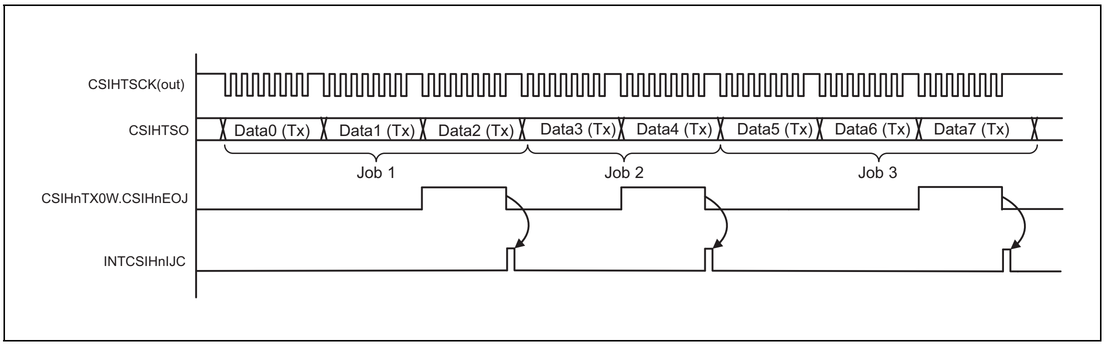

Figure 14.16 Job Examples

A job ends by transmitting data with CSIHnTX0W.CSIHnEOJ = 1.

Communication can be specified to stop when a job is finished. This is done by setting CSIHnCTL0.CSIHnJOBE. When CSIHnJOBE is set, the communication continues until data is transmitted, for which the CSIHnEOJ bit was set. After this data is transmitted, the communication is stopped and the job completion interrupt INTCSIHnIJC is generated.

14.5.4 Chip Select Timing Details

14.5.4.1 Changing the Clock Phase

The serial clock level specified by CSIHnCFGx.CSIHnCKPx may be changed when communication is disabled. The minimum value of an idle time is one transmission clock (CSIHTSCK(out)) cycle.

If the idle time is set to 0.5 transmission clock periods (in CSIHnCFGx.CSIHnIDx[2:0]) and two consecutive data are transmitted with different CSIHnCFGx.CSIHnCKPx configuration, the idle time is automatically extended to one CSIHTSCK(out) cycle.

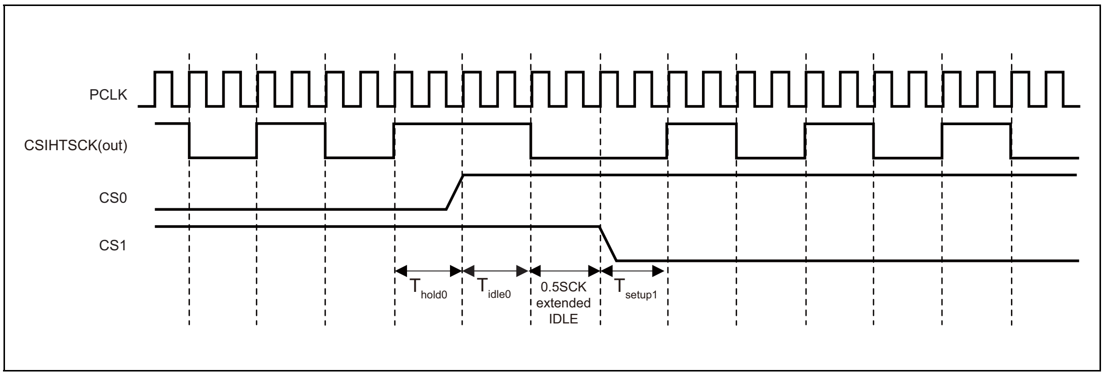

Figure 14.17 Clock Phase Timing with PCLK/4, T_{hold0} = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

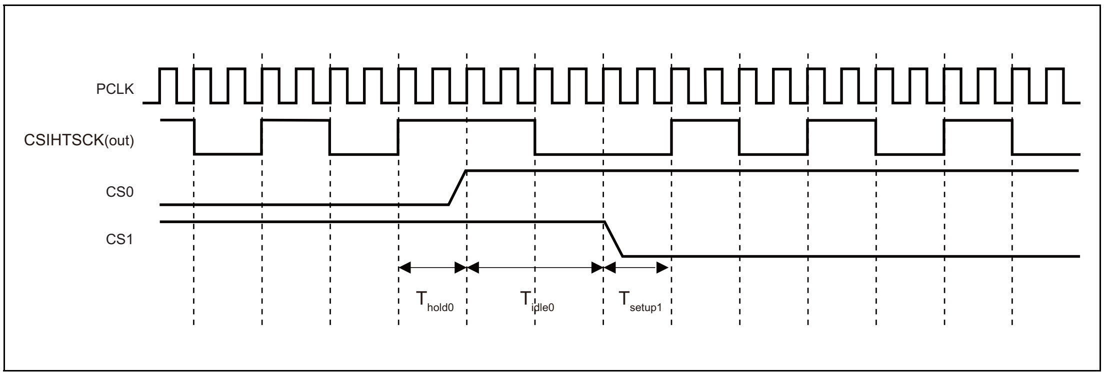

Figure 14.18 Clock Phase Timing with PCLK/4, T_{hold0} = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 1CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG1.CSIHnCKP1 = 1 (CSIHTCSS1)

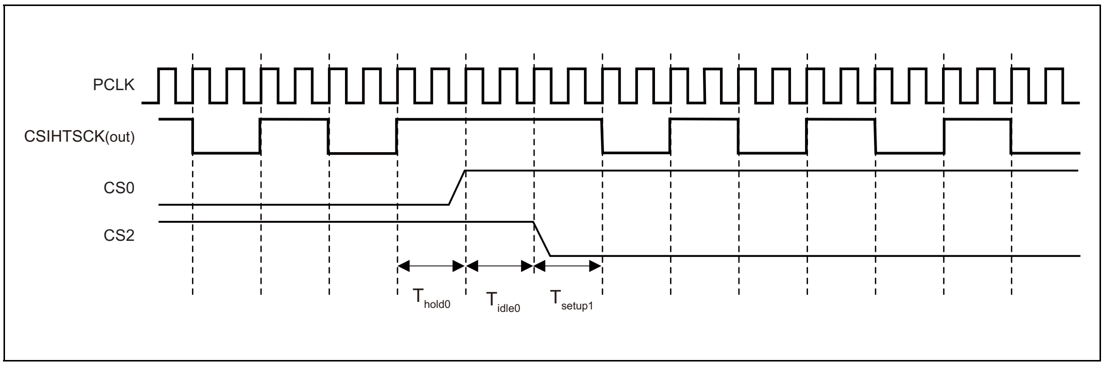

Figure 14.19 Clock Phase Timing with PCLK/4, T_{hold0} = T_{setup1} = 0.5CSIHTSCK, T_{idle0} = 0.5CSIHTSCK, CSIHnCFG0.CSIHnCKP0 = 0 (CSIHTCSS0) → CSIHnCFG2.CSIHnCKP2 = 0 (CSIHTCSS2)

14.5.4.2 Changing the Data Phase

The CSIHnCFGx.CSIHnDAPx bit defines the phase of the data bits relative to the clock.

The relation between the setting of the CSIHnCFGx.CSIHnDAPx bit and the hold and setup times is as follows:

The hold time period is a period from the last edge of the serial clock (CSIHTSCK) until CSIHTCSS[7:0] becomes inactive level regardless of the CSIHnCFGx.CSIHnDAPx setting.

The setup time period is a period from the time when CSIHTCSS[7:0] becomes active level until transmission data (CSIHTSO) is output.

For this reason, there is a time difference of 0.5 CSIHTSCK cycles until the serial clock (CSIHTSCK) edge is output depending on the CSIHnCFGx.CSIHnDAPx setting.

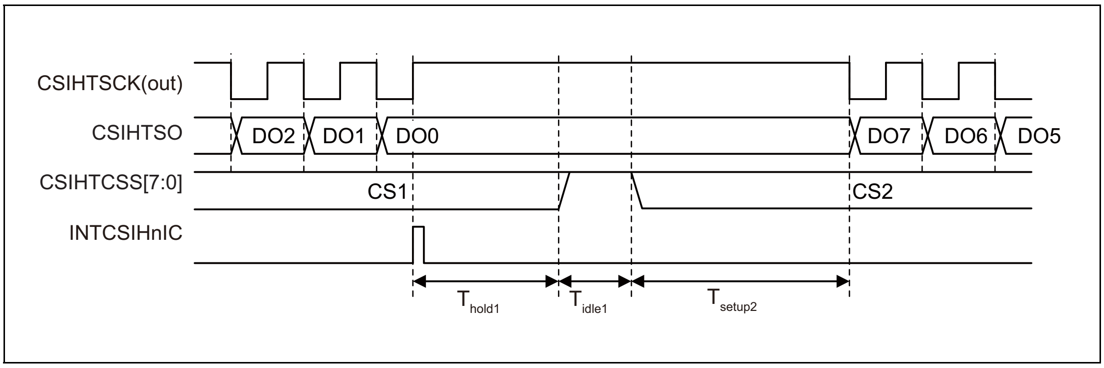

Figure 14.20 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 0, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 0

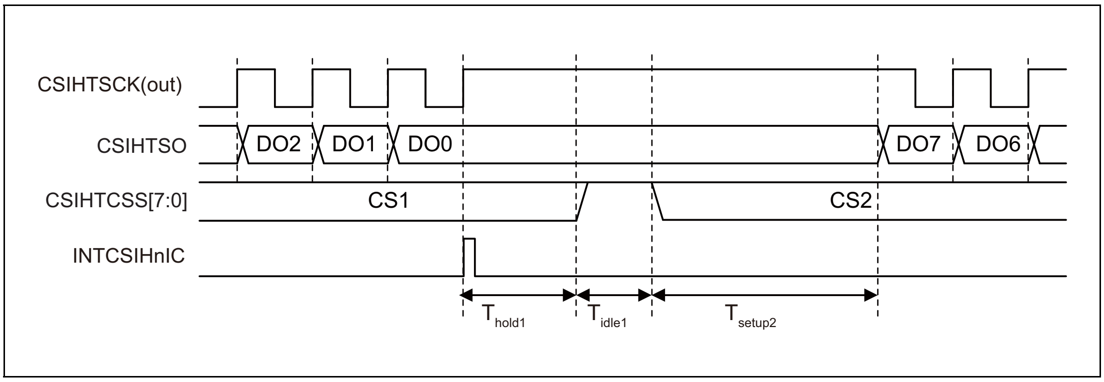

Figure 14.21 Data Phase Timing with CSIHnCFG1.CSIHnCKP1 = 1, CSIHnCFG1.CSIHnDAP1 = 0 and CSIHnCFG2.CSIHnCKP2 = 0, CSIHnCFG2.CSIHnDAP2 = 1

14.5.5 Transmission Clock Selection

In master mode, the transfer clock frequency is selectable using the following bits:

- CSIHnCTL2.CSIHnPRS[2:0]
- CSIHnBRSy.CSIHnBRS[11:0](y = 0-3)
- CSIHnCFGx.CSIHnBRSSx[1:0] (x = 0 to 7)

The transfer clock frequency of the transmit clock CSIHTSCK is determined by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS [11:0] settings. One among four baud rates, CSIHnBRS3 to CSIHnBRS0, is selected for each chip select signal by the CSIHnCFGx.CSIHnBRSSx[1:0] setting.

The following figure shows a block diagram of the baud rate generator.

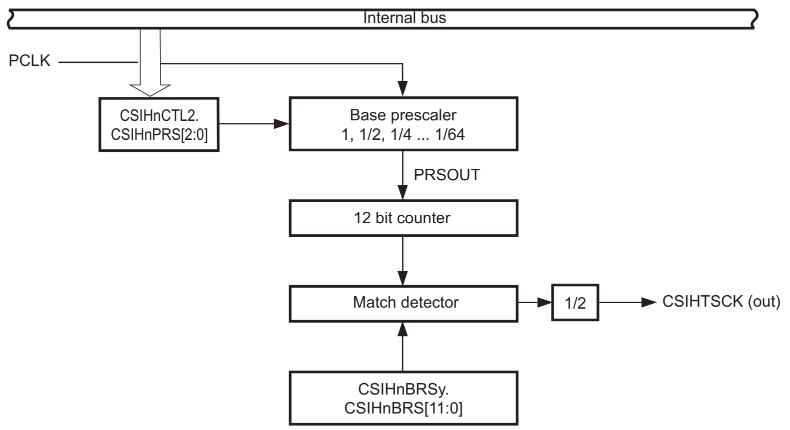

Figure 14.22 Baud Rate Generator Block Diagram

Setting CSIHnBRSy.CSIHnBRS[11:0] to 000_H disables the baud rate generator, and thus all CSIHTSCK are stopped.

Transfer clock frequency calculation

The transfer clock frequency in master mode is calculated by the following formula.

Transfer clock frequency (CSIHTSCK) = PCLK / (PCLK’s division ratio) = PCLK / ($2^{\alpha} \times k \times 2$)

where:

α = CSIHnCTL2.CSIHnPRS[2:0] = 0 to 6

k = CSIHnBRS0.CSIHnBRS0[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 0)

CSIHnBRS1.CSIHnBRS1[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 1)

CSIHnBRS2.CSIHnBRS2[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 2)

CSIHnBRS3.CSIHnBRS3[11:0] = 1 to 4095
(when CSIHnCFGx.CSIHnBRSSx[1:0] = 3)

Transfer clock frequency limits

When setting the transfer clock frequency, please note the followings:

- Minimum transfer clock frequency = PCLK / 524160 (both master mode and slave mode)
- Maximum transfer clock frequency is as follows:
  - Master mode: 10.0 MHz
  - Slave mode: 6.66 MHz

14.5.6 CSIH Buffer Memory

The CSIH has a configurable RAM that can be used for buffered I/O. The size is 128 words. One word is comprised of 32-bit data and 7-bit ECC.

The following configurations are available:

Mode	CSIHnCTL0. CSIHnMBS	CSIHnMCTL0. CSIHnMMS[1:0]
FIFO mode	0	00_B
Dual buffer mode		01_B
Transmit-only buffer mode		10_B
Direct access mode	1	X

14.5.6.1 FIFO Mode

In FIFO mode, data can be written to the CSIHnTX0W register without waiting for completion of the transmission, and data can be received without reading the CSIHnRX0W register immediately, provided that the FIFO is not full.

Transmission and reception occur simultaneously - one data is transmitted, one data is received. That means, received data overwrites the transmitted data in the FIFO.

The CSIH automatically updates the respective FIFO memory pointers when data is written to or read from the FIFO memory or transmitted from or received to the FIFO memory.

Table 14.41 FIFO Mode

Pointer Description	Control Bits*[1]	Range
Number of untransmitted words	CSIHnSTR0.CSIHnSPF[7:0]	0 to 128
Number of words received and stored in the FIFO	CSIHnSTR0.CSIHnSRP[7:0]	0 to 128
Address of transmission data to be written or read	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
Address of receive data to be read	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $01FC_H$
Transmission address	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. The value is automatically updated each time data is written, read, transmitted, or received.

The CSIH status register contains two FIFO status flags:

- CSIHnSTR0.CSIHnFLF: FIFO full
- CSIHnSTR0.CSIHnEMF: FIFO empty

When this mode is started, bit CSIHnSTCR0.CSIHnPCT must be set. This sets only CSIHnSTR0.CSIHnEMF, but not reset).

All FIFO pointers and FIFO flags except CSIHnSTR0.CSIHnEMFare reset and CSIHnSTR0.CSIHnEMF is set.

14.5.6.2 Dual Buffer Mode

In this mode, the memory is divided into two parts of equal size – this means the lower-order 64 words for transmit data and the higher-order 64 words for received data. In dual buffer mode, the respective buffer pointers indicate the values shown in the following table.

Table 14.42 Dual Buffer Mode

Pointer Description	Pointer*1	Range
Address of data to be written to or read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $00FC_H$
Address of data to be read from receive buffer	CSIHnMRWP0.CSIHnRRA[6:0]	0000_H to $00FC_H$
Number of transmission data remaining in transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 64
Transmission address	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $00FC_H$

Note 1. Pointers are automatically incremented each time data is written or read.

14.5.6.3 Transmit-Only Buffer Mode

In this mode, the entire memory is used to save transmission data.

Received data must be read directly from CSIHnRX0W/H.

In transmit-only buffer mode, the respective buffer pointer indicates the values shown in the following table.

Table 14.43 Transmit-Only Buffer Mode

Pointer Description	Pointer*1	Range
Address of data to be written to or read from transmit buffer	CSIHnMRWP0.CSIHnTRWA[6:0]	0000_H to $01FC_H$
Number of transmission data remaining in transmit buffer	CSIHnMCTL2.CSIHnND[6:0]	0 to 128
Transmission address	CSIHnMCTL2.CSIHnSOP[6:0]	0000_H to $01FC_H$

Note 1. Pointers are automatically incremented each time data is written or read.

14.5.6.4 Direct Access Mode

In direct access mode, the CSIH memory is completely bypassed:

- Transmission data provided by the CPU to the transmission register CSIHnTX0W or CSIHnTX0H is directly copied to the shift register.
- Reception data is directly copied from the shift register to the reception register CSIHnRX0W or CSIHnRX0H.

14.5.7 Data Transfer Modes

14.5.7.1 Transmit-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 0 puts the CSIH in transmit-only mode. Start of transmission depends on the memory mode:

- In case of FIFO or direct access mode, transmission starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, transmission starts when the CSIHnMCTL2.CSIHnBTST bit is set.

14.5.7.2 Receive-Only Mode

Setting CSIHnCTL0.CSIHnTXE = 0 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in receive-only mode.

In master mode, start of reception depends on the memory mode:

- In case of FIFO or direct access mode, reception starts when dummy data is written in the CSIHnTX0W or CSIHnTX0H register.

In slave mode, reception starts as soon as the CSIHTSCK transmission clock is received from the master. It is not necessary to write data to the CSIHnTX0W or CSIHnTX0H register of the slave.

- In dual-buffer mode or transmit-only buffer mode, reception starts when the CSIHnMCTL2.CSIHnBTST bit is set.

14.5.7.3 Transmit/Receive Mode

Setting CSIHnCTL0.CSIHnTXE = 1 and CSIHnCTL0.CSIHnRXE = 1 puts the CSIH in transmit/ receive mode.

Start of communication (transmission and reception) depends on the memory mode:

- In case of FIFO or direct access mode, communication starts when transmit data is written to the CSIHnTX0W or CSIHnTX0H register.
- In case of dual buffer or transmit-only buffer mode, communication starts when the CSIHnMCTL2.CSIHnBTST bit is set.

14.5.7.4 Summary

The following table summarizes this section. It shows how data transfer is started in the various memory, operating, and transfer modes.

Table 14.44 Start of Data Transfer

Memory and Operating Mode		Transfer Mode: Transmit-only Transmit/Receive	Transfer Mode: Receive-only
FIFO, direct access	Master	Writing to the CSIHnTX0W register or the CSIHnTX0H register	Writing to the CSIHnTX0W register or the CSIHnTX0H register
	Slave	Clock supplied from the master	Clock supplied from the master
Transmit-only buffer, dual buffer	Master	CSIHnMCTL2.CSIHnBTST = 1	CSIHnMCTL2.CSIHnBTST = 1
	Slave	Incoming clock from the master	Incoming clock from the master

14.5.8 Data Length Selection

14.5.8.1 Data Length Between 2 and 16 bits

The length of a data packet is selectable for each chip select signal from 2 to 16 bits using CSIHnCFGx.CSIHnDLSx[3:0]. The examples below show the communication with MSB first (CSIHnCFGx.CSIHnDIRx = 0).

Data length = 16 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 0000_B)

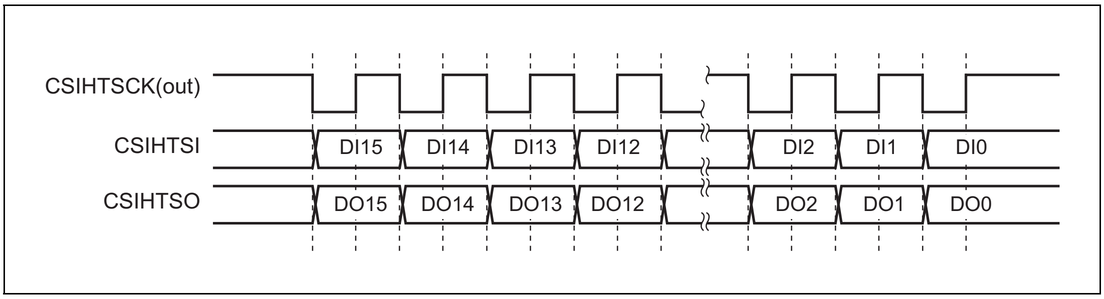

Figure 14.23 16-Bit Data Length, MSB First

Data length = 14 bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1110_B):

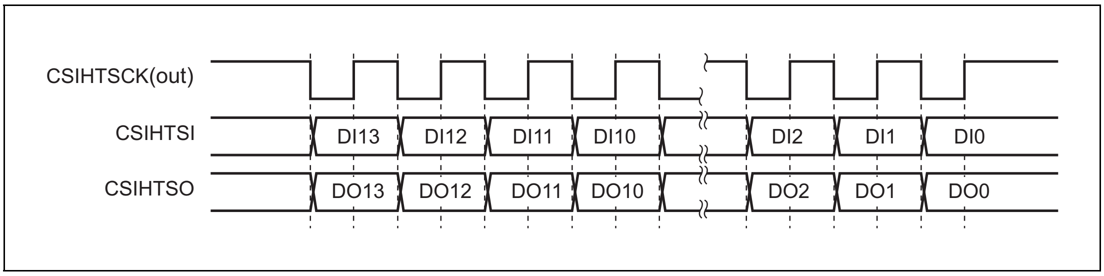

Figure 14.24 14-Bit Data Length, MSB First

14.5.8.2 Data Length Greater than 16 Bits

To transmit/receive data exceeding 16 bits, the extended data length (EDL) feature can be used.

The EDL feature is enabled by setting the CSIHnCTL1.CSIHnEDLE to 1.

The EDL feature works as follows:

- The data must be broken into 16-bit blocks plus remainder. For example, 42-bit data would be broken into two 16-bit blocks plus 10 bits.
- The remainder bit length is set in CSIHnCFGx.CSIHnDLSx[3:0] as “data length.”
- For transmitting the 16-bit blocks, CSIHnTX0W.CSIHnEDL must be set to 1. In this case, the data written to CSIHnTX0W is transmitted as a 16-bit data length regardless of the CSIHnCFGx.CSIHnDLSx[3:0] bit setting.
- The transfer is complete after a block with the specified data length (the remainder of data specified with CSIHnTX0W.CSIHnEDL = 0) has been transmitted.

Example

Example for transmitting 40-bit data (123456789A$_H$) to CS0:

40 bits are split into two 16-bit blocks and 8 bits.

- Initialize to CSIHnCFG0.CSIHnDLS0[3:0] = 8$_H$.
- To transmit 123456789A$_H$ with MSB first, write the following sequence to CSIHnTX0W:
  - 20FE 1234$_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - 20FE 5678$_H$ (CSIHnTX0W.CSIHnEDL = 1)
  - 00FE 009A$_H$ (CSIHnTX0W.CSIHnEDL = 0)

The following figure illustrates the timing.

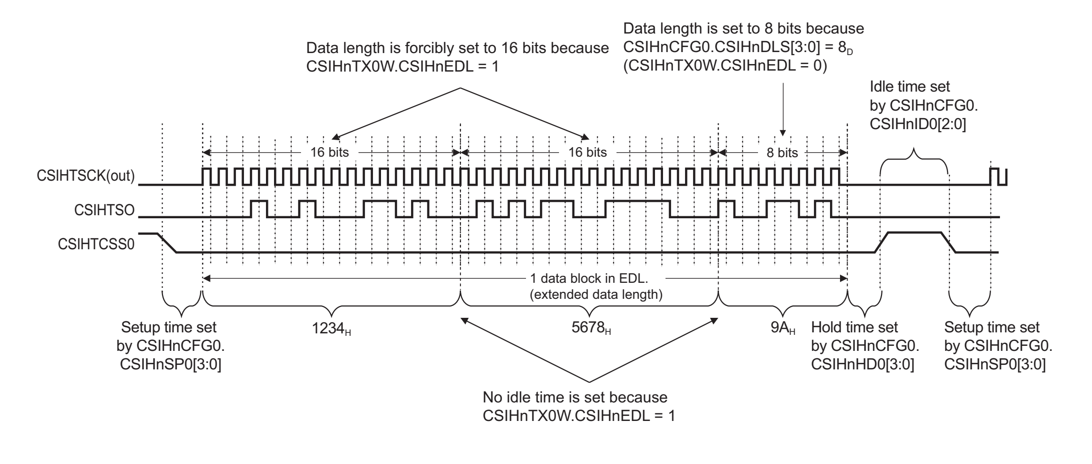

Figure 14.25 EDL Timing Diagram

NOTES

1. Data lengths settings lower than 7 bits are only permitted in combination with EDL mode.
2. It is not possible to transmit two consecutive data with a data length of less than 7 bits.
3. If parity is enabled, the parity bit is added after the last bit.
4. When the extended data length (EDL) feature is used, use the same chip select signal.
5. If CSIHnTX0W.CSIHnEOJ and CSIHnTX0W.CSIHnEDL are set to 1 at the same time while CSIHnCTL1.CSIHnJE = 1 and CSIHnCTL1.CSIHnEDLE = 1, correct operation is not guaranteed.
6. Examples for consider the data direction, pay attention to the following example:
   - Data to be transmitted: 123456_H
   - MSB first:
     Set CSIHnCFGx.CSIHnDIRx = 0
     Write CSIHnTX0W = 20FE 1234_H (EDL bit = 1)
     Write CSIHnTX0W = 00FE 0056_H (EDL bit = 0)
   - LSB first:
     Set CSIHnCFGx.CSIHnDIRx = 1
     Write CSIHnTX0W = 20FE 3456_H (EDL bit = 1)
     Write CSIHnTX0W = 00FE 0012_H (EDL bit = 0)
7. EDL mode cannot be used in receive-only mode of slave mode.
   (CSIHnCTL2.CSIHnPRS[2:0] = 111_B, CSIHnCTL0.CSIHnTXE = 0,
   CSIHnCTL0.CSIHnRXE = 1)

14.5.9 Serial Data Direction Selection

The serial data direction is selectable for each chip select signal by using the CSIHnDIRx bit in the CSIHnCFGx register.

The examples below show communication for a data length of 8 bit (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).

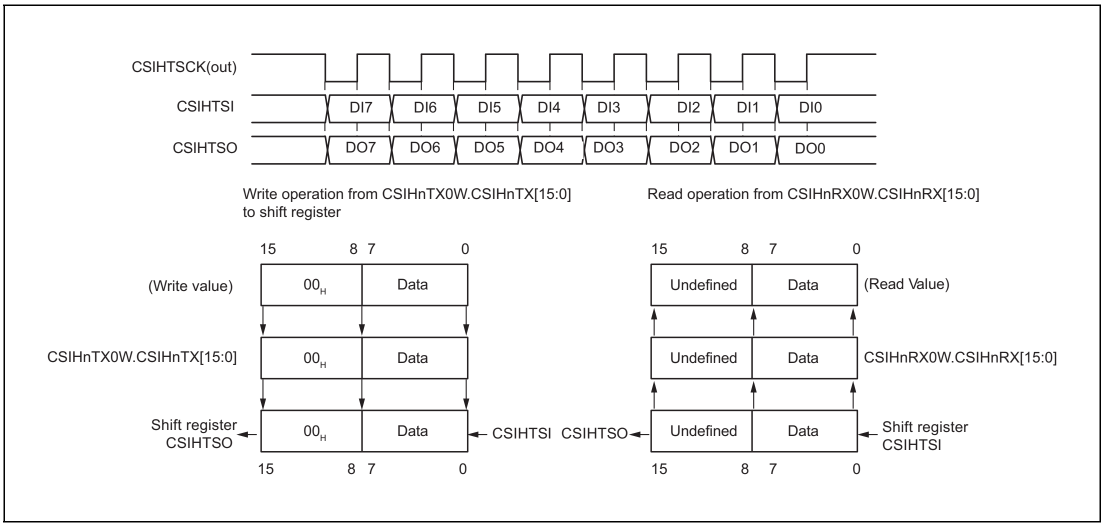

Figure 14.26 Serial Data Direction Select Function - MSB First (CSIHnDIRx = 0)

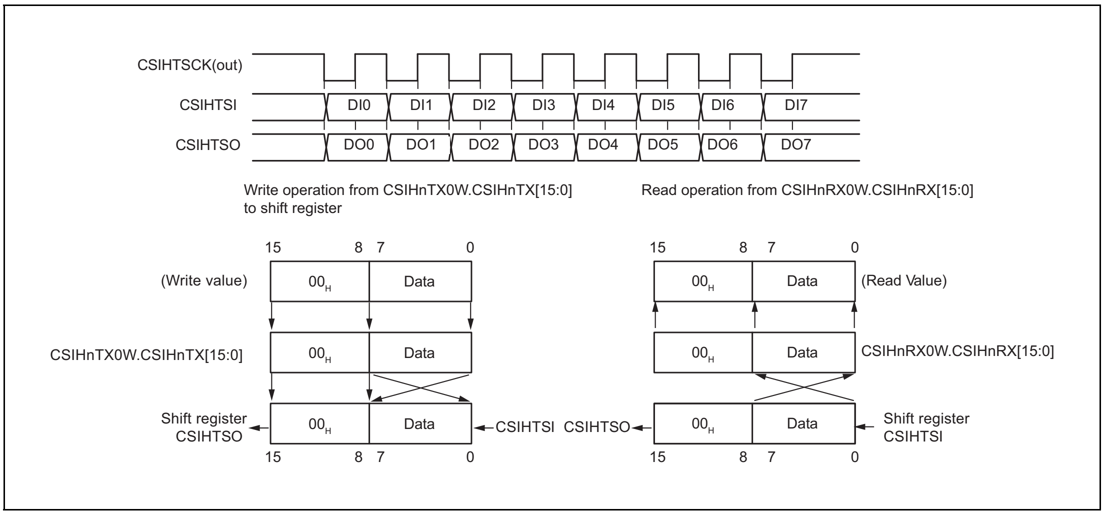

Figure 14.27 Serial Data Direction Select Function - LSB First (CSIHnDIRx = 1)

14.5.10 Slave Select (SS) Function

The SS (slave select) function enables communication between one master and multiple slaves.

In master mode, the master device outputs the slave select signal (CSIHTCSSx) to a slave. Communication by a device in slave mode is enabled when the slave input select signal ($\overline{\text{CSIHTSSI}}$) is at the low level.

Refer to the **Section 14.5.2, Master/Slave Connections**, for examples of connections using the SS function.

14.5.10.1 Communication Timing Using SS Function

The following figure illustrates the communication signal and timings using the SS function.

In slave mode, the data transfer configuration is determined by the CSIHnCFG0 register.

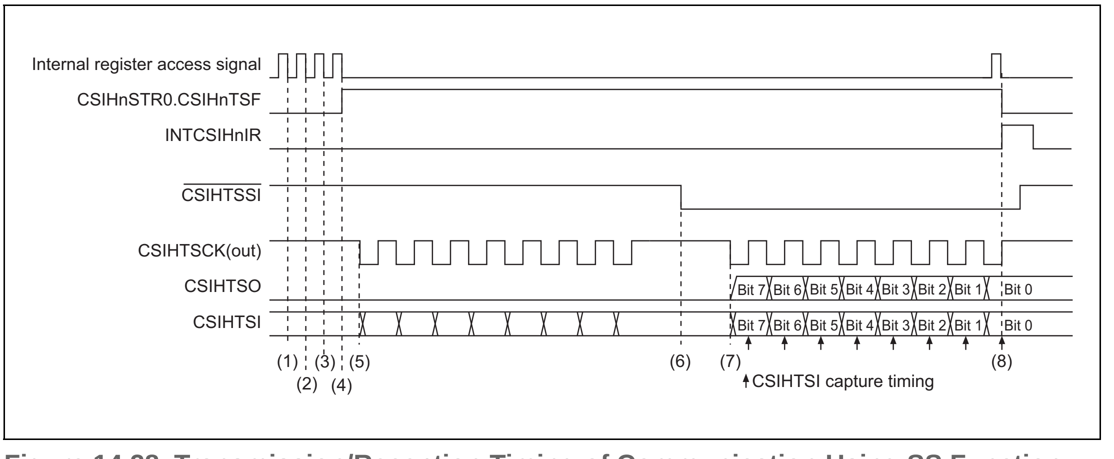

Figure 14.28 Transmission/Reception Timing of Communication Using SS Function

(1) CSIH enters slave mode by setting CSIHnCTL2.CSIHnPRS[2:0] = 111_B. CSIHnCFG0.CSIHnCKP0 and CSIHnCFG0.CSIHnDAP0 are 0.

(2) The data length is 8 bits (CSIHnCFG0.CSIHnDLS0[3:0] = 1000_B). The data direction is MSB first (CSIHnCFG0.CSIHnDIR0 = 0).

(3) Transmit/receive mode is set. (CSIHnCTL0.CSIHnTXE = 1, CSIHnCTL0.CSIHnPWR = 1). Communication start is permitted.

(4) The transfer status flag CSIHnSTR0.CSIHnTSF is automatically set in direct access mode or FIFO mode when transfer data is written to the CSIHnTX0W or CSIHnTX0H transmission register.

(5) As long as signal $\overline{\text{CSIHTSSI}}$ is high, transmission/reception is not started, even if an external transmission clock CSIHTSCK is supplied Input to CSIHTSI is ignored.

(6) Changing $\overline{\text{CSIHTSSI}}$ to low level indicates that CSIHTSO is enabled and ready for transmission.

(7) As soon as the external clock signal CSIHTSCK appears, the slave transmits data to CSIHTSO and simultaneously captures data from CSIHTSI.

(8) Interrupt INTCSIHnIR indicates that the reception is complete. The CSIHnRX0W/H register can be read.

14.5.10.2 CSIHTSSO Operation

CSIHnPWR	CSIHnTXE	CSIHnRXE	CSIHnSSE	CHISTSSO
0	—	—	—	H
1	—	—	0	H
	0		1	H
	1		1	Reversed value of $\overline{\text{CSIHTSSI}}$ level

The CSIHTSSO pin is a signal to control the I/O function of the chip's SO pin in case of using the SS function.

The CSIHTSO pin is enabled when the CSIHTSSO pin is "High" (the chip's SO pin is being driven).

The CSIHTSO pin is disabled when the CSIHTSSO pin is "Low" (the chip's SO pin is not being driven).

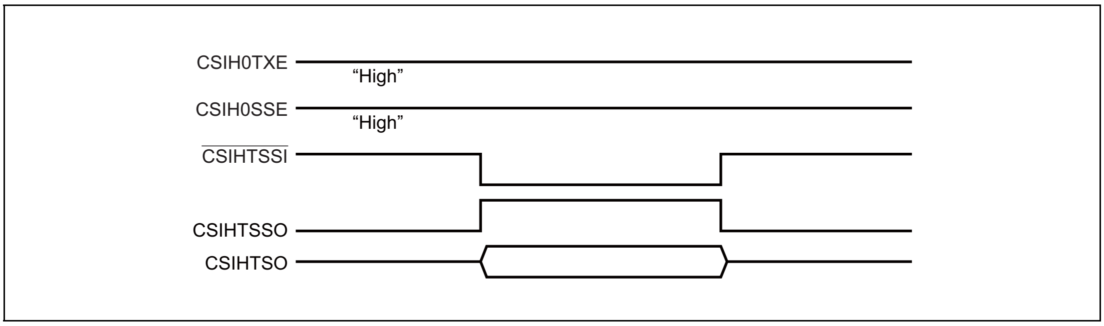

Figure 14.29 Operation of CSIHTSSO

CAUTION

If $\overline{\text{CSIHTSSI}}$ pin is changed during communication (CSIHnSTR0.CSIHnTSF = 1), current communication is not guaranteed.

14.5.11 Handshake Function

CSIH features a handshake function to synchronize the master and the slave devices. This function can be enabled/disabled by bit CSIHnCTL1.CSIHnHSE. For handshake, the signals CSIHTRYI and CSIHTRYO are used.

The timing of transitions to the busy state depends on the setting of the data phase selection bit, CSIHnCFGx.CSIHnDAPx.

14.5.11.1 Slave Mode

When the slave becomes busy while CSIHnCTL1.CSIHnHSE = 1, the CSIHTRYO signal outputs low level 0. This state is produced in the following two cases:

1. When the next transmission data is not ready:
   When the slave is set to transmit-only mode or transmit/receive mode (CSIHnCTL0.CSIHnTXE = 1), CSIHTRYO outputs low level (busy state) in the following conditions.

Table 14.45 Memory Mode and Transmission State of Slave

Memory Mode	Transmission State of Slave
Direct access mode	No next transfer data
FIFO mode	No next transfer data (CSIHnSTR0.CSIHnEMF = 1)
Dual buffer mode	CSIHnMCTL2.CSIHnBTST is not set to 1
Transmit-only buffer mode	

The example below describes the waveform in case of an eight-bit data length.

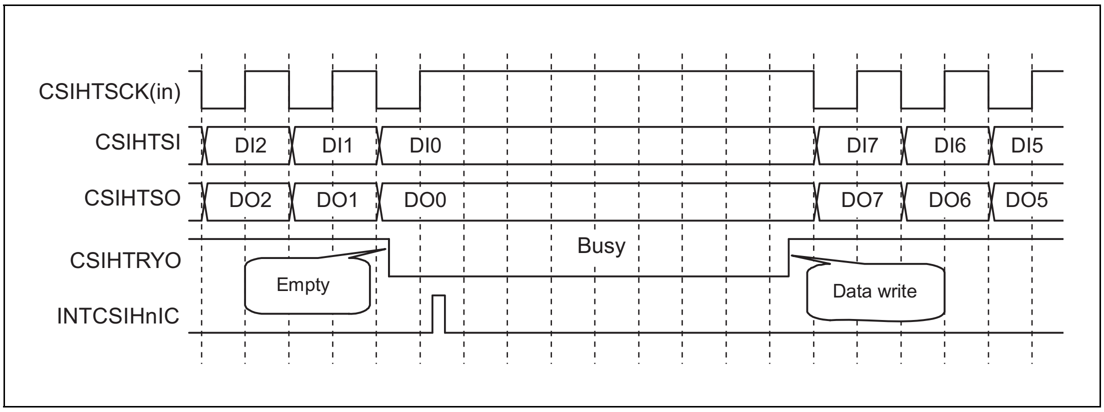

Figure 14.30 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 0)

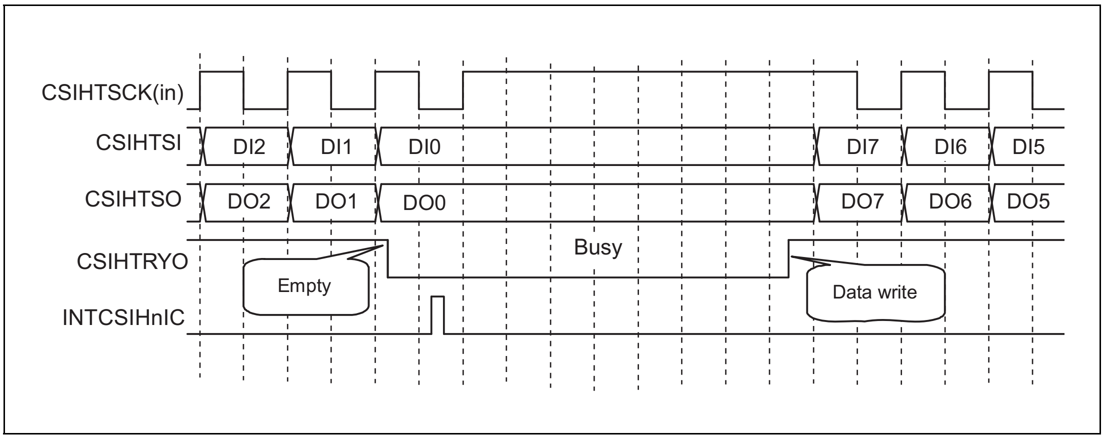

Figure 14.31 Busy Signal from the Slave (FIFO Mode; CSIHnCFGx.CSIHnDAPx = 1)

2. When the receive register is full:
   Because the previously received data is still in the CSIHnRX0W or CSIHnRX0H register while the slave is in receive-only or transmit/receive mode (CSIHnCTL0.CSIHnRXE = 1), new data cannot be copied from the shift register to CSIHnRX0W or CSIHnRX0H (CSIHnRX0W or CSIHnRX0H full condition).
   When CSIHnCTL0.CSIHnRXE = 1, CSIHTRYO outputs low level (busy state) in the following conditions.

Table 14.46 Memory Mode and Reception State of Slave

Memory Mode	Reception State of Slave
Direct access mode	CSIHnRX0W or CSIHnRX0H is full
FIFO mode	Receive data remaining in the buffer (CSIHnSTR0.CSIHnFLF = 1)
Dual buffer mode	No applicable state
Transmit-only buffer mode	CSIHnRX0W or CSIHnRX0H is full

The example below describes the waveform in case of an eight-bit data length.

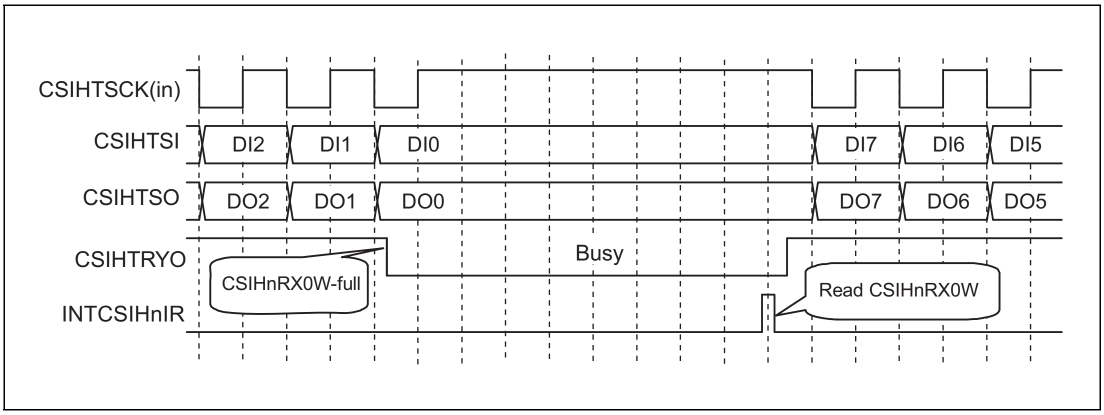

Figure 14.32 Busy Signal from the Slave (Direct Access Mode; CSIHnCFGx.CSIHnDAPx = 0)

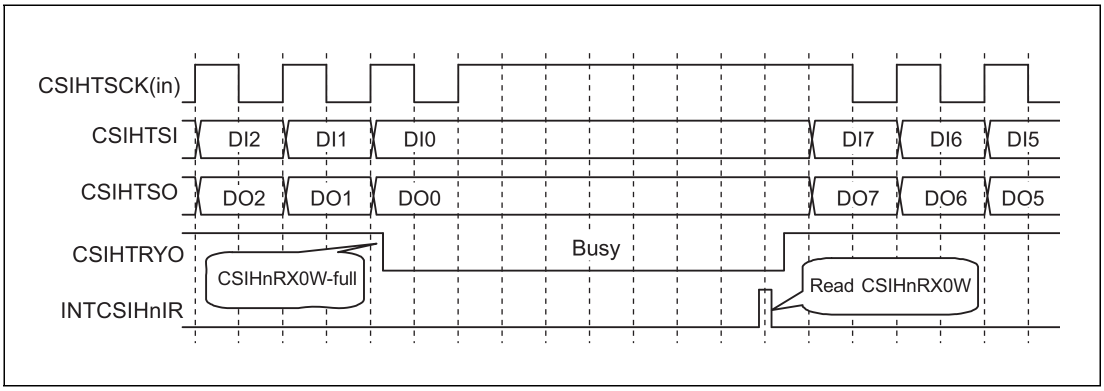

Figure 14.33 Busy Signal from the Slave (CSIHnCFGx.CSIHnDAPx = 1)

14.5.11.2 Master Mode

When the master detects CSIHTRYI = 0 while CSIHnCTL1.CSIHnHSE = 1, the subsequent transfers are put on hold, the master goes into wait state and suspends the CSIHTSCK clock.

The CSIHTRYI level is checked at each half clock cycle of CSIHTSCK.

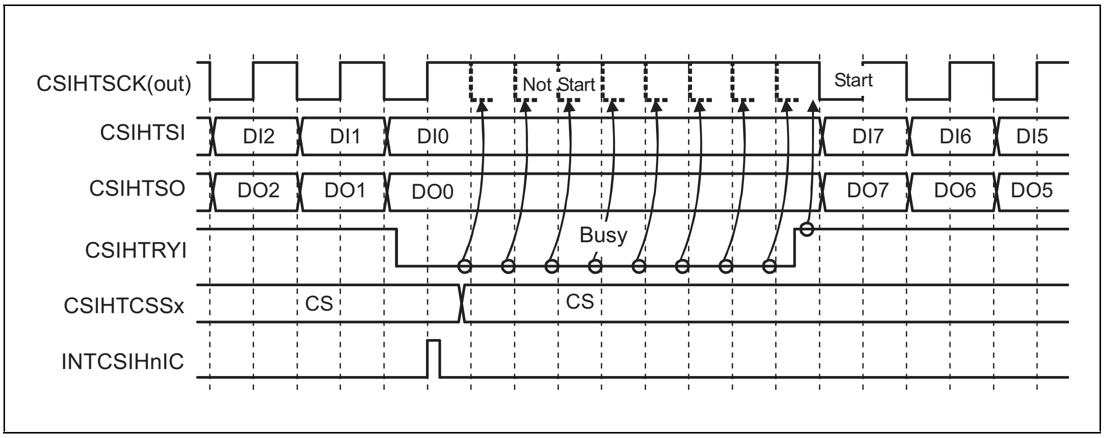

Figure 14.34 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 0)

CSIHTRYI must be pulled down by the slave before the next transfer starts. When the slave changes the CSIHTRYI signal to low level during data transfer, the serial clock from the master stops at the completion of data transfer.

The master resumes the communication as soon as CSIHTRYI becomes high level (the slave is "ready").

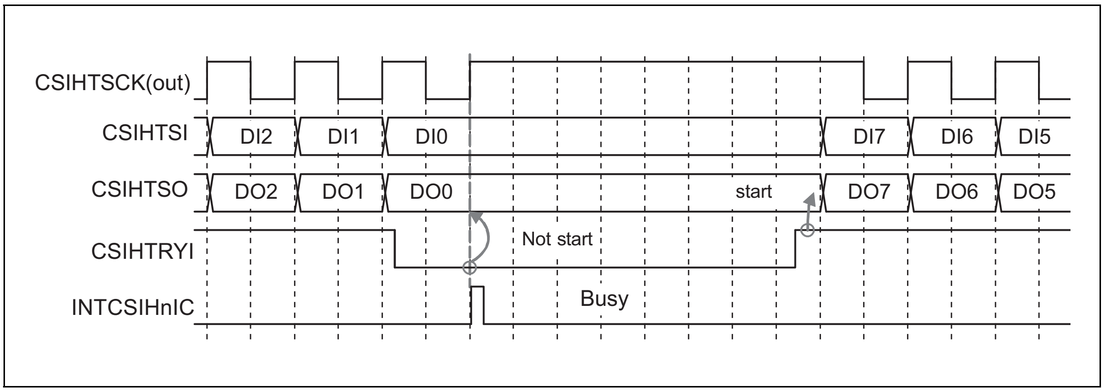

Figure 14.35 Master's Reaction to CSIHTRYI (CSIHnCFGx.CSIHnDAPx = 1)

CAUTIONS

1. **If multiple slaves are connected, the master must detect only the CSIHTRYI signal from the slave it has selected for communication.**
2. **Even when the CSIHTRYI pin of the master detects the CSIHTRYO signal of the slave during data transfer, communication is not in wait status until data transfer finishes.**

14.5.12 Error Detection

CSIH can detect five error types:

- Data consistency check error (transmission data)
- Parity error (received data)
- Overrun error (received data)
- Time-out error (in FIFO mode)
- Overflow error (in FIFO mode)

Check for parity, data consistency check and time-out errors can be enabled or disabled individually.

If any of these errors are detected, the interrupt request INTCSIHnIRE is generated and the corresponding flags are set.

14.5.12.1 Data Consistency Check

The purpose of the data consistency check is to ensure that the data physically transmitted as output signal is identical to the original data that was copied to the shift register.

The data consistency check can be enabled/disabled by the CSIHnCTL1.CSIHnDCS bit. When executing a data consistency check, always set CSIHTSO to PIPCn.PIPCn_m = 1. It will not be enabled if data transmission is disabled (CSIHnCTL0.CSIHnTXE = 0).

When the data consistency check is active, the data transferred from CSIHnTX0W or CSIHnTX0H to the shift register is copied to a separate register. In addition, the physical levels of CSIHTSO are read back into a separate shift register.

After completion of the transmission, the transmitted data is compared with the original transmission data.

Mismatch is considered as a data consistency check error and:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnDCE bit is set.

Additionally, CSIHnRX0W.CSIHnTDCE of data that contains the error is set.

The data consistency check function is illustrated in the following block diagram.

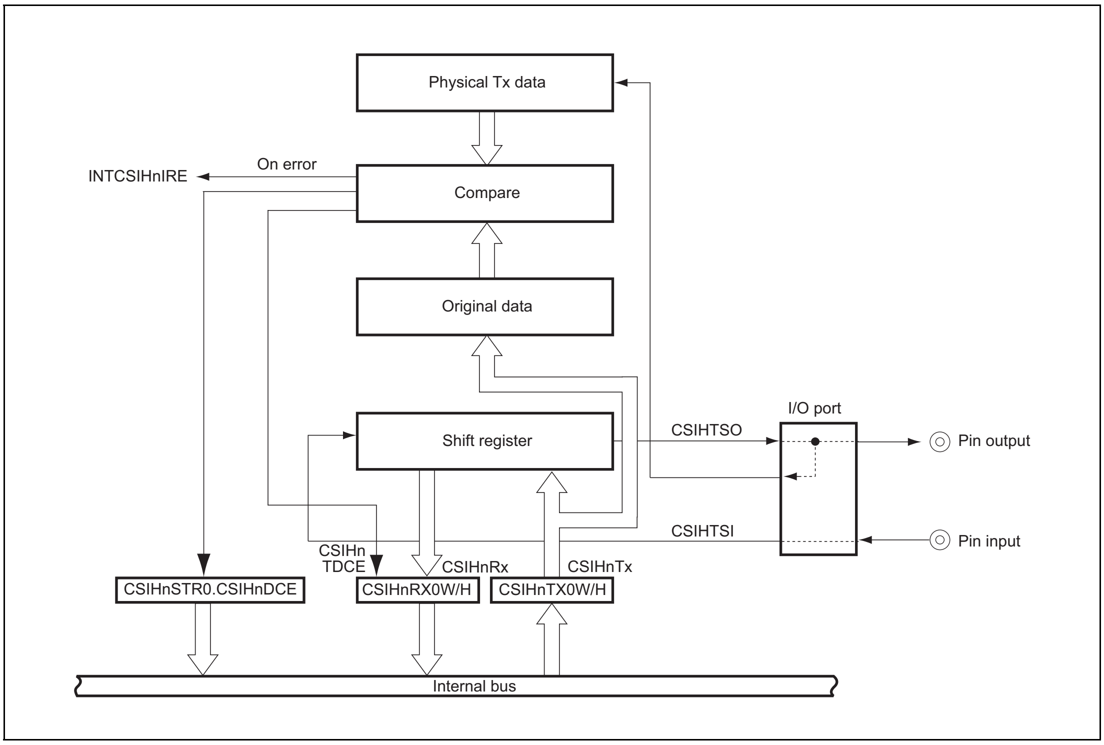

Figure 14.36 Block Diagram of Data Consistency Check Function

14.5.12.2 Parity Check

CSIH can append a parity bit to the last data bit (even if extended data length is used).

The use and type of parity is specified in CSIHnCFGx.CSIHnPSx[1:0].

Parity check is enabled if CSIHnCFGx.CSIHnPSx[1] = 1.

The parity bit is checked after a reception is complete. If an parity error occurs, the following happen:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnPE bit is set.

Additionally, CSIHnRX0W.CSIHnRPE of data that contains the error is set.

The figure below shows an example.

- Data length is 8 bits.
- The data to be transmitted is 05_H and 35_H.
- Data direction is LSB first.
- Parity type is odd.

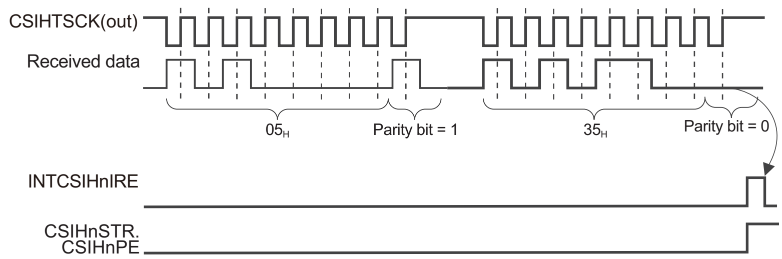

Figure 14.37 Parity Check Example

The parity bit of the first data is 1. There is no parity error, because the total number of ones (including the parity bit) is odd.

The parity bit of the second data is 0. This is detected as a parity error, because the total number of ones (including the parity bit) is even.

If the EDL (extended data length) function is used, the parity bit is added after the last bit of the data.

14.5.12.3 Time-Out Error

Time-out errors can be checked only in slave FIFO mode of the slave.

This error occurs if neither of the following occurred within a certain period of time:

- Received data in FIFO is read
- FIFO receives data from CSIHTSI

The time-out time is defined in CSIHnMCTL0.CSIHnTO[4:0] in units of "8 x transmission clock CSIHTSCK". A time-out error occurs when the specified time is exceeded (the time-out time is not detected when CSIHnMCTL0.CSIHnTO[4:0] = 00000_B).

A dedicated time-out counter is set by the CSIHnCTL2.CSIHnPRS[2:0] and CSIHnBRSy.CSIHnBRS[11:0] bits.

The CSIHnBRSy.CSIHnBRS[11:0] bits is left as set at 000_H, the dedicated time-out counter does not operate.

The dedicated time-out counter measures the time between the last and the next read operation.

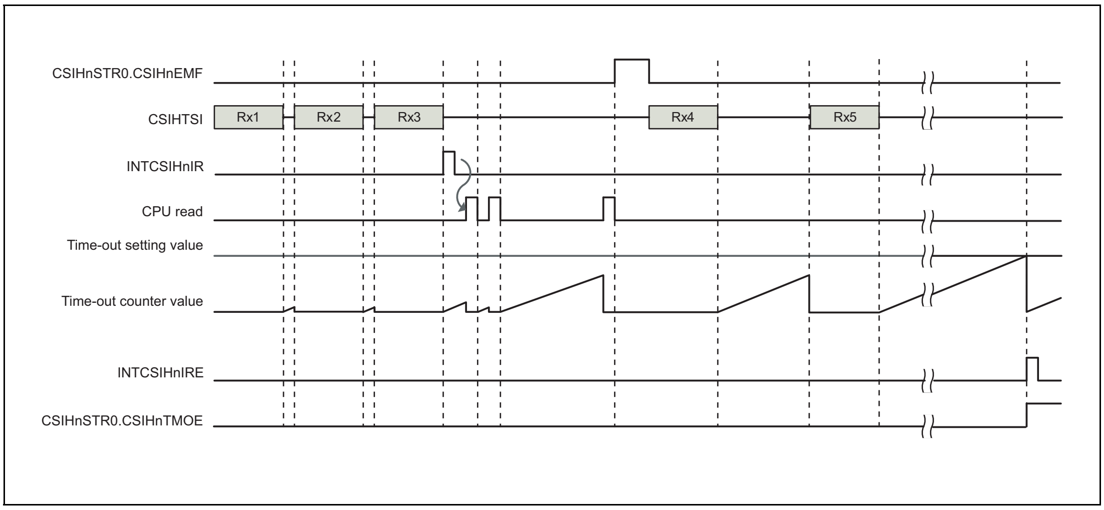

Figure 14.38 Time-Out Check Functional Timing Diagram

The start timing of the time-out counter is as follows:

- When reception is completed
- The CPU reads the received data.
  (The counter does not start if the buffer is empty.)
- When a time-out error is detected

After a time-out error is detected, if data is still available in FIFO, the time-out counter restarts.

If the value set by bit CSIHnMCTL0.CSIHnTO[4:0] is reached again, the INTCSIHnIRE interrupt is output again.

The timeout counter continues to count as long as receive data is not read. To stop the counter, read all received data or set CSIHnSTCR0.CSIHnPCT to 1. Note that the pointer is cleared if you set the CSIHnSTCR0.CSIHnPCT.

The counter is reset at the following timing:

- Data is read once.

- New data is received.
- A timeout error is detected.
- The CSIHnSTCR0.CSIHnPCT bit is set to 1.

If a timeout error occurs, the following occur:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnTMOE bit is set.

14.5.12.4 Overflow Error

An overflow error occurs in FIFO mode. It occurs when transmission data is written to the CSIHnTX0W register while the FIFO buffer is filled with received data.

Example

100 data have been transmitted. That is, the FIFO contains 100 received data. The application starts to read the received data.

While the read operation is in progress, the application begins to write another set of 50 transmission data to the FIFO.
However, only 10 received data have been read up to now and 90 data are still in the FIFO.

In this case, only 38 buffers are available for new transmission data. When the CPU tries to write the 39th data, an overflow error occurs.

This is illustrated in the following figure.

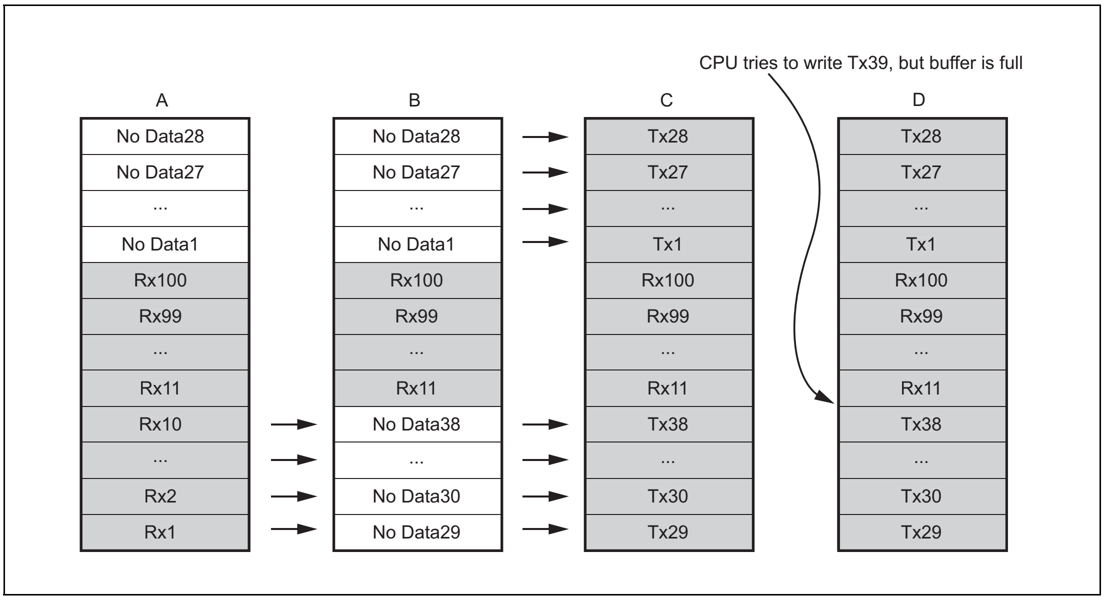

Figure 14.39 FIFO Overview

Data after 39 are discarded. The figure below shows the overflow timing.

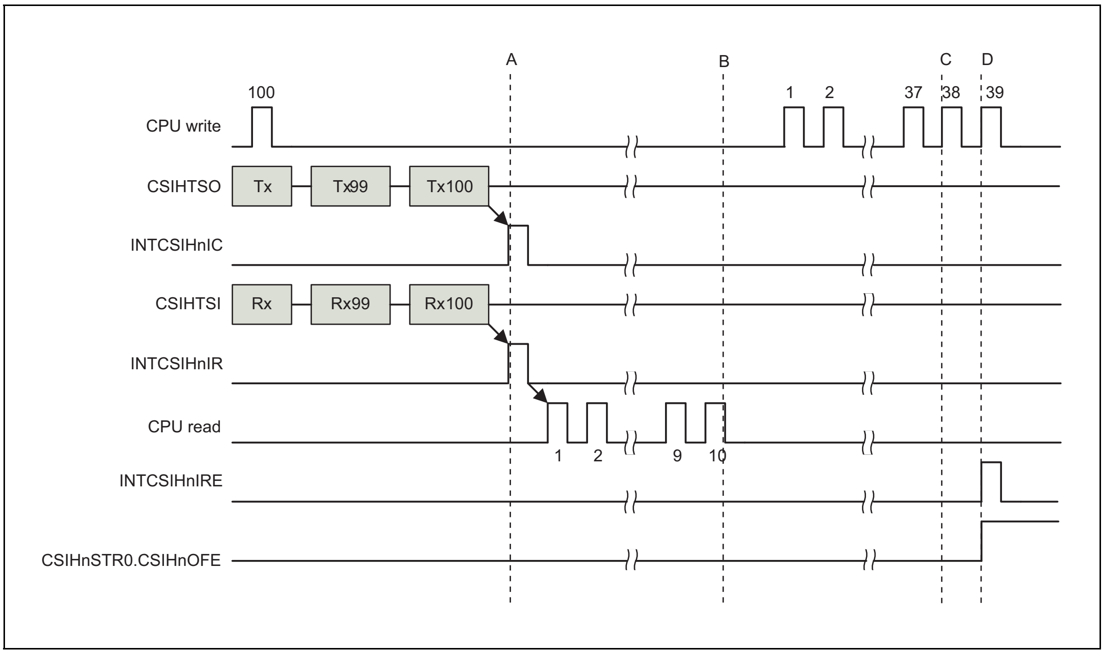

Figure 14.40 FIFO Overflow Timing

In case of overflow error:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnOFE bit is set.

14.5.12.5 Overrun Error

An overrun error occurs. in direct access, transmit-only buffer, and FIFO modes. It does not occur in dual buffer mode. The overrun error does not occur if data reception is disabled (CSIHnCTL0.CSIHnRXE = 0).

An overrun error occurs under the two conditions below.

(Error occurrence condition 1)

- When the CPU reads the CSIHnRX0W/H register with no receive data remaining in FIFO mode

(Error occurrence condition 2)

- When CSIHnCTL1.CSIHnHSE = 0 (handshake function disabled) in slave mode
  - When reception is completed with the previous receive data remaining in the CSIHnRX0W/H register in direct access mode or transmit-only buffer mode
  - When reception is completed while the FIFO buffer is full of receive data in FIFO mode

(1) Direct access/transmit-only buffer

In direct access and transmit-only buffer modes, this error occurs when newly received data cannot be transferred from the shift register to the reception register CSIHnRX0W/H without overwriting it. This happens when CSIHnRX0W/H was not read and therefore contains previously received data.

The following figure illustrates the overrun error detection function.

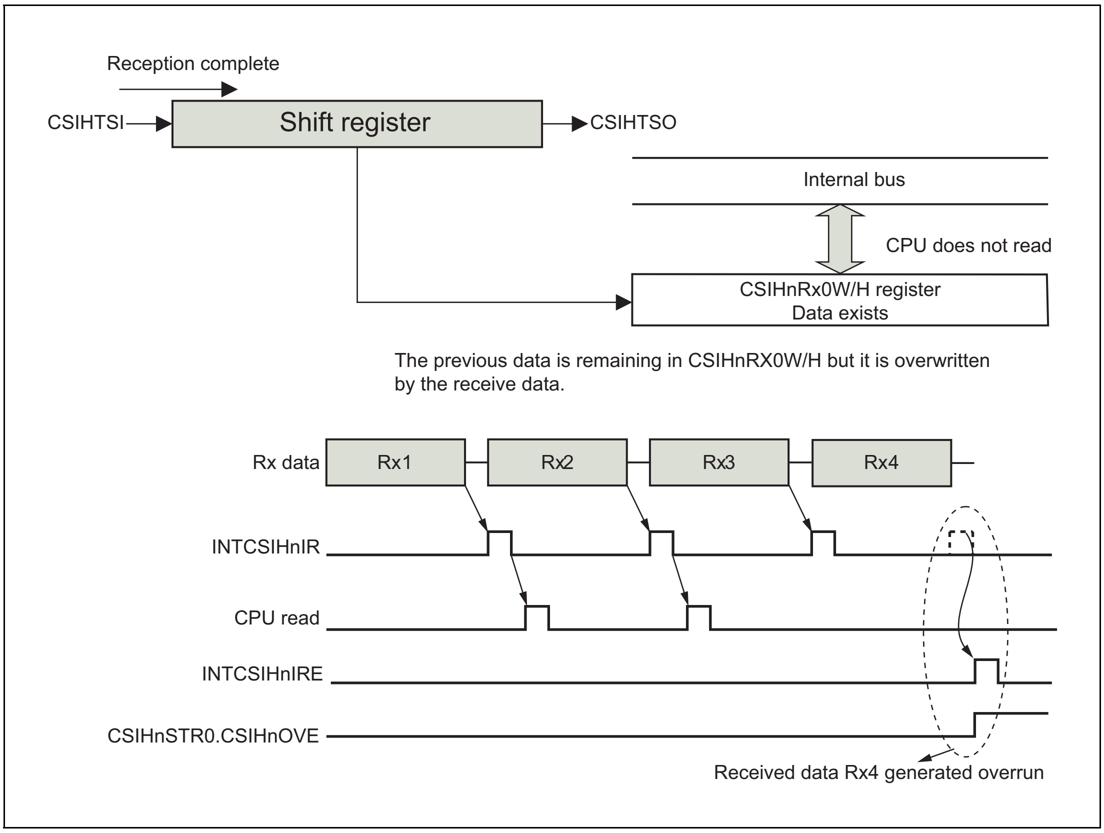

Figure 14.41 Overrun Error Detection in Direct Access and Transmit-Only Buffer Modes

NOTE

An overrun error can be avoided in slave mode by using the handshake function.
When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

(2) FIFO mode

In FIFO mode, this error occurs if:

1. New data is received while the FIFO is full and the old data in the buffer is overwritten.

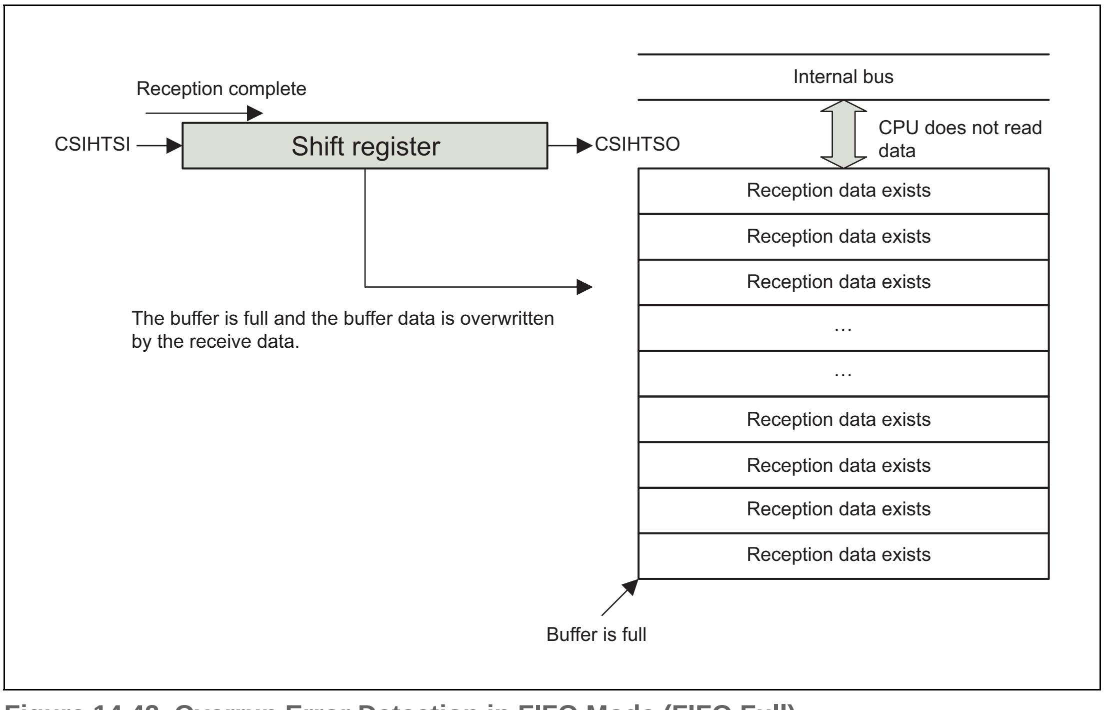

Figure 14.42 Overrun Error Detection in FIFO Mode (FIFO Full)

NOTE

An overrun error can be avoided in slave mode by using the handshake function.
When handshake is used in slave mode, the receiver (slave) signals to the transmitter (master) that it is busy. The transmitter then waits until the receiver reads its reception register and becomes ready again.

2. The CPU attempts to read non-existent receive data.

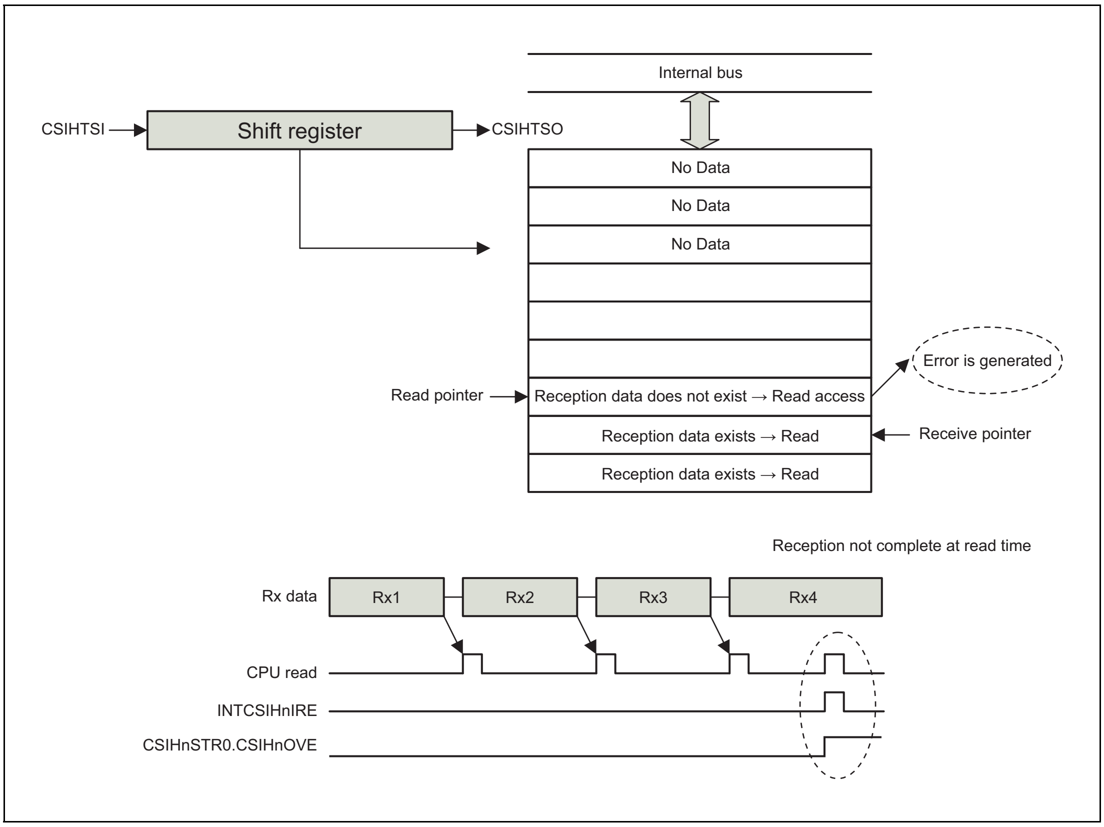

Figure 14.43 Overrun Error Detection in FIFO Mode (No Data)

In case of overrun error:

- Interrupt INTCSIHnIRE is generated.
- The CSIHnSTR0.CSIHnOVE bit is set.
- Receive data is overwritten and communication continues.
  (The CPU can read received data after reception is completed.)

For details, see **Section 14.5.11, Handshake Function**.

14.5.13 Loop-Back Mode

Loop-back mode is a special mode for self-test. This feature is only available in master mode.

When this mode is active (CSIHnCTL1.CSIHnLBM = 1), CSIHTCSSx is fixed to the inactive level (the active level is defied by the CSIHnCTL1.CSIH0CSLx value). The transmit and receive signals are internally connected, as shown in the figures below. The signals CSIHTSCK, CSIHTSO, and CSIHTSI are disconnected from the ports. In addition, the CSIHTSO output level is fixed to low, and CSIHTSCK is set to high level regardless of the CSIHnCFGx.CSIHnCKPx value.

In order to test CSIH, put it in loop-back mode and carry out normal transfer operations. Then check that the received data is the same as the transmitted data. The loopback test does not affect connected devices.

Table 14.47 Pin Output Level when Loopback Mode is Used

Pin Name	Output Level
CSIHTSCK(out)	High level
CSIHTCSS[7:0]	Inactive level
CSIHTSO	Low level (independent of the previous value)
Interrupt	Normal function
CSIHTRYO	Normal function (low level)

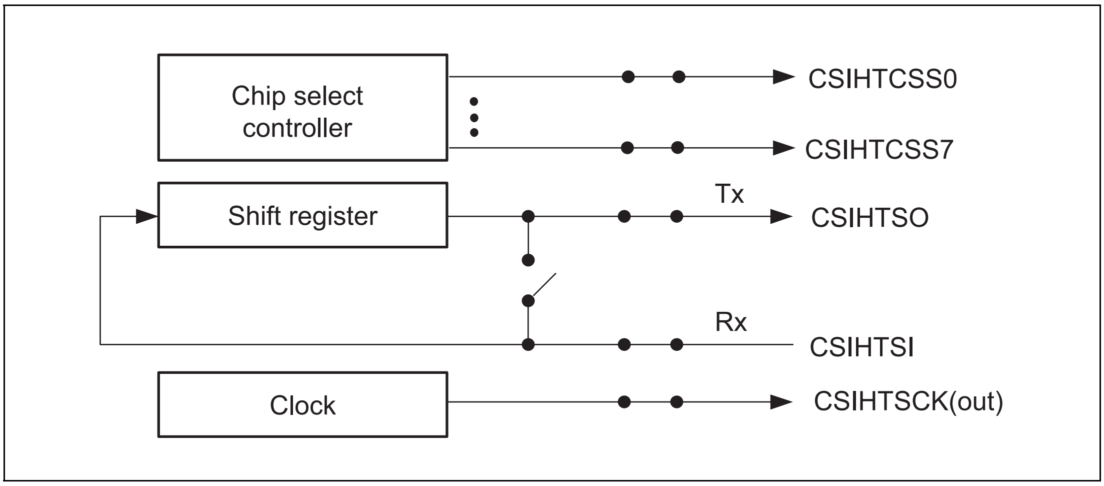

Figure 14.44 Normal Operation

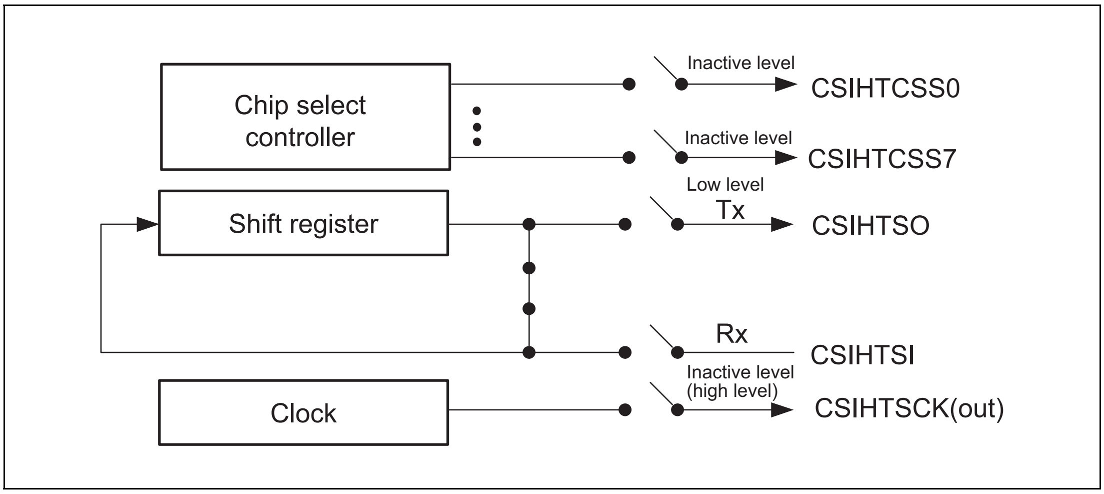

Figure 14.45 Loopback Mode Operation

14.5.14 CPU-Controlled High Priority Communication Function

CSIH has a function to abort low priority communication to perform high priority communication if it receives a high-priority communication request from the CPU while low-priority communication is being used. This function supports transmit-only buffer mode as low priority communication and only direct access mode as high-priority communication.

To enable this function, set CSIHnCTL1.CSIHnPHE = 1 and CSIHnCTL1.CSIHnJE = 1.

The following figure illustrates CPU-controlled high-priority communication.

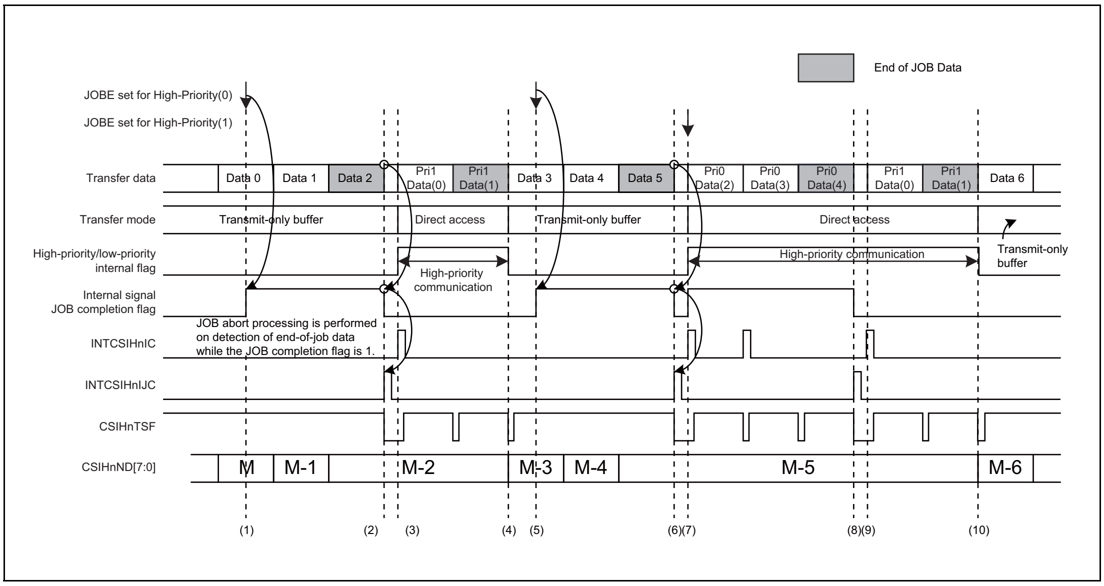

Figure 14.46 Example of CPU-Controlled High-Priority Communication

(1) By setting CSIHnCTL0.CSIHnJOBE = 1 during low-priority communication, start of high-priority communication following end-of-job data is notified, and the internal signal flag is set.

(2) When end-of-job data is detected, the current low-priority communication is aborted and the INTCSIHnIJC interrupt occurs. An internal signal, the JOB completion flag is cleared due to the communication abort, and memory mode is automatically switched to direct access mode for the subsequent high-priority communication.

(3) The CPU detects the interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H.

(4) When end-of-job data is detected, communication is aborted. At this time, because the internal signal end-of-job flag is set to 0, the CSIH determines that the next communication is low-priority and switches memory mode to transmit-only buffer mode automatically, and then resumes the aborted low-priority communication.

(5) Same as (1) above.

(6) Same as (2) above.

(7) The CPU detects an interrupt and starts communication by writing the first transmission data of high-priority communication to CSIHnTX0W or CSIHnTX0H. The CPU sets CSIHnCTL0.CSIHnJOBE = 1 again to notify that the next communication is high-priority.

(8) When end-of-job data is detected, communication is aborted and the INTCSIHnIJC interrupt is generated. At this time, the CPU determines that the subsequent communication is also high-priority because the internal signal end-of-job flag is 1, and waits for communication to start.

(9) Same as (3) above.

(10) Same as (4) above.

CAUTION

Memory mode is switched automatically when communication is changed from low priority to high priority (from transmit-only buffer mode to direct access mode) and from high priority to low priority (from direct access mode to transmit-only buffer mode).

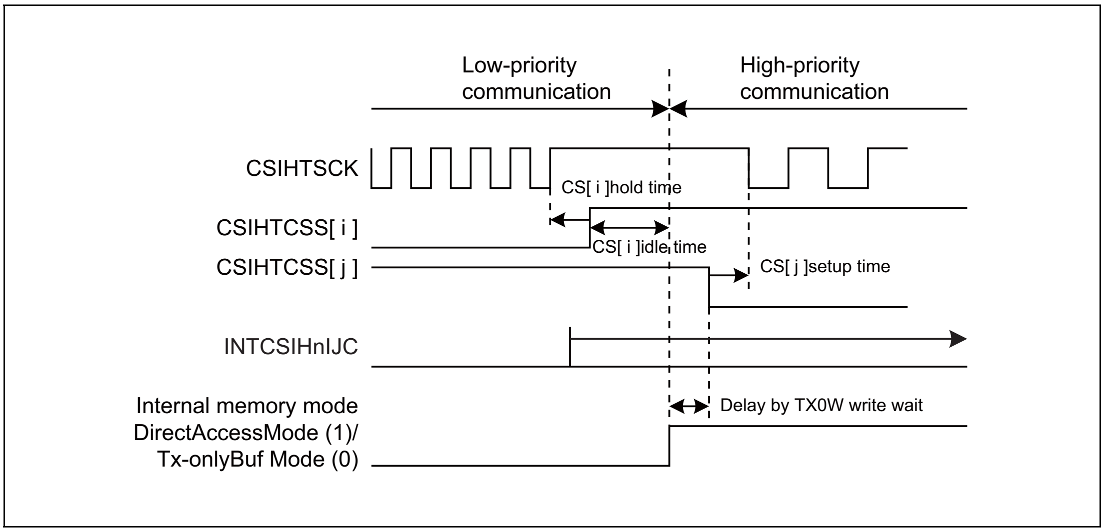

Figure 14.47 Transition from Low-Priority Mode to High-Priority Mode

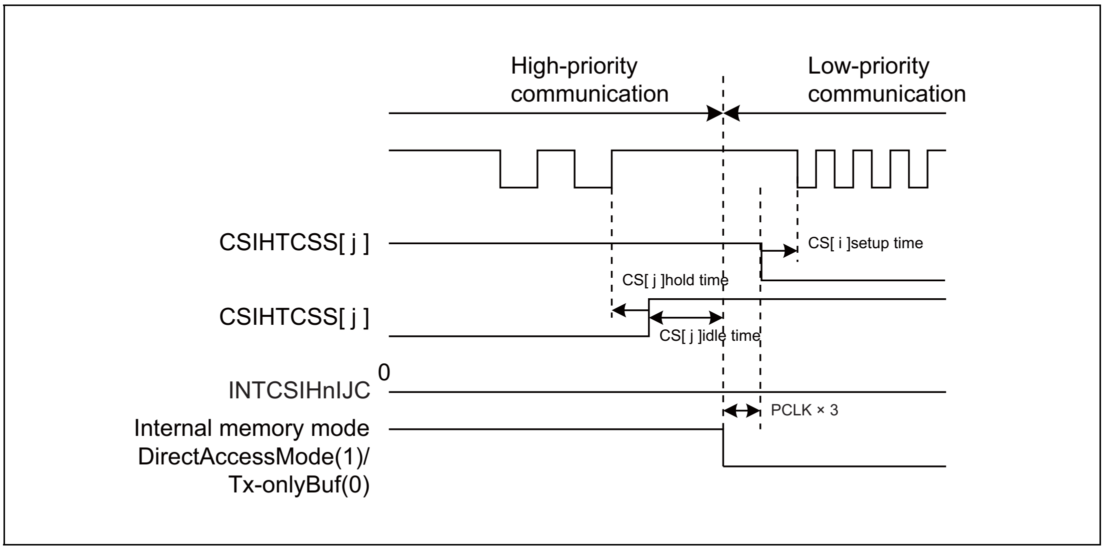

Figure 14.48 Transition from High-Priority Mode to Low-Priority Mode

To correctly switch low-priority communication mode and high-priority communication mode, do not write communication data or manipulate the CSIHnCTL0.CSIHnJOBE bit during the setting prohibited time period.

CSIHnTX0W register write prohibited time period:

- A time period from CSIHnJOBE bit setting for transition to high-priority communication mode until an INTCSIHnIJC interrupt is detected

- A time period from the last end-of-job data write of high-priority communication until (CSIHnHPST state = 0) is detected

CSIHnJOBE register write prohibited time period:

- A time period from CSIHnJOBE bit setting for transition to high-priority communication mode until an INTCSIHnIJC interrupt is detected

There is no setting prohibited time period of the CSIHnJOBE bit during the high-priority communication mode. It is also possible to set the CSIHnJOBE bit before writing communication data. For example, when it has been made clear in advance that multiple job data are sent and received in high-priority communication mode, the CSIHnJOBE bit can be set before the first transmission data is written.

CAUTION

If the CSIHnJOBE bit is set immediately before the last high-priority communication ends, operation differs depending on the timing for internally detecting the CSIHnJOBE bit setting.

If the setting of the CSIHnJOBE bit is detected before communication of the last bit is completed, high-priority communication mode continues.

When the CSIHnJOBE bit setting is detected after communication of the last bit has been completed, low-priority communication mode is restored and then end-of-job data of low-priority communication is detected and mode changes again to high-priority communication mode.

14.5.15 Enforced Chip Select Idle Setting

CSIHn units can insert an idle state between the two consecutive transfer data by the setting of CSIHnCFGx.CSIHnIDLx. Detail is as follows.

1. When CSIHnCFGx.CSIHnIDLx = 0
   If the next CSIHTCSSx is the same as the previous one, an idle state is not inserted and an inter-data time is inserted.
   If the next CSIHTCSSx is different from the previous one, an idle state is inserted.
2. When CSIHnCFGx.CSIHnIDLx = 1
   An idle state is always inserted even if a next CSIHTCSSx is not different from the previous one.

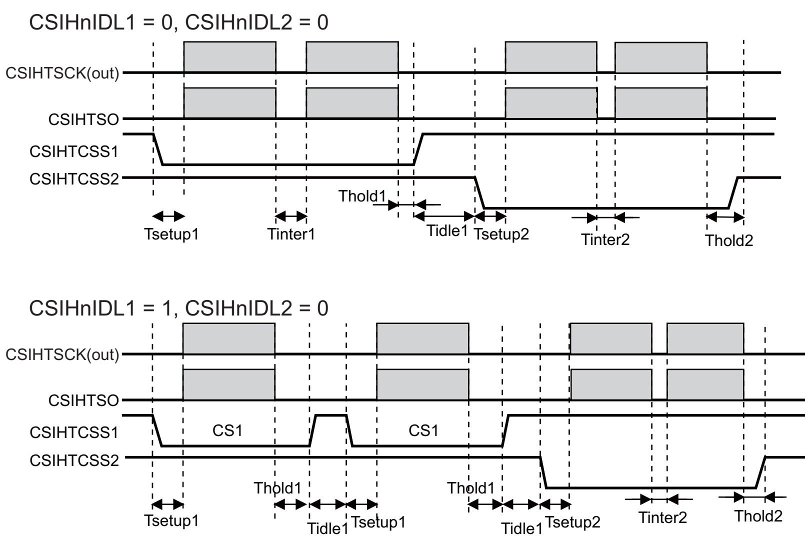

Figure 14.49 Enforced Chip Select Idle Setting Example

CAUTION

If the CPU-controlled high priority communication function is enabled (CSIHnCTL1.CSIHnPHE = 1), when the mode is switched from low priority communication to high priority communication or from high priority communication to low priority communication, an IDLE state is inserted regardless of the setting of CSIHnCFGx.CSIHnIDLx bit.

14.6 Operating Procedures

The examples and procedures below are described according to the memory mode in the following order:

- Direct access mode
- Transmit-only buffer mode
- Dual buffer mode
- FIFO mode

14.6.1 Procedures in Direct Access Mode

Two examples for a master are provided, one with job mode disabled, and the other with job mode enabled.

14.6.1.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedures below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)

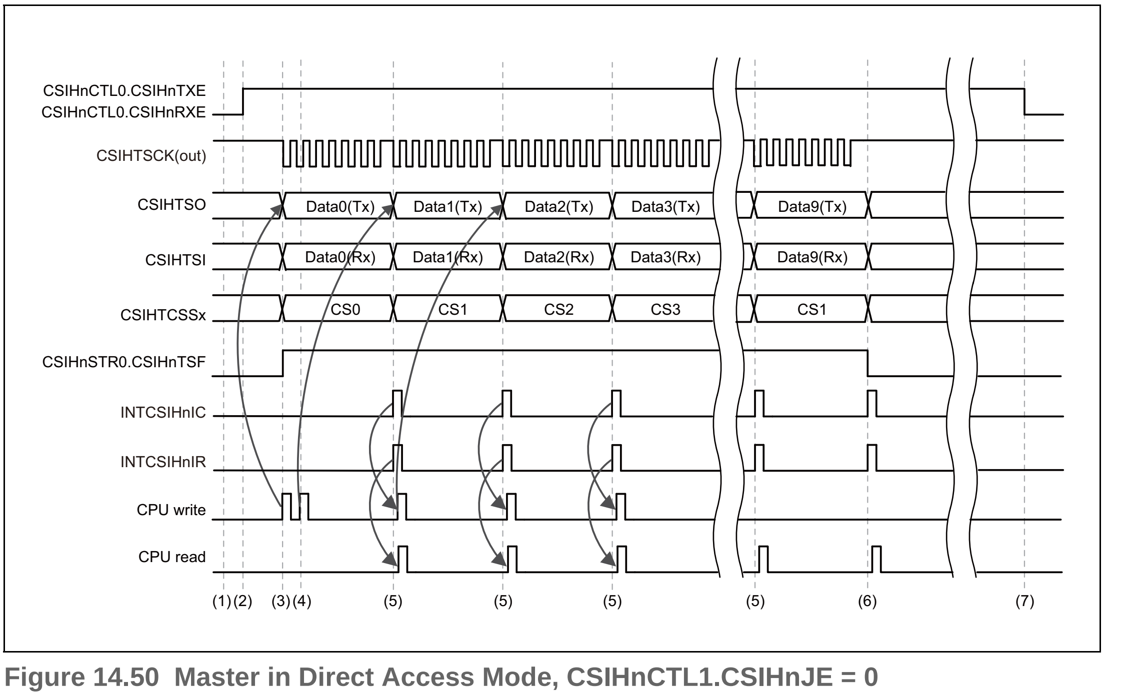

Figure 14.50 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS0 to CS3.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first transmission data to the transmission register CSIHnTX0W. Within the same write operation, activate CS0. Transmission starts automatically when the first data becomes available.
4. Write the second data to CSIHnTX0W. If required, you can change the CS to address a different device. Writing the second data immediately after the first one avoids unnecessary delays between data.
5. Each time data is transmitted and received, INTCSIHnIC and INTCSIHnIR interrupts are generated.
   - INTCSIHnIC indicates that the next data can be written to CSIHnTX0W.
   - INTCSIHnIR indicates that the reception register, CSIHnRX0W must be read.
6. No more write action is required after completion of transmission of data 8. Data 9 (the last data) has been written when a successful transmission interrupt of data 7 was generated. However, reception register CSIHnRX0W must be read after completion of writing data 8 and 9.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/ receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.1.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- Transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Direct access mode (CSIHnCTL0.CSIHnMBS = 1)
- Two jobs, each of them transmits three data.

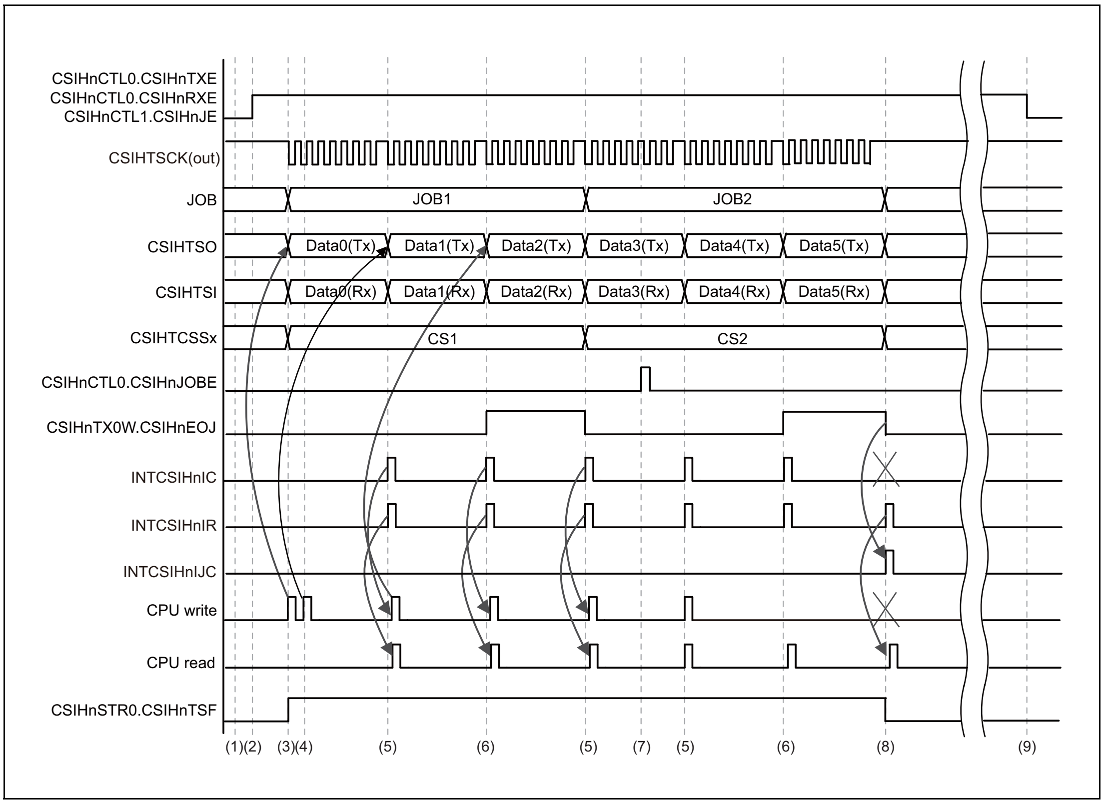

Figure 14.51 Master in Direct Access Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1 and CS2.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), CSIHnRXE = 1 (permits the reception), and CSIHnMBS = 1 (selects direct access mode).
3. Write the first transmission data to the transmission register CSIHnTX0W. Transmission starts automatically when the first data becomes available.
   The CSIHnSTR0.CSIHnTSF flag indicates that communication is in progress.
4. Write the second data to CSIHnTX0W. Writing the second data immediately after the first one avoids unnecessary delays between data.
5. Each time data is transmitted and received, INTCSIHnIC and INTCSIHnIR interrupts are generated.
   – INTCSIHnIC indicates that the next data can be written to CSIHnTX0W.
   – INTCSIHnIR indicates that the reception register CSIHnRX0W must be read.
6. Setting CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is transmitted.
7. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of the current job (JOB2).
8. After the forced stop of communication, the interrupt request INTCSIHnIC is replaced by INTCSIHnIJC. INTCSIHnIR is generated as usual.
   The interrupt request INTCSIHnIJC indicates that the communication was forcibly stopped at the end of the current job.
   The interrupt request INTCSIHnIC is not generated. Additionally, the transmission data available in the CSIHnTX0W register is not transmitted.
9. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/ receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

To start another transmission without stopping communication, perform steps 3 and later.

14.6.2 Procedures in Transmit-Only Buffer Mode

Two examples for a master is provided, one with job mode disabled, and the other one with job mode enabled.

14.6.2.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Number of data: 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

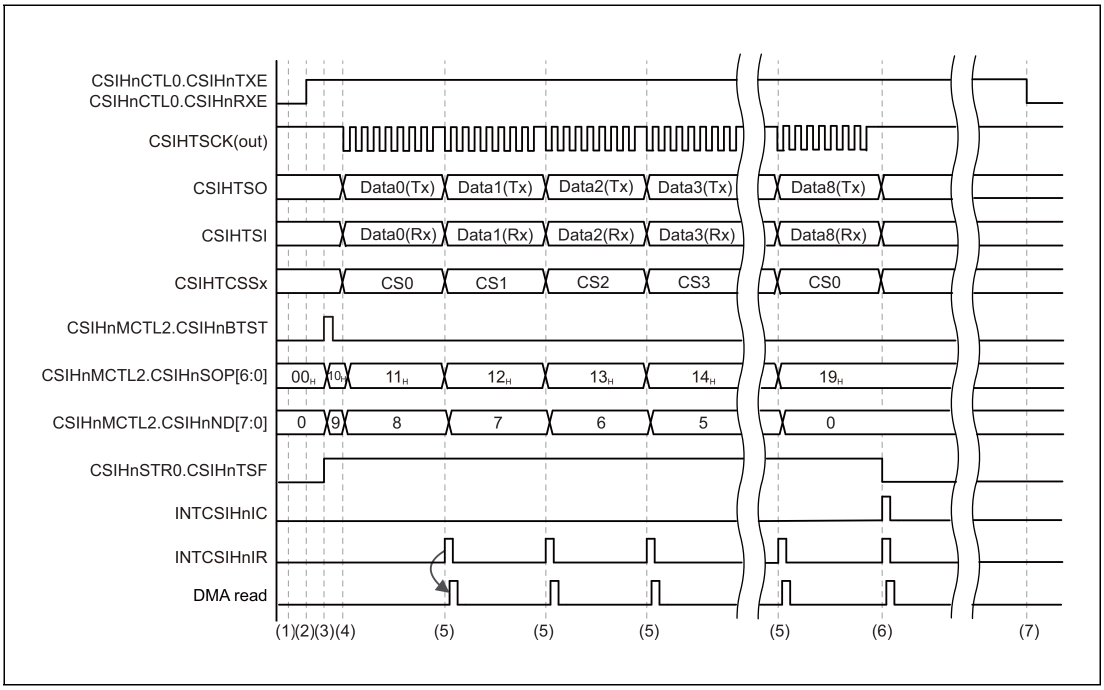

Figure 14.52 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] to 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission) and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission/reception is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. An interrupt request INTCSIHnIR is generated each time a piece of data is received. INTCSIHnIR indicates that the reception register, CSIHnRX0W must be read.
6. When all transmissions are completed, the interrupt request, INTCSIHnIC is generated.
7. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.2.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Number of data: 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Transmit-only buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 10_B)

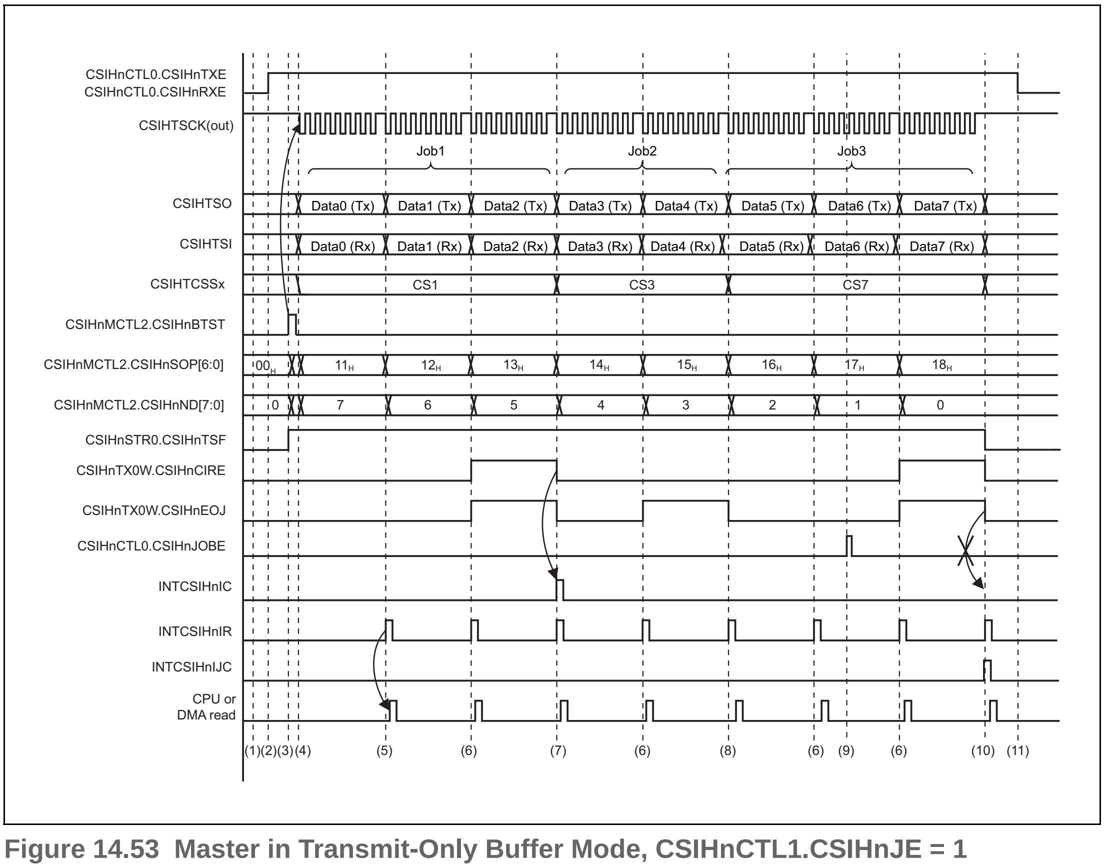

Figure 14.53 Master in Transmit-Only Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. This example uses chip select signals CS1, CS3, and CS7.
   Specify the transfer mode and job mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] to 10_B (transmit-only buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure the transmission pointer and the number of data by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. An interrupt request INTCSIHnIR is generated each time a piece of data is received. INTCSIHnIR indicates that the reception register CSIHnRX0W must be read.
6. The CSIHnTX0W.CSIHnEOJ = 1 setting indicates that the last data of the current job is transmitted.
7. The interrupt request INTCSIHnIC is generated. INTCSIHnIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 1.
8. The INTCSIHnIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CHABnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 0.
9. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
10. After the forced stop of communication, interrupt requests INTCSIHnIJC and INTCSIHnIR are generated at the end of job3.
    The INTCSIHnIJC interrupt request indicates a forced stop of communication at the end of the current job.
    The INTCSIHnIC interrupt request is not generated because the INTCSIHnIJC interrupt request is generated instead of the INTCSIHnIC interrupt request. Additionally, the transmission data available in the CSIHnTX0W register is not transmitted.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/ receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.3 Procedures in Dual Buffer Mode

The following examples are provided: those with job mode enabled and disabled during master mode, and one with job mode disabled during slave mode.

14.6.3.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CHIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Number of data: 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

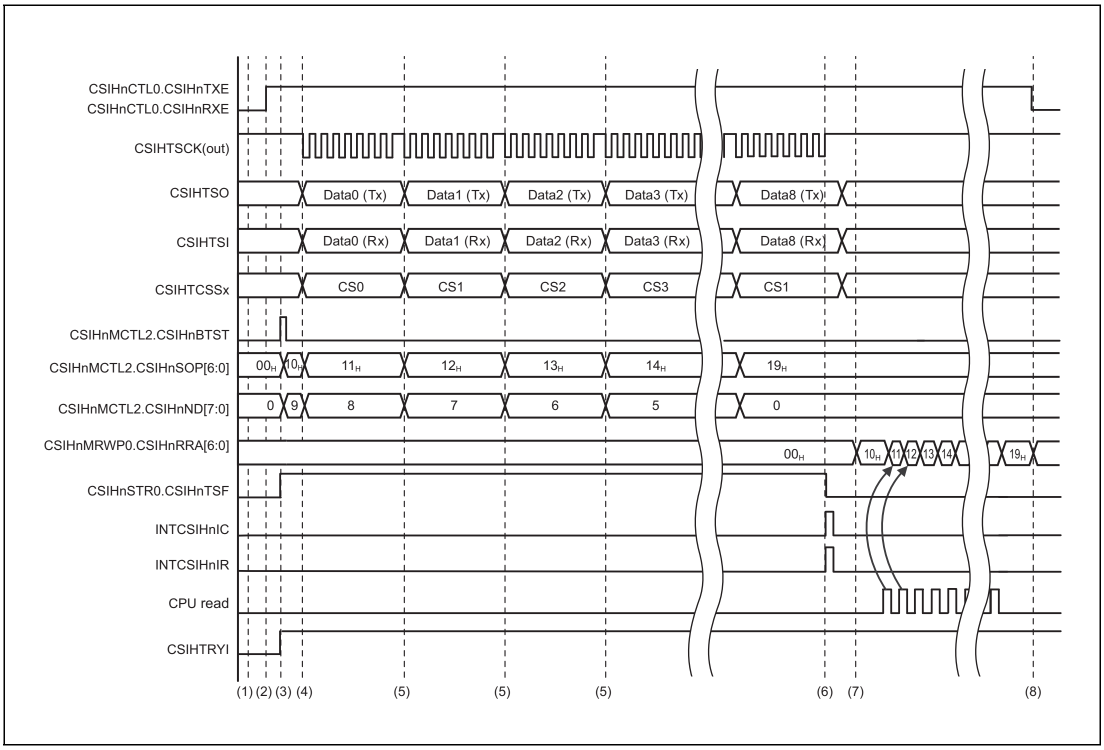

Figure 14.54 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. The example uses chip select signals CSIHTCSS0 to CSIHTCSS3.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] to 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits the reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received. The interrupt requests INTCSIHnIC and INTCSIHnIR are not generated.
6. When the last data is transmitted and received, interrupt requests INTCSIHnIC and INTCSIHnIR are generated.
   The CPU starts to read the received data from the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0] (CSIHnMRWP0.CSIHnRRA[6:0] is set to 10_H by the software in this figure). These bits are incremented each time a piece of data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.3.2 Transmit/Receive in Master Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- Number of data: 8 (CSIHnMCTL2.CSIHnND[7:0] = 08_H).
- The transfer start address is 00_H (CSIHnMCTL2.CSIHnSOP[6:0] = 00_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)

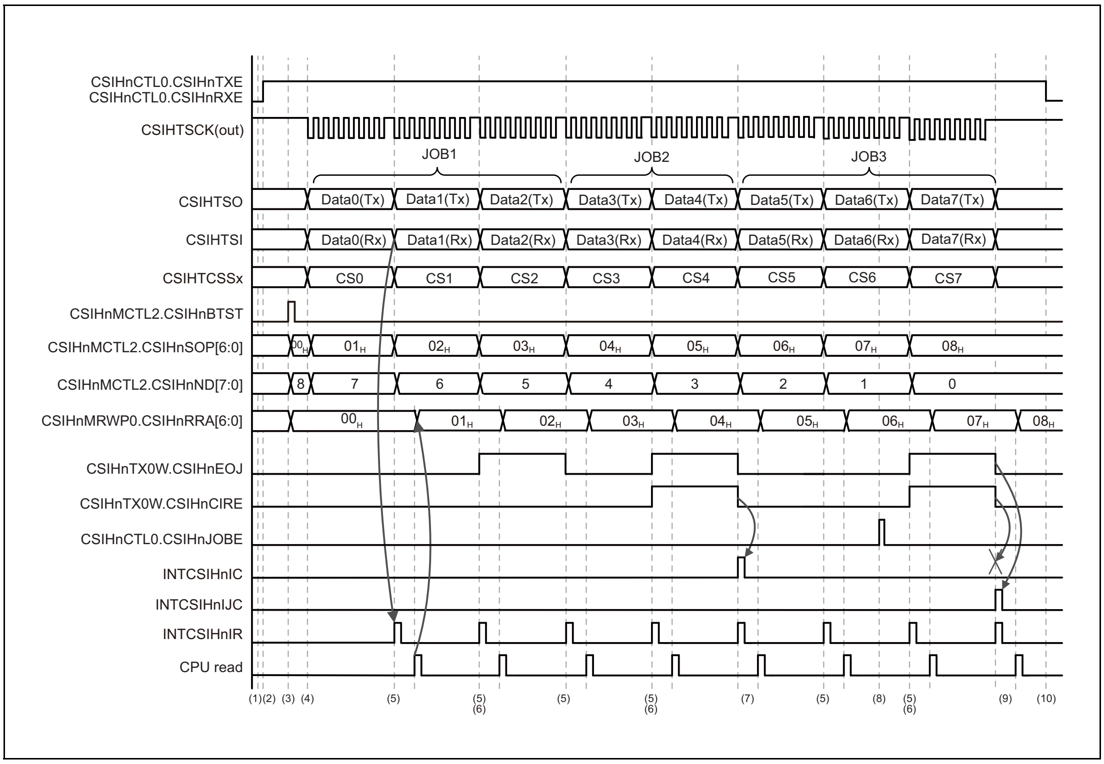

Figure 14.55 Master in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 1

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in the CSIHnCFGx register. The example uses chip select signals CS0 to CS7.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0].
   Set CSIHnMCTL0.CSIHnMMS[1:0] to 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Configure communication by setting the CSIHnMCTL2.CSIHnSOP[6:0] and CSIHnMCTL2.CSIHnND[7:0] bits. Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented, and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission. This is repeated until the last data is transmitted/received.
5. An interrupt request INTCSIHnIR is generated each time a piece of data is received.
   The INTCSIHnIC interrupt request is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 0.
6. CSIHnTX0W.CSIHnEOJ = 1 indicates that the last data of the current job is transmitted.
7. The INTCSIHnIC interrupt request is generated. INTCSIHnIC indicates that the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 1.
8. By setting CSIHnCTL0.CSIHnJOBE = 1, communication is forced to stop at the end of JOB3.
9. After the forced stop of communication, interrupt requests INTCSIHnIJC and INTCSIHnIR are generated at the end of JOB3.
   The INTCSIHnIJC interrupt request indicates a forced stop of communication at the end of the current job.
   The INTCSIHnIC interrupt request is not generated because the INTCSIHnIJC interrupt request is generated instead. Additionally, the transmission data available in register CSIHnTX0W is not transmitted.
10. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.3.3 Transmit/Receive in Slave Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCTL1.CSIHnCKR = 0, CSIHnCFG0.CSIHnDAP0 = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Number of data: 9 (CSIHnMCTL2.CSIHnND[7:0] = 09_H).
- The transfer start address is 10_H (CSIHnMCTL2.CSIHnSOP[6:0] = 10_H).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- Dual buffer mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 01_B)
- The handshake function is enabled. (CSIHnCTL1.CSIHnHSE = 1)

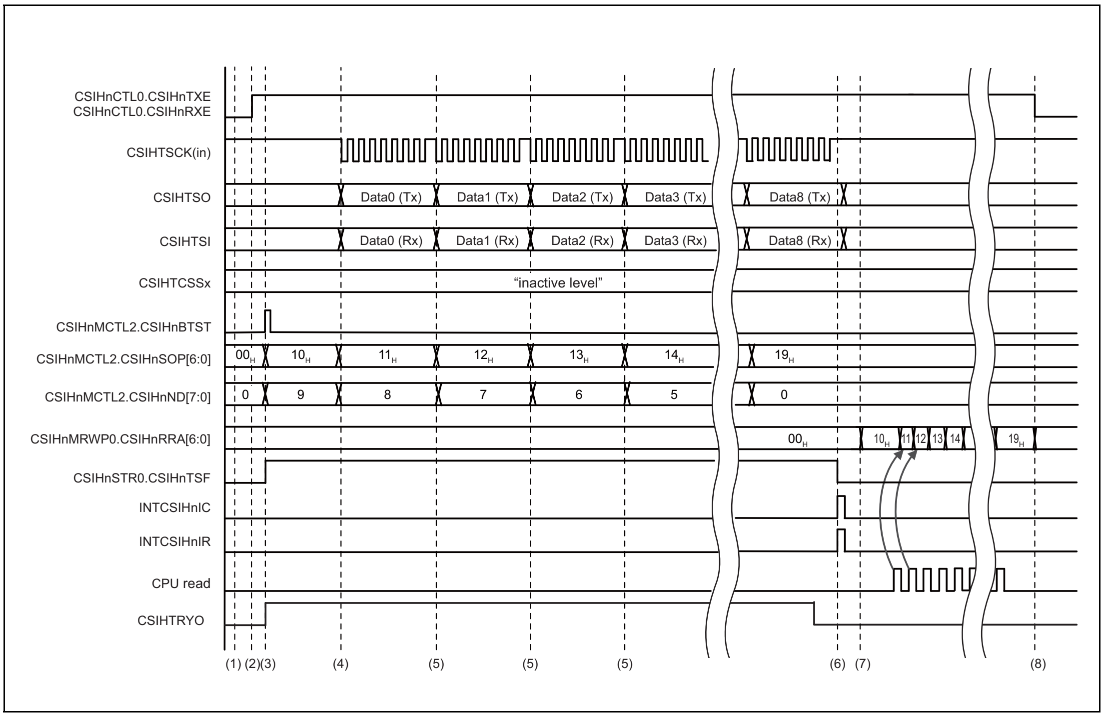

Figure 14.56 Slave in Dual Buffer Mode, CSIHnCTL1.CSIHnJE = 0

NOTE

The procedure of writing the data into the buffer is not described here.

Procedure:

1. Configure the communication protocol in register CSIHnCFG0.
   Specify the transfer and operating modes by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2.
   Set the memory mode by CSIHnMCTL0.CSIHnMMS[1:0]
   Set CSIHnMCTL0.CSIHnMMS[1:0] to 01_B (dual buffer mode).
2. In the CSIHnCTL0 register, set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
3. Specify the transfer start address by setting the CSIHnMCTL2.CSIHnSOP[6:0] bits and the number of data by setting the CSIHnMCTL2.CSIHnND[7:0] bits.
   Start the buffer transfer by setting CSIHnMCTL2.CSIHnBTST.
4. Transmission is started when the input clock is received from the master. The CSIHnMCTL2.CSIHnSOP[6:0] bits are automatically incremented and the CSIHnMCTL2.CSIHnND[7:0] bits are decremented after each data transmission.
5. This is repeated until the last data is transmitted/received.
   The interrupt requests INTCSIHnIC and INTCSIHnIR are not generated because transmission data is sent from the buffer, and received data is stored in the buffer.
6. When the last data is transmitted and received, interrupt requests INTCSIHnIC and INTCSIHnIR are generated.
   The CPU starts to read the received data that is stored in the receive buffer.
7. The start address of the read access is specified in CSIHnMRWP0.CSIHnRRA[6:0] (CSIHnMRWP0.CSIHnRRA[6:0] is set to 10_H by the software in this figure). These bits are incremented each time a piece of data is read.
8. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When communication is not performed, set CSIHnCTL0.CSIHnPWR = 0 to minimize the power consumption of CSIHn.

14.6.4 Procedures in FIFO Mode

Two examples for a master is provided, one with job mode disabled, the other one with job mode enabled.

14.6.4.1 Transmit/Receive in Master Mode when Job Mode is Disabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0).
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is disabled (CSIHnCTL1.CSIHnJE = 0).
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

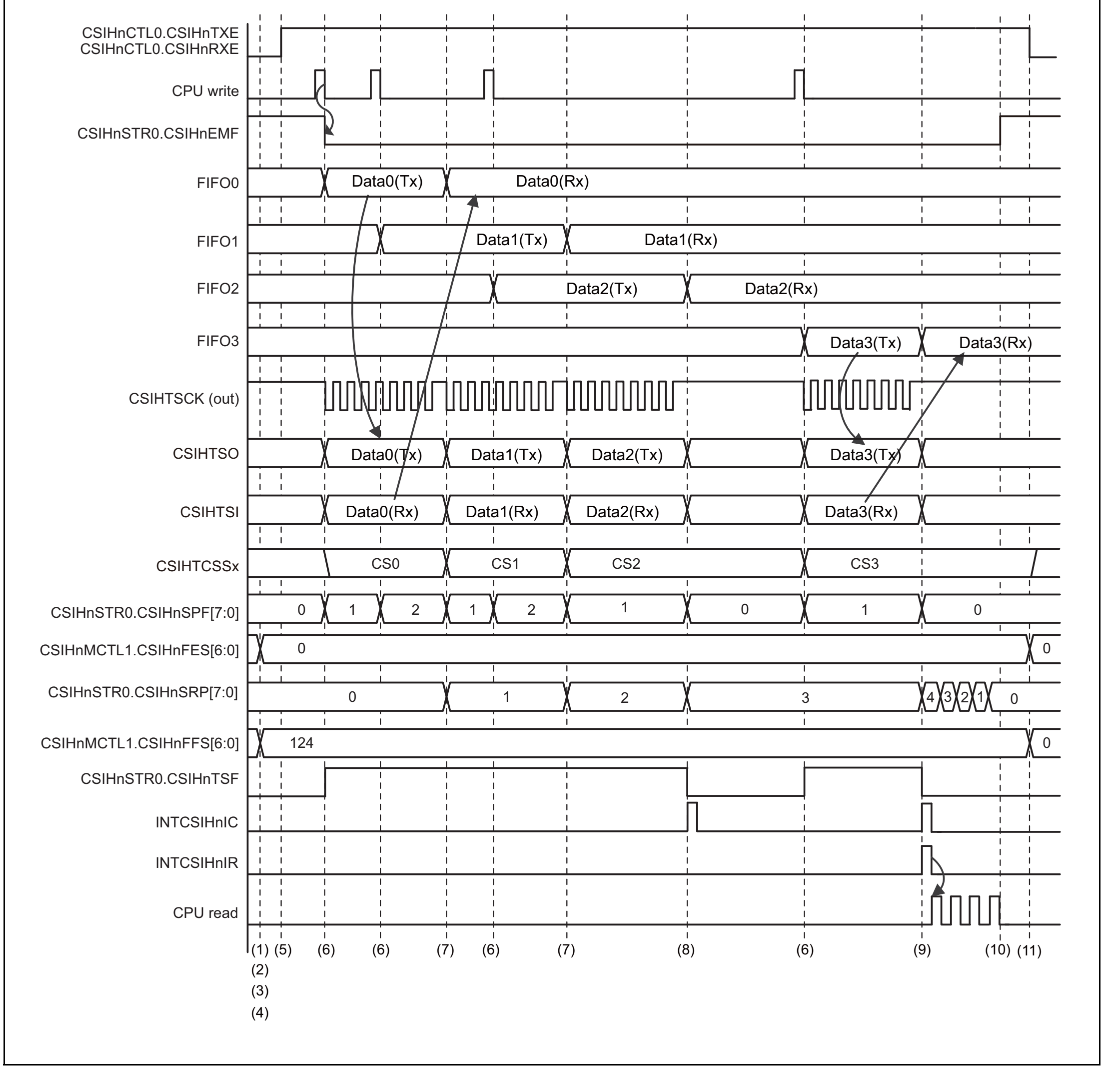

Figure 14.57 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 0

Procedure:

1. Configure the communications protocol in the CSIHnCFGx register, specify the job mode and master mode by setting the corresponding bits in registers CSIHnCTL1 and CSIHnCTL2, and select FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] to 00_B. These examples use chip select signals CSIHTCSS0 to CSIHTCSS3.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H respectively.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for the INTCSIHnIC interrupt output. With CSIHnFFS[6:0] in the same register, specify the conditions for the INTCSIHnIR interrupt output.
5. Set CSIHnCTL0.CSIHnPWR is set to 1 (enables the clock), CSIHnTXE is set to 1 (permits transmission), and CSIHnRXE is set to 1 (permits reception). The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the transmission data to the transmission register CSIHnTX0W. When the transmission data becomes available, transmission starts automatically.
   Make sure that CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. The interrupt request, INTCSIHnIC is not generated because CSIHnFES[6:0] is not CSIHnSPF[7:0].
8. The interrupt request, INTCSIHnIC is generated because CSIHnFES[6:0] is CSIHnSPF[7:0].
9. When CSIHnFFS[6:0] becomes 128-CSIHnSRP[7:0], the interrupt request, INTCSIHnIR is generated. Since CSIHnFES[6:0] = CSIHnSPF[7:0], an interrupt request INTCSIHnIC is generated. After the interrupt is generated, the CPU starts reading the received data stored in the receive buffer.
10. When the CPU has read the received data stored in the receive buffer, CSIHnSTR0.CSIHnEMF is set to 1 and the FIFO buffer becomes empty.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/ receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize the power consumption of the CSIHn.

14.6.4.2 Transmit/Receive in Mater Mode when Job Mode is Enabled

The procedure below is based on the assumption that:

- The transmission data length is 8-bits (CSIHnCFGx.CSIHnDLSx[3:0] = 1000_B).
- The transmission direction is MSB first (CSIHnCFGx.CSIHnDIRx = 0)
- Normal clock and data phase (CSIHnCFGx.CSIHnCKPx = 0, CSIHnCFGx.CSIHnDAPx = 0)
- No interrupt delay (CSIHnCTL1.CSIHnSIT = 0)
- Job mode is enabled (CSIHnCTL1.CSIHnJE = 1).
- JOB1 consists of four data, JOB2 consists of three data, and JOB3 consists of five data.
- Normal INTCSIHnIC interrupt timing (CSIHnCTL1.CSIHnSLIT = 0)
- FIFO mode (CSIHnCTL0.CSIHnMBS = 0, CSIHnMCTL0.CSIHnMMS[1:0] = 00_B)

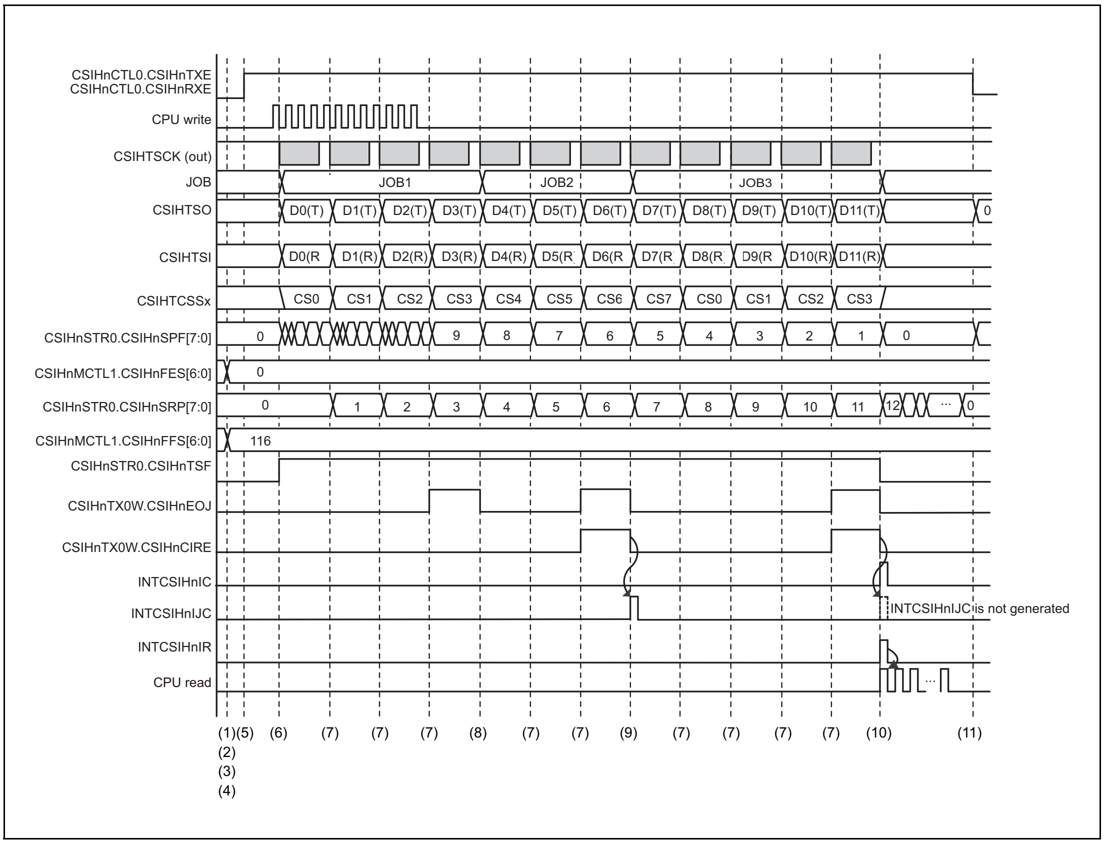

Figure 14.58 Master in FIFO Mode, CSIHnCTL1.CSIHnJE = 1

Procedure:

1. Set communication protocol in the CSIHnCFGx register, set job mode disable and master mode by corresponding bits in the CSIHnCTL1 and CSIHnCTL2 registers, and specify FIFO mode by setting CSIHnMCTL0.CSIHnMMS[1:0] = 00_B. These examples use chip select signals CS0 to CS7.
2. Set CSIHnSTCR0.CSIHnPCT to 1 to clear all buffer pointers.
3. Make sure that CSIHnSTR0.CSIHnFLF is set to 0, CSIHnSTR0.CSIHnEMF is set to 1, and CSIHnSTR0.CSIHnSPF[7:0] is set to 00_H respectively.
4. With CSIHnMCTL1.CSIHnFES[6:0], specify the conditions for generating an interrupt request INTCSIHnIC. With CSIHnMCTL1.CSIHnFFS[6:0], specify the conditions for generating an interrupt request INTCSIHnIR.
5. Set CSIHnPWR = 1 (enables the clock), CSIHnTXE = 1 (permits transmission), and CSIHnRXE = 1 (permits reception) in the CSIHnCTL0 register. The CSIHnCTL0.CSIHnMBS bit must be cleared.
6. Write the transmission data to the transmission register CSIHnTX0W. When the transmission data becomes available, transmission starts automatically.
   Make sure that CSIHnSTR0.CSIHnEMF is set to 0.
7. The current transmission is completed. The interrupt request, INTCSIHnIC is not generated because CSIHnFES[6:0] is not CSIHnSPF[7:0]
8. An interrupt request INTCSIHnIJC is not generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 0.
9. An interrupt request INTCSIHnIJC is generated because the last data of the current job (CSIHnTX0W.CSIHnEOJ = 1) was transmitted with CSIHnTX0W.CSIHnCIRE = 1.
10. Since CSIHnSTR0.CSIHnSPF[7:0] = CSIHnMCTL1.CSIHnFES[6:0], an interrupt request INTCSIHnIC is generated. Interrupt request INTCSIHnIJC is not generated because interrupt request INTCSIHnIC is generated instead. When CSIHnMCTL0.CSIHnFFS[6:0] becomes 128-CSIHnSTR0.CSIHnSRP[7:0], an interrupt request, INTCSIHnIR is generated. After the INTCSIHnIR interrupt is generated, the CPU starts reading the received data stored in the receive buffer.
11. Finally, clear CSIHnCTL0.CSIHnTXE and CSIHnCTL0.CSIHnRXE to prohibit the transmit/receive operation. When no communication is conducted, set CSIHnCTL0.CSIHnPWR to 0 to minimize the power consumption of the CSIHn.

Section 15 Serial Communication Interface 3 (SCI3)

The serial communication interface 3 (SCI3: Serial Communication Interface 3) can handle two methods of serial communications: asynchronous and clock synchronous serial communications. Asynchronous serial data communications can be carried out with standard asynchronous communication LSIs such as Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA). Asynchronous mode is equipped with a serial communications function between multiple processors (multi-processor communications function).

15.1 Features of RH850/P1M-E SCI3

15.1.1 Number of Units and Channels

This microcontroller has the following number of SCI3 units.

Each unit has one channel SCI3. “Number of channels” is used with the same meaning as “number of units” in this section.

Table 15.1 Number of Units

Product Name	RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of Units	3	3
Name	SCI3n (n = 0 to 2)	SCI3n (n = 0 to 2)

Table 15.2 SCI3 Unit Configurations and Channels

Unit Name SCI3n	Channels per Unit	RH850/P1M-E 100 pins (3ch)	RH850/P1M-E 144 pins (3ch)
SCI30	1	√	√
SCI31	1	√	√
SCI32	1	√	√

Note: The channel name is the same as the unit name.

Table 15.3 Index

Index	Meaning
n	Throughout this section, the individual SCI3 units are identified by the index “n” (n = 0 to 2): for example, SCI3nSMR is the serial mode register.

15.1.2 Register Base Address

SCI3 base addresses are listed in the following table.

SCI3 register addresses are given as offsets from these base addresses.

Table 15.4 Register Base Address

Base Address Name	Base Address
<SCI30_base>	FFDF 0000_H
<SCI31_base>	FFDF 1000_H
<SCI32_base>	FFDF 2000_H

15.1.3 Clock Supply

Clock supply by and to SCI3 is listed in the following table.

Table 15.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
SCI3n	PCLK	High-speed peripheral clock CLK_HSB

15.1.4 Interrupt Request

SCI3 interrupt requests are listed in the following table.

Table 15.6 Interrupt Request

Unit Interrupt Signal	Description	Interrupt Number	DMA/DTS Trigger Number
SCI30			
INTSCI30ERI	Receive error	106	—
INTSCI30RXI	Receive data full	107	87
INTSCI30TXI	Transmit data empty	108	88
INTSCI30TEI	End of transmission	109	—
SCI31			
INTSCI31ERI	Receive error	110	—
INTSCI31RXI	Receive data full	111	89
INTSCI31TXI	Transmit data empty	112	90
INTSCI31TEI	End of transmission	113	—
SCI32			
INTSCI32ERI	Receive error	218	—
INTSCI32RXI	Receive data full	219	91
INTSCI32TXI	Transmit data empty	220	92
INTSCI32TEI	End of transmission	221	—

15.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

15.1.6 External Input/Output Signals

External input/output signals of SCI3 are listed below.

Table 15.7 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal
SCI30			
SCI0SCK	I	SCI30 serial clock input	SCI30SCI
	O	SCI30 serial clock output	SCI30SCO
SCI0RxD	I	SCI30 data input signal	SCI30RX
SCI0TxD	O	SCI30 data output signal	SCI30TX
SCI31			
SCI1SCK	I	SCI31 serial clock input	SCI31SCI
	O	SCI31 serial clock output	SCI31SCO
SCI1RxD	I	SCI31 data input signal	SCI31RX
SCI1TxD	O	SCI31 data output signal	SCI31TX
SCI32			
SCI2SCK	I	SCI32 serial clock input	SCI32SCI
	O	SCI32 serial clock output	SCI32SCO
SCI2RxD	I	SCI32 data input signal	SCI32RX
SCI2TxD	O	SCI32 data output signal	SCI32TX

15.1.7 Combination of Pins and Ports

Combinations of SCI3 pins and ports are listed in the following table.

Table 15.8 Combinations of Pins and Ports

Function	Pin Name	Port Name					
		Group 1	Group 2	Group 3	Group 4	Group 5	Group 6
SCI30	SCI30RX	P0_2	P2_5	P3_7	P4_5	P5_0	P5_0
	SCI30TX	P0_3*1	P2_6	P3_12	P4_6	P5_1	P5_1
	SCI30SCI / SCI30SCO	P0_4*1	P2_7	P3_13	P4_2	P5_2*1	P5_4
SCI31	SCI31RX	P2_8	P5_5	—	—	—	—
	SCI31TX	P2_9	P5_6	—	—	—	—
	SCI31SCI / SCI31SCO	P3_5	P5_7*1/ P0_13	—	—	—	—
SCI32	SCI32RX	P3_4	P5_8*1/ P0_2	—	—	—	—
	SCI32TX	P3_3	P5_9	—	—	—	—
	SCI32SCI / SCI32SCO	P3_9	P5_10	—	—	—	—

Note 1. Available in devices with 144-pin.

15.2 Outline of Functions

- The serial data communication mode can be configured for asynchronous communications or clock synchronous communications.
- Full-duplex communications are available. The independent transmitter unit and receiver unit allow simultaneous transmission and reception. Both the transmitter and the receiver have a double-buffered structure, enabling continuous data transmission and reception.
- An arbitrary bit rate is selectable with the on-chip baud rate generator. An external clock is also selectable as a transmission/reception clock source.
- LSB-first or MSB-first transfer is selectable (except for asynchronous 7-bit data.)
- Interrupt sources: 4 types consisting of transmit-end, transmit-data-empty, receive-data-full, and receive-error. Transmit-data-empty and receive-data-full interrupt sources can activate the DMAC.
- The bit rate modulation function can reduce errors averagely (even in a high bit rate) by correcting the output of the on-chip baud rate generator (except for the maximum speed in clock synchronous mode).
- The pin level of serial input data can be checked.
- On-chip 6-bit divider (PSC)

15.2.1 Serial Communication Modes

Asynchronous mode

- Data length: 7 bits or 8 bits selectable
- Stop bit length: 1 bit or 2 bits selectable
- Parity: Even parity, odd parity, or none selectable
- Receive error detection: Parity error, overrun error, and framing error
- Break detection: A break can be detected by reading a register when a framing error occurs

Clock synchronous mode

- Data length: 8 bits
- Receive error detection: Overrun error

15.3 Register Descriptions

The SCI3 has the following registers. Some registers have limitations in read/write by the CPU. For <SCI3n_base>, refer to **Section 15.1.2, Register Base Address**.

CAUTION

SCI3nBRR and SCI3nMDDR are allocated to the same address (relative address 4). The SCI3nMDDRS bit in SCI3nSEMR is used to switch these registers.

Table 15.9 Register Configuration

Register Name	Symbol*[1]	Value after Reset	Address	Access Size
Receive shift register	SCI3nRSR	—	—	—
Serial mode register	SCI3nSMR	00_H	<SCI3n_base> + 0000_H	8
Bit rate register / Modulation duty register	SCI3nBRR/ SCI3nMDDR	FF_H	<SCI3n_base> + 0004_H	8
Serial control register	SCI3nSCR	00_H	<SCI3n_base> + 0008_H	8
Transmit data register	SCI3nTDR	FF_H	<SCI3n_base> + $000C_H$	8
Transmit shift register	SCI3nTSR	—	—	—
Serial status register	SCI3nSSR	84_H	<SCI3n_base> + 0010_H	8
Receive data register	SCI3nRDR	00_H	<SCI3n_base> + 0014_H	8
Serial transfer format register	SCI3nSCMR	$F2_H$	<SCI3n_base> + 0018_H	8
Serial extended mode register	SCI3nSEMR	04_H	<SCI3n_base> + $001C_H$	8

Note 1. n = 0 to 2

Relative addresses 4n + 1, 4n + 2, and 4n + 3 (n = 0 to 2) are reserved areas. These areas are always read as 0. Writing is invalid.

15.3.1 SCI3nRSR — Receive Shift Register

SCI3nRSR is a shift register which is used to receive serial data input from the SCInRxD pin and convert it to parallel data. When one frame of data has been received, it is automatically transferred to SCI3nRDR. SCI3nRSR cannot be directly accessed by the CPU.

15.3.2 SCI3nRDR — Receive Data Register

SCI3nRDR is an 8-bit register to store receive data. The value of SCI3nRDR after a reset is 00_H. When one frame of data has been received, it is transferred from SCI3nRSR to this register allowing SCI3nRSR to receive the next data. SCI3nRSR and SCI3nRDR function as a double-buffer, allowing continuous receive operations. Be sure to check that the RDRF flag in SCI3nSSR is set to 1 before reading SCI3nRDR. SCI3nRDR cannot be written from the CPU.

When the data length is 7 bits, receive data is stored in bits 0 to 6 and bit 7 is fixed to 0 regardless of the SINV bit in SCI3nSCMR.

15.3.3 SCI3nTDR — Transmit Data Register

SCI3nTDR is an 8-bit register to store transmit data. The value of SCI3nTDR after a reset is FF_H. When SCI3nTSR empty is detected, the transmit data written to SCI3nTDR is transferred to SCI3nTSR and transmission starts. The double-buffered structure of SCI3nTDR and SCI3nTSR allows continuous serial transmission. If the next transmit data has been written to SCI3nTDR when one frame of data is sent, the transmit data is transferred to SCI3nTSR to continue transmission. SCI3nTDR can always be read and written by the CPU. Be sure to check that the TDRE flag in SCI3nSSR is set to 1 before writing transmit data to SCI3nTDR.

15.3.4 SCI3nTSR — Transmit Shift Register

SCI3nTSR is a shift register to transmit serial data. To perform serial data transmission, transmit data written to SCI3nTDR is automatically transferred SCI3nTSR, and is then sent to the SCInTxD pin. SCI3nTSR cannot be directly accessed by the CPU.

15.3.5 SCI3nSMR — Serial Mode Register

SCI3nSMR is a register used to select the communication format and the clock source for the on-chip baud rate generator.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CM	CHR	PE	PM	STOP	MP	CKS1	CKS0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. Writable only when TE = RE = 0.

Table 15.10 SCI3nSMR Register Contents

Bit Position	Bit Name	Function
7	CM	Communication Mode 0: Asynchronous mode 1: Clock synchronous mode
6	CHR	Character Length (Valid only in asynchronous mode) 0: Selects 8 bits as the data length. 1: Selects 7 bits as the data length. It is fixed to LSB-first and the MSB (bit 7) in SCI3nTDR is not sent in transmission. In clock synchronous mode, a data length of 8 bits is always used.
5	PE	Parity Enable (Valid only in asynchronous mode) When this bit is set to 1, a parity bit is added to transmit data and the parity bit is checked in reception. Regardless of the setting of this bit, no parity bit is added or checked in the multi-processor format.
4	PM	Parity Mode (Valid only when PE = 1 in asynchronous mode) 0: Selects even parity. 1: Selects odd parity. When even parity is set, parity bit is added so that the total number of 1-bits in the transmit/receive character plus the parity bit is even. Similarly, when odd parity is set, parity bit is added so that the total number of 1-bits in the transmit/receive character plus the parity bit is odd.
3	STOP	Stop Bit Length (Valid only in asynchronous mode) 0: 1 stop bit for transmission 1: 2 stop bits for transmission In reception, only the first stop bit is checked regardless of the setting of this bit. If the second stop bit is 0, it is treated as the start bit of the next transmission frame.
2	MP	Multi-Processor Mode (Valid only in asynchronous mode) When this bit is set to 1, the multi-processor communication function is enabled. In multi-processor mode, settings of the PE and PM bits are invalid.
1, 0	CKS[1:0]	Clock Select 1, 0 These bits select the clock source for the on-chip baud rate generator. 00: PCLK clock (α = 0) 01: PCLK/4 clock (α = 1) 10: PCLK/16 clock (α = 2) 11: PCLK/64 clock (α = 3) For the relation between the setting of these bits and the baud rate, see **Section 15.3.10, SCI3nBRR — Bit Rate Register**. The character α is the decimal notation of the value of α in **Section 15.3.10, SCI3nBRR — Bit Rate Register**.

15.3.6 SCI3nSCR — Serial Control Register

SCI3nSCR is a register used for the transmission/reception control, interrupt control, and transmission/reception clock source selection listed below. For interrupt requests, see **Section 15.8, Interrupt Sources**.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0008_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	TIE	RIE	TE	RE	MPIE	TEIE	CKE1	CKE0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W*1	R/W*1	R/W	R/W	R/W*2	R/W*2

Note 1. While the CM bit in SCI3nSMR is 1, a value of 1 can be written only when TE = 0 and RE = 0. After the TE or RE bit is set to 1, only 0 can be written to TE and RE. While the CM bit in SCI3nSMR is 0, writing is enabled at any timing.

Note 2. Writable only when TE = 0 and RE = 0. Also, writable at the same time when TE = 0 and RE = 0 are written.

Table 15.11 SCI3nSCR Register Contents (1/2)

Bit Position	Bit Name	Function
7	TIE	Transmit Interrupt Enable When this bit is set to 1, INTSCI3nTXI interrupt request is enabled. INTSCI3nTXI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0, or clearing the TIE bit.
6	RIE	Receive Interrupt Enable When this bit is set to 1, INTSCI3nRXI and INTSCI3nERI interrupt requests are enabled. INTSCI3nRXI and INTSCI3nERI interrupt requests can be cancelled by reading 1 from the RDRF, FER, PER, or ORER flag and then clearing the flag to 0, or clearing the RIE bit.
5	TE	Transmit Enable When this bit is set to 1, transmission is enabled. In this state, serial transmission is started by writing transmit data to SCI3nTDR and clearing the TDRE flag in SCI3nSSR to 0. Be sure to configure SCI3nSMR before setting the TE bit to 1 to determine the transmission format. When this bit is set to 0 to disable transmission, the TDRE flag in SCI3nSSR is fixed to 1.
4	RE	Receive Enable When this bit is set to 1, reception is enabled. In this state, serial reception is started by detecting a start bit in asynchronous mode or the input of synchronous clock in clock synchronous mode. Be sure to configure SCI3nSMR before setting the RE bit to 1 to determine the reception format. Even if reception is disabled by clearing this bit, the RDRF, FER, PER, or ORER flags are not affected and the previous value is retained.
3	MPIE	Multiprocessor Interrupt Enable (Valid only when MP in SCI3nSMR = 1 in asynchronous mode) When this bit is set to 1 and the data with the multi-processor bit set to 0 is received, the data is not read and setting the RDRF, FER, and ORER flags in SCI3nSSR to 1 is disabled. When the data with the multi-processor bit set to 1 is received, this bit is automatically cleared to 0, and normal reception is resumed. For details, see **Section 15.5, Multi-Processor Communication Function**. When the receive data includes MPB = 0 in SCI3nSSR, the receive data is not transferred from SCI3nRSR to SCI3nRDR, a receive error is not detected, and setting the RDRF, FER, and ORER flags in SCI3nSSR to 1 is disabled. When the receive data includes MPB = 1 in SCI3nSSR, the MPB bit in SCI3nSSR is set to 1, the MPIE bit is automatically cleared to 0, the INTSCI3nRXI and INTSCI3nERI interrupt requests are enabled (if the RIE bit in SCI3nSCR is set to 1), and setting the FER and ORER flags to 1 is enabled.

Table 15.11 SCI3nSCR Register Contents (2/2)

Bit Position	Bit Name	Function
2	TEIE	Transmit End Interrupt Enable When this bit is set to 1, INTSCI3nTEI interrupt request is enabled. INTSCI3nTEI interrupt request can be cancelled by reading 1 from the TDRE flag and then clearing the flag to 0 to clear the TEND flag to 0, or clearing the TEIE bit.
1, 0	CKE[1:0]	Clock Enable 1, 0 These bits select the clock source and the SCInSCK pin function. For asynchronous mode 00: On-chip baud rate generator (The SCInSCK pin functions as an input/output port.) 01: On-chip baud rate generator (The clock with the same frequency as the bit rate is output from the SCInSCK pin.) 1X: Setting prohibited For clock synchronous mode 0X: Internal clock (The SCInSCK pin functions as a clock output pin.) 1X: External clock (The SCInSCK pin functions as a clock input pin.)

Note: X: Don't care

15.3.7 SCI3nSSR — Serial Status Register

SCI3nSSR consists of SCI3 status flags and multi-processor transmit/receive bits.
The TDRE, RDRF, ORER, PER, and FER flags can be cleared only.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0010_H

Value after reset: 84_H

Bit	7	6	5	4	3	2	1	0
	TDRE	RDRF	ORER	FER	PER	TEND	MPB	MPBT
Value after reset	1	0	0	0	0	1	0	0
R/W	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R	R	R/W

Note 1. Only 0 can be written to clear the flag.

Table 15.12 SCI3nSSR Register Contents (1/2)

Bit Position	Bit Name	Function
7	TDRE	Transmit Data Register Empty Indicates whether or not transmit data exists in SCI3nTDR. [Setting conditions] • When the TE bit in SCI3nSCR is 0 • When the data in SCI3nTDR has been transferred to SCI3nTSR so that new data can be written to SCI3nTDR [Clearing condition] • Writing 0 to TDRE after reading TDRE = 1 • When transmit data is written to SCI3nTDR while TE = 1
6	RDRF	Receive Data Register Full Indicates whether or not receive data exists in SCI3nRDR [Setting condition] • When reception finishes successfully and the receive data is transferred from SCI3nRSR to SCI3nRDR [Clearing conditions] • Writing 0 to RDRF after reading RDRF = 1 • When data is read from SCI3nRDR Even when the RE bit in SCI3nSCR is cleared, the RDRF flag is not affected and the previous value is retained. • Note that completing the reception of the next data with the RDRF flag set to 1 will cause an overrun error, resulting in the loss of the receive data.
5	ORER	Overrun Error Indicates that an overrun error has occurred during reception and the reception abended. [Setting condition] • When the next data is received while RDRF = 1 In SCI3nRDR, data received prior to the overrun error is retained, but data received after the overrun error occurrence is lost. When the ORER flag is set to 1, subsequent serial reception cannot be continued. In clock synchronous mode, serial transmission also cannot be continued. [Clearing condition] • Writing 0 to ORER after reading ORER = 1 Even when the RE bit in SCI3nSCR is cleared, the ORER flag is not affected and the previous value is retained.

Table 15.12 SCI3nSSR Register Contents (2/2)

Bit Position	Bit Name	Function
4	FER	Framing Error Indicates that a framing error has occurred during reception in asynchronous mode and the reception abended. [Setting condition] • When the stop bit is 0 In 2-stop-bit mode, only whether the first stop bit is 1 is checked but the second stop bit is not checked. Although the receive data that existed when a framing error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the FER flag is set to 1, the subsequent receive data is not transferred to SCI3nRDR. [Clearing condition] • Writing 0 to FER after reading FER = 1 Even when the RE bit in SCI3nSCR is cleared to 0, the FER flag is not affected and the previous value is retained.
3	PER	Parity Error Indicates that a parity error has occurred during reception in asynchronous mode and the reception abended. [Setting condition] • Although the receive data that existed when a parity error has occurred is transferred to SCI3nRDR, the RDRF flag is not set. In addition, while the PER flag is set to 1, the subsequent receive data is not transferred to SCI3nRDR. [Clearing condition] • Writing 0 to PER after reading PER = 1 Even when the RE bit in SCI3nSCR is cleared to 0, the PER flag is not affected and the previous value is retained.
2	TEND	Transmit End Indicates that a transmission is completed. [Setting conditions] • When the TE bit in SCI3nSCR is 0 • When the TDRE flag is 1 while the last bit of a transmit character is being transmitted [Clearing condition] • Writing 0 to the TDRE flag after reading TDRE = 1 • When transmit data is written to SCI3nTDR while TE = 1
1	MPB	Multi-processor Bit Holds the value of the multi-processor bit in the receive frame.
0	MPBT	Multi-processor Bit Transfer Sets the value of the multi-processor bit to be added to the transmit frame.

15.3.8 SCI3nSCMR — Serial Transfer Format Register

SCI3nSCMR is a register to select the communication format which can be commonly configured for both asynchronous mode and clock synchronous mode.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0018_H

Value after reset: $F2_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SDIR	SINV	—	—
Value after reset	1	1	1	1	0	0	1	0
R/W	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. Writable only when TE = 0 and RE = 0.

Table 15.13 SCI3nSCMR Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	SDIR	Serial Data Transfer Direction (Valid in asynchronous mode and clock synchronous mode) This bit is used to select the direction of serial/parallel conversion. 0: Transfer with LSB-first 1: Transfer with MSB-first This bit is valid only when the transfer format is 8-bit data. For 7-bit data, LSB-first transfer is used.
2	SINV	Serial Data Invert (Valid in asynchronous mode and clock synchronous mode) This bit is used to invert the transmit/receive data logic level. The SINV bit does not affect the logic level of the start bit, stop bit, parity bit, and multi-processor bit. To invert the parity bit, invert the PM bit in SCI3nSMR. 0: SCI3nTDR data is transmitted as it is, and receive data is stored in SCI3nRDR as it is. 1: SCI3nTDR data is inverted and transmitted, and receive data is inverted and stored in SCI3nRDR.
1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

15.3.9 SCI3nSEMR — Serial Extended Mode Register

SCI3nSEMR is a register to select a 1-bit period.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + $001C_H$

Value after reset: 04_H

Bit	7	6	5	4	3	2	1	0
	BRME	MDDRS	—	—	ABCS	RXDMON	—	—
Value after reset	0	0	0	0	0	1	0	0
R/W	R/W*1	R/W*1	R	R	R/W*1	R	R	R

Note 1. Writable only when TE = 0 and RE = 0.

Table 15.14 SCI3nSEMR Register Contents

Bit Position	Bit Name	Function
7	BRME	Bit Rate Modulation Enable When this bit is set to 1, the bit rate modulation function is enabled.
6	MDDRS	Modulation Duty Register Select This bit is used to select an accessible register. 0: SCI3nBRR is accessible. 1: SCI3nMDDR is accessible.
5, 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	ABCS	Asynchronous Reference Clock Select (Valid only in asynchronous mode) This bit is used to select the reference clock for 1-bit period. 0: Operates on the reference clock with a frequency of 16 times the transfer rate. 1: Operates on the reference clock with a frequency of 8 times the transfer rate (double-speed operation).
2	RXDMON	Serial Input Data Monitor This bit indicates the SCInRxD pin state. 0: SCInRxD pin state is low level. 1: SCInRxD pin state is high level.
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

15.3.10 SCI3nBRR — Bit Rate Register

SCI3nBRR is an 8-bit register to adjust the bit rate. Since each SCI3 channel has an independent baud rate generator, different bit rates can be set for each channel. **Table 15.16** shows the relationship between the setting (N) in SCI3nBRR and the bit rate (B) in normal asynchronous mode and clock synchronous mode. The value of SCI3nBRR after reset is FF_H. SCI3nBRR is allocated at the same address as SCI3nMDDR and is selected when MDDRS in SCI3nSEMR is 0. This register is writable only when TE = 0 and RE = 0.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0004_H

Value after reset: FF_H

Bit	7	6	5	4	3	2	1	0
	BRR							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.15 SCI3nBRR Register Contents

Bit Position	Bit Name	Function
7 to 0	BRR	Baud rate generator setting (0 ≤ N ≤ 255)

Table 15.16 Relationship between Setting N in SCI3nBRR and Bit Rate B

Mode	ABCS Setting	Bit Rate	Mean Error
Asynchronous	0	$B = \frac{PCLK \times 10^6}{64 \times 2^{2\alpha-1} \times (N+1)}$	$\text{Error}(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 64 \times 2^{2\alpha-1} \times (N+1)} - 1 \right\} \times 100$
	1	$B = \frac{PCLK \times 10^6}{32 \times 2^{2\alpha-1} \times (N+1)}$	$\text{Error}(\%) = \left\{ \frac{PCLK \times 10^6}{B \times 32 \times 2^{2\alpha-1} \times (N+1)} - 1 \right\} \times 100$
Clock synchronous	—	$B = \frac{PCLK \times 10^6}{8 \times 2^{2\alpha-1} \times (N+1)}$	

Note: B: Bit rate (bps)
N: SCI3nBRR setting value for baud rate generator (0 ≤ N ≤ 255)
PCLK: Operating frequency (MHz)
α: Determined by the SCI3nSMR setting value as shown in the following table.

15.3.11 SCI3nMDDR — Modulation Duty Register

SCI3nMDDR is a register to correct the bit rate adjusted by SCI3nBRR. The value of SCI3nMDDR after a reset is FF_H. When the BRME bit in SCI3nSEMR is set to 1, the bit rate generated by the on-chip baud rate generator is corrected to SCI3nMDDR/256 on average. **Table 15.22** shows the relationship between the SCI3nMDDR setting and the bit rate B. SCI3nMDDR is allocated at the same address as SCI3nBRR and is selected when MDDRS in SCI3nSEMR is 1. This register is writable only when TE = 0 and RE = 0. Bit 7 is fixed to 1.

Access: This register can be read/written in 8-bit units.

Address: <SCI3n_base> + 0004_H

Value after reset: FF_H

Bit	7	6	5	4	3	2	1	0
	MDDR							
Value after reset	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 15.21 SCI3nMDDR Register Contents

Bit Position	Bit Name	Function
7 to 0	MDDR	Baud rate generator setting value (128 ≤ MDDR ≤ 255)

15.4 Operation in Asynchronous Mode

Figure 15.2 shows the general format for asynchronous serial communications. One frame consists of a start bit (low level), transmit/receive data, a parity bit, and stop bits (high level). In asynchronous serial communications, the communication line is usually held in the mark state (high level). The SCI3 monitors the communication line, and when the SCI3 detects the space state (low level), it recognizes a start bit and starts serial communications. Inside the SCI3, the transmitter and the receiver are independent, enabling full-duplex communications. Both the transmitter and the receiver have a double-buffered structure so that data can be read or written during transmission or reception, enabling continuous data transmission and reception.

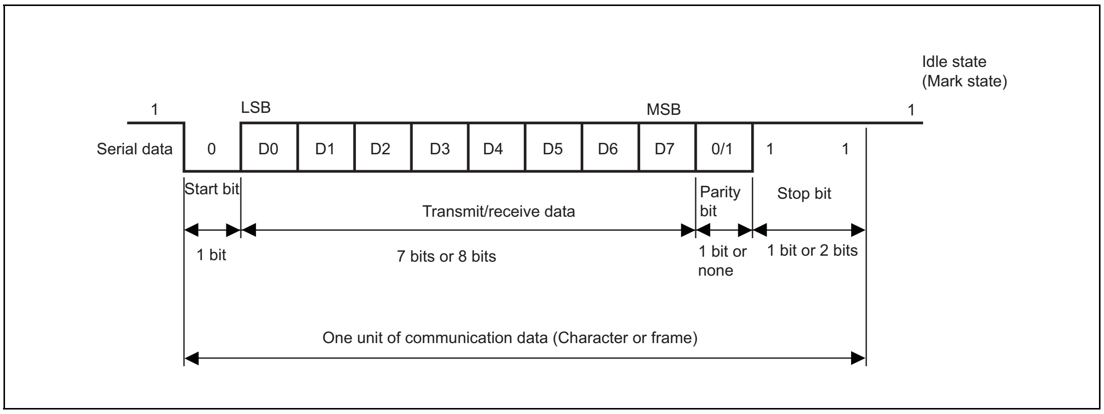

Figure 15.2 Data Format in Asynchronous Serial Communications (Example with 8-Bit Data, Parity, Two Stop Bits)

15.4.1 Transmission/Reception Format

Table 15.23 lists the transmission/reception formats that can be configured in asynchronous mode. Any of 12 transmission/reception formats can be selected according to the SCI3nSMR setting. For details of the multi-processor bit, see **Section 15.5, Multi-Processor Communication Function**.

Table 15.23 Serial Transmission/Reception Formats (Asynchronous Mode)

SMR Setting				Serial Transmission/Reception Format and Frame Length											
CHR	PE	MP	STOP	1	2	3	4	5	6	7	8	9	10	11	12
0	0	0	0	S	8-bit data								STOP		
0	0	0	1	S	8-bit data								STOP	STOP	
0	1	0	0	S	8-bit data								P	STOP	
0	1	0	1	S	8-bit data								P	STOP	STOP
1	0	0	0	S	7-bit data							STOP			
1	0	0	1	S	7-bit data							STOP	STOP		
1	1	0	0	S	7-bit data							P	STOP		
1	1	0	1	S	7-bit data							P	STOP	STOP	
0	—	1	0	S	8-bit data								MPB	STOP	
0	—	1	1	S	8-bit data								MPB	STOP	STOP
1	—	1	0	S	7-bit data							MPB	STOP		
1	—	1	1	S	7-bit data							MPB	STOP	STOP	

Note: S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multi-processor bit

15.4.2 Receive Data Sampling Timing and Reception Margin

In asynchronous mode, the SCI3 operates on a reference clock with a frequency of 16 times (8 times for the double-speed mode) the bit rate. In reception, the SCI3 samples the falling edge of the beginning of the start bit (low level) using the reference clock and performs internal synchronization. As shown in **Figure 15.3**, data is latched at the middle of each bit by sampling receive data at the rising edge of the eighth pulse (fourth pulse for the double-speed mode) of the reference clock.

Thus the reception margin in asynchronous mode is determined by formula (1) below.

$$M = \left| \left(0.5 - \frac{1}{2N}\right) - (L - 0.5)F - \frac{|D - 0.5|}{N}(1 + F) \right| \times 100[\%] \text{...formula(1)}$$

M: Reception margin
N: Ratio of bit rate to clock (N = 16 when ABCS in SCI3nSEMR = 0, N = 8 when ABCS = 1)
D: Duty cycle of clock (D = 0.5 to 1.0)
L: Frame length (L = 9 to 12)
F: Absolute value of clock frequency deviation

Assuming that F (absolute value of clock frequency deviation) = 0, D (duty cycle of clock) = 0.5, and N = 16 in formula (1), the reception margin is obtained by the formula below.

$$M = \left\{0.5 - \frac{1}{(2 \times 16)}\right\} \times 100[\%] = 46.875\%$$

However, this is only the calculated value, and a margin of 20% to 30% should be allowed in system design.

When the bit rate modulation function is used, the reference clock frequency is corrected on average.

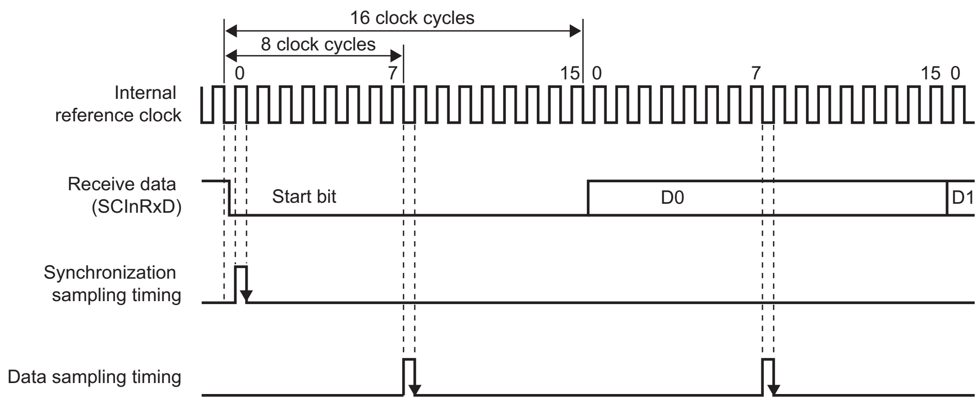

Figure 15.3 Receive Data Sampling Timing in Asynchronous Mode

15.4.3 Clock

An internal clock generated by the on-chip baud rate generator can be selected as the SCI3's transmission/reception clock according to the settings of the CM bit in SCI3nSMR and the CKE1 and CKE0 bits in SCI3nSCR. When the SCI3 is operated on an internal clock, the clock can be output from the SCInSCK pin.

For details of clock synchronous mode, see **Section 15.6, Operation in Clock Synchronous Mode**.

In asynchronous mode, the frequency of the clock output is equal to the bit rate and the phase is such that the rising edge of the clock comes at the center of the transmit data, as shown in **Figure 15.4**.

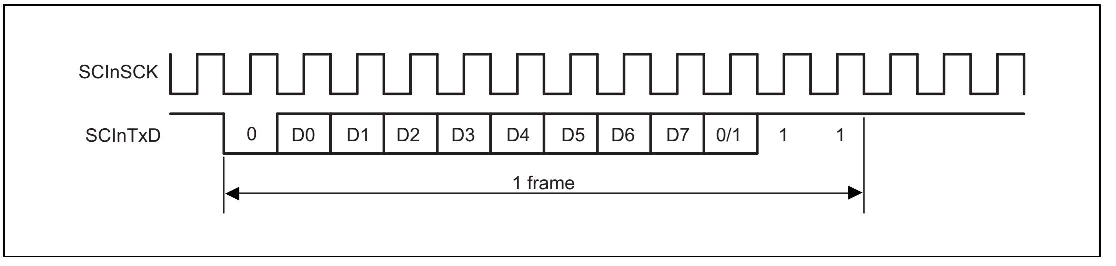

Figure 15.4 Phase Relationship between Output Clock and Transmit Data (Asynchronous Mode)

15.4.4 Double-Speed Operation

In addition to the operation described in **Section 15.4.3, Clock**, double-speed operation is enabled by the setting of the ABCS bit in SCI3nSEMR.

In double-speed operation, the same operation on a clock with a frequency of 16 times the bit rate in normal operation can be conducted on a clock with a frequency of 8 times the bit rate, meaning that the SCI3 operates on a double transfer rate using the same reference clock.

15.4.5 SCI3 Initialization (Asynchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR and then initialize the SCI3 according to the sample flowchart in **Figure 15.5**. Before changing the operating mode or transfer format, be sure to clear the TE and RE bits to 0. Note that clearing the TE bit to 0 sets the TDRE flag to 1, but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

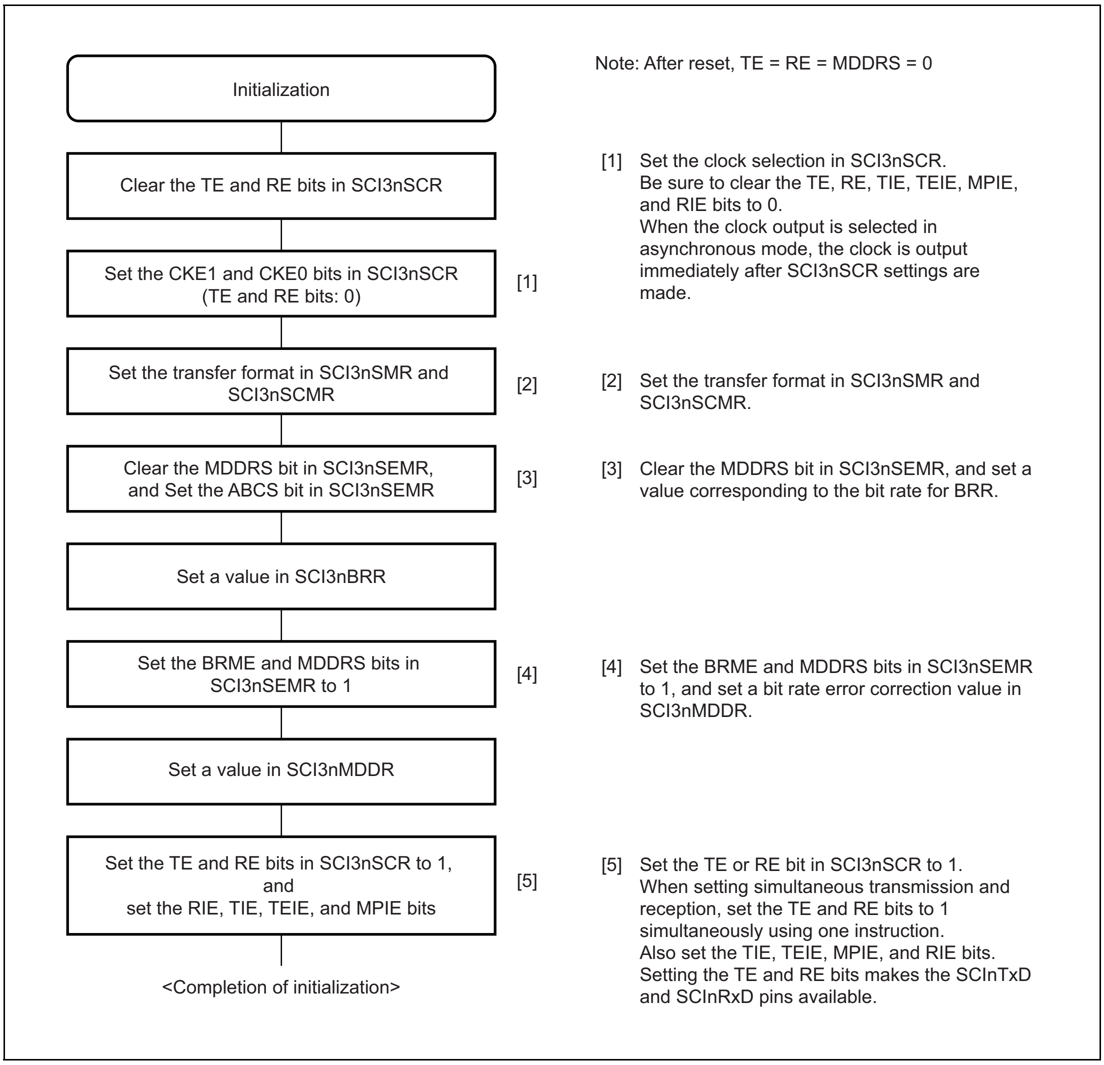

Figure 15.5 Sample Flowchart for SCI3 Initialization

15.4.6 Serial Data Transmission (Asynchronous Mode)

Figure 15.6 shows an example of operation for data transmission in asynchronous mode. In data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0. The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR. When writing transmit data to SCI3nTDR at a trigger of INTSCI3nTXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a INTSCI3nTXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR and the TDRE flag is set to 1. If the TIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this INTSCI3nTXI interrupt processing routine before transmission of the previously transferred data is completed. When an INTSCI3nTEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1.
3. Data is sent from the SCInTxD pin in the following order: start bit, transmit data, parity bit or multi-processor bit (may be omitted depending on the format), and stop bit.
4. The TDRE flag is checked when the stop bit is output.
5. When the TDRE flag is 0, the next transmit data is transferred from SCI3nTDR to SCI3nTSR. After the stop bit has been sent, transmission of the next frame starts.
6. When the TDRE flag is 1, the TEND flag in SCI3nSSR is set to 1, the stop bit is sent, and then 1 is output to enter the mark state. If the TEIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTEI interrupt request is generated.

Figure 15.7 shows a sample flowchart for data transmission. **Figure 15.8** shows a sample flowchart for stopping the SCI3 after data transmission.

Note about the operation when transmission is enabled in asynchronous mode:

When the setting of the TE bit is changed from 0 to 1, a high level (preamble) is output for one frame. If transmit data is written to SCI3nTDR while the preamble is being output, that data will be transferred from SCI3nTDR to SCI3nTSR after preamble output is complete.

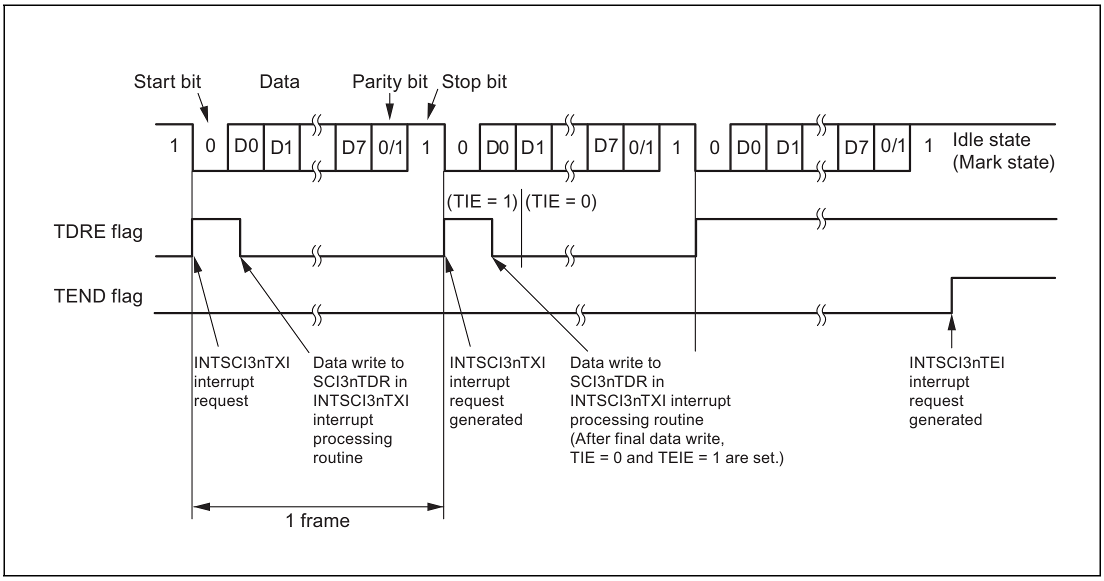

Figure 15.6 Example of Operation for Transmission in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

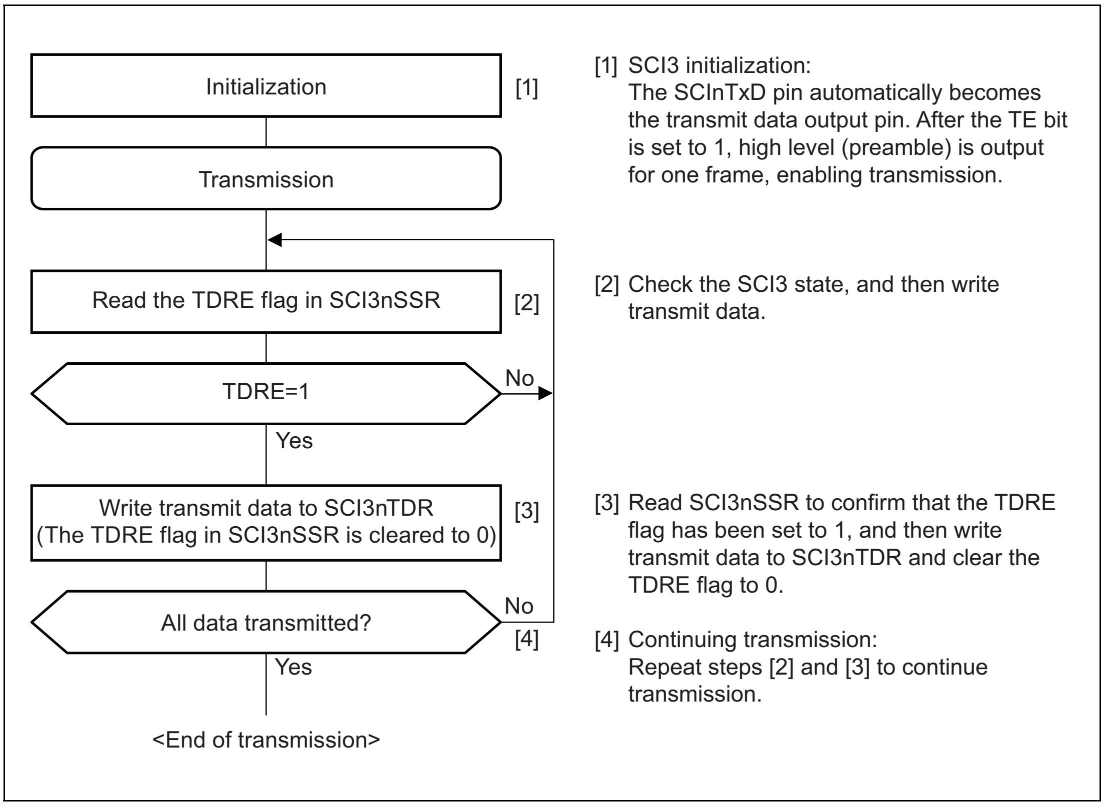

Figure 15.7 Example of Serial Transmission Flowchart

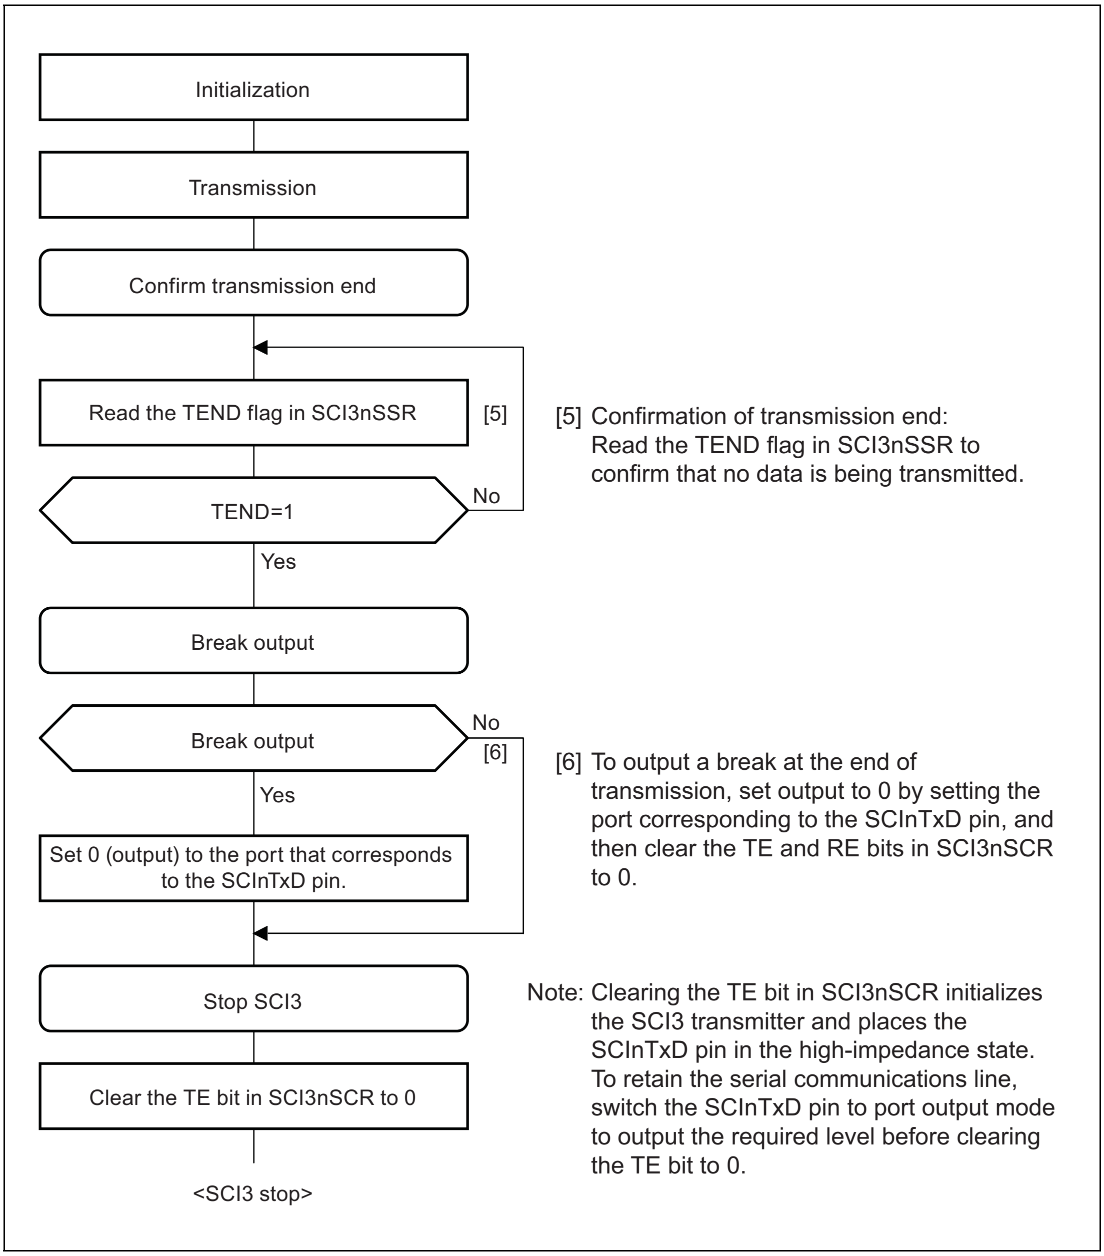

Figure 15.8 Example Flowchart for Stopping the SCI3 after Serial Transmission

15.4.7 Serial Data Reception (Asynchronous Mode)

Figure 15.9 shows an example of the operation for data reception in asynchronous mode. In data reception, the SCI3 operates as described below.

1. SCI3 monitors the communications line and upon detection of a start bit, it performs internal synchronization, stores receive data in SCI3nRSR, and checks the parity bit and the stop bit.
2. When an overrun error occurs (the next data has been received with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1.
3. When a parity error is detected, the PER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated.
4. When a framing error (when the stop bit is 0) is detected, the FER flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated.
5. When reception finishes successfully, the RDRF flag in SCI3nSSR is set to 1 and receive data is transferred to SCI3nRDR. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nRXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this INTSCI3nRXI interrupt processing routine before reception of the next receive data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0.

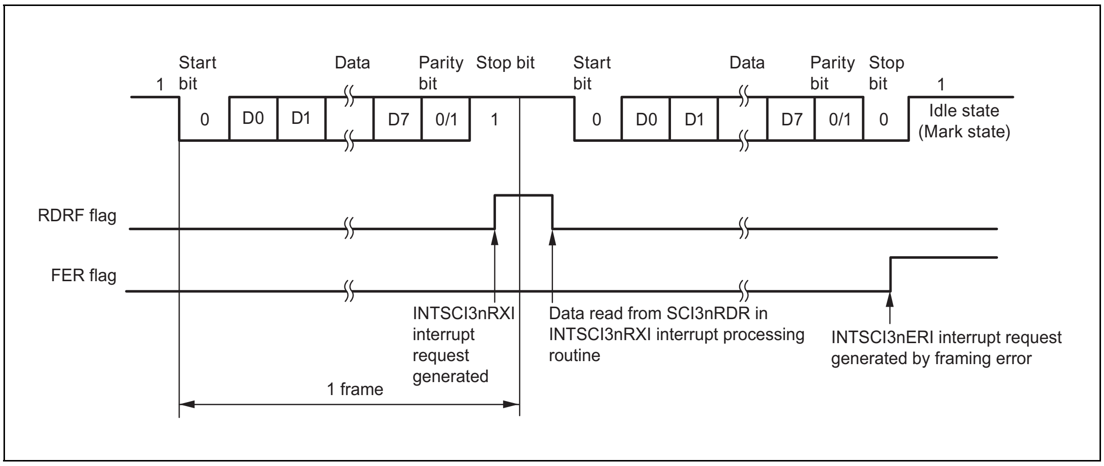

Figure 15.9 Example of Operation for Reception in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

Table 15.24 lists the states of the SCI3nSSR status flags and receive data handling when a receive error is detected. When a receive error is detected, the RDRF flag retains the status before receiving the data. Subsequent data reception is disabled while a receive error flag is set to 1. Accordingly, clear the ORER, FER, PER, and RDRF flags before continuing data reception. **Figure 15.10** shows a sample flowchart for data reception.

Table 15.24 SCI3nSSR Status Flags and Receive Data Handling

SCI3nSSR Status Flags					
RDRF*1	ORER	FER	PER	Receive Data	Receive Status
1	0	0	0	Transferred to SCI3nRDR	Successful reception
0	0	1	0	Transferred to SCI3nRDR	Framing error
0	0	0	1	Transferred to SCI3nRDR	Parity error
0	0	1	1	Transferred to SCI3nRDR	Framing error + parity error
1*	1	0	0	Lost	Overrun error
1*	1	1	0	Lost	Overrun error + framing error
1*	1	0	1	Lost	Overrun error + parity error
1*	1	1	1	Lost	Overrun error + framing error + parity error

Note 1. In the case of an overrun error, the RDRF flag retains the state before the data reception.

Note: "+" indicates that two or more receive statuses occur simultaneously in a single reception operation.

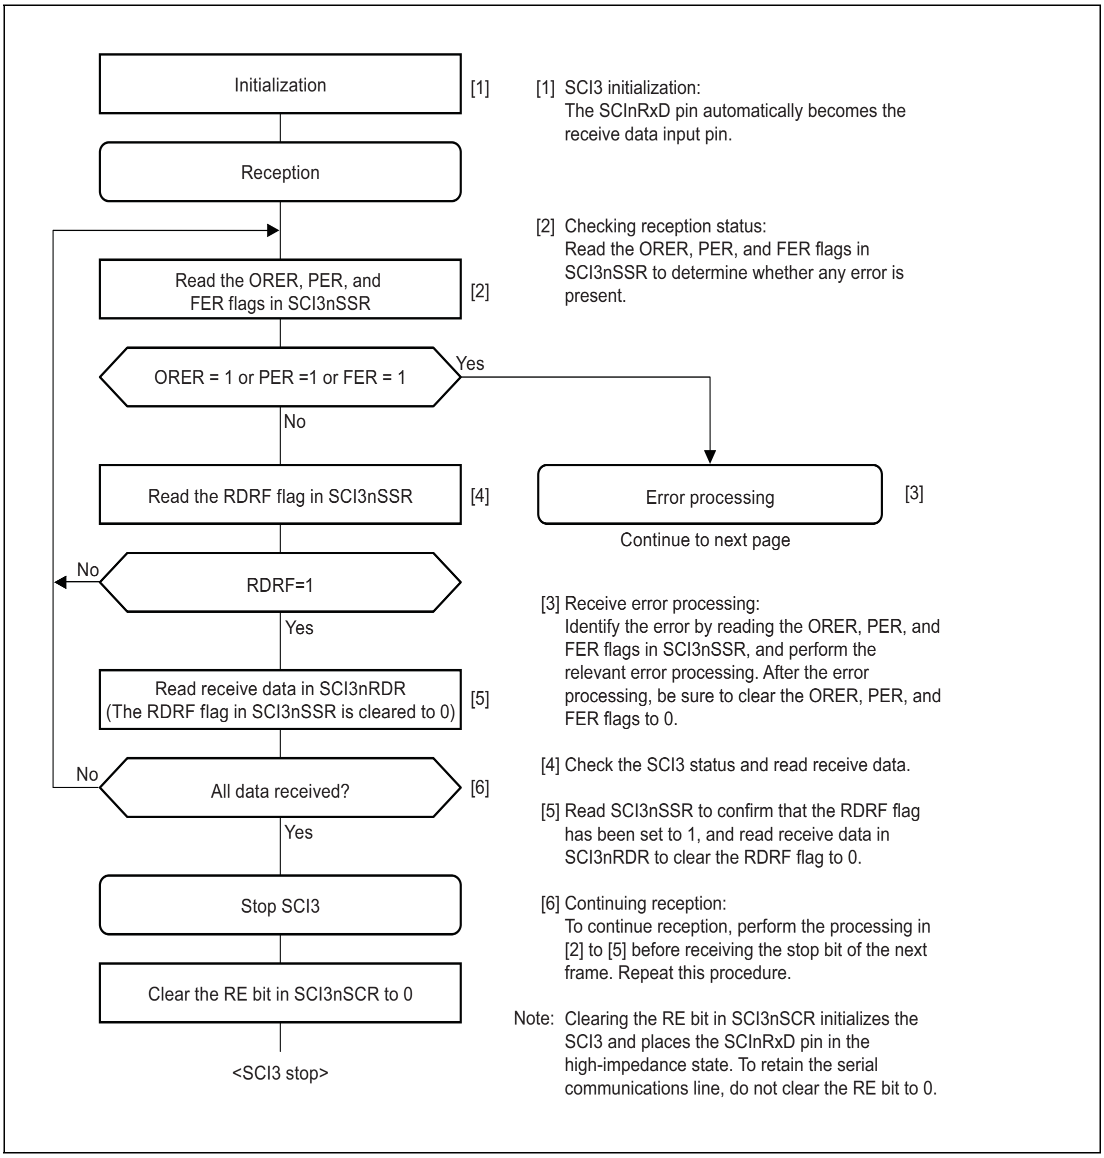

Figure 15.10 Example of Serial Reception Flowchart (1)

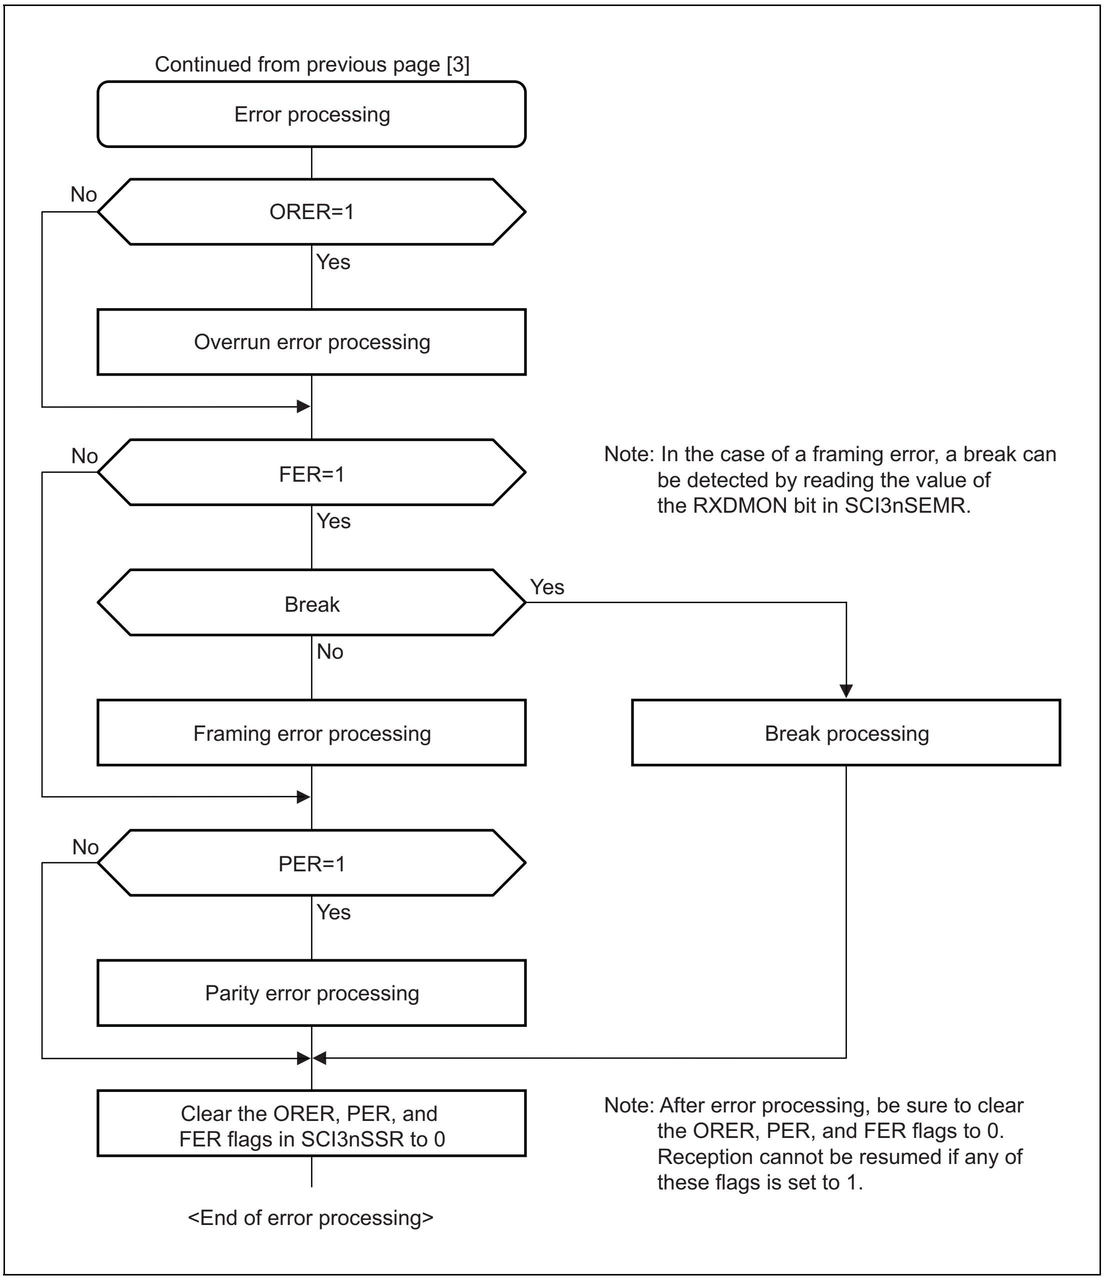

Figure 15.11 Example of Serial Reception Flowchart (2)

15.5 Multi-Processor Communication Function

15.5.1 Overview and Sample Connection

Using the multi-processor communication function allows data transmission and reception by sharing a communication line between multiple processors by using asynchronous serial communication in which the multi-processor bit is added. In multi-processor communication, a unique ID code is allocated to each receiving station. Serial communication cycles consist of an ID transmission cycle to specify the receiving station and a data transmission cycle to transmit data to the specified receiving station. The multi-processor bit is used to distinguish the ID transmission cycle from the data transmission cycle. When the multi-processor bit is set to 1, it indicates the ID transmission cycle. When the multi-processor bit is set to 0, it indicates the data transmission cycle. **Figure 15.12** shows an example of communication between processors by using the multi-processor format. First, a transmitting station sends communication data in which the multi-processor bit (= 1) is added to the ID code of the receiving station. Next, the transmitting station sends communication data in which the multi-processor bit (= 0) is added to the transmit data. Upon receiving the communication data in which the multi-processor bit is set to 1, the receiving station compares the received ID with the ID of the receiving station itself. When these IDs match, the receiving station receives communication data that is subsequently transmitted. If these IDs do not match, the receiving station skips communication data until it receives communication data in which the multi-processor bit is set to 1.

To support this function, the SCI3 provides the MPIE bit in SCI3nSCR. When the MPIE bit is set to 1, transfer of receive data from SCI3nRSR to SCI3nRDR, detection of a receive error, and setting the RDRF, FER, and ORER flags in SCI3nSSR are disabled until data in which the multi-processor bit is set to 1 is received. Upon receiving a character in which the multi-processor bit is set to 1, the MPB bit in SCI3nSSR is set to 1 and the MPIE bit is automatically cleared to 0, thus returning to a normal reception operation. When the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nRXI interrupt request is generated. While the MPIE bit is cleared to 0, reception operation is conducted regardless of the multi-processor bit value. The multi-processor bit is stored in the MPB bit in SCI3nSSR.

When the multi-processor format is specified, specification of the parity bit is disabled. Apart from this, there is no difference from the operation in the normal asynchronous mode. A clock that is used for multi-processor communications is also the same as the clock used in the normal asynchronous mode.

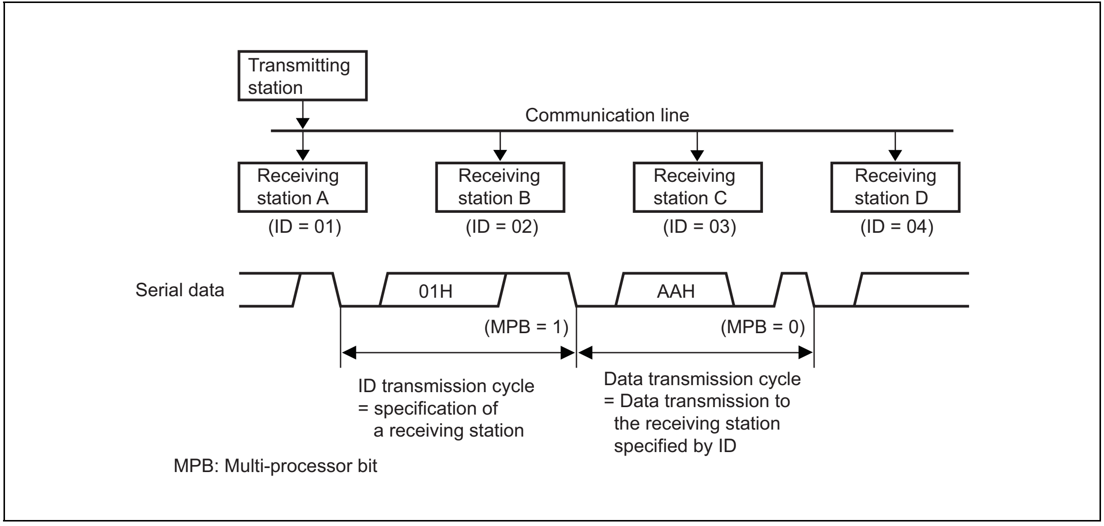

Figure 15.12 Example of Communication Using the Multi-Processor Format (Example of Transmission of Data AA_H to Receiving Station A)

15.5.2 Multi-Processor Serial Data Transmission

Figure 15.13 shows a sample flowchart of multi-processor data processing. In the ID transmission cycle, send the ID with the MPBT bit in SCI3nSSR set to 1. In the data transmission cycle, send data with the MPBT bit in SCI3nSSR cleared to 0. Other operations are the same as operations in asynchronous mode.

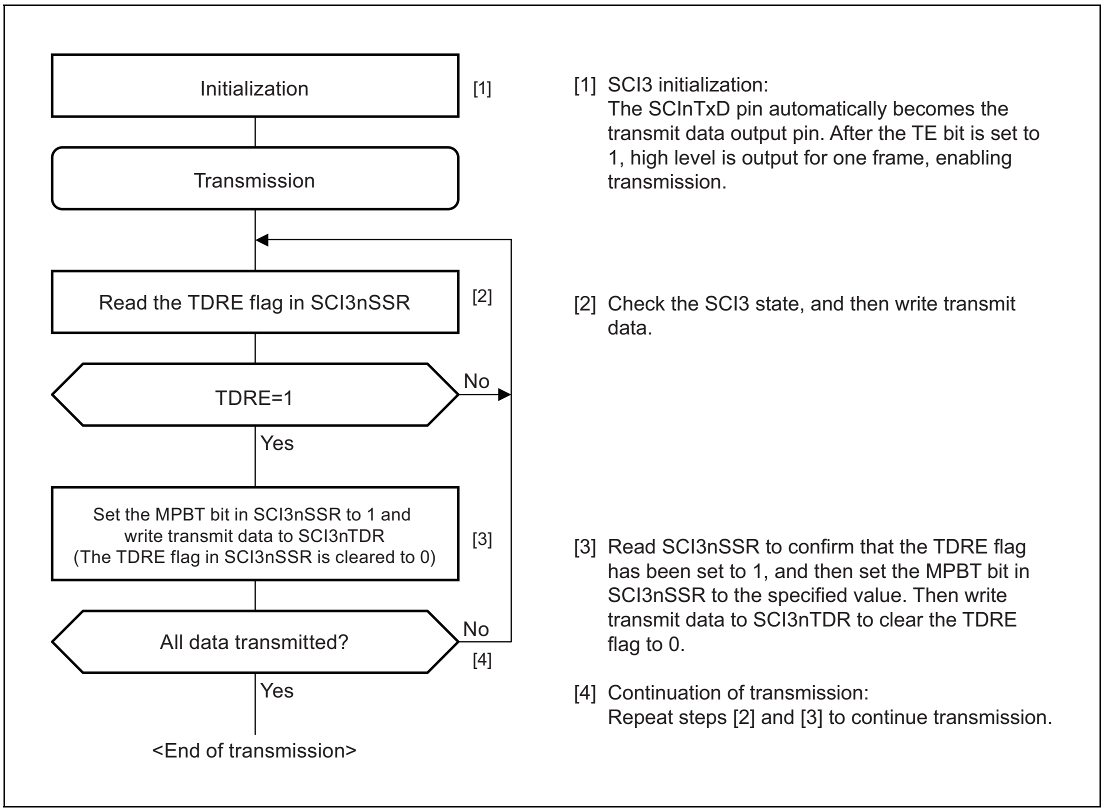

Figure 15.13 Example of Multi-Processor Serial Transmission Flowchart

15.5.3 Multi-Processor Serial Data Reception

Figure 15.15 shows a sample flowchart of multi-processor data reception. When the MPIE bit in SCI3nSCR is set to 1, reading the communication data is skipped until communication data in which the multi-processor bit is set to 1 is received. When communication data in which the multi-processor bit is set to 1 is received, the receive data is transferred to SCI3nRDR. At this time, an INTSCI3nRXI interrupt request is generated. Other operations are the same as operations in asynchronous mode. **Figure 15.14** shows an example of operation for reception.

CAUTION

Do not write data to SCI3nSCR when communication data in which the multi-processor bit is set to 1 is received. The MPIE bit may not become the desired state.

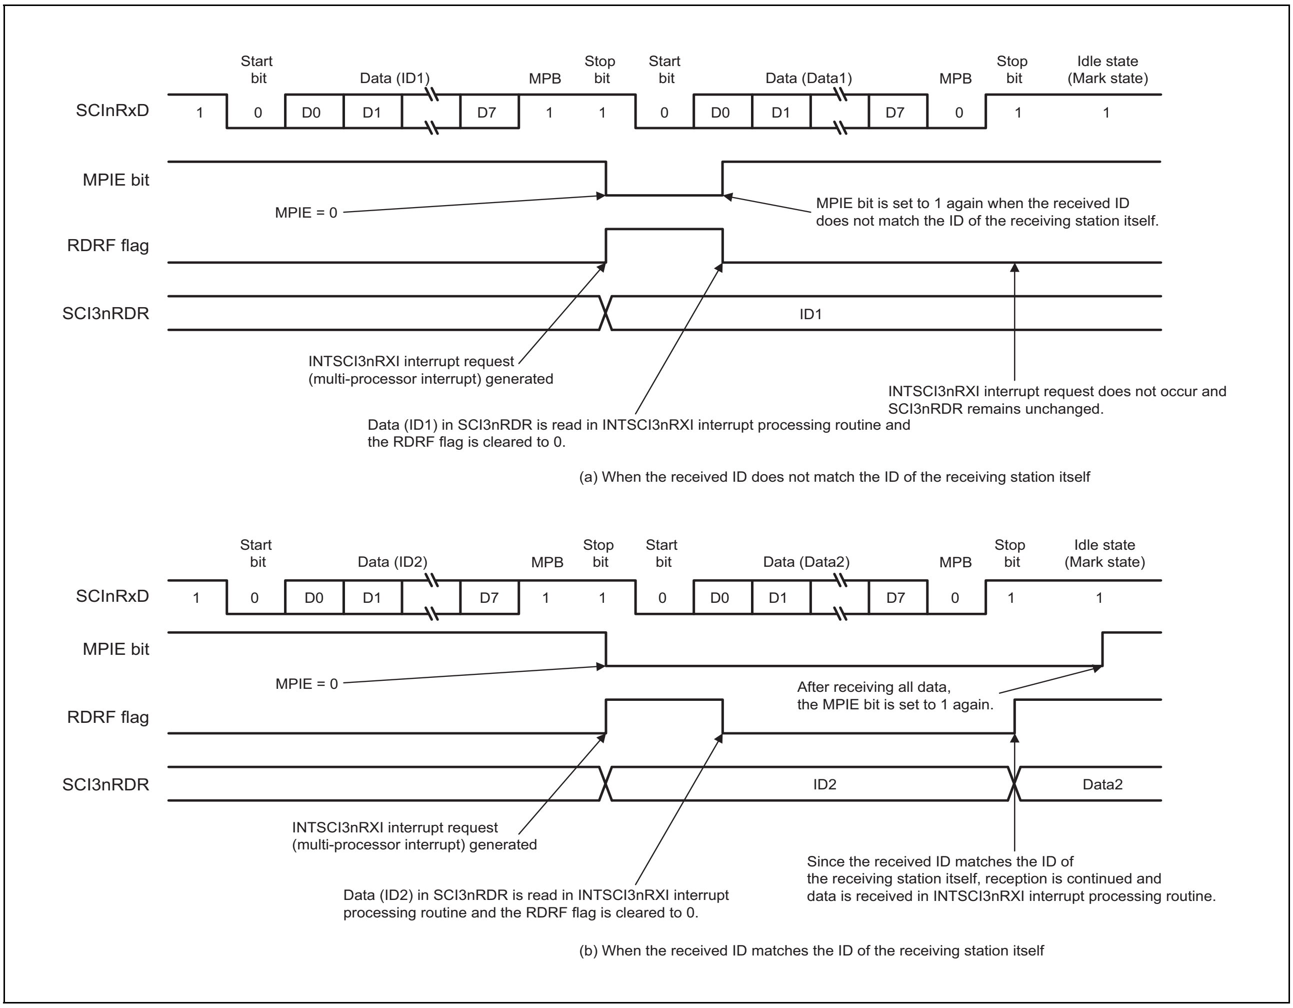

Figure 15.14 Example of SCI3 Reception (8-Bit Data, Multi-Processor Bit, One Stop Bit)

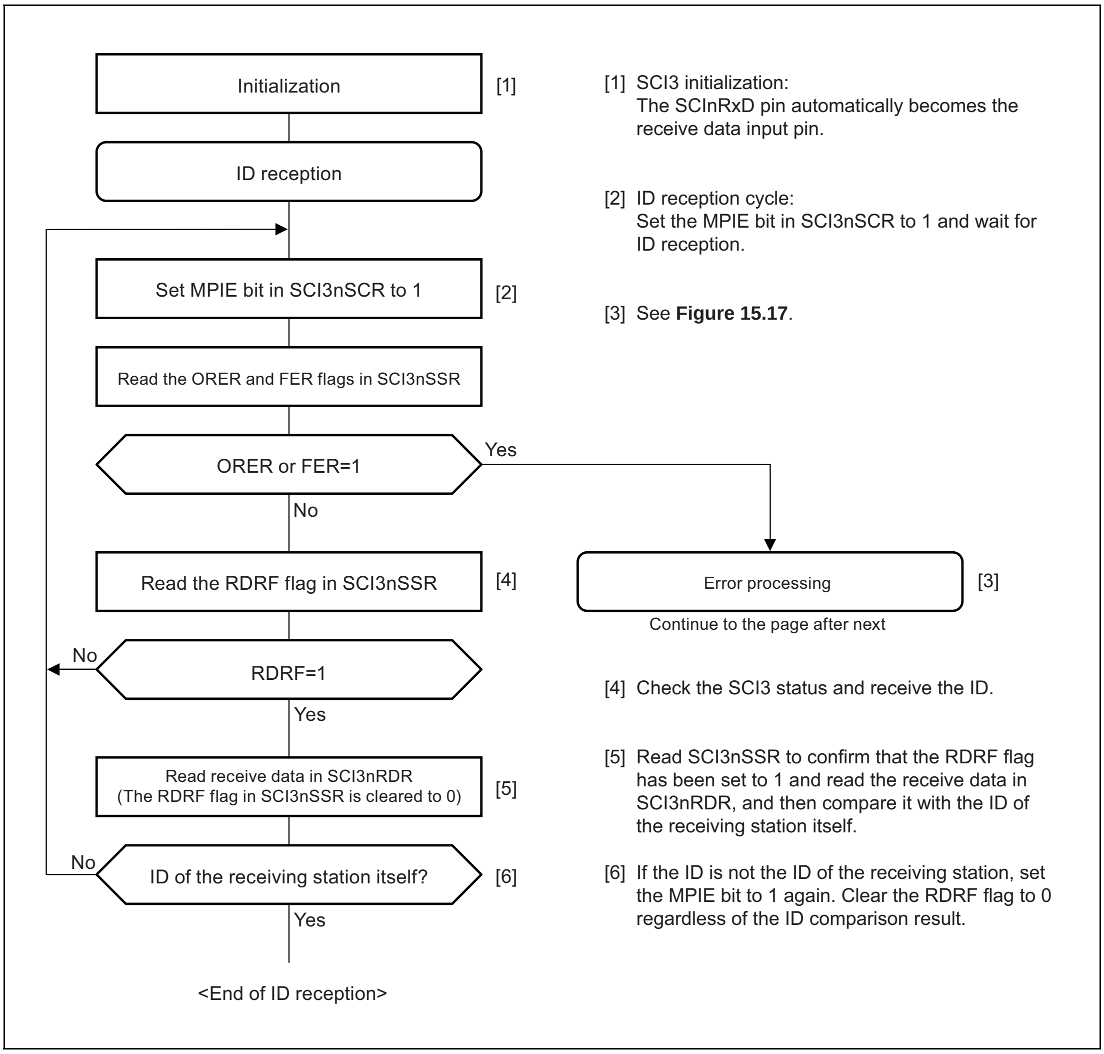

Figure 15.15 Example of Multi-Processor Serial Reception Flowchart (1)

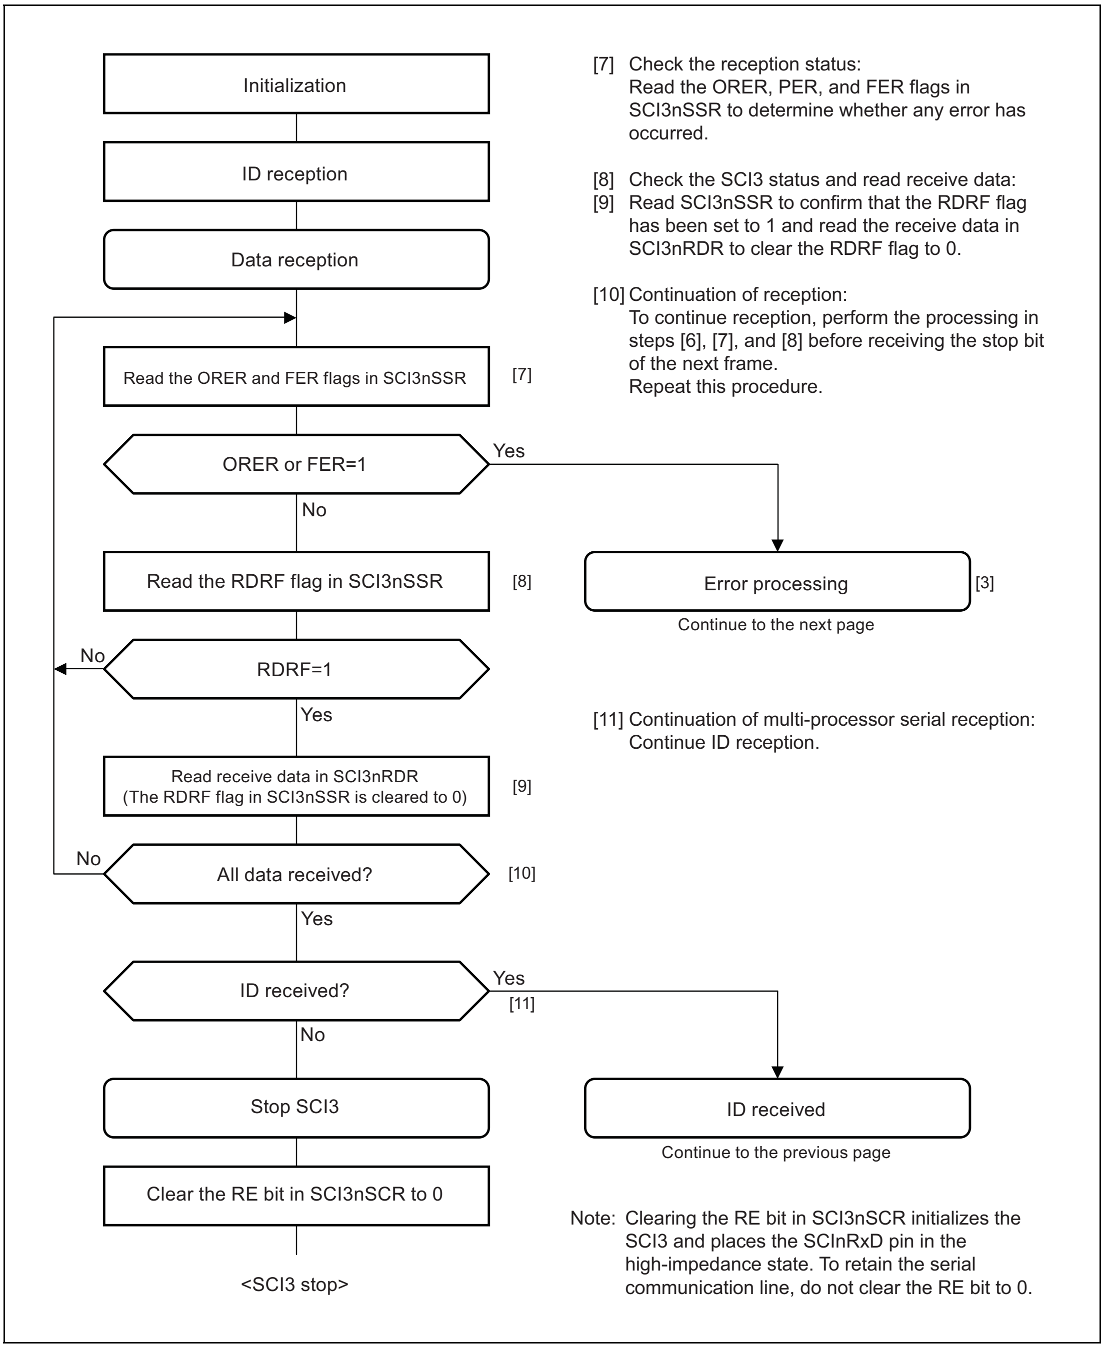

Figure 15.16 Example of Multi-Processor Serial Reception Flowchart (2)

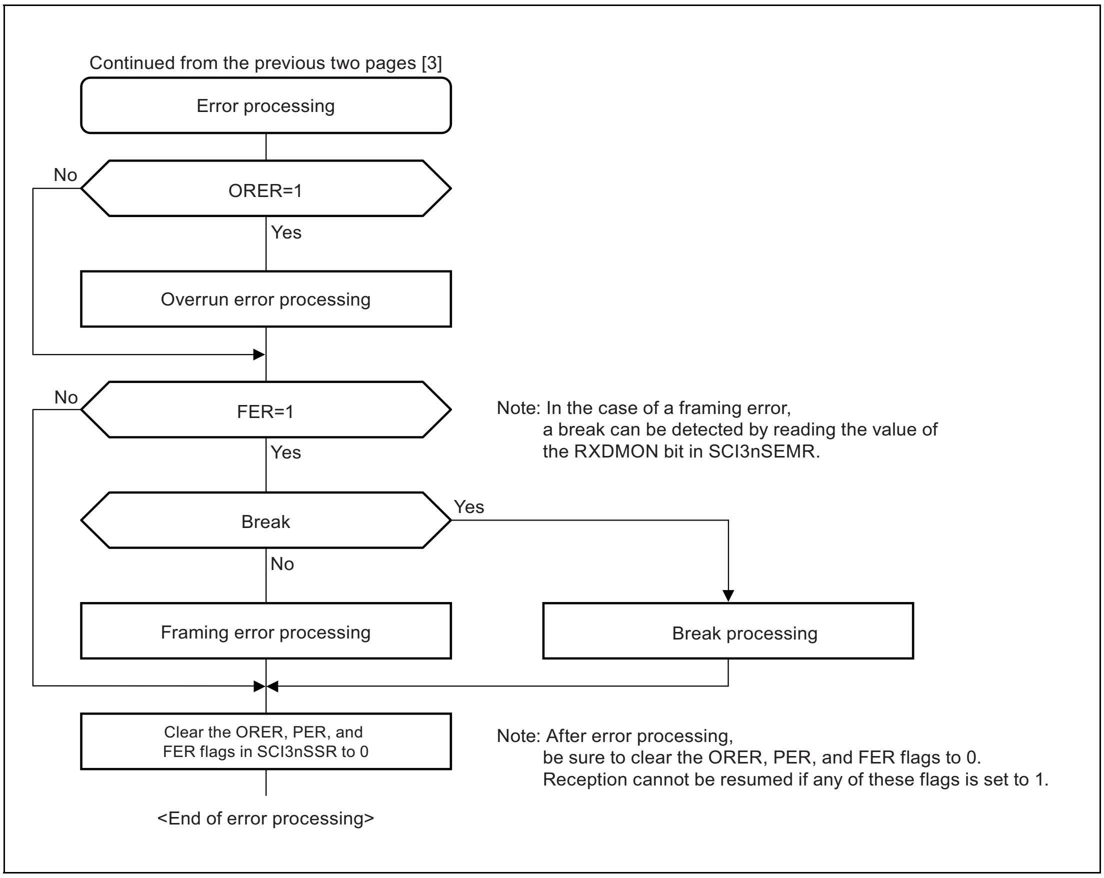

Figure 15.17 Example of Multi-Processor Serial Reception Flowchart (3)

15.6 Operation in Clock Synchronous Mode

Figure 15.18 shows the data format for clock synchronous serial data communication. In clock synchronous mode, data is transmitted or received in synchronization with clock pulses. One character in transfer data consists of 8-bit data. In data transmission with the synchronization clock output, the SCI3 outputs data from one falling edge to the next falling edge of the synchronization clock. In data transmission with the synchronization clock input, the SCI3 outputs the first data (bit 0) after starting transfer immediately after clearing the TDRE bit in SCI3nSSR to 0, and then outputs the next bit data after 2 to 3 PCLK clock cycles from the rising edge of the synchronization clock. In data reception, the SCI3 receives data in synchronization with the rising edge of the synchronization clock. After 8-bit data is output, the communication line holds the last-bit output state. In clock synchronous mode, neither parity bit nor multi-processor bit can be added. The transmitter and the receiver are independent in the SCI3, enabling full-duplex communication by using a common clock. Both the transmitter and the receiver have a double-buffered structure so that the next transmit data can be written during transmission or the previous receive data can be read during reception, enabling continuous data transfer.

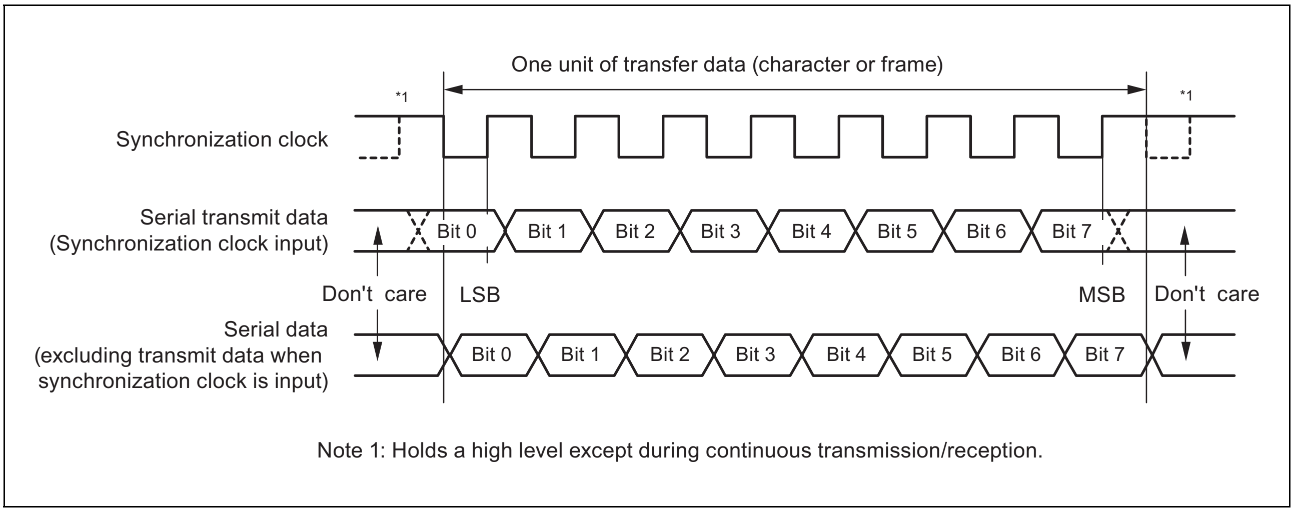

Figure 15.18 Data Format in Clock Synchronous Mode (LSB-First)

15.6.1 Clock

An internal clock generated by the on-chip baud rate generator or an external synchronous clock that is input from the SCInSCK pin can be selected by the setting of the CKE1 and CKE0 bits in SCI3nSCR. When operating the SCI3 on the internal clock, a synchronous clock is output from the SCInSCK pin. Eight pulses of the synchronous clock are output during transfer of one character, and the clock is held high while no data is transferred.

15.6.2 SCI3 Initialization (Clock Synchronous Mode)

Before transmitting and receiving data, clear the TE and RE bits in SCI3nSCR to 0 and then initialize the SCI3 according to the sample flowchart in **Figure 15.19**. To switch the operation between transmission, reception, and transmission/reception, clear the TE and RE bits to 0 and then set these bits to the desired value. Before changing the transfer format, be sure to clear the TE and RE bits to 0. Note that clearing the TE bit to 0 sets the TDRE flag to 1, but clearing the RE bit to 0 initializes neither the RDRF, PER, FER, and ORER flags nor SCI3nRDR.

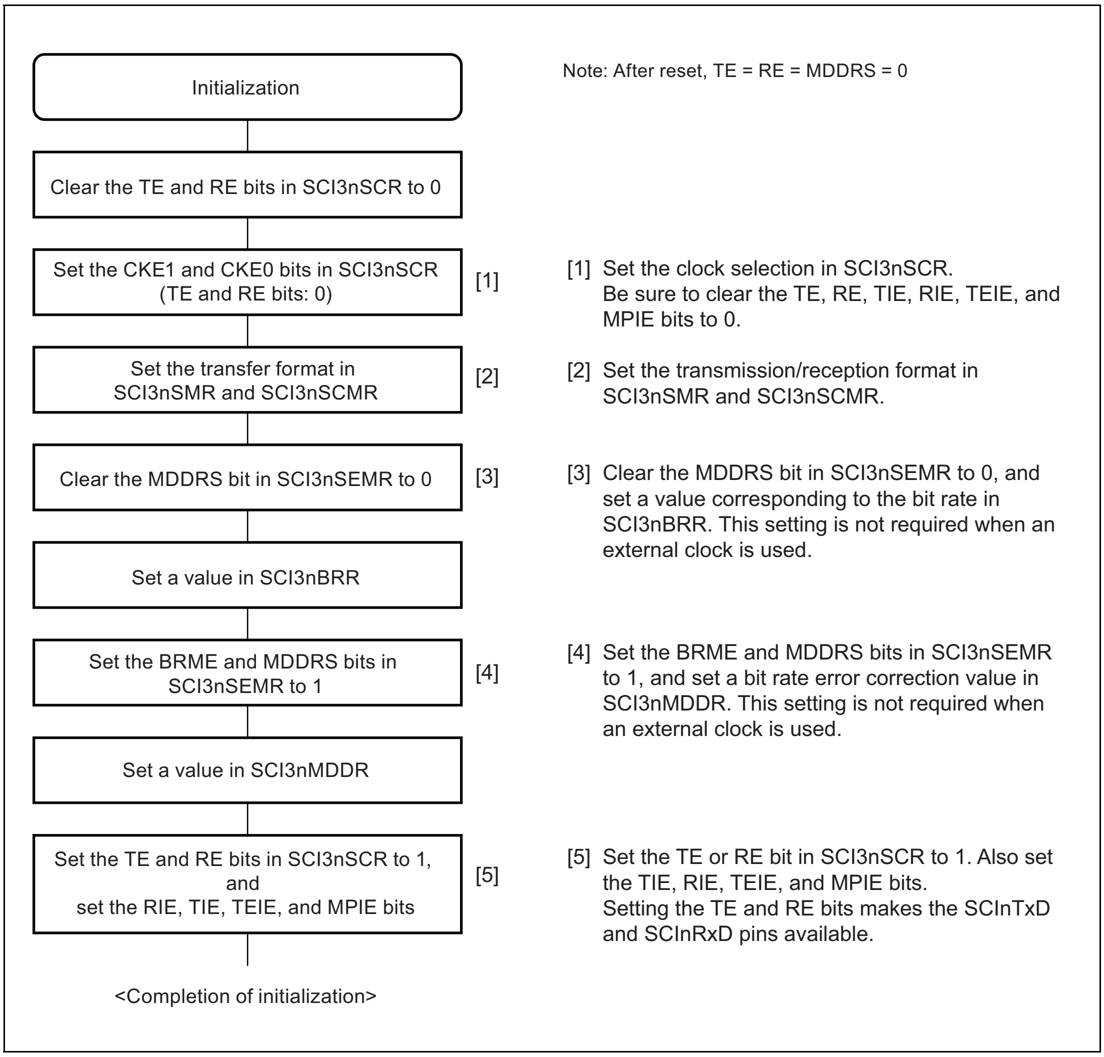

Figure 15.19 Example of SCI3 Initialization Flowchart

15.6.3 Serial Data Transmission (Clock Synchronous Mode)

Figure 15.20 shows an example of the operation for serial transmission in clock synchronous mode. In serial data transmission, the SCI3 operates as described below.

1. When transmit data is written to SCI3nTDR, the TDRE flag is automatically cleared to 0. The SCI3 monitors the TDRE flag in SCI3nSSR. When the flag is cleared, the SCI3 recognizes that data has been written to SCI3nTDR and transfers data from SCI3nTDR to SCI3nTSR, starting output of the first bit when the synchronization clock is input. To write transmit data to SCI3nTDR at a trigger of INTSCI3nTXI interrupt request, set the TIE bit to 1 and then set the TE bit to 1 or set both TIE and TE bits simultaneously with one instruction to generate a INTSCI3nTXI interrupt request for starting data transfer.
2. Transmission starts after data is transferred from SCI3nTDR to SCI3nTSR, and the TDRE flag is set to 1. When the TIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTXI interrupt request is generated. Continuous transmission is enabled by writing the next transmit data to SCI3nTDR in this INTSCI3nTXI interrupt processing routine before the transmission of the previously transferred data is completed. When a INTSCI3nTEI interrupt request is used, the TIE bit is cleared to 0 after the last transmit data has been written to SCI3nTDR, and the TEIE bit is set to 1.
3. 8-bit data is output from the SCInTxD pin in synchronization with the output clock (when clock output mode has been specified) or in synchronization with the input clock (when external clock has been specified).
4. The SCI3 checks the TDRE flag when the last bit is output.
5. When the TDRE flag is 0, the next transmit data is transferred from SCI3nTDR to SCI3nTSR, and serial transmission of the next frame starts.
6. When the TDRE flag is 1, the TEND flag in SCI3nSSR is set to 1 and the SCInSCK pin retains the output state of the last bit. If the TEIE bit in SCI3nSCR is set to 1 at this time, a INTSCI3nTEI interrupt request is generated. The SCInSCK pin is held high.

Figure 15.21 shows a sample flowchart of serial data transmission. Also, **Figure 15.22** shows a sample flowchart for stopping the SCI3 after data transmission. Transmission will not start even if the TDRE flag is cleared while a receive error flag (ORER) is set to 1. Be sure to clear the receive error flags to 0 before starting transmission. Note that clearing the RE bit to 0 does not clear the receive error flags.

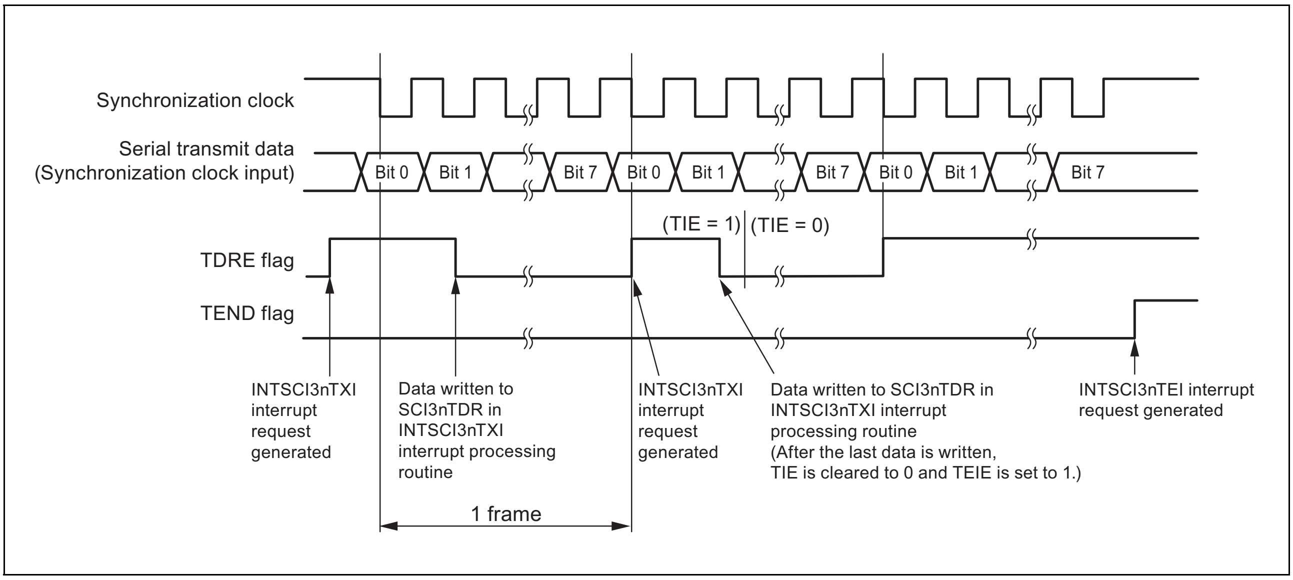

Figure 15.20 Example of Operation for Transmission in Clock Synchronous Mode

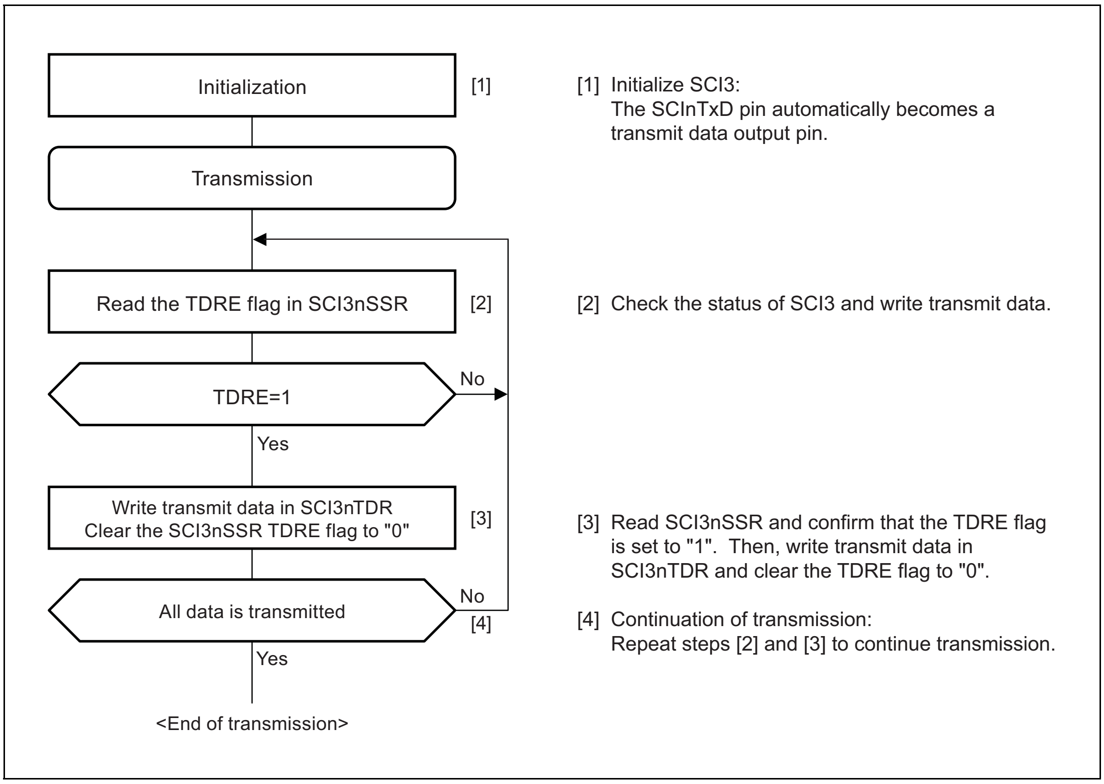

Figure 15.21 Example of Serial Transmission Flowchart

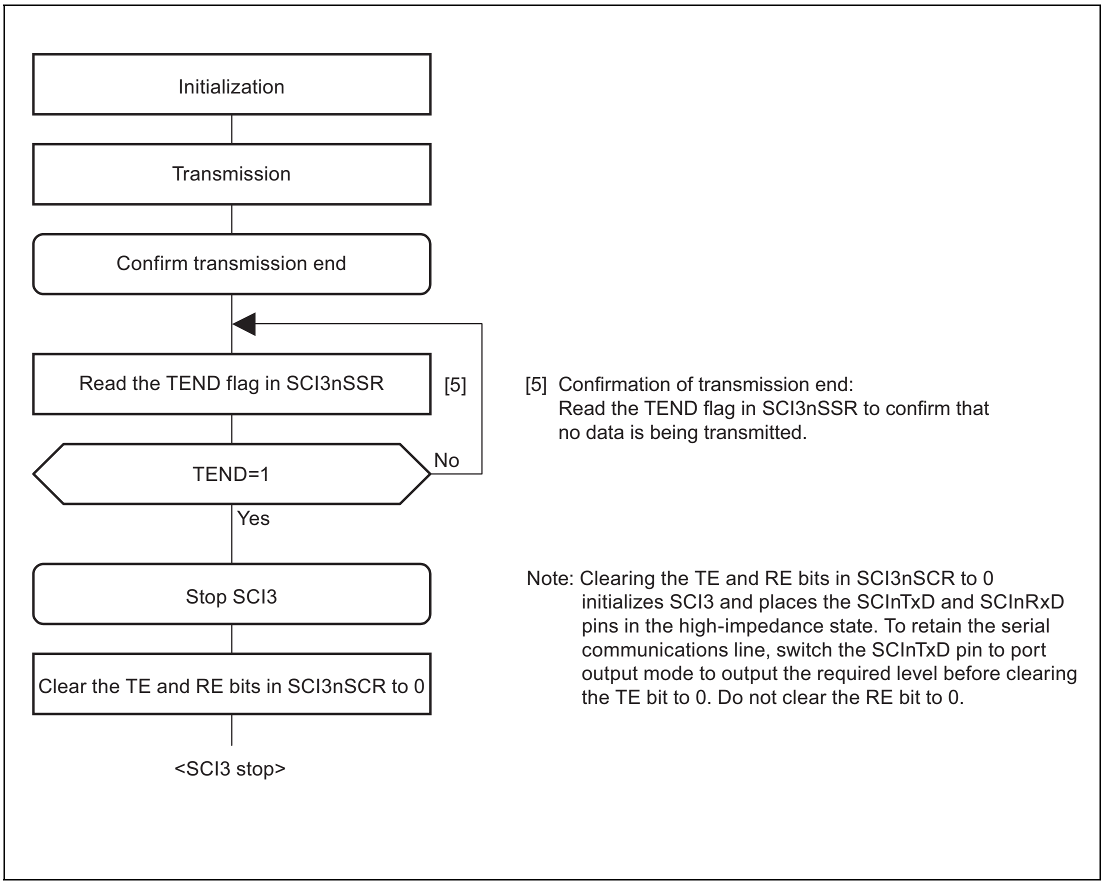

Figure 15.22 Example Flowchart for Stopping the SCI3 after Serial Transmission

15.6.4 Serial Data Reception (Clock Synchronous Mode)

Figure 15.23 shows an example of SCI3 operation for serial reception in clock synchronous mode. In serial data reception, the SCI3 operates as described below.

1. The SCI3 performs internal initialization and starts receiving data in synchronization with a synchronization clock input or output, and stores receive data in SCI3nRSR.
2. When an overrun error occurs (the reception of the next data is completed with the RDRF flag in SCI3nSSR set to 1), the ORER flag in SCI3nSSR is set to 1. If the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nERI interrupt request is generated. Receive data is not transferred to SCI3nRDR. The RDRF flag retains the state of being set to 1.
3. When data has been successfully received, the RDRF flag in SCI3nSSR is set to 1 and the receive data is transferred to SCI3nRDR. When the RIE bit in SCI3nSCR is set to 1 at this time, an INTSCI3nRXI interrupt request is generated. Continuous reception is enabled by reading the receive data transferred to SCI3nRDR in this INTSCI3nRXI interrupt processing routine before reception of the next data is completed. Reading SCI3nRDR automatically clears the RDRF flag to 0.

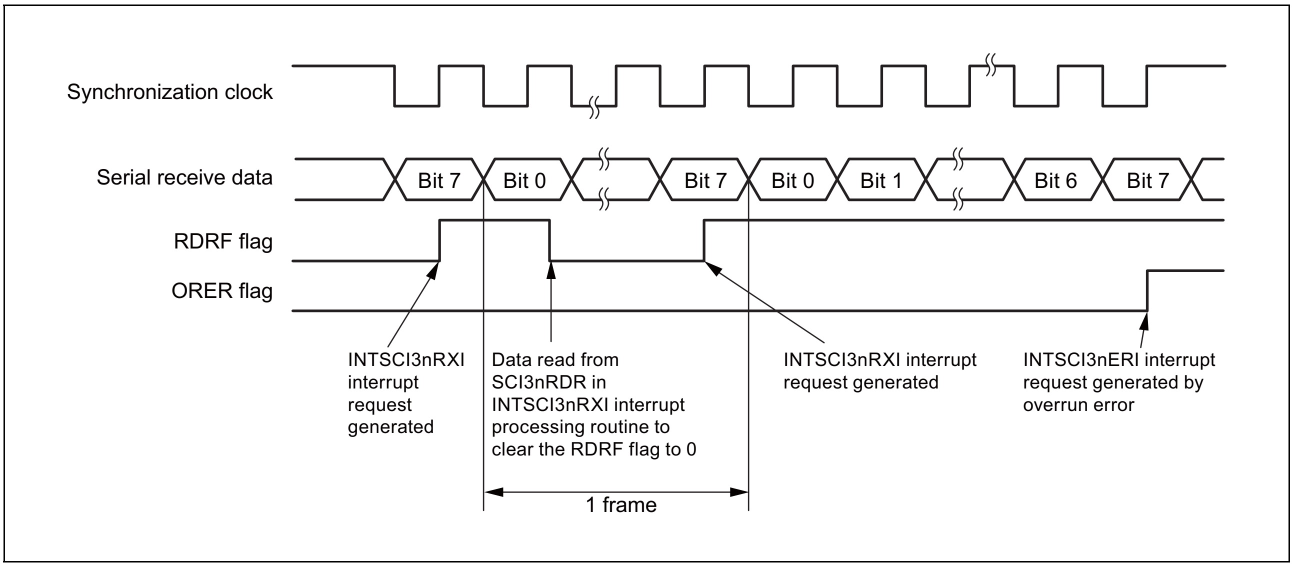

Figure 15.23 Example of SCI3 Operation for Reception

Subsequent transmission and reception are disabled with a receive error flag set to 1. Therefore, be sure to clear the ORER, FER, PER, and RDRF flags to 0 before continuing reception. **Figure 15.24** shows an example of flowchart for data reception.

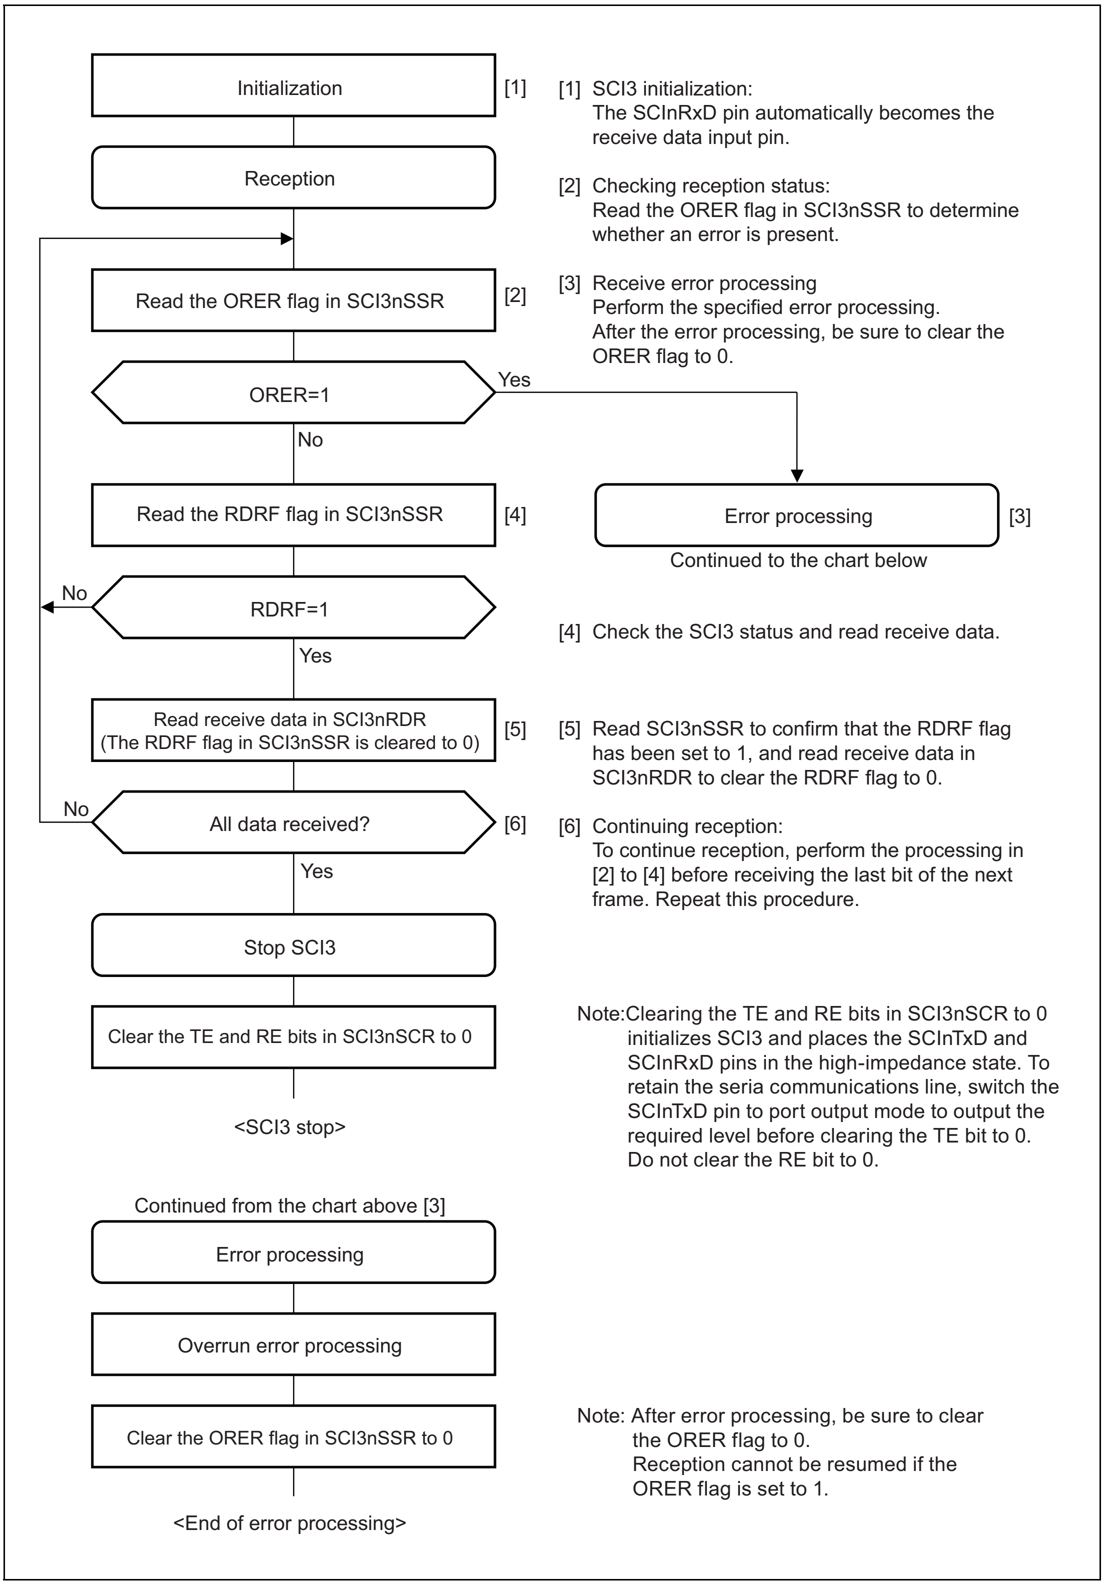

Figure 15.24 Example of Serial Reception Flowchart

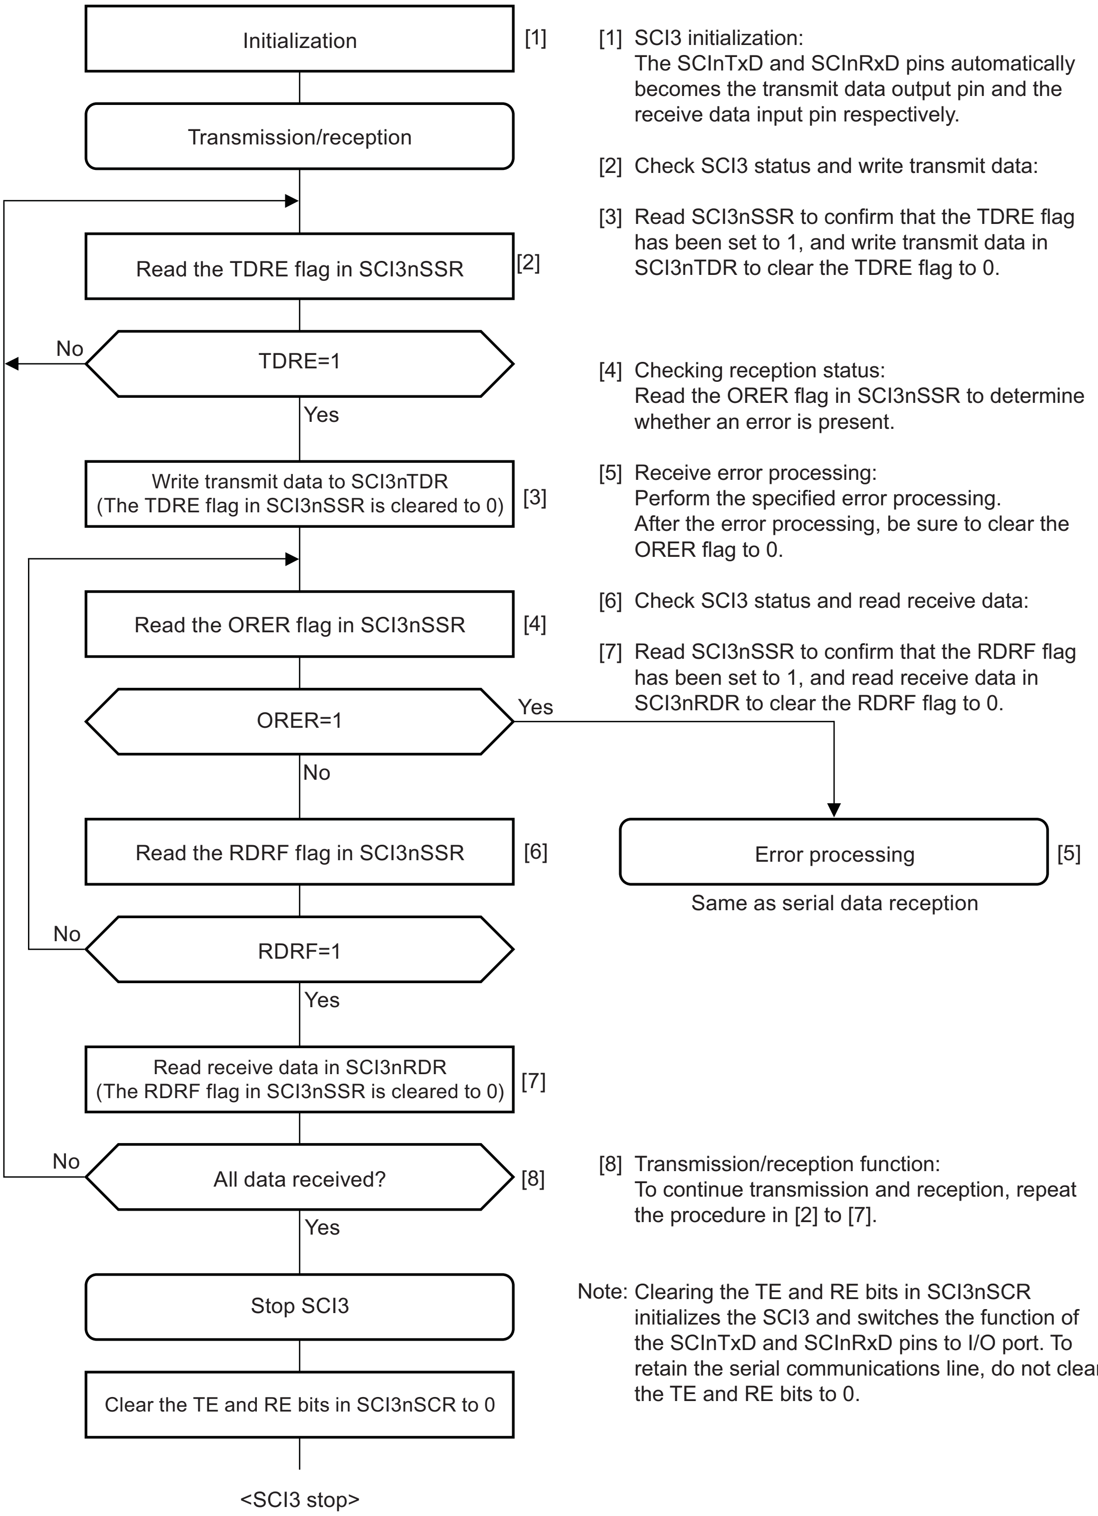
15.6.5 Simultaneous Serial Data Transmission and Reception (Clock Synchronous Mode)

Figure 15.25 shows a sample flowchart for simultaneous data transmit and receive operations. After the SCI3 is initialized, perform the following procedure for simultaneous data transmit and receive operations.

1. To switch from transmit mode to simultaneous transmit and receive mode, check that the SCI3 has finished transmission and the TDRE and TEND flags are set to 1. Then clear the TE bit to 0 and then set the TE and RE bits to 1 with a single instruction.
2. To switch from receive mode to simultaneous transmit and receive mode, check that the SCI3 has finished reception and clear the RE bit to 0. Then check that the RDRF and error flags (ORER, FER, and PER) are cleared to 0 and then set the TE and RE bits to 1 with a single instruction.



[1] SCI3 initialization:
The SCInTxD and SCInRxD pins automatically becomes the transmit data output pin and the receive data input pin respectively.

[2] Check SCI3 status and write transmit data:

[3] Read SCI3nSSR to confirm that the TDRE flag has been set to 1, and write transmit data in SCI3nTDR to clear the TDRE flag to 0.

[4] Checking reception status:
Read the ORER flag in SCI3nSSR to determine whether an error is present.

[5] Receive error processing:
Perform the specified error processing.
After the error processing, be sure to clear the ORER flag to 0.

[6] Check SCI3 status and read receive data:

[7] Read SCI3nSSR to confirm that the RDRF flag has been set to 1, and read receive data in SCI3nRDR to clear the RDRF flag to 0.

[8] Transmission/reception function:
To continue transmission and reception, repeat the procedure in [2] to [7].

Note: Clearing the TE and RE bits in SCI3nSCR initializes the SCI3 and switches the function of the SCInTxD and SCInRxD pins to I/O port. To retain the serial communications line, do not clear the TE and RE bits to 0.

Figure 15.25 Example of Simultaneous Serial Transmission and Reception Flowchart

15.7 Bit Rate Modulation Function

The bit rate modulation function corrects a bit rate by averagely enabling the internal clocks specified by the CKS1 and CKS0 bits in SCI3nSMR for the number specified by SCI3nMDDR out of 256 clocks.

Figure 15.26 shows an example of asynchronous mode in which PCLK clock is selected with the CKS1 and CKS0 bits, SCI3nBRR is set to 0, and SCI3nMDDR is set to 160. In this example, the reference clock cycle is corrected to 256/160 on average and the bit rate is corrected to 160/256. Note that the pulse widths of the internal reference clock expand or contract for the amount of the selected internal clocks because there is a deviation in the enabling of the internal clocks.

Do not use this function with the maximum speed settings (CKS1 and CKS0 bits = 0 in SCI3nSMR, CKE1 bit = 0 in SCI3nSCR, and SCI3nBRR = 0) for clock synchronous mode.

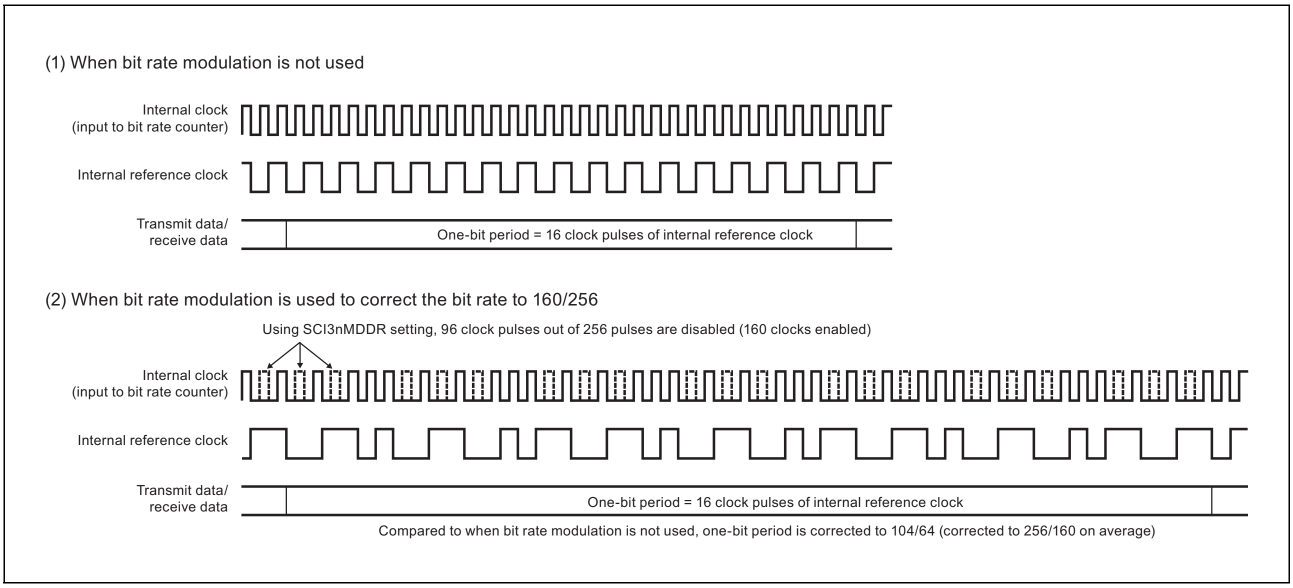


Figure 15.26 Example of Internal Reference Clock when the Bit Rate Modulation Function is Used

15.8 Interrupt Sources

Table 15.25 lists interrupt sources. Each interrupt source outputs an individual interrupt request signal. These interrupt sources can be enabled independently with the enable bit in SCI3nSCR.

A INTSCI3nTXI interrupt request is generated when the TDRE flag in SCI3nSSR is set to 1. A INTSCI3nTEI interrupt request is generated when the TEND flag in SCI3nSSR is set to 1. A INTSCI3nTXI interrupt request can activate the DMAC to handle data transfer. The TDRE flag is automatically cleared to 0 when data is transferred using the DMAC.

CAUTION

The TDRE flag and TEND flag cannot be cleared to 0 when the TE bit in SCI3nSCR is 0. The TEND flag is the level interrupt request flag for the INTSCI3nTEI interrupt. Therefore, when the TE bit is 0, do not set the TEIE bit in SCI3nSCR to 1.

An INTSCI3nRXI interrupt request is generated when the RDRF flag in SCI3nSSR is set to 1. An INTSCI3nERI interrupt is generated when any of the ORER, PER, and FER flags in SCI3nSSR is set to 1. An INTSCI3nRXI interrupt request can activate the DMAC to handle data transfer. The RDRF flag is automatically cleared to 0 when data is transferred using the DMAC.

A INTSCI3nTEI interrupt request is generated when the TEND flag is set to 1 with the TEIE bit set to 1.

CAUTION

If a INTSCI3nTEI interrupt request and a INTSCI3nTXI interrupt request are generated at the same time, the INTSCI3nTXI interrupt request is accepted first. Note that clearing the TDRE flag to 0 at this time in the INTSCI3nTXI interrupt processing routine also clears the TEND flag to 0 automatically, disabling the branch to the INTSCI3nTEI interrupt processing routine.

Table 15.25 SCI3 Interrupt Sources

Name	Interrupt Source	Interrupt Flag	DMAC Activation	DTS Activation
INTSCI3nERI	Receive error	ORER, FER, PER	Not possible	Not possible
INTSCI3nRXI	Receive data full	RDRF	Possible	Possible
INTSCI3nTXI	Transmit data empty	TDRE	Possible	Possible
INTSCI3nTEI	Transmit end	TEND	Not possible	Not possible

15.9 Usage Notes

15.9.1 Break Detection and Processing

A break can be detected by reading the RXDMON bit in SCI3nSEMR when detecting a framing error. Since all inputs from the SCInRxD pin are 0 in the break state, the FER flag is set to 1 and the PER flag may also be set to 1. The SCI3 continues data reception even after it receives a break. For this reason, note that the FER flag is set to 1 again even after the FER flag is cleared to 0.

15.9.2 Mark State and Break Output

While the TE bit is 0 (transmission/reception disabled), the SCInTxD pin can output any level by switching the SCInTxD pin to a general output port. This allows the SCInTxD pin to enter the mark state or to output a break during data transmission. When the TE bit is cleared to 0, the transmitter unit is initialized regardless of the current transmission state.

15.9.3 Receive Error Flags and Transmit Operations in Clock Synchronous Mode

During the clock synchronous simultaneous data transmit/receive operation, transmission cannot be started when a receive error flag (ORER) is set to 1, even if the TDRE flag is cleared to 0. Be sure to clear the receive error flags to 0 before starting transmission. Note that the receive error flags cannot be cleared to 0 even by clearing the RE bit to 0.

15.9.4 Relationship between Writing to SCI3nTDR and the TDRE Flag

The TDRE flag in SCI3nSSR is a status flag indicating that transmit data in SCI3nTDR has been transferred to SCI3nTSR. The TDRE flag is set to 1 when the SCI3 transfers data from SCI3nTDR to SCI3nTSR.

Data can be written to SCI3nTDR regardless of the status of the TDRE flag. However, writing new data to SCI3nTDR while the TDRE flag is 0 will cause the data stored in SCI3nTDR to be lost because it has not been transferred to SCI3nTSR. Therefore, make sure to check that the TDRE flag is set to 1 before writing transmit data to SCI3nTDR.

15.9.5 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

When using an external synchronization clock, clear the TDRE flag to 0 and then input a transmission clock (See **Figure 15.27**). Also in continuous transmission mode, clear the TDRE flag to 0 and then input a transmission clock for the next frame.

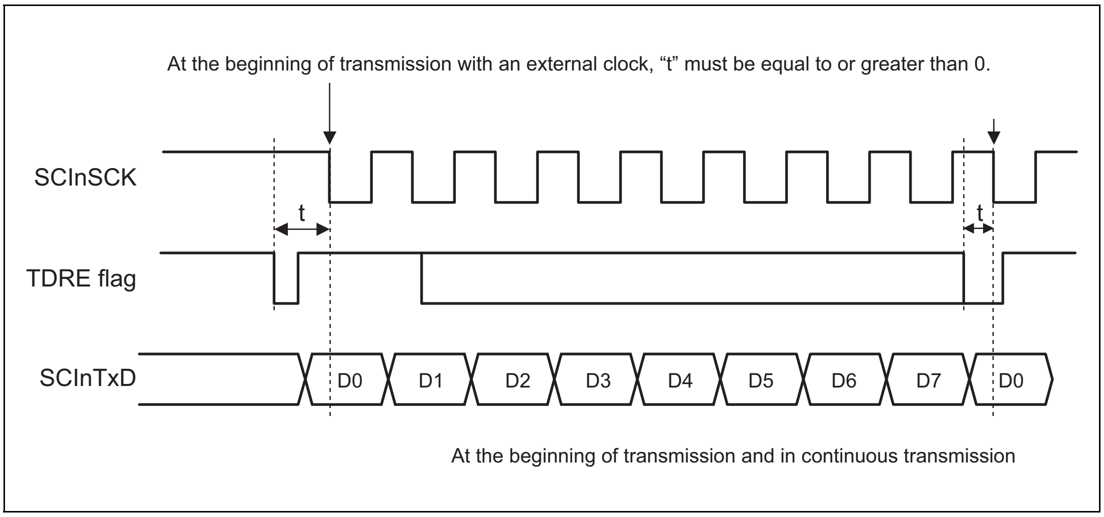

Figure 15.27 Restrictions on Using an External Clock for Transmission in Clock Synchronous Mode

15.9.6 External Clock Input in Clock Synchronous Mode

For the external clock SCInSCK input in clock synchronous mode, see **Section 37.9.7, SCI3 Timing**.

Section 16 LIN/UART Interface (RLIN3)

This section contains a generic description of the LIN/UART interface (RLIN3).

The first part of this section describes all RH850/P1M-E specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RLIN3.

16.1 Features of RH850/P1M-E RLIN3

16.1.1 Number of Units and Channels

This microcontroller has the following number of RLIN3 units.

Each RLIN3 unit has a single channel interface. "Number of channels" therefore has the same meaning as "number of units" in this section.

Table 16.1 Number of Units

Product Name	RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of units	2	2
Name	RLIN3n (n = 0, 1)	RLIN3n (n = 0, 1)

Table 16.2 Unit Configurations and Channels

Unit Name (Channel Name) RLIN3n	Channels per Unit	RH850/P1M-E 100 pins (2 ch)	RH850/P1M-E 144 pins (2 ch)
RLIN30	1	√	√
RLIN31	1	√	√

Note: The channel names are same as those of the corresponding units.

Table 16.3 Index

Index	Description
n	Throughout this section, the individual RLIN3 units are identified by the index “n” (n = 0): for example, RLN3nLCUC is the LIN control register.
b	Throughout this section, the individual transmit/receive data buffers of RLIN3n are identified by the index “b” (b = 1 to 8): for example, RLIN3nLDBR1 is the first stage data buffer register.

The following lists the index corresponding to each product.

Table 16.4 Index Correspondence of Each Product

Index Corresponding to Product
All products
b = 1 to 8

16.1.2 Register Base Address

RLIN3 base addresses are listed in the following table.

RLIN3 register addresses are given as offsets from the base addresses in general.

Table 16.5 Register Base Addresses

Base Address Name	Base Address
<RLIN30_base>	FFDF 8000_H
<RLIN31_base>	FFDF 9000_H

16.1.3 Clock Supply

The RLIN3 clock supply is shown in the following table.

Table 16.6 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
RLIN3n	LIN communication clock sources	High-speed peripheral clock CLK_HSB

16.1.4 Interrupt Request

RLIN3 interrupt requests are listed in the following table.

Table 16.7 Interrupt Requests

Unit Interrupt Signal	Description	Interrupt Number	DMA Trigger Number
RLIN30			
INTRLIN3nUR2 (n = 0)	RLIN30 status interrupt	114	—
INTRLIN3nUR1 (n = 0)	RLIN30 receive completion interrupt	115	95
INTRLIN3nUR0 (n = 0)	RLIN30 transmit interrupt	116	96
RLIN31			
INTRLIN3nUR2 (n = 1)	RLIN31 status interrupt	117	—
INTRLIN3nUR1 (n = 1)	RLIN31 receive completion interrupt	118	97
INTRLIN3nUR0 (n = 1)	RLIN31 transmit interrupt	119	98

16.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

16.1.6 External Input/output Signals

External input/output signals of RLIN3 are listed below.

Table 16.8 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signal Name
RLIN30			
RLIN3nRX (n = 0)	I	RLIN30 receive data input	RLIN30RX
RLIN3nTX (n = 0)	O	RLIN30 transmit data output	RLIN30TX
RLIN31			
RLIN3nRX (n = 1)	I	RLIN31 receive data input	RLIN31RX
RLIN3nTX (n = 1)	O	RLIN31 transmit data output	RLIN31TX

16.1.7 Combination of Pin Name and Port Name

Combinations of RLIN3 pins and ports are listed in the following table.

Table 16.9 Combination of Pins and Ports

Function	Pin Name	Port Name					
		Group 1	Group 2	Group 3	Group 4	Group 5	Group 6
RLIN30	RLIN30RX	P1_1	P3_4	P4_0	P5_10	P5_14	P5_14
	RLIN30TX	P1_0*1	P3_5	P4_1	P5_11*1	P5_15*1	P0_0
RLIN31	RLIN31RX	P2_5	P0_1	P5_15*1	P5_12*1	—	—
	RLIN31TX	P2_4	P3_11	P3_11	P5_13*1	—	—

Note 1. Usable in the 144-pin product

16.2 Overview

16.2.1 Functional Overview

The LIN/UART interface is a hardware LIN communication controller that supports LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602, and automatically performs frame communication and error determination.

The LIN/UART interface is provided with UART mode and can also be used as a UART.

The appropriate mode should be used for the LIN/UART interface according to the application: LIN master, or UART.

LIN master

- LIN reset mode
- LIN mode (LIN master mode)
  - LIN wake-up mode
  - LIN operation mode
- LIN self-test mode

UART

- LIN reset mode
- UART mode

Table 16.10 gives the LIN/UART interface specifications.

Table 16.10 LIN/UART Interface Specifications (1/2)

Item		Specifications	
Number of Channel		2 channels	
LIN communication function	Protocol	LIN Specification Package Revision 1.3, 2.0, 2.1, 2.2, and SAE J2602	
	Variable frame structure	Master	• Break transmission width: 13 to 28 Tbits • Break delimiter transmission width: 1 to 4 Tbits • Transmission inter-byte space width (header): 0 to 7 Tbits (space between Sync field and ID field)*1 • Transmission response space width: 0 to 7 Tbits*1 • Transmission inter-byte space width: 0 to 3 Tbits (space between data bytes in response area) • Transmission wake-up width: 1 to 16 Tbits
	Checksum	• Automatic operation for both transmission and reception • Classic or enhanced selectable (for each frame)	
	Response field data byte count	Variable from 0 to 8 bytes Multi-byte (9 or more bytes) response transmission and reception also possible	
	Frame communication mode	Master	• Mode in which header transmission and response transmission/reception are started with a single transmission start request • Mode in which header transmission and response transmission are started with separate transmission start requests (frame separate mode)
	Wake-up transmission and reception	LIN wake-up mode provided • Wake-up transmission (1 to 16 Tbits) • Wake-up reception Low-level width of input signals measured	
	Status	Master	• Frame/wake-up transmission complete • Header transmission complete • Frame/wake-up reception complete*2 • Data 1 reception complete • Error detection • Operation mode (LIN reset mode, LIN wake-up mode, LIN operation mode, LIN self-test mode)
	Error status	Master	• Bit error • Checksum error • Frame timeout error/response timeout error • Physical bus error • Framing error • Response preparation error
	Baud rate selection	Baud rate conforming to the LIN specifications generated using baud rate generator	
	Test mode	Self-test mode for user evaluation	
	Interrupt function	Master	• Header/frame/wake-up transmission complete • Frame/wake-up reception complete*2 • Error detection

Table 16.10 LIN/UART Interface Specifications (2/2)

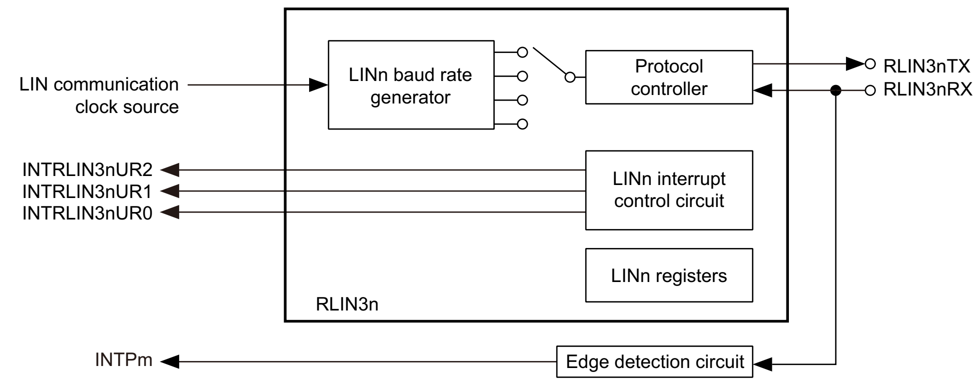
Item		Specifications
UART communication function	Data buffer	• Transmission data buffer/transmission data buffer for wait (exclusively for transmission; data length of 1. Character length of 7, 8, and 9 bits supported) • UART buffer (exclusively for transmission; variable data length from 1 to 9 bits. Character length of 7 and 8 bits supported) • Reception data buffer (exclusively for reception; data length of 1. Character length of 7, 8, and 9 bits supported)
	Data format	Character length: 7 or 8 bits Length of 9 bits supported by using the expansion bit.
		Transmission stop bit: 1 or 2 bits
		Parity function: odd, even, 0, or none
		LSB- or MSB-first transfer selectable
		Reverse input/output of transmission/reception data possible
	Status	• Transmission status • Reception status • Successful UART buffer transmission • Error detection • Expansion bit detection • ID match • Reset mode status
	Error status	• Bit error • Framing error • Parity error • Overrun error
	Baud rate selection	With the built-in baud rate generator, any baud rate can be set.
	When a certain expansion bit is at the expected level, the data received can be compared to the 8-bit data preset in the register.	
	The stop bit received is guaranteed (start of transmission can be delayed when start of transmission is attempted during reception of the stop bit).	
	Interrupt function	• Transmission start/complete • Reception complete • Status/error detection

Note 1. Since the same register is used for setting, the inter-byte space (header) = response space.

Note 2. For wake-up reception, the input signal low-level width count is indicated.

16.2.2 Block Diagram

Figure 16.1 shows a block diagram of the LIN/UART interface.



Note: (n, m) = (0, 3), (1, 4)

Figure 16.1 LIN/UART Interface Block Diagram

16.2.3 Description of Blocks

- RLIN3nTX, RLIN3nRX: LIN/UART interface I/O pins
- LINn baud rate generator: Generates the LIN/UART interface communication clock
- LINn registers: LIN/UART interface registers
- LINn interrupt control circuit: Controls interrupt requests generated by the LIN/UART interface

16.3 Registers

16.3.1 List of Registers

RLIN3 registers are listed in the following table.

For <RLIN3n_base>, see **Section 16.1.2, Register Base Address**.

Table 16.11 Registers

Module	Register	Symbol	Address	LIN Master	UART
RLIN3n	LIN wake-up baud rate selector register	RLN3nLWBR	<RLIN3n_base> + 01_H	√	√
RLIN3n	LIN / UART baud rate prescaler 01 register	RLN3nLBRP01	<RLIN3n_base> + 02_H	—	√
RLIN3n	LIN / UART baud rate prescaler 0 register	RLN3nLBRP0	<RLIN3n_base> + 02_H	√	√
RLIN3n	LIN / UART baud rate prescaler 1 register	RLN3nLBRP1	<RLIN3n_base> + 03_H	√	√
RLIN3n	LIN self-test control register	RLN3nLSTC	<RLIN3n_base> + 04_H	√	—
RLIN3n	LIN / UART mode register	RLN3nLMD	<RLIN3n_base> + 08_H	√	√
RLIN3n	LIN break field configuration register/ UART configuration register	RLN3nLBFC	<RLIN3n_base> + 09_H	√	√
RLIN3n	LIN / UART space configuration register	RLN3nLSC	<RLIN3n_base> + $0A_H$	√	√
RLIN3n	LIN wake-up configuration register	RLN3nLWUP	<RLIN3n_base> + $0B_H$	√	—
RLIN3n	LIN interrupt enable register	RLN3nLIE	<RLIN3n_base> + $0C_H$	√	—
RLIN3n	LIN / UART error detection enable register	RLN3nLEDE	<RLIN3n_base> + $0D_H$	√	√
RLIN3n	LIN / UART control register	RLN3nLCUC	<RLIN3n_base> + $0E_H$	√	√
RLIN3n	LIN / UART transmission control register	RLN3nLTRC	<RLIN3n_base> + 10_H	√	√
RLIN3n	LIN / UART mode status register	RLN3nLMST	<RLIN3n_base> + 11_H	√	√
RLIN3n	LIN / UART status register	RLN3nLST	<RLIN3n_base> + 12_H	√	√
RLIN3n	LIN / UART error status register	RLN3nLEST	<RLIN3n_base> + 13_H	√	√
RLIN3n	LIN data field configuration register	RLN3nLDFC	<RLIN3n_base> + 14_H	√	√
RLIN3n	LIN / UART ID buffer register	RLN3nLIDB	<RLIN3n_base> + 15_H	√	√
RLIN3n	LIN checksum buffer register	RLN3nLCBR	<RLIN3n_base> + 16_H	√	—
RLIN3n	UART data buffer 0 register	RLN3nLUDB0	<RLIN3n_base> + 17_H	—	√
RLIN3n	LIN / UART data buffer 1 register	RLN3nLDBR1	<RLIN3n_base> + 18_H	√	√
RLIN3n	LIN / UART data buffer 2 register	RLN3nLDBR2	<RLIN3n_base> + 19_H	√	√
RLIN3n	LIN / UART data buffer 3 register	RLN3nLDBR3	<RLIN3n_base> + $1A_H$	√	√
RLIN3n	LIN / UART data buffer 4 register	RLN3nLDBR4	<RLIN3n_base> + $1B_H$	√	√
RLIN3n	LIN / UART data buffer 5 register	RLN3nLDBR5	<RLIN3n_base> + $1C_H$	√	√
RLIN3n	LIN / UART data buffer 6 register	RLN3nLDBR6	<RLIN3n_base> + $1D_H$	√	√
RLIN3n	LIN / UART data buffer 7 register	RLN3nLDBR7	<RLIN3n_base> + $1E_H$	√	√
RLIN3n	LIN / UART data buffer 8 register	RLN3nLDBR8	<RLIN3n_base> + $1F_H$	√	√
RLIN3n	UART operation enable register	RLN3nLUOER	<RLIN3n_base> + 20_H	—	√
RLIN3n	UART option register 1	RLN3nLUOR1	<RLIN3n_base> + 21_H	—	√
RLIN3n	UART transmission data register	RLN3nLUTDR	<RLIN3n_base> + 24_H	—	√
RLIN3n	UART transmission data register L	RLN3nLUTDRL	<RLIN3n_base> + 24_H	—	√
RLIN3n	UART transmission data register H	RLN3nLUTDRH	<RLIN3n_base> + 25_H	—	√
RLIN3n	UART reception data register	RLN3nLURDR	<RLIN3n_base> + 26_H	—	√
RLIN3n	UART reception data register L	RLN3nLURDRL	<RLIN3n_base> + 26_H	—	√
RLIN3n	UART reception data register H	RLN3nLURDRH	<RLIN3n_base> + 27_H	—	√
RLIN3n	UART wait transmission data register	RLN3nLUWTDR	<RLIN3n_base> + 28_H	—	√
RLIN3n	UART wait transmission data register L	RLN3nLUWTDRL	<RLIN3n_base> + 28_H	—	√
RLIN3n	UART wait transmission data register H	RLN3nLUWTDRH	<RLIN3n_base> + 29_H	—	√

Note: √: Used, —: Not used
When writing to an unused register, write the value after reset.

16.3.2 LIN Master Related Registers

16.3.2.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			LWBR0
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.12 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	LWBR0	Wake-up Baud Rate Select 0: In LIN wake-up mode, the clock specified in the LCKS bit of the RLN3nLMD register is used. (LIN1.3) 1: In LIN wake-up mode, the clock fa is used regardless of the setting in the LCKS bit of the RLN3nLMD register. (LIN2.x)

Set the RLN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

These bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In LIN master mode (LIN/UART mode select bits in LIN mode register = 00_B), set these bits to 0000_B or 1111_B (16 sampling).

LPRS[2:0] Bits (Prescaler Clock Select)

These bits select the frequency division ratio for the prescaler.
The LIN communication clock source is divided by this prescaler.

LWBR0 Bit (Wake-up Baud Rate Select)

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.
When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 selects fa as the LIN system clock (fLIN) during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed). This allows an input signal with a low-level width of 2.5 Tbits or more to be measured.

Setting the baud rate to 19200 bps while fa is selected allows an input signal with a low-level width of 130 µs or longer to be detected during LIN wake-up mode regardless of the setting of the RLN3nLMD.LCKS bit.

16.3.2.2 RLN3nLBRP0 — LIN Baud Rate Prescaler 0 Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 02_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP0[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.13 RLN3nLBRP0 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP0[7:0]	Assuming that the value set in this register is N (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by N + 1. Setting range: 00_H to FF_H

Set the RLN3nLBRP0 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock sources fa, fb, and fc.

Assuming that the value set in this register is N, baud rate prescaler 0 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by N + 1.

The RLN3nLBRP0 and RLN3nLBRP1 registers are accessible in a 16-bit unit as RLN3nLBRP01.

16.3.2.3 RLN3nLBRP1 — LIN Baud Rate Prescaler 1 Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 03_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LBRP1[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.14 RLN3nLBRP1 Register Contents

Bit Position	Bit Name	Function
7 to 0	LBRP1[7:0]	Assuming that the value set in this register is M (0 to 255), the baud rate prescaler divides the frequency of the prescaler clock by M + 1. Setting range: 00_H to FF_H

Set the RLN3nLBRP1 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

The value set in this register is used to control the frequency of baud rate clock source fd.

Assuming that the value set in this register is M, baud rate prescaler 1 divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) by M+1.

The RLN3nLBRP0 and RLN3nLBRP1 registers are accessible in 16-bit units as RLN3nLBRP01.

16.3.2.4 RLN3nLSTC — LIN Self-Test Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	LSTM
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.15 RLN3nLSTC Register Contents

Bit Position	Bit Name	Function
7 to 0	—	Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.
0	LSTM	LIN Self-Test Mode 0: The module is not in LIN self-test mode. 1: The module is in LIN self-test mode.

The RLN3nLSTC register cancels protection of LIN self-test mode.

Set the RLN3nLSTC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Writing $A7_H$, 58_H, and 01_H successively to the RLN3nLSTC register places the module into LIN self-test mode.

When successive writing is completed and the mode is changed to LIN self-test mode, the LSTM bit is set to 1.

Do not write any other value during successive writing.

For making transition to LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

When read, bits 6 to 1 return “000000_B”, and bit 7 returns an undefined value.

LSTM Bit (LIN Self-Test Mode)

When transition to LIN self-test mode is completed, the LSTM bit is set to 1.
For leaving LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.
Writing 1 to this bit does not affect the value of the RLN3nLSTC register if it is not a part of successive writing of $A7_H$, 58_H, and 01_H.

16.3.2.5 RLN3nLMD — LIN Mode Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	LIOS	LCKS[1:0]		LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.16 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	LRDNFS	LIN Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4	LIOS	LIN Interrupt Output Select 0: No RLIN3n interrupt is used. 1: RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are used.
3, 2	LCKS[1:0]	LIN System Clock Select b3 b2 0 0: fa (Clock generated by baud rate prescaler 0) 0 1: fb (1/2 clock generated by baud rate prescaler 0) 1 0: fc (1/8 clock generated by baud rate prescaler 0) 1 1: fd (1/2 clock generated by baud rate prescaler 1)
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 0: LIN master mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode)

LRDNFS Bit (LIN Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LIOS Bit (LIN Interrupt Output Select)

The LIOS bit selects the number of interrupt outputs from the LIN/UART interface.
With 0 set, no RLIN3 interrupt is generated from the LIN/UART interface.
With 1 set, the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, and RLIN3n status interrupt are generated from the LIN/UART interface.
For each interrupt source, see **Section 16.4, Interrupt Sources**.

LCKS[1:0] Bits (LIN System Clock Select)

The LCKS bits select the clock to be input to the protocol controller.
With 00_B set, the protocol controller is provided with fa (clock generated by baud rate prescaler 0).
With 01_B set, the protocol controller is provided with fb (1/2 clock generated by baud rate prescaler 0).
With 10_B set, the protocol controller is provided with fc (1/8 clock generated by baud rate prescaler 0).
With 11_B set, the protocol controller is provided with fd (1/2 clock generated by baud rate prescaler 1).

When 1_B is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), and the RLN3nLMST register is 01_H (LIN wake-up mode), the protocol controller is supplied with fa regardless of the setting of this bit (the LCKS bit is not changed).

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an LIN master, set these bits to 00_B.

16.3.2.6 RLN3nLBFC — LIN Break Field Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	BDT[1:0]		BLT[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.17 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5, 4	BDT[1:0]	Transmission Break Delimiter (High Level) Width Select b5 b4 0 0: 1 Tbit 0 1: 2 Tbits 1 0: 3 Tbits 1 1: 4 Tbits
3 to 0	BLT[3:0]	Transmission Break (Low Level) Width Select b3 b0 0 0 0 0: 13 Tbits 0 0 0 1: 14 Tbits 0 0 1 0: 15 Tbits : 1 1 1 0: 27 Tbits 1 1 1 1: 28 Tbits

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the set values result in the length of a frame exceeding the timeout time. Set the appropriate values in this register.

BDT[1:0] Bits (Transmission Break Delimiter (High Level) Width Select)

The BDT bits set the break delimiter (high level) width of transmission frame header.
1 Tbit to 4 Tbits can be set.

BLT[3:0] Bits (Transmission Break (Low Level) Width Select)

The BLT bits set the break (low level) width of transmission frame header.
13 Tbits to 28 Tbits can be set.

16.3.2.7 RLN3nLSC — LIN Space Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	IBHS[2:0]		
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R/W	R/W	R/W

Table 16.18 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2 to 0	IBHS[2:0]	Inter-Byte Space (Header)/Response Space Select b2 b0 0 0 0: 0 Tbit 0 0 1: 1 Tbit 0 1 0: 2 Tbits 0 1 1: 3 Tbits 1 0 0: 4 Tbits 1 0 1: 5 Tbits 1 1 0: 6 Tbits 1 1 1: 7 Tbits

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Some combinations of the set values result in the length of a frame or a response exceeding the timeout time. Set the appropriate values in this register.

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the inter-byte space of the transmission frame response field.
0 Tbit to 3 Tbits can be set.
These bits are enabled only during response transmission; these are disabled during response reception.
For transmission from the transmission data buffer (RLN3nLUTDR register) or the transmission data buffer for wait (RLN3nLUWTDR register), the setting of these bits is ineffective. In this case, set these bits to "00_B".

IBHS[2:0] Bits (Inter-Byte Space (Header)/Response Space Select)

The IBHS bits set the width of the inter-byte space (header) of the transmission frame header field and the response space.
0 Tbit to 7 Tbits can be set.
The response space setting is enabled only during response transmission; setting is disabled during response reception.
The inter-byte space (header) is equal to the response space.

16.3.2.8 RLN3nLWUP — LIN Wake-Up Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base>+ $0B_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	WUTL[3:0]				—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R	R	R	R

Table 16.19 RLN3nLWUP Register Contents

Bit Position	Bit Name	Function
7 to 4	WUTL[3:0]	Wake-up Transmission Low Level Width Select b7 b4 0 0 0 0: 1 Tbit 0 0 0 1: 2 Tbits 0 0 1 0: 3 Tbits 0 0 1 1: 4 Tbits : 1 1 0 0: 13 Tbits 1 1 0 1: 14 Tbits 1 1 1 0: 15 Tbits 1 1 1 1: 16 Tbits
3 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Set the RLN3nLWUP register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

WUTL[3:0] Bits (Wake-up Transmission Low Level Width Select)

The WUTL bits set the low level width of the wake-up signal transmission.
1 Tbit to 16 Tbits can be set.

With 1 is set in the LWBR0 bit in the RLN3nLWBR register (LIN 2.x is used), fa is selected as the LIN system clock (fLIN) regardless of the setting of the RLN3nLMD.LCKS bit (the LCKS bit is not changed).

16.3.2.9 RLN3nLIE — LIN Interrupt Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0C_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	SHIE	ERRIE	FRCIE	FTCIE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 16.20 RLN3nLIE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	SHIE	Successful Header Transmission Interrupt Enable 0: Disables successful header transmission interrupt. 1: Enables successful header transmission interrupt.
2	ERRIE	Error Detection Interrupt Enable 0: Disables error detection interrupt. 1: Enables error detection interrupt.
1	FRCIE	Successful Frame/Wake-up Reception Interrupt Enable 0: Disables successful frame/wake-up reception interrupt. 1: Enables successful frame/wake-up reception interrupt.
0	FTCIE	Successful Frame/Wake-up Transmission Interrupt Enable 0: Disables successful frame/wake-up transmission interrupt. 1: Enables successful frame/wake-up transmission interrupt.

Set the RLN3nLIE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

SHIE Bit (Successful Header Transmission Interrupt Enable)

The SHIE bit enables or disables interrupt request upon successful transmission of a header.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the HTRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the HTRC flag in the RLN3nLST register is set to 1.

ERRIE Bit (Error Detection Interrupt Enable)

The ERRIE bit enables or disables an interrupt request upon detection of an error.
With 0 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n status is not generated when the ERR flag in the RLN3nLST register is set to 1.
Occurrence factors are bit errors, physical bus errors, frame/response timeout errors, framing errors, checksum errors, and response preparation errors.
Detection of the bit error, physical bus error, frame/response timeout error, and framing error can be enabled or disabled using the RLN3nLEDE register.

FRCIE Bit (Successful Frame/Wake-up Reception Interrupt Enable)

The FRCIE bit enables or disables an interrupt request upon successful reception of a frame or a wake-up signal (input signal low-level width count).
With 0 set, the interrupt request for RLIN3n reception complete is not generated when the FRC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n reception complete is generated when the FRC flag in the RLN3nLST register is set to 1.

FTCIE Bit (Successful Frame/Wake-up Transmission Interrupt Enable)

The FTCIE bit enables or disables an interrupt request upon successful transmission of a frame or a wake-up signal.
With 0 set, the interrupt request for RLIN3n transmission is not generated when the FTC flag in the RLN3nLST register is set to 1.
With 1 set, the interrupt request for RLIN3n transmission is generated when the FTC flag in the RLN3nLST register is set to 1.

16.3.2.10 RLN3nLEDE — LIN Error Detection Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LTES	—	—	—	FERE	FTERE	PBERE	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Table 16.21 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7	LTES	Timeout Error Select 0: Frame timeout error 1: Response timeout error
6 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	FTERE	Timeout Error Detection Enable 0: Disables frame/response timeout error detection. 1: Enables frame/response timeout error detection.
1	PBERE	Physical Bus Error Detection Enable 0: Disables physical bus error detection. 1: Enables physical bus error detection.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LTES Bit (Timeout Error Select)

The LTES bit selects the timeout function to be used.
With 0 set, the timeout function is used for frame timeout.
With 1 set, the timeout function is used for response timeout.
For details on the timeout error, see **Section 16.7.6, Error Status**.

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 16.7.6, Error Status**.

FTERE Bit (Timeout Error Detection Enable)

The FTERE bit enables or disables detection of the frame timeout error or the response timeout error.
With 0 set, the frame timeout error or response timeout error is not detected.
With 1 set, the frame timeout error or response timeout error is detected.
When this bit is set to 1, the detection result is indicated in the FTER flag in the RLN3nLEST register.
With the LTES bit, either the frame timeout error or response timeout error can be selected.
Do not use the timeout error if response data of 9 bytes or more is to be transmitted or received.
For details on the timeout error, see **Section 16.7.6, Error Status**.

PBERE Bit (Physical Bus Error Detection Enable)

The PBERE bit enables or disables detection of the physical bus error.
With 0 set, the physical bus error is not detected.
With 1 set, the physical bus error is detected.
When this bit is set to 1, the detection result is indicated in the PBER flag in the RLN3nLEST register.
For details on the physical bus error, see **Section 16.7.6, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.
For details on the bit error, see **Section 16.7.6, Error Status**.

16.3.2.11 RLN3nLCUC — LIN Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OM1	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 16.22 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	OM1	LIN Mode Select 0: LIN wake-up mode 1: LIN operation mode
0	OM0	LIN Reset 0: LIN reset mode 1: Release from LIN reset mode

Set the RLN3nLCUC register to 01_H to cause a transition to LIN wake-up mode after canceling LIN reset mode, and set the register to 03_H to cause a transition to LIN operation mode.

In LIN self-test mode, set the RLN3nLCUC register to 03_H after a transition to LIN self-test mode is completed.

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM1 Bit (LIN Mode Select)

The OM1 bit selects the specific operation mode (either LIN wake-up mode or LIN operation mode) after canceling LIN reset mode.
Setting this bit to 0 causes a transition to LIN wake-up mode.
Setting it to 1 leads to release from LIN operation mode.
This bit is valid only when the OMM0 bit in the RLN3nLMST register is 1.
Writing a value to this bit is disabled while the FTS bit in the RLN3nLTRC register is 1.

OM0 Bit (LIN Reset)

The OM0 bit selects either causing a transition to LIN reset mode or canceling LIN reset mode.
Setting this bit to 0 causes a transition to LIN reset mode.
Setting it to 1 leads to release from LIN reset mode.

16.3.2.12 RLN3nLTRC — LIN Transmission Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	FTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 16.23 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	RTS	Response Transmission/Reception Start 0: Response transmission/reception is stopped in frame separate mode. 1: Response transmission/reception is started in frame separate mode.
0	FTS	Frame Transmission/Wake-up Transmission /Reception Start 0: Frame Transmission/wake-up transmission/reception is stopped. 1: Frame Transmission/wake-up transmission reception is started.

RTS Bit (Response Transmission/Reception Start)

Set the RTS bit to 1 in frame separate mode after header transmission is started (FTS bit is 1) and response transmission data is ready. Once set, this bit is automatically cleared to 0 upon completion of frame communication (including error detection) or transition to LIN reset mode.
Only 1 can be written to this bit; 0 cannot be written.
To write 1 to this bit, write 02_H to the RLN3nLTRC register using the store instruction.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Writing a value to this bit is disabled when the FTS bit is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set this bit to 1 each time a data group (variable from 0 to 8 bytes) is transmitted or received. Once set, this bit is automatically cleared to 0 at the end of data group communication or transition to LIN reset mode.

FTS Bit (Frame Transmission/Wake-up Transmission/Reception Start)

Set the FTS bit to 1 to start frame transmission.
Also set this bit to 1 to allow wake-up transmission and reception (input signal low-level width count).
Only 1 can be written to this bit; 0 cannot be written.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).

This bit is set to 0 upon completion of frame or wake-up communication (including error detection) and transition to LIN reset mode.

16.3.2.13 RLN3nLMST — LIN Mode Status Register

Access: This register can only be read in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	OMM1	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 16.24 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read.
1	OMM1	LIN Mode Status Monitor 0: LIN wake-up mode. 1: LIN operation mode.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode. 1: LIN reset mode.

OMM1 Bit (LIN Mode Status Monitor)

The OMM1 bit indicates the current operating mode.

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

16.3.2.14 RLN3nLST — LIN Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	HTRC	D1RC	—	—	ERR	—	FRC	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R	R	R	R	R/W	R/W

Table 16.25 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7	HTRC	Successful Header Transmission Flag 0: Header transmission has not been completed. 1: Header transmission has been completed.
6	D1RC	Successful Data 1 Reception Flag 0: Data 1 reception has not been completed. 1: Data 1 reception has been completed.
5, 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	FRC	Frame/Wake-up Reception Complete Flag 0: Frame or wake-up reception has not been completed. 1: Frame or wake-up reception has been completed.
0	FTC	Frame/Wake-up Transmission Complete Flag 0: Frame or wake-up transmission has not been completed. 1: Frame or wake-up transmission has been completed.

The RLN3nLST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

HTRC Flag (Successful Header Transmission Flag)

Only 0 can be written to the HTRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The HTRC flag is set to 1 upon completion of header transmission. Here, an interrupt request for RLIN3n transmission is generated if the SHIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

D1RC Flag (Successful Data 1 Reception Flag)

Only 0 can be written to the D1RC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The D1RC flag is set to 1 upon completion of data 1 reception. Here, an interrupt request is not generated. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC

register is 1), write 0 to the bit in LIN operation mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time data 1 of a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

ERR Flag (Error Detection Flag)

The ERR flag is set to 1 upon detection of an error (when at least one of the flags of the RLN3nLEST register is set to 1). Here, an interrupt request for RLIN3n status is generated if the ERRIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the RPER, CSER, FER, FTER, PBER, and BER flags in the RLN3nLEST register in LIN operation mode or LIN wake-up mode. This clears the ERR flag to 0.

FRC Flag (Frame/Wake-up Reception Complete Flag)

Only 0 can be written to the FRC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FRC flag is set to 1 upon completion of frame or wake-up reception. Here, an interrupt request for RLIN3n reception complete is generated if the FRCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be received, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is received. Write 0 before starting reception of the next data group.

FTC Flag (Frame/Wake-up Transmission Complete Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The FTC flag is set to 1 upon completion of frame or wake-up transmission. Here, an interrupt request for RLIN3n transmission is generated if the FTCIE bit in the RLN3nLIE register is 1 (interrupt is enabled). To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.
When response data of 9 bytes or more is to be transmitted, this bit is set to 1 each time a data group (variable from 0 to 8 bytes) is transmitted. Write 0 before starting transmission of the next data group.

16.3.2.15 RLN3nLEST — LIN Error Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	RPER	—	CSER	—	FER	FTER	PBER	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R	R/W	R	R/W	R/W	R/W	R/W

Table 16.26 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	RPER	Response Preparation Error Flag 0: Response preparation error has not been detected. 1: Response preparation error has been detected.
6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	CSER	Checksum Error Flag 0: Checksum error has not been detected. 1: Checksum error has been detected.
4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	FTER	Timeout Error Flag 0: Frame/response timeout error has not been detected. 1: Frame/response timeout error has been detected.
1	PBER	Physical Bus Error Flag 0: Physical bus error has not been detected. 1: Physical bus error has been detected.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode and start of the next communication (when the FTS bit of the RLN3nLTRC register is 1).

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

When the FTS bit in the RLN3nLTRC register is 1 (frame transmission or wake-up transmission/ reception is started), do not write a value to this register.

To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits using the store instruction.

RPER Flag (Response Preparation Error Flag)

Only 0 can be written to the RPER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The RPER flag is set to 1 upon response preparation error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

CSER Flag (Checksum Error Flag)

Only 0 can be written to the CSER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
The CSER flag is set to 1 upon checksum error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FER Flag (Framing Error Flag)

Only 0 can be written to the FER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the value of the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled), the FER flag is set to 1 upon framing error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

FTER Flag (Timeout Error Flag)

Only 0 can be written to the FTER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the FTERE bit of the RLN3nLEDE register is 1 (frame/response timeout error detection enabled), the FTER flag is set to 1 upon frame timeout error or response timeout error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode.

PBER Flag (Physical Bus Error Flag)

Only 0 can be written to the PBER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the PBERE bit of the RLN3nLEDE register is 1 (physical bus error detection enabled), the PBER flag is set to 1 upon physical bus error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

BER Flag (Bit Error Flag)

Only 0 can be written to the BER flag; when 1 is written, the bit retains the value that has been retained before 1 is written.
When the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled), the BER flag is set to 1 upon bit error detection. To clear the bit to 0 before the next communication (when the FTS bit of the RLN3nLTRC register is 1), write 0 to the bit in LIN operation mode or LIN wake-up mode.

16.3.2.16 RLN3nLDFC — LIN Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LSS	FSM	CSM	RFT	RFDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.27 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7	LSS	Transmission/Reception Continuation Select 0: The data group to be transmitted/received next is the last one. 1: The data group to be transmitted/received next is not the last one. (Checksum is not included.)
6	FSM	Frame Separate Mode Select 0: Frame separate mode is not set. 1: Frame separate mode is set.
5	CSM	Checksum Select 0: Classic checksum mode 1: Enhanced checksum mode
4	RFT	Response Field Communication Direction Select 0: Reception 1: Transmission
3 to 0	RFDL[3:0]	Response Field Length Select b3 b0 0 0 0 0: 0 byte (+ checksum) 0 0 0 1: 1 byte (+ checksum) 0 0 1 0: 2 bytes (+ checksum) : 0 1 1 1: 7 bytes (+ checksum) 1 0 0 0: 8 bytes (+ checksum) Settings other than the above are prohibited.

LSS Bit (Transmission/Reception Continuation Select)

The LSS bit indicates that the data group to be transmitted or received next is not the last data group when response data of 9 bytes or more is to be transmitted or received.
With 0 set, data and checksum are transmitted or received because the next data group to be transmitted or received is the last one.
With 1 set, only data is transmitted or received, and the checksum is not included because the next data group to be transmitted or received is not the last one.
Set the LSS bit only when the FSM bit is 1 (frame separate mode) and response data of 9 bytes or more is to be transmitted or received.

Set the LSS bit only when the RTS bit in the RLN3nLTRC is 0 (response transmit/receive is stopped).

FSM Bit (Frame Separate Mode Select)

The FSM bit sets the response communication mode.
With 0 set, frame separate mode is not selected. In this case, after header transmission is started (the FTS bit in the RLN3nLTRC register is 1), response is transmitted/received without setting the RTS bit in the RLN3nLTRC register.

With 1 set, frame separate mode is selected. If the RTS bit of the RLN3nLTRC register is set to 1 during header transmission, response transmission is executed after header transmission is completed.

For response reception which is 8 bytes or less (the RFT bit is 0), set the FSM bit to 0.
When causing a transition to LIN self-test mode, set this bit to 0 before transition.
For details on frame separate mode, see **Section 16.7.3.1, Transmission of LIN Frames**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, set the FSM bit to 1.

CSM Bit (Checksum Select)

The CSM bit sets the checksum mode.
With 0 set, classic checksum mode is selected.
With 1 set, enhanced checksum mode is selected.
When the timeout error is used (the FTERE bit in the RLN3nLEDE register is 1), the specific timeout time depends on the setting of this bit. For details on the bit error, see **Section 16.7.6, Error Status**.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the CSM bit setting after the first data group through the last data group.
During communication of response data of 9 bytes or more, only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

RFT Bit (Response Field Communication Direction Select)

The RFT bit sets the direction of the response field/wake-up signal communication.
With 0 set, reception is performed in the response field. In LIN wake-up mode, wake-up reception is performed (input signal low-level width count).
With 1 set, transmission is performed in the response field. In LIN wake-up mode, wake-up transmission is performed.
Set this bit when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).
When response data of 9 bytes or more is to be transmitted or received, do not change the RFT bit setting after the first data group through the last data group.

RFDL[3:0] Bits (Response Field Length Select)

The RFDL bits set the length of the response field data.
The data length can be 0 to 8 bytes excluding the checksum size.
To transmit response data with the FSM bit set to 0 (not frame separate mode), set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
To transmit response data with the FSM bit set to 1 (frame separate mode), set the RFDL bits before response transmission (the RTS bit in the RLN3nLTRC register is 0).
To receive response data, set the RFDL bits before header transmission (the FTS bit in the RLN3nLTRC register is 0).
When response data of 9 bytes or more is to be transmitted or received, set the RFDL bits before data group transmission/reception (RTS bit in the RLN3nLTRC register is 0).
Only the last data group (the LSS bit is 0) includes the checksum, and no other groups (the LSS bit is 1) include the checksum.

16.3.2.17 RLN3nLIDB — LIN ID Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	IDP1	IDP0	ID[5:0]					
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.28 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7	IDP1	Parity Setting (P1) Sets the parity bits (P1) to be transmitted in the ID field.
6	IDP0	Parity Setting (P0) Sets the parity bits (P0) to be transmitted in the ID field.
5 to 0	ID[5:0]	ID Setting Sets the 6-bit ID value to be transmitted in the ID field.

Set the RLN3nLIDB register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

In LIN self-test mode, this register operates as described below.

Write the value to be transmitted before communication. After completion of frame transmission/ reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

IDP[1:0] Bits (Parity Setting)

The IDP bits set the parity bits (P0 and P1) to be transmitted in the ID field of the LIN frame. IDP0 is for P0 and IDP1 for P1.

Since parity is not automatically calculated, set the calculation result. Note that if the erroneous result is set, it is transmitted as is.

ID[5:0] Bits (ID Setting)

The ID bits set the 6-bit ID value to be transmitted in the ID field of the LIN frame.

16.3.2.18 RLN3nLCBR — LIN Checksum Buffer Register

Access: This register can only be read in 8-bit units. In LIN self-test mode, this register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 16_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CKSM[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.29 RLN3nLCBR Register Contents

Bit Position	Bit Name	Function
7 to 0	CKSM[7:0]	Holds the checksum value transmitted or received.

In LIN mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  The value transmitted can be read. Read the value after transmission is completed.
  Writing to this register is invalid.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  The value received can be read. Read the value after reception is completed.
  Writing to this register is invalid.

In LIN self-test mode, this register operates as follows:

- When the RFT bit in the RLN3nLDFC register is 1 (transmission):
  After completion of the frame transmission (after loopback), the reversed value of the received value can be read.
- When the RFT bit in the RLN3nLDFC register is 0 (reception):
  Write the value to be received before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

Set the RLN3nLCBR register when the FTS bit in the RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted).

When response data of 9 bytes or more is to be transmitted or received, the checksum is appended only to the last data group; this register is not updated for other data groups.

16.3.2.19 RLN3nLDBRb — LIN Data Buffer b Register (b = 1 to 8)

Access: This register can be read/written in 8-bit units.

Address: RLN3nLDBR1: <RLIN3n_base> + 18_H
RLN3nLDBR2: <RLIN3n_base> + 19_H
RLN3nLDBR3: <RLIN3n_base> + $1A_H$
RLN3nLDBR4: <RLIN3n_base> + $1B_H$
RLN3nLDBR5: <RLIN3n_base> + $1C_H$
RLN3nLDBR6: <RLIN3n_base> + $1D_H$
RLN3nLDBR7: <RLIN3n_base> + $1E_H$
RLN3nLDBR8: <RLIN3n_base> + $1F_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	LDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.30 RLN3nLDBRb Register Contents

Bit Position	Bit Name	Function
7 to 0	LDB[7:0]	Sets the data to be transmitted or reads the received data. Setting range: 00_H to FF_H

- For response transmission:
  The LDBRn registers set the data to be transmitted in the response field.
  Use these registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 0 (not frame separate mode)
  - FTS in RLN3nLTRC register is 0 (frame transmission or wake-up transmission/reception is halted)

  or

  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For response reception:
  The LDBRn registers hold the data received in the response field.
  The received data is overwritten. If an error is detected, the data up to the byte in which the error was detected are stored in the register.
  Do not read these registers when the FTS bit is 1 (frame transmission or wake-up transmission/reception is started)
- For transmission of response data of 9 bytes or more:
  Use the LDBRn registers with the following settings.
  - RFT in RLN3nLDFC register is 1 (transmission)
  - FSM in RLN3nLDFC register is 1 (frame separate mode)
  - RTS in RLN3nLTRC register is 0 (response transmission/reception is halted)
- For reception of response data of 9 bytes or more:
  Do not read these registers when the RTS bit is 1 (response transmission/reception is started).

In LIN self-test mode, these registers operate as described below.

Write the value to be transmitted before communication. After completion of frame transmission/reception (after loopback), the reversed value of the received value can be read.

For details about the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

16.3.3 UART Related Registers

16.3.3.1 RLN3nLWBR — LIN Wake-Up Baud Rate Select Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 01_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	NSPB[3:0]				LPRS[2:0]			—
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Table 16.31 RLN3nLWBR Register Contents

Bit Position	Bit Name	Function
7 to 4	NSPB[3:0]	Bit Sampling Count Select b7 b4 0 0 0 0: 16 sampling 0 1 0 1: 6 sampling 0 1 1 0: 7 sampling 0 1 1 1: 8 sampling 1 0 0 0: 9 sampling 1 0 0 1: 10 sampling 1 0 1 0: 11 sampling 1 0 1 1: 12 sampling 1 1 0 0: 13 sampling 1 1 0 1: 14 sampling 1 1 1 0: 15 sampling 1 1 1 1: 16 sampling Settings other than the above are prohibited.
3 to 1	LPRS[2:0]	Prescaler Clock Select b3 b1 0 0 0: 1/1 0 0 1: 1/2 0 1 0: 1/4 0 1 1: 1/8 1 0 0: 1/16 1 0 1: 1/32 1 1 0: 1/64 1 1 1: 1/128
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Set the LN3nLWBR register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

NSPB[3:0] Bits (Bit Sampling Count Select)

The NSPB bits select the number of sampling in one Tbit (reciprocal of the baud rate).
In UART mode, it is possible to set the NSPB bits from 6 sampling to 16 sampling.

LPRS[2:0] Bits (Prescaler Clock Select)

The LPRS bits select the frequency division ratio for the prescaler.

The LIN communication clock source is divided by this prescaler.

16.3.3.2 RLN3nLBRP01 — UART Baud Rate Prescaler 01 Register

Access: RLN3nLBRP01 register can be read/written in 16-bit units.
RLN3nLBRP0 register can be read/written in 8-bit units.
RLN3nLBRP1 register can be read/written in 8-bit units.

Address: RLN3nLBRP01: <RLIN3n_base> + 02_H
RLN3nLBRP0: <RLIN3n_base> + 02_H
RLN3nLBRP1: <RLIN3n_base> + 03_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BRP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.32 RLN3nLBRP01 Register Contents

Bit Position	Bit Name	Function
15 to 0	LBRP0[15:0]	Assuming that the value set in this register is L (0 to 65535), the baud rate prescaler divides the frequency of the prescaler clock by L + 1. Setting range: 0000_H to $FFFF_H$

Set the RLN3nLBRP01 register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

Assuming that the value set in this register is L, the baud rate prescaler divides the frequency of the clock that is selected by the LPRS bits (prescaler clock select bits) in the RLN3nLWBR register by L + 1.

The RLN3nLBRP01 register can be accessed in 8-bit units by the registers RLN3nLBRP0 and RLN3nLBRP1.

16.3.3.3 RLN3nLMD — UART Mode Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 08_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	LRDNFS	—	—	—	LMD[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R	R	R/W	R/W

Table 16.33 RLN3nLMD Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	LRDNFS	UART Reception Data Noise Filter Disable 0: The noise filter is enabled. 1: The noise filter is disabled.
4 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	LMD[1:0]	LIN/UART Mode Select b1 b0 0 1: UART mode

Set the RLN3nLMD register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

LRDNFS Bit (UART Reception Data Noise Filter Disable)

The LRDNFS bit enables or disables the noise filter when receiving data.
With 0 set, the noise filter is enabled when receiving data.
With 1 set, the noise filter is disabled when receiving data.

LMD[1:0] Bits (LIN/UART Mode Select)

The LMD bits select the LIN/UART interface mode.
To use the LIN/UART interface as an UART, set these bits to 01_B.

16.3.3.4 RLN3nLBFC — UART Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 09_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UTPS	URPS	UPS[1:0]		USBLS	UBOS	UBLS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.34 RLN3nLBFC Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	UTPS	UART Output Polarity Switch 0: Transmit data normal output 1: Transmit data inverted output
5	URPS	UART Input Polarity Switch 0: Reception data normal output 1: Reception data inverted output
4, 3	UPS[1:0]	UART Parity Select 00: Parity disabled 01: Even parity 10: 0 Parity 11: Odd parity
2	USBLS	UART Stop Bit length Select 0: Stop bit:1 bit 1: Stop bit: 2 bits
1	UBOS	UART Transfer Format Order Select 0: LSB First 1: MSB First
0	UBLS	UART Character Length Select 0: UART 8 bits communication 1: UART 7 bits communication

Set the RLN3nLBFC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

UTPS Bit (UART Output Polarity Switch)

Sets the output polarity for UART communication.
With 0 set, transmit data is output without inversion.
With 1 set, inverted transmit data is output.
The setting of this bit is valid for all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of URPS bit.

URPS Bit (UART Input Polarity Switch)

Sets the input polarity for UART communication.
With 0 set, receive data is input without inversion.
With 1 set, receive data is input with inversion.
The setting of this bit is valid for all the bits of the UART frame.
In half-duplex communication, this setting should match the setting of UTPS bit.
When setting this bit to “1” and expansion bit reception ((with expansion bit comparison) or (with data

comparison)) is performed, set the UEBDL bit in the RLN3nLUOR1 register and RLN3nLIDB register to the inverses of the expected values to enable comparison of the inverses of the received values.

UPS[1:0] Bits (UART Parity Select)

Sets the UART parity.

- When these bits are set to “00_B”, data is communicated without the parity.

  [Transmission]

  A parity bit is not added to transmit data.

  [Reception]

  Data is received without parity processing. Therefore, a parity error does not occur.

- When these bits are set to “01”, data is communicated with the even parity.

  [Transmission]

  If the number of 1s in transmit data is odd, “1” is added to the parity bit. If the number of 1s in transmit data is even, “0” is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is odd, a parity error occurs.

- When these bits are set to “10”, data is communicated with 0 parity.

  [Transmission]

  Regardless of the number of 1s in transmit data, “0” is added to the parity bit.

  [Reception]

  The value of the parity bit is not judged. Therefore, no parity error occurs.

- When these bits are set to “11”, data is communicated with the odd parity.

  [Transmission]

  If the number of 1s in transmit data is odd, “0” is added to the parity bit. If the number of 1s in transmit data is even, “1” is added to the parity bit.

  [Reception]

  If the number of 1s in receive data including the parity bit is even, a parity error occurs.

USBLS Bit (UART Stop Bit Length Select)

Sets the stop bit length of data for UART communication.
With 0 set, stop bit length of 1 bit is selected.
With 1 set, stop bit length of 2 bits is selected.

UBOS Bit (UART Transfer Format Select)

Sets the bit order of data for UART communication.
With 0 set, LSB first is selected.
With 1 set, MSB first is selected.

UBLS Bit (UART Character Length Select)

Sets the character length of one frame for UART communication.
With 0 set, the character length is 8 bits.
With 1 set, the character length is 7 bits.
When the character length of one frame is 9 bits (the UEBE bit in the RLN3nLUOR1 register is 1), the setting of this bit is ignored.

16.3.3.5 RLN3nLSC — UART Space Configuration Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0A_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	IBS[1:0]		—	—	—	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R	R

Table 16.35 RLN3nLSC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5, 4	IBS[1:0]	Inter-Byte Space Select b5 b4 0 0: 0 Tbit 0 1: 1 Tbit 1 0: 2 Tbits 1 1: 3 Tbits
3 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Set the RLN3nLSC register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

IBS[1:0] Bits (Inter-Byte Space Select)

The IBS bits set the width of the space between the UART frames when transmitting data from the UART buffer. 0 to 3 Tbits can be set.

16.3.3.6 RLN3nLEDE —UART Error Detection Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0D_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FERE	OERE	—	BERE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R	R/W

Table 16.36 RLN3nLEDE Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3	FERE	Framing Error Detection Enable 0: Disables framing error detection. 1: Enables framing error detection.
2	OERE	Overrun Error Detection Enable 0: Disables overrun error detection. 1: Enables overrun error detection.
1	Reserved	When read, the value after reset is read. When writing to this bit, write the value after reset.
0	BERE	Bit Error Detection Enable 0: Disables bit error detection. 1: Enables bit error detection.

Set the RLN3nLEDE register when the OMM0 bit in the RLN3nLMST register is 0_B (LIN reset mode).

FERE Bit (Framing Error Detection Enable)

The FERE bit enables or disables detection of the framing error.
With 0 set, the framing error is not detected.
With 1 set, the framing error is detected.
When this bit is set to 1, the detection result is indicated in the FER flag in the RLN3nLEST register.
For details on the framing error, see **Section 16.8.5, Error Status**.

OERE Bit (Overrun Error Detection Enable)

This bit enables or disables detection of the overrun error.
With 0 set, the overrun error is not detected.
With 1 set, the overrun error is detected.
When this bit is set to 1, the detection result is reflected in the OER flag in the RLN3nLEST register.
For details on the overrun error, see **Section 16.8.5, Error Status**.

BERE Bit (Bit Error Detection Enable)

The BERE bit enables or disables detection of the bit error.
With 0 set, the bit error is not detected.
With 1 set, the bit error is detected.
When this bit is set to 1, the detection result is indicated in the BER flag in the RLN3nLEST register.
In full-duplex communication, do not set this bit to “1”.
Do not set this register when the NSPB bits in the RLN3nLWBR register are 0101_B (6 sampling) and the LRDNFS bit in the RLN3nLMD register is 0 (noise filter is enabled).

For details on the bit error, see **Section 16.8.5, Error Status**.

16.3.3.7 RLN3nLCUC — UART Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + $0E_H$

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 16.37 RLN3nLCUC Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	OM0	LIN Reset 0: LIN reset mode 1: Release from LIN reset mode

After a value is written to this register, confirm that the value written is actually indicated in the RLN3nLMST register before writing another value.

OM0 Bit (LIN Reset)

The OM0 bit selects either a transition to LIN reset mode or release from LIN reset mode.
Setting this bit to 0 causes a transition to LIN reset mode.
Setting it to 1 leads to release from LIN reset mode.

16.3.3.8 RLN3nLTRC — UART Transmission Control Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	RTS	—
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R

Table 16.38 RLN3nLTRC Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	RTS	UART Buffer Transmission Start 0: UART Buffer transmission is stopped. 1: UART Buffer transmission is started.
0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

RTS Bit (UART Buffer Transmission Start)

When transmitting data from the UART buffer, set this bit to “1”.
Only 1 can be written to this bit; 0 cannot be written.
Write to this bit when the UTOE bit in the RLN3nLUOER register is 1 (transmission enabled) and the UTS bit in the RLN3nLST register is 0 (transmission is not in progress).
Once set, regardless of errors, this bit is automatically cleared to 0 upon completion of the number of data transmission specified by the MDL bit in the RLN3nLDFC register. This bit is also automatically cleared to 0 upon transition to LIN reset mode.
Writing a value to this bit is disabled when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
When writing 1 to this bit while the UTSW bit in the RLN3nLRFC register is 1 (when UART buffer transmission is requested, the start of transmission is delayed until the stop bit of reception data is completed), write only during the reception of the stop bit.

16.3.3.9 RLN3nLMST — UART Mode Status Register

Access: This register can only be read in 8-bit units

Address: <RLIN3n_base> + 11_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	OMM0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 16.39 RLN3nLMST Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	OMM0	LIN Reset Status Monitor 0: LIN reset mode 1: Not in LIN reset mode

OMM0 Bit (LIN Reset Status Monitor)

The OMM0 bit indicates the current operating mode.

16.3.3.10 RLN3nLST — UART Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 12_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	URS	UTS	ERR	—	—	FTC
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 16.40 RLN3nLST Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	URS	Data Reception Status 0: Reception is not operated. 1: Reception is operated.
4	UTS	Transmission Status 0: Transmission is not operated. 1: Transmission is operated.
3	ERR	Error Detection Flag 0: No error has been detected. 1: Error has been detected.
2, 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	FTC	Successful UART Buffer Transmission Flag 0: UART buffer transmission has not been completed. 1: UART buffer transmission has been completed.

The RLN3nLST register is automatically cleared to “00_H” upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains “00_H”. To clear the specific bits in the register, write 0 to the bits to be cleared and write 1 to the other bits by using the store instruction.

URS Bit (Data Reception Status)

At the start of the reception, this flag is set to 1.
The reception is started under the following condition.

- When the start bit is detected

At the end of reception, this flag is cleared to 0. While reception is stopped, this flag retains 0.
The reception is ended under the following condition.

- Sampling point of the first bit of the stop bits

UTS Bit (Transmission Status Flag)

At the start of the transmission, this flag is set to 1. During the transmission, this flag retains 1.
The transmission is started under the following conditions.

- When transmission data is set to the RLN3nLUTDR or RLN3nLUWTDR register
- When the RTS bit in the RLN3nLTRC register is set to 1

This flag is cleared to 0 at the end of transmission.
The transmission is ended under the following conditions.

- When transmission of data set in the RLN3nLUTDR or RLN3nLUWTDR register is completed and next data is not set
- When transmission from UART buffer is completed (when the RTS bit in the RLN3nLTRC register is cleared to 0)

ERR Flag (Error Detection Flag)

This flag is set to 1 upon detection of an error, detection of an expansion bit, or upon ID matching (when at least one of the flags of the RLN3nLEST register is 1). At this time, an interrupt request for RLIN3n status is generated. However, when this bit is 1, an interrupt is not generated upon detection of an error, detection of an expansion bit, or upon ID matching. To clear the bit to 0, write 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register.

FTC Flag (Successful UART Buffer Transmission Flag)

Only 0 can be written to the FTC flag; when 1 is written, the bit retains the value that it was before 1 was written.
Regardless of errors, this bit is set to 1 upon completion of transmission of the number of data specified by the MDL bit in the RLN3nLDFC register from the UART buffer. At this time, an interrupt request for RLIN3n transmission is generated. Write 0 to clear this flag.

16.3.3.11 RLN3nLEST — UART Error Status Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 13_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	UPER	IDMT	EXBT	FER	OER	—	BER
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R/W	R/W	R/W	R/W	R/W	R	R/W

Table 16.41 RLN3nLEST Register Contents

Bit Position	Bit Name	Function
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	UPER	Parity Error Flag 0: Parity error has not been detected. 1: Parity error has been detected.
5	IDMT	ID Matching Flag 0: The receive data does not match with the ID value. 1: The receive data matches with the ID value.
4	EXBT	Expansion Bit Detection Flag 0: Expansion bit has not been detected. 1: Expansion bit has been detected.
3	FER	Framing Error Flag 0: Framing error has not been detected. 1: Framing error has been detected.
2	OER	Overrun Error Flag 0: Overrun error has not been detected. 1: Overrun error has been detected.
1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	BER	Bit Error Flag 0: Bit error has not been detected. 1: Bit error has been detected.

The RLN3nLEST register is automatically cleared to 00_H upon transition to LIN reset mode. In LIN reset mode, this register cannot be written to, and the value of 00_H is held. To clear certain bits in this register, write 0 to those bits, and write 1 to the bits not to be cleared by using the store instruction.

UPER Flag (Parity Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

This flag is set to 1 upon parity error detection. Write 0 to clear this flag.

IDMT Flag (ID Matching Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.

The IDMT flag becomes 1 when all the following conditions are met:

- The UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enabled)
- The UECD bit in the RLN3nLUOR1 register is 0 (expansion bit comparison enabled)

- The UEBDCE bit in the RLN3nLUOR1 register is 1 (data comparison after expansion bit is detected)
  - The received expansion bit and the value of the UEBDL bit of the RLN3nLUOR1 register match.
  - The value of the 8-bit of the received data excluding the expansion bit and the value of the RLN3nLIDB register match.

Write 0 to clear this flag.

EXBT Flag (Expansion Bit Detection Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.
When the UEBE bit in the RLN3nLUOR1 register is 1 (expansion bit enable), if the received expansion bit matches the UEBDL bit in the RLN3nLUOR1 register, this flag is set to 1.
Write 0 to clear this flag.

FER Flag (Framing Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.
The FER flag is set to 1 upon framing error detection while the FERE bit of the RLN3nLEDE register is 1 (framing error detection enabled). Write 0 to clear this flag.

OER Flag (Overrun Error Flag)

Only 0 can be written to this flag; when 1 is written, the bit retains the value that it was before 1 was written.
The OER flag is set to 1 upon overrun error detection while the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). Write 0 to clear this flag.

BER Flag (Bit Error Flag)

Only 0 can be written to the this flag; when 1 is written, the bit retains the value that it was before 1 was written.
The BER flag is set to 1 when the transmitted data and the data monitored by the receive pin do not match while the BERE bit of the RLN3nLEDE register is 1 (bit error detection enabled).
Write 0 to clear this flag.

16.3.3.12 RLN3nLDFC — UART Data Field Configuration Register

Access: This register can be read/written in 8-bit units.

Address: <RLIN3n_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	UTSW	—	MDL[3:0]			
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R	R/W	R/W	R/W	R/W

Table 16.42 RLN3nLDFC Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5	UTSW	Transmission Start Wait 0: When UART buffer transmission is requested, transmission is started immediately. 1: When UART buffer transmission is requested, transmission is not started until reception of the stop bit is completed.
4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	MDL[3:0]	UART Buffer Data Length Select b3 b0 0 0 0 0: 9 data 0 0 0 1: 1 data 0 0 1 0: 2 data 0 0 1 1: 3 data 0 1 0 0: 4 data 0 1 0 1: 5 data 0 1 1 0: 6 data 0 1 1 1: 7 data 1 0 0 0: 8 data 1 0 0 1: 9 data Settings other than the above are prohibited.

UTSW Bit (Transmission Start Wait)

This bit controls the transmission start timing of UART buffer.
With 0 set, transmission is started as soon as the start of UART buffer transmission is requested.
With 1 set, transmission is started after the completion of the stop bit reception.
Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.
This bit is enabled when the RTS bit in the RLN3nLTRC register is set to 1. In addition, writing a value to this bit is disabled when the RTS bit is 1 (UART buffer transmission started).
Set this bit to 1 only to switch from reception to transmission in half-duplex communication.

MDL[3:0] Bits (UART Buffer Data Length Select)

These bits specify the data length of the UART buffer.
Writing a value to these bits is disabled when the RTS bit in the RLN3nLTRC register is 1 (UART buffer transmission started).

16.3.3.13 RLN3nLIDB — UART ID Buffer Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 15_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	ID[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.43 RLN3nLIDB Register Contents

Bit Position	Bit Name	Function
7 to 0	ID[7:0]	ID value that is referred for the expansion bit data comparison is set

ID Bits (ID Bits)

When the UEBE bit in the RLN3nLUOR1 register is set to 1 (expansion bit enabled), the UECD bit is set to 0 (expansion bit comparison enabled), and the UEBDCE bit is set to 1 (data comparison after expansion bit is detected), set the value to be compared with the received data. Write to the RLN3nLIDB register when the URS bit in the RLN3nLST register is 0 (receive operation is not in progress).

16.3.3.14 RLN3nLUDB0 — UART Data Buffer 0 Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 17_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	UDB[7:0]							
Value after reset	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.44 RLN3nLUDB0 Register Contents

Bit Position	Bit Name	Function
7 to 0	UDB[7:0]	Sets the data to be UART transmitted.

When transmitting 9-byte data from the UART buffer (the RLN3nLDFC.MDL bit is 0_H or 9_H), set the first data to be transmitted.

Write to the RLN3nLUDB0 register when the RTS bit of the RLN3nLTRC register is 0 (UART buffer transmission stopped).

Table 16.45, Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format, shows the bit arrangement according to the set communication format.

For details about the UART buffer, see **Section 16.8.1.2, UART Buffer Transmission**, **(1) UART Buffer Transmission**.

Table 16.45 Bit Arrangement of the RLN3nLUDB0 Register According to Each Communication Format

	RLN3nLUDB0

16.3.3.16 RLN3nLUOER — UART Operation Enable Register

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 20_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	UROE	UTOE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W

Table 16.48 RLN3nLUOER Register Contents

Bit Position	Bit Name	Function
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	UROE	Reception Enable 0: Disables reception. 1: Enables reception.
0	UTOE	Transmission Enable 0: Disables transmission. 1: Enables transmission.

The RLN3nLUOER register is automatically cleared to 00_H upon transition to LIN reset mode.

In LIN reset mode, this register cannot be written to. In LIN reset mode, the register retains 00_H.

UROE Bit (Reception Enable)

The UROE bit enables or disables reception.
With 0 set, reception is disabled.
With 1 set, reception is enabled.
Do not clear this bit during reception. If the communication is suspended during reception, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the transmit operation is also suspended at this time.
When the UART buffer transmits data, do not set this bit to 1.

UTOE Bit (Transmission Enable)

The UTOE bit enables or disables transmission.
With 0 set, transmission is disabled.
With 1 set, transmission is enabled.
Do not clear this bit during transmission. If the communication is suspended during transmission, set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) to shift to the LIN reset mode. However, the receive operation is also suspended at this time.

16.3.3.17 RLN3nLUOR1 — UART Option Register 1

Access: This register can be read/written in 8-bit units

Address: <RLIN3n_base> + 21_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	UECD	UTIGTS	UEBDCE	UEBDL	UEBE
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Table 16.49 RLN3nLUOR1 Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	UECD	Expansion Bit Comparison Disable 0: Enables expansion bit comparison. 1: Disables expansion bit comparison.
3	UTIGTS	Transmission Interrupt Generation Timing Select 0: Transmission interrupt is generated at the start of transmission. 1: Transmission interrupt is generated at the completion of transmission.
2	UEBDCE	Expansion Bit Data Comparison Enable 0: Disables data comparison after an expansion bit is detected. 1: Enables data comparison after an expansion bit is detected.
1	UEBDL	Expansion Bit Detection Level Select 0: Selects expansion bit value 0 as the expansion bit detection level. 1: Selects expansion bit value 1 as the expansion bit detection level.
0	UEBE	Expansion Bit Enable 0: Disables expansion bit operation. 1: Enables expansion bit operation.

UECD Bit (Expansion Bit Comparison Disable)

The UECD bit enables or disables comparison between the received expansion bit and the UEBDL bit value when the UEBE bit is 1 (expansion bit operation is enabled).
With 0 set, comparison between the received expansion bit and the UEBDL bit value is enabled when the expansion bit is received.
With 1 set, comparison between the received expansion bit and the UEBDL bit value is disabled when the expansion bit is received.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.
Do not set this bit to 1 when the UEBDCE bit is 1 (data comparison after expansion bit is detected).

UTIGTS Bit (Transmission Interrupt Generation Timing Select)

The UTIGTS bit sets the generation timing of the transmission interrupt.
With 0 set, the transmission interrupt is generated at the start of transmission.
With 1 set, the transmission interrupt is generated at the completion of transmission.
When transmission from the UART buffer is performed with 0 set, the transmission interrupt is generated only at the start of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.
When transmission from the UART buffer is performed with 1 set, the transmission interrupt is

generated only at the completion of the transmission of the last data of the data length set with the MDL bits in the RLN3nLDFC register.

UEBDCE Bit (Expansion Bit Data Comparison Enable)

After an expansion bit is detected, this bit enables or disables the comparison between the 8-bit receive data excluding the expansion bit and the value of the RLN3nLIDB register.
With 0 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is disabled.
With 1 set, when the level selected by the UEBDL bit is detected as an expansion bit, the comparison between the received value in the RLN3nLURDR register and the value of the RLN3nLIDB register is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UEBE bit is 0 (expansion bit operation disabled).
Do not set this bit to 1 when the UECD bit is 1 (expansion bit comparison disabled).
Do not set this bit to 1 when the UART buffer is used.

UEBDL Bit (Expansion Bit Detection Level Select)

The UEBDL bit sets the level to be detected as the expansion bit when the UEBE bit is 1 (expansion bit operation is enabled) and the UECD bit is 0 (comparison of the expansion bit is enabled).
With 0 set, expansion bit value 0 is the level to be detected as the expansion bit.
With 1 set, expansion bit value 1 is the level to be detected as the expansion bit.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

UEBE Bit (Expansion Bit Enable Bit)

The UEBE bit enables or disables expansion bit operation.
With 0 set, expansion bit operation is disabled.
With 1 set, expansion bit operation is enabled.
Set this bit when the OMM0 bit of the RLN3nLMST register is 0_B (LIN reset mode).
Do not set this bit to 1 when the UART buffer is used.

16.3.3.18 RLN3nLUTDR — UART Transmission Data Register

Access: RLN3nLUTDR register can be read/written in 16-bit units.
RLN3nLUTDRL register can be read/written in 8-bit units.
RLN3nLUTDRH register can be read/written in 8-bit units.

Address: RLN3nLUTDR: <RLIN3n_base> + 24_H
RLN3nLUTDRL: <RLIN3n_base> + 24_H
RLN3nLUTDRH: <RLIN3n_base> + 25_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.50 RLN3nLUTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8 to 0	UTD[8:0]	Sets the data to be transmitted. Setting range: 000_H to $1FF_H$

The RLN3nLUTDR register sets the data to be transmitted from the transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

This register can be accessed in 8 bits.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

Also, do not write data to this register when a transmission request is being generated due to write access to the RLN3nLUWTDR register.

When transmitting data continuously, do not set another piece of transmission data in this register before the generation of transmission interrupt.

The table below shows the bit arrangement according to the set communication format.

Table 16.51 Bit Arrangement of the RLN3nLUTDR Register According to Each Communication Format

	RLN3nLUTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0

16.3.3.19 RLN3nLURDR — UART Reception Data Register

Access: RLN3nLURDR register can only be read in 16-bit units.
RLN3nLURDRL register can only be read in 8-bit units.
RLN3nLURDRH register can only be read in 8-bit units.

Address: RLN3nLURDR: <RLIN3n_base> + 26_H
RLN3nLURDRL: <RLIN3n_base> + 26_H
RLN3nLURDRH: <RLIN3n_base> + 27_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	URD [8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 16.52 RLN3nLURDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is read.
8 to 0	URD [8:0]	Stores the received data Storing range: 000_H to $1FF_H$

The RLN3nLURDR allows the reception data to be read from the receive data register.

When the UROE bit in the RLN3nLUOER register is 1, the reception data is stored in this register and can be read out.

This register is updated when the stop bit of the receive data is received.

This register is also updated when an error is caused by the parity or stop bit.

However, the value of this register is not updated upon occurrence of an overrun error when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). The value of this register is updated upon occurrence of an overrun error when the OERE bit is 0 (overrun error detection disabled).

Read this register upon occurrence of a receive error (overrun error, framing error, parity error) when the OERE bit of the RLN3nLEDE register is 1 (overrun error detection enabled). If the next data is received without reading this register, an overrun error occurs.

This register can be accessed in 8 bits.

However, during expansion bit use (UEBE bit of the RLN3nLUOR1 register is 1 (expansion bit operation enabled), do not attempt 8-bit access.

The table below shows the bit arrangement according to the set communication format.

Table 16.53 Bit Arrangement of the RLN3nLURDR Register According to Each Communication Format

16.3.3.20 RLN3nLUWTDR — UART Wait Transmission Data Register

Access: RLN3nLUWTDR register can be read/written in 16-bit units.
RLN3nLUWTDRL register can be read/written in 8-bit units.
RLN3nLUWTDRH register can be read/written in 8-bit units.

Address: RLN3nLUWTDR: <RLIN3n_base> + 28_H
RLN3nLUWTDRL: <RLIN3n_base> + 28_H
RLN3nLUWTDRH: <RLIN3n_base> + 29_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	UWTD[8:0]								
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 16.54 RLN3nLUWTDR Register Contents

Bit Position	Bit Name	Function
15 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8 to 0	UWTD[8:0]	Sets the data to be transmitted from the wait transmit data register after waiting for the stop bit reception to be completed. Setting range: 000_H to $1FF_H$

The RLN3nLUWTDR register sets the data to be transmitted from the UART wait transmit data register.

Writing data to this register with the UTOE bit in the RLN3nLUOER register set to 1 starts transmission.

Use this register only to switch from reception to transmission in half-duplex communication.

The user should write to this register only while the stop bit is being received.

Note that the wait time is only 1 bit even if the stop bit length is set to 2 bits with the USBLS bit in the RLN3nLBFC register.

When this register is read, the RLN3nLUTDR register value is actually read.

In 9-bit communication mode, do not attempt 8-bit access.

Do not write data to this register when data transmission from the UART buffer is in progress.

The table below shows the bit arrangement according to the set communication format.

Table 16.55 Bit Arrangement of the RLN3nLUWTDR Register According to Each Communication Format

	RLN3nLUWTDR								
	b8	b7	b6	b5	b4	b3	b2	b1	b0
7-bit; LSB first	—	—	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0

9-bit; LSB first	Bit8	Bit7	Bit6	Bit5	Bit4	Bit3	Bit2	Bit1	Bit0
9-bit; MSB first	Bit0	Bit1	Bit2	Bit3	Bit4	Bit5	Bit6	Bit7	Bit8

16.4 Interrupt Sources

The LIN/UART interface generates three types of interrupt requests.

- RLIN3n successful transmission interrupt
- RLIN3n successful reception interrupt
- RLIN3n status interrupt

When the LIOS bit in the RLN3nLMD register is set to 0, no interrupt occurs.

Setting the LIOS bit in the RLN3nLMD register to 1 allows to output the RLIN3n transmission interrupt, RLIN3n successful reception interrupt, or RLIN3n status interrupt depending on the interrupt source.

Table 16.56 lists the sources for each interrupt.

Table 16.56 Interrupt Sources

		LIOS bit in RLN3nLMD register is 1*[1]		
		RLIN3n Transmission Interrupt	**RLIN3n Successful Reception Interrupt**	**RLIN3n Status Interrupt**
LIN mode	LIN master mode	• Successful frame transmission • Successful wake-up transmission • Successful header transmission	• Successful wake-up reception • Successful wake-up reception	• Bit error • Physical bus error • Frame/response timeout error • Framing error • Checksum error • Response preparation error
UART mode		• Transmission start/ successful transmission	• Successful reception • Expansion bit mismatch	• Bit error • Overrun error • Framing error • Expansion bit match • ID match • Parity error

Note 1. The LIOS bit setting is valid in LIN Mode. In UART mode, setting the LIOS bit is not required.

In LIN mode, each interrupt request is output when the corresponding bit in the RLN3nLIE register is 1 (interrupt is enabled) and the corresponding flag in the RLN3nLST register is 1.

16.5 Modes

The LIN/UART interface provides the following four modes, depending upon the specific function to be performed:

- LIN reset mode
- LIN mode
  - LIN master mode
- UART mode
- LIN self-test mode

In LIN reset mode, clock supply to the LIN/UART interface stops. This enables to reduce power consumption.

Figure 16.2 shows mode transitions. **Table 16.57** describes mode transition conditions. **Table 16.58** lists operations available in each mode.

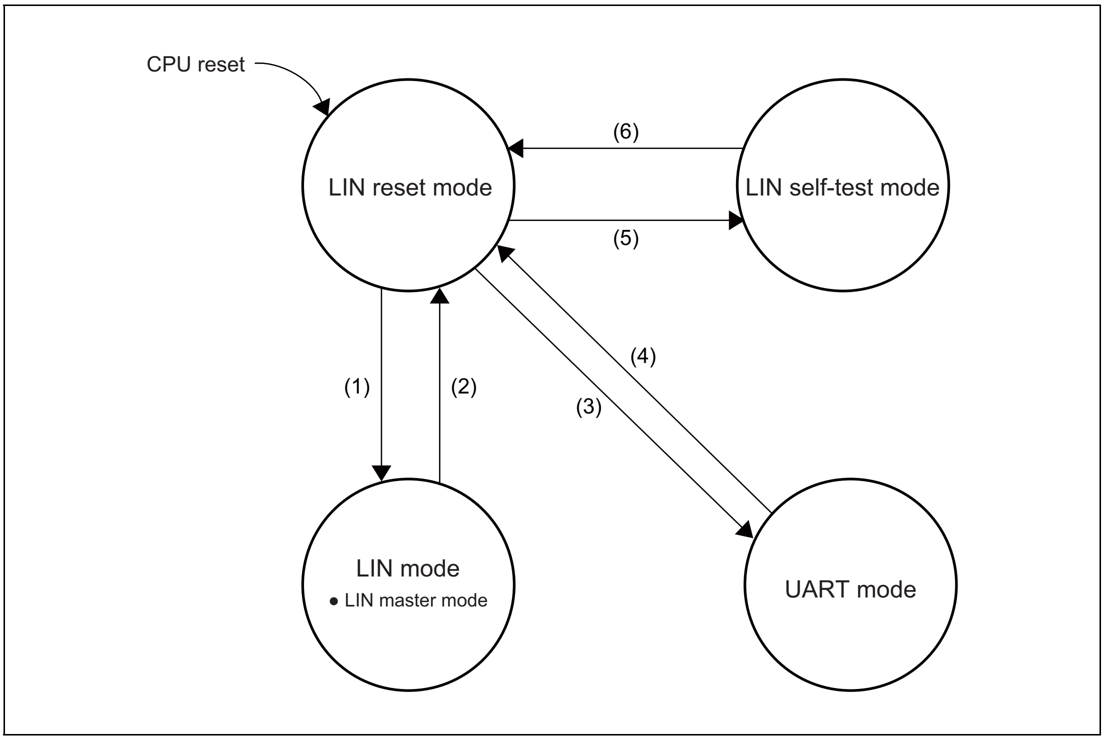

Figure 16.2 Mode Transitions

Table 16.57 Transition Condition of Each Mode

	Transition Mode			Transition Condition
(1)	LIN reset mode	→	LIN mode • LIN master mode	• LMD bits in the RLN3nLMD register = 00_B and OM1 and OM0 bits in the RLN3nLCUC register = 01_B or 11_B
(2)	LIN mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(3)	LIN reset mode	→	UART mode	LMD bits in RLN3nLMD register = 01_B and OM0 bit in RLN3nLCUC register = 1_B
(4)	UART mode	→	LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(5)	LIN reset mode	→	LIN self-test mode	See **Section 16.9, LIN Self-Test Mode**.
(6)	LIN self-test mode	→	LIN reset mode	See **Section 16.9, LIN Self-Test Mode**.

Table 16.58 Operations Available in Each Mode

LIN Mode		
LIN Master Mode	**UART Mode**	**LIN Self-Test Mode**
Header transmission Response transmission Response reception Wake-up transmission Wake-up reception Error detection	UART transmission UART reception Error detection	Self test

Whether mode has transitioned to LIN reset mode, the LIN mode, or the UART mode can be verified by reading the LMD bits in the RLN3nLMD register and the OMM0 bit in the RLN3nLMST register.

For a description of the LIN self-test mode, see **Section 16.9, LIN Self-Test Mode**.

16.6 LIN Reset Mode

Setting the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode) causes a transition to LIN reset mode. The change to LIN reset mode can be verified by determining that the OMM0 bit in the RLN3nLMST register has been set to 0 (LIN reset mode). In this mode, the LIN communication and the UART communication functions are halted.

From LIN reset mode, transitions to LIN mode, UART mode, and LIN self-test mode can be made.

When the mode changes to LIN reset mode, the following registers are initialized to their reset values, and as long as LIN reset mode is in effect, they retain their initial values.

- RLN3nLTRC register
- RLN3nLST register
- RLN3nLEST register
- RLN3nLUOER register

The following registers retain their previous values even when a transition to LIN reset mode is made:

- RLN3nLWBR register
- RLN3nLBRP0 register
- RLN3nLBRP1 register
- RLN3nLMD register
- RLN3nLBFC register
- RLN3nLSC register
- RLN3nLWUP register
- RLN3nLIE register
- RLN3nLEDE register
- RLN3nLDFC register
- RLN3nLIDB register
- RLN3nLCBR register
- RLN3nLUDB0 register
- RLN3nLDBRb register (b = 1 to 8)
- RLN3nLUOR1 register
- RLN3nLUTDR register
- RLN3nLURDR register
- RLN3nLUWTDR register

16.7 LIN Mode

LIN mode can operate in LIN master mode.

In LIN master mode, the following operations can be performed: header transmission, response transmission, response reception, wake-up transmission, wake-up reception, and error detection. In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 00_B (LIN master mode) and the OM1 and OM0 bits in the RLN3nLCUC register to either 01_B or 11_B sets LIN master mode, turning the OMM1 and OMM0 bits in the RLN3nLMST register to either 01_B to 11_B.

When changing a submode to another submode within LIN mode, a transition to LIN reset mode should first be made and change the LMD bits in the RLN3nLMD register.

The LIN mode provides the following two operation modes:

- LIN operation mode
- LIN wake-up mode

Figure 16.3 shows the transition of operation modes. **Table 16.59** describes the transition conditions of operation modes.

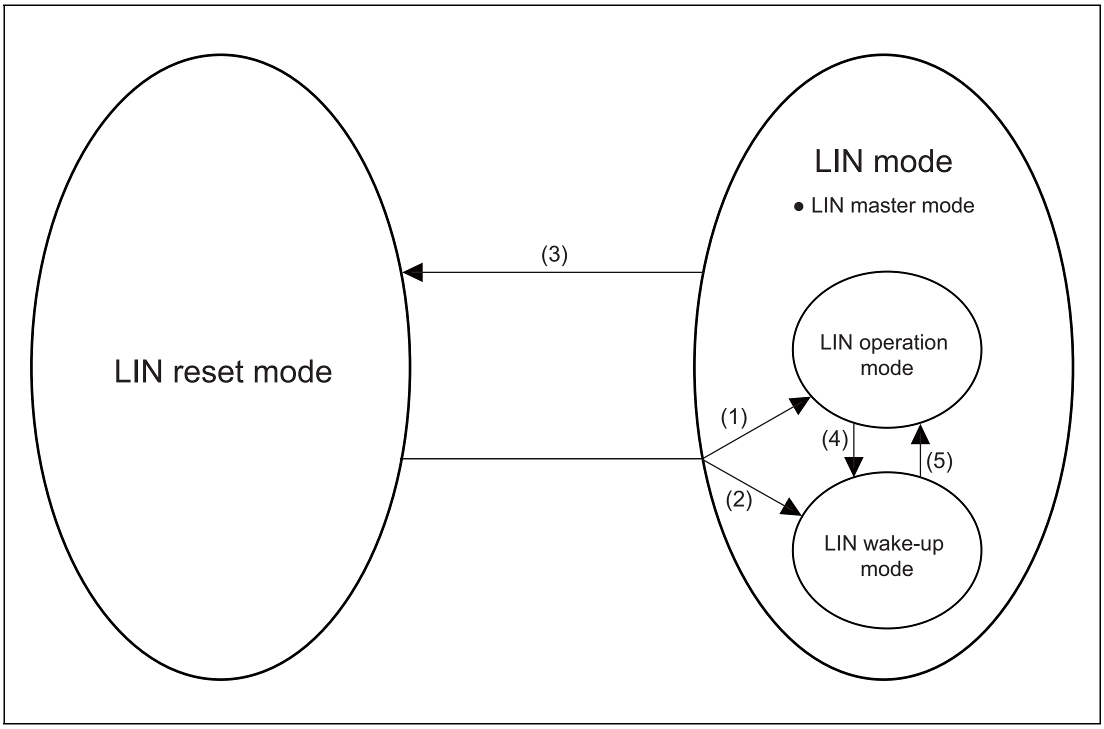

Figure 16.3 Transition of Operation Modes

Table 16.59 Transition Condition for Operation Mode

	Operation Mode Transition		Transition Condition
(1)	LIN reset mode	→ LIN mode • LIN operation mode	LMD bits in RLN3nLMD register = 00_B and OM1 and OM0 bits in RLN3nLCUC register = 11_B
(2)	LIN reset mode	→ LIN mode • LIN wake-up mode	LMD bits in RLN3nLMD register = 00_B and OM1 and OM0 bits in RLN3nLCUC register = 01_B
(3)	LIN mode • LIN operation mode • LIN wake-up mode	→ LIN reset mode	OM0 bit in RLN3nLCUC register = 0_B
(4) *1	LIN mode • LIN operation mode	→ LIN mode • LIN wake-up mode	OM1 and OM0 bits in RLN3nLCUC register = 01_B
(5) *1	LIN mode • LIN wake-up mode	→ LIN mode • LIN operation mode	OM1 and OM0 bits in RLN3nLCUC register = 11_B

Note 1. Transition between LIN operation mode and LIN wake-up mode cannot be made when communication is in progress (when the FTS bit in the RLN3nLTRC register is 1).

(1) LIN Operation Mode

In LIN operation mode, frame processing (header transmission, header reception, response transmission, response reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 11_B changes the mode to LIN operation mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 11_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 11_B.

(2) LIN Wake-up Mode

In LIN wake-up mode, wake-up signal processing (wake-up transmission, wake-up reception, and error detection) can be performed.

During a transition from LIN reset mode to LIN mode, setting the OM1 and OM0 bits in the RLN3nLCUC register to 01_B changes the mode to LIN wake-up mode, changing the OMM1 and OMM0 bits in the RLN3nLMST register to 01_B. Communication settings should be performed after the OMM1 and OMM0 bits have become 01_B.

16.7.1 LIN Master Mode

16.7.1.1 Header Transmission

Figure 16.4 shows the operation of the LIN/UART interface (LIN master mode) in header transmission. **Table 16.60** describes the processing in header transmission.

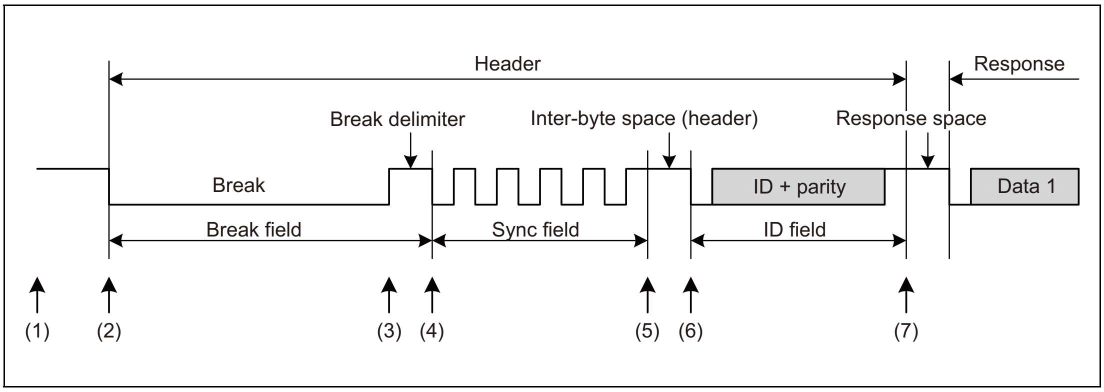

Figure 16.4 Operation in Header Transmission

Table 16.60 Processing in Header Transmission

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables interrupt • Enables error detection • Sets frame configuration parameters • Changes the LIN/UART interface to the LIN master mode: LIN operation mode • Sets information on the frame to be transmitted (ID, parity, data length, response direction, checksum method, and transmission data)	Waits for the setting of the FTS bit in the RLN3nLTRC register by software (idle)
(2)	Sets the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started)	Transmits a break.
(3)	Waits for an interrupt request	Transmits a break delimiter.
(4)		Transmits a sync field (55_H).
(5)		Transmits an inter-byte space (header).
(6)		Transmits an ID field.
(7)		Sets a successful header transmission flag.

NOTE

For information about error detection conditions, see **Section 16.7.6, Error Status**.

16.7.1.2 Response Transmission

Figure 16.5 shows the operation of the LIN/UART interface (LIN master mode) in response transmission. **Table 16.61** describes the processing in response transmission.

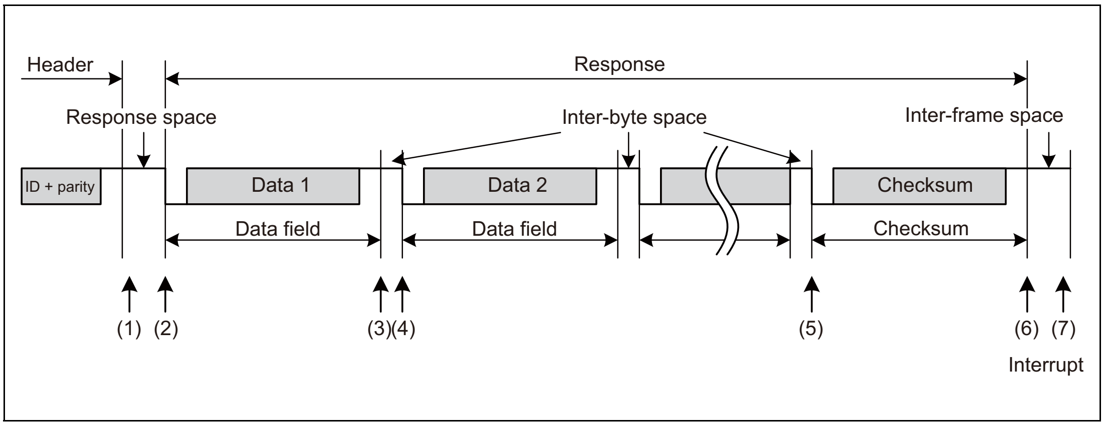

Figure 16.5 Operation in Response Transmission

Table 16.61 Processing in Response Transmission

	Software Processing	LIN/UART Interface Processing
(1)	[When in frame separate mode] • Sets the RTS bit in the RLN3nLTRC register to 1 (response transmission/ reception started) [When not in frame separate mode] • Waits for an interrupt request	[When in frame separate mode] • Waits for the setting of the RTS bit in the RLN3nLTRC register to 1 by software. • When the bit is set to 1, sends a response space. [When not in frame separate mode] • Sends a response space.
(2)	Waits for an interrupt request	Transmits data 1.
(3)		Transmits an inter-byte space.
(4)		• Transmits data 2. • Transmits an inter-byte space • Transmits data 3. • Transmits an inter-byte space (The transmission of an inter-byte space is repeated as many times as the data length specified in bits RFDL[3:0] in the RFC register. This is halted if the BER flag in the RLN3nLEST register is 1 (detection of a bit error). Process (5), checksum transmission, does not proceed if an error occurs). : :
(5)		Transmits the checksum.
(6)		• Sets a successful frame/wake-up transmission flag. Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped) [When in frame separate mode] • Set the RTS bit in the RLN3nLTRC register to 0 (response transmission/reception stopped).
(7)	• Processing after communication Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection conditions, see **Section 16.7.6, Error Status**.

16.7.1.3 Response Reception

Figure 16.6 shows the operation of the LIN/UART interface (LIN master mode) in response reception. **Table 16.62** describes the processing in response reception.

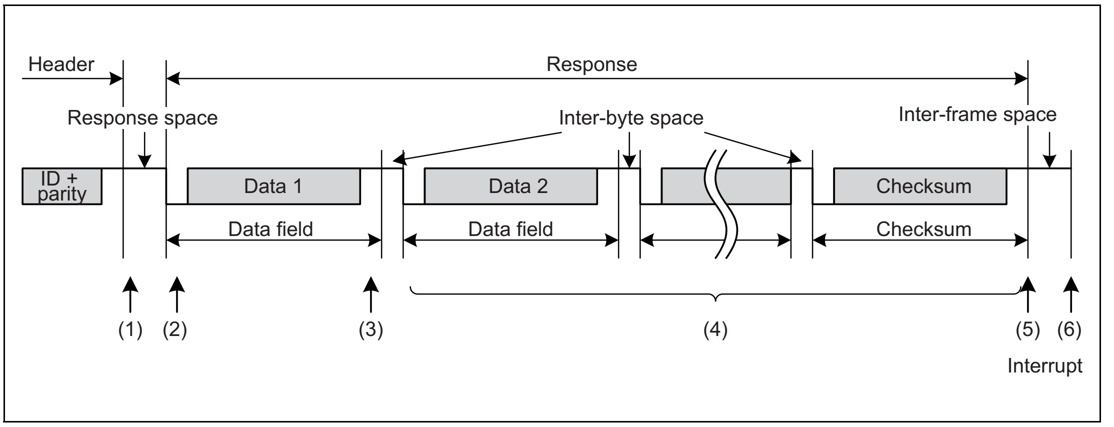

Figure 16.6 Operation in Response Reception

Table 16.62 Processing in Response Reception

	Software Processing	LIN/UART Interface Processing
(1)	Waits for an interrupt request (no processing)	Waits for detection of a start bit.
(2)		Receives data 1 when the start bit is detected.
(3)		Sets the successful data 1 reception flag.
(4)		• Receives data 2 when the start bit is detected. • Receives data 3 when the start bit is detected. (The transmission of an inter-byte space is repeated as many times as the data length specified in bits RFDL[3:0] in the RLN3nLDFC register. This is halted if any bit in the RLN3nLEST register is 1 (detection of any error). Process (5), checksum transmission, does not proceed if an error occurs). : : • Receives the checksum when the start bit is detected.
(5)		• Determines the checksum. • Sets the successful frame/wake-up reception flag. • Sets the FTS bit in the RLN3nLTRC register to 0 (frame transmission or wake-up transmission/reception stopped).
(6)	• Processing after communication Reads the received data. Checks the RLN3nLST register, and clears flags.	Idle

NOTE

For information about error detection, see **Section 16.7.6, Error Status**.

16.7.2 Data Transmission/Reception

16.7.2.1 Data Transmission

One bit of data is transmitted per 1 Tbit.

The data that is transmitted returns to the reception data input pin via the LIN transceiver. The received data and the transmitted data are compared bit by bit, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 16.7.6, Error Status**).

In LIN master mode, 1 Tbit is generated to be 16/fLIN, and thus the sampling point for received data is at the 13th clock cycle (81.25% position).

Figure 16.7 shows an example of data transmission timing.

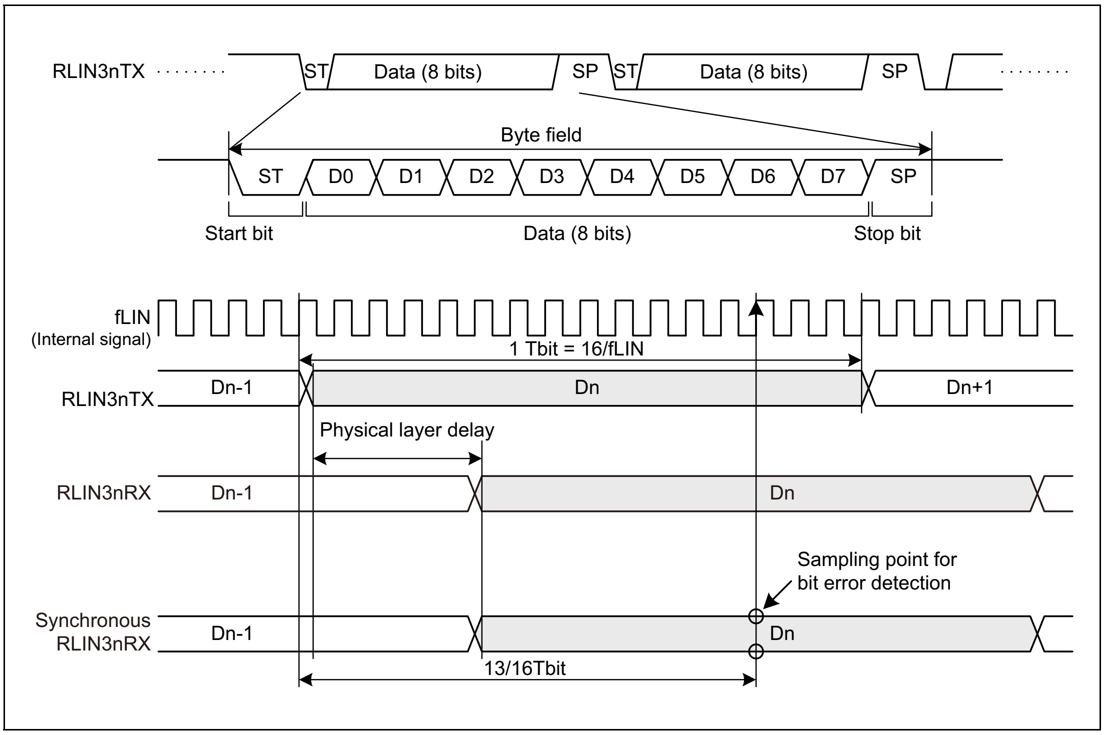

Figure 16.7 Example of Data Transmission Timing (LIN Master Mode)

16.7.2.2 Data Reception

Data reception is performed by using the synchronized RLIN3nRX signal (an internal signal) that is the input from the RLIN3nRX pin synchronized with prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, sampling is performed again 0.5 Tbit later, and the falling edge is recognized as a start bit if the synchronized RLIN3nRX signal is low level. The falling edge is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected on re-sampling.

After the start bit is detected, the system samples 1 bit per Tbit.

The LIN/UART interface has a noise filter function for reception data. If the LRDNFS bit in the RLN3nLMD register is 0, the LIN/UART interface uses a noise filter, and the value determined by a 3-sampling majority rule on prescaler clocks is used as the sampling value. If the LRDNFS bit in the RLN3nLMD register is 1, the LIN/UART interface does not use a noise filter, and the value of the synchronized RLIN3nRX value at the sampling position is used as the sampling value.

Figure 16.8 shows an example of data reception timing.

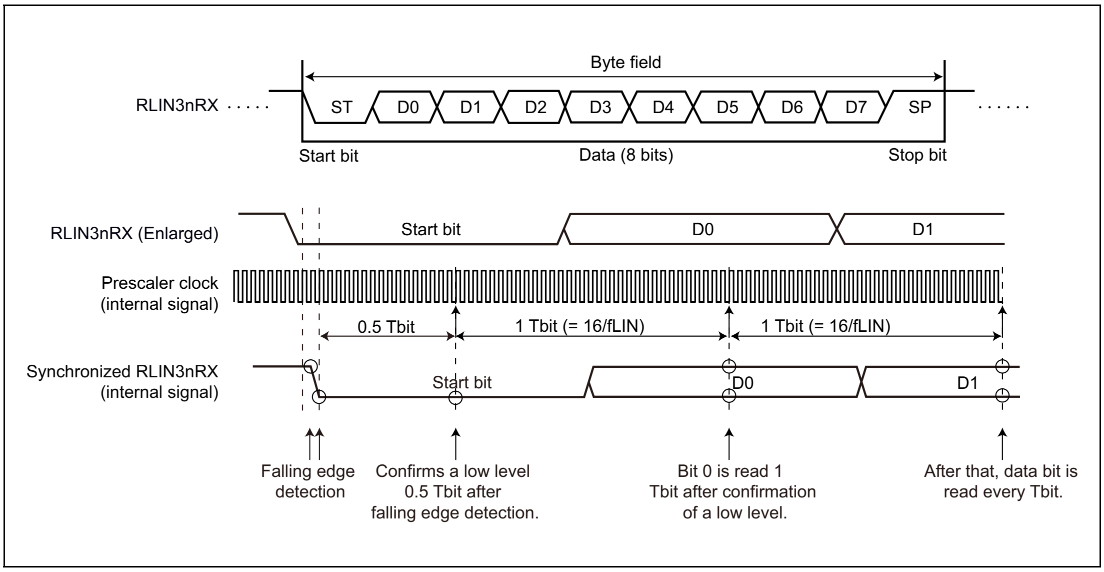

Figure 16.8 Example of Data Reception Timing (LIN Master Mode)

16.7.3 Transmission/Reception Data Buffering

This section explains the buffer processing that takes place when the LIN/UART interface sends or receives data continuously.

16.7.3.1 Transmission of LIN Frames

For an 8-byte transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR8 are sequentially transmitted to data areas 1 to 8 of the LIN frame. In the case of a 4-bytes transmission, the contents stored in registers RLN3nLDBR1 to RLN3nLDBR4 are transmitted to data areas 1 to 4 of the LIN frame, but the contents of registers RLN3nLDBR5 to RLN3nLDBR8 are not transmitted. The transmitted checksum data is stored in the RLN3nLCBR register.

Figure 16.9 shows the LIN transmission processing and the required buffers.

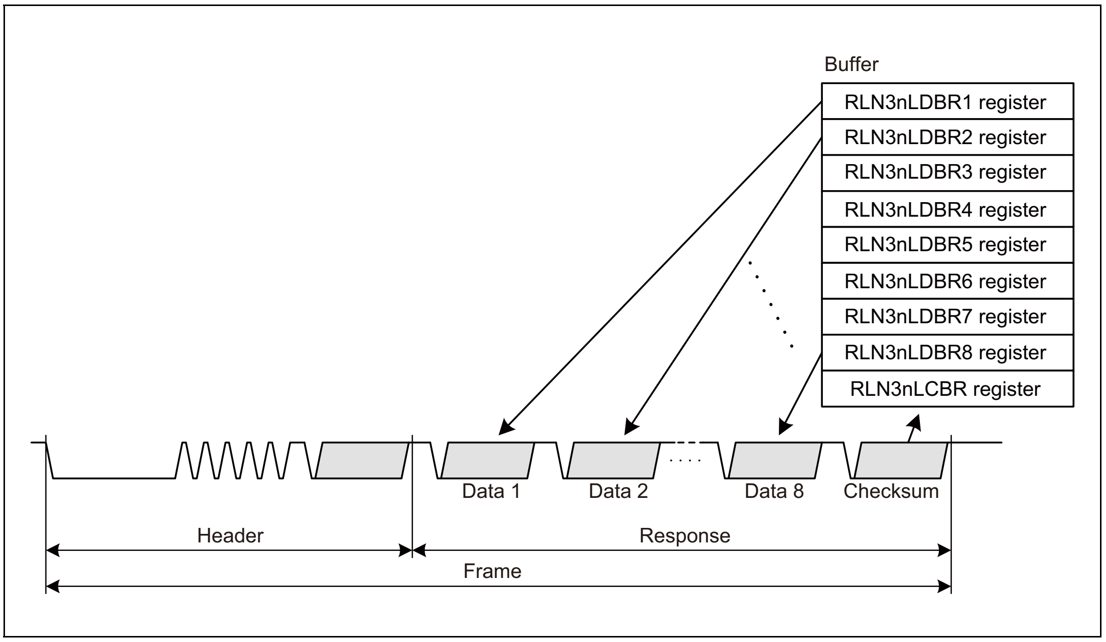

Figure 16.9 LIN Transmission Processing and Required Buffer

[Frame Separate Mode]

Setting the FSM bit in the RLN3nLDFC register to 1 turns on the frame separate mode.

In frame separate mode, a header and a response are transmitted when prompted by separate transmission start requests.

When the transmission of a header is finished, the HTRC flag in the RLN3nLST register is set to 1 (successful header transmission).

Use frame separate mode when transmitting or receiving response data of 9 bytes or more in LIN master mode.

16.7.3.2 Reception of LIN Frames

For an 8-byte reception, the contents of data areas 1 to 8 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR8, respectively, upon reception of a stop bit. In the case of a 4-byte reception, the contents of data areas 1 to 4 of the LIN frame are stored in registers RLN3nLDBR1 to RLN3nLDBR4, respectively; no data is stored in registers RLN3nLDBR5 to RLN3nLDBR8. Also, the received checksum data is stored in the RLN3nLCBR register.

Figure 16.10 shows the LIN reception processing and the required buffers.

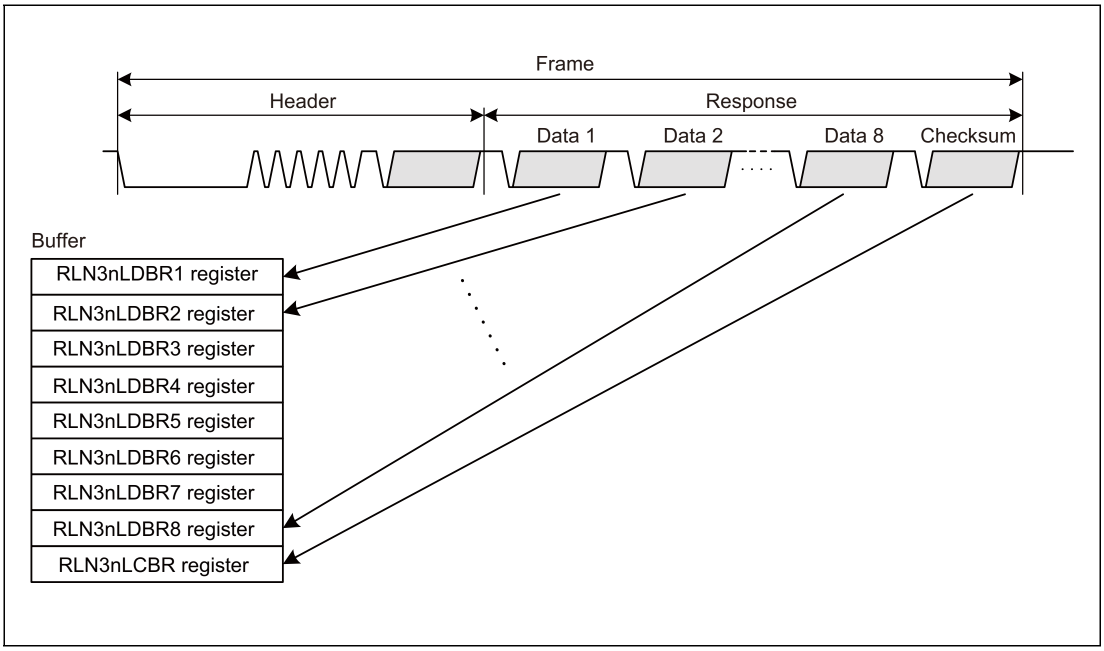

Figure 16.10 LIN Reception Processing and Required Buffer

[Reception of Data 1]

When the reception of the first byte of data is finished, the D1RC flag in the RLN3nLST register is set to 1 (successful data 1 reception).

16.7.3.3 Multi-Byte Response Transmission/Reception Function

Normally in LIN communications, a response is 9 bytes or less including a checksum field; however, responses of 10 bytes or more can also be transmitted and received.

In such a case, the bit error, framing error, response preparation error detection, and auto checksum functions are enabled.

If the data length is longer than 8 bytes, the LSS bit in RLN3nLDFC register should be set to 1 (indicating that the next data group to be transmitted or received is not the last data group) in the first data group (variable from 0 to 8 bytes) before transmitting or receiving the data group. After the transmission or reception, the user should determine whether the next data group is the last data group. If it is the last data group, the LSS bit in the RLN3nLDFC register should be set to 0 (indicating that the next data group to be transmitted or received is the last data group), and a checksum should be appended to the last data group.

By changing the RFDL bit in RLN3nLDFC register settings when the RTS bit in RLN3nLTRC register is 0, the user can change the data length for each data group.

When performing multi-byte response transmission/reception in LIN master mode, set the FSM bit in RLN3nLDFC register to 1 (frame separate mode).

16.7.4 Wake-up Transmission/Reception

The wake-up transmission/reception can be used in LIN wake-up mode.

16.7.4.1 Wake-up Transmission

In LIN wake-up mode, setting the RFT bit in the RLN3nLDFC register to 1 (LIN master mode: response transmission) and the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started) causes a wake-up signal to be output from the output pin. The low width of the wake-up signal should be set using the WUTL[3:0] bits in the RLN3nLWUP register.

However, if the LWBR0 bit of the RLN3nLWBR register in LIN master mode is 1 (LIN2.x), the LIN system clock (fLIN) becomes low level width at fa regardless of the setting of the LCKS bit of the RLN3nLMD register. By setting the WUTL[3:0] bits of the RLN3nLWUP register to 0100_B (5 Tbits), 260 µs low width can be output in LIN wake-up mode regardless of the setting of the LCKS bit of the RLN3nLMD register.

If a wake-up low-level is output without any bit error, the FTC flag in the RLN3nLST register is set to 1 (successful frame or wake-up transmission); when the FTCIE bit in the RLN3nLIE register is 1 (successful frame/wakeup transmission interrupt enabled), an interrupt request for RLIN3n transmission is generated.

If RLN3nLEDE.BERE is set and a bit error is detected, wake-up transmission is canceled and the BER flag in the RLN3nLEST register is set to 1 (bit error detection).

When RLN3nLEDE.PBERE is set in LIN master mode, set RLN3nLEST.PBER flag to 1 (physical bus error detection) at the same time of a bit error.

Figure 16.11 shows the wake-up transmission timing.

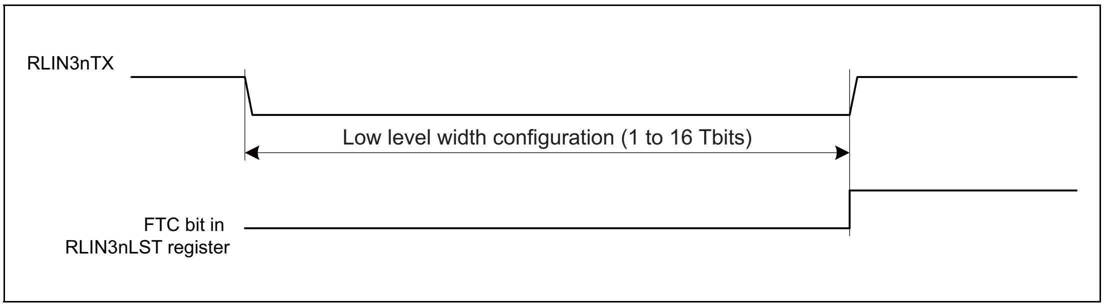

Figure 16.11 Wake-up Transmission Timing

16.7.4.2 Wake-up Reception

To detect a wake-up signal, use the input signal low-level width count function. The input signal low level width count function measures the low level width of the input signal to the RLIN3nRX pin, using the same sampling point as data reception. This allows the 2.5-Tbit or longer low-level width of the input signal of fLIN to be measured.

In LIN master mode, by setting the LWBR0 bit in the RLN3nLWBR register, operation can be executed without changing the baud rate generator setting when switching between LIN operation mode and LIN wake-up mode.

When LIN Specification Package Revision 1.3 is used, set the LWBR0 bit in the RLN3nLWBR register to 0. When LIN Specification Package Revision 2.x is used, set the LWBR0 bit to 1. Setting the LWBR0 bit to 1 sets the LIN system clock (fLIN) to fa regardless of the setting of the LCKS bit in the RLN3nLMD register. (The LCKS bit is not changed). By setting the baud rate to 19200bps while fa is selected, an input signal with a low-level width of 130 μs or longer to be measured regardless of the setting of the LCKS bit in the RLN3nLMD register.

When using the wake-up reception function, in LIN wake-up mode set the RFT bit in the RLN3nLDFC register to 0 (LIN master mode: response reception), or the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).

When the low level width to be measured is reached, the FRC flag in the RLN3nLST register is set to 1 (successful frame/wake-up reception). If the FRCIE bit in the RLN3nLIE register is 1 (successful frame or wake-up reception interrupt enabled), an interrupt request for successful RLIN3n reception is generated.

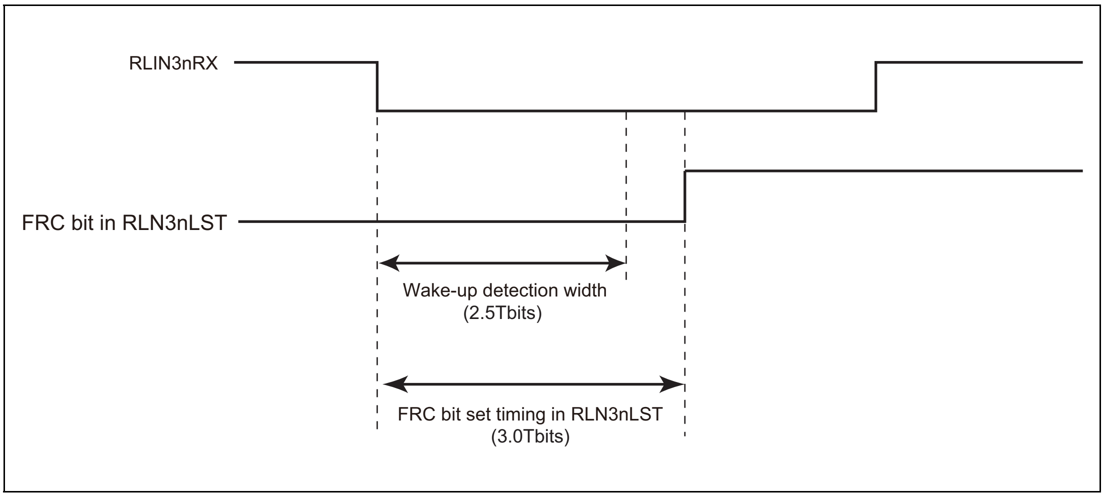

Figure 16.12 Input Signal Low level Count Function

16.7.4.3 Wakeup Collision

If the master node and the slave node transmit wakeup signals simultaneously, a collision will occur on the LIN bus, though a collision of wakeup signals is not detected by the LIN/UART interface.

16.7.5 Status

In LIN mode operation, the LIN/UART interface can detect seven types of statuses.

The four statuses, successful frame/wake-up transmission, successful frame/wake-up reception, error detection, and successful header transmission/reception, can generate interrupt requests.

Table 16.63 shows the types of statuses available in LIN master mode.

Table 16.63 Types of Statuses in LIN Master Mode

Status	Status Set Condition	Status Clear Condition	Operation Mode Capable of Status Detection	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/ UART interface enters LIN reset mode.	All modes	OMM0 bit in RLN3nLMST register	—
Operation mode	After the OM1 bit in the RLN3nLCUC register is set to LIN operation mode, if actually the LIN/UART interface enters LIN operation mode.	After the OM1 bit in the RLN3nLCUC register is set to LIN wake-up mode, if actually the LIN/ UART interface enters LIN wake-up mode.	• LIN operation mode • LIN wake-up mode	OMM1 bit in RLN3nLMST register	—
Frame/wake-up transmission end	When a frame (header transmission + response transmission), a wake-up signal, or a data group is transmitted successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FTC flag in RLN3nLST register	√
Frame/wake-up reception end	When a frame (header transmission + response reception), a wake-up signal, or a data group is received successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	FRC flag in RLN3nLST register	√
Error detection	If any of the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software*1 • After transition to LIN reset mode	• LIN operation mode • LIN wake-up mode	ERR flag in RLN3nLST register	√
Data 1 reception end	The RFT bit in the RLN3nLDFC register is 0 (reception) and the first byte of the response field or the first byte of each data group is received successfully.*2	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	D1RC flag in RLN3nLST register	—
Header transmission end	When a header field is transmitted successfully.	• When another communication is started (When the FTS bit in the RLN3nLTRC register is set) • When cleared by software • After transition to LIN reset mode	LIN operation mode	HTRC flag in RLN3nLST register	√

Note 1. In LIN operation mode and LIN operation mode, the ERR flag in the RLN3nLST register is cleared to 0 by writing 0 to the RPER flag, CSER flag, FER flag, FTER flag, PBER flag, or BER flag in the RLN3nLEST register.

Note 2. Not detected when the RFDL [3:0] bits in the RLN3nLDFC register are 0000_B (0-byte + checksum).

16.7.6 Error Status

16.7.6.1 LIN Master Mode

(1) Types of Error Statuses

The LIN/UART interface can detect six types of error statuses in LIN master mode. The condition of these error statuses can be verified by checking of the corresponding bits in the RLN3nLEST register.

All error statuses are interrupt factors.

Table 16.64 shows the types of error statuses.

Table 16.64 Types of Error Statuses in LIN Master Mode

Status	Error Detection Condition	Operation Mode Capable of Error Detection	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data on the LIN bus monitored by the receive pin do not match *1*2	• LIN operation mode • LIN wake-up mode	Cancel	Enabled	BER flag in RLN3nLEST register
Physical bus error	• LIN bus detected a high level when sending a break • LIN bus detected a low level when sending a break delimiter • LIN bus detected a high level when sending a wake-up	• LIN operation mode • LIN wake-up mode	Cancel	Enabled	PBER flag in RLN3nLEST register
Timeout error	A frame or response transmission/reception is not completed within a given time*3	LIN operation mode	Cancel	Enabled	FTER flag in RLN3nLEST register
Framing error	In response field reception, a stop bit of each data byte is low level	LIN operation mode	Cancel	Enabled	FER flag in RLN3nLEST register
Checksum error	In response field reception, the result of checksum indicate an error	LIN operation mode	—	Disabled	CSER flag in RLN3nLEST register
Response preparation error	One of the following conditions occurs in frame separate mode during a multi-byte response reception: • After header transmission is complete, the first byte of receive data is received before a response transmission/reception request is set. • After the previous data group reception is complete, the first byte of receive data is received before a transmission/reception request for the next data group is set.	LIN operation mode	Cancel	Disabled	RPER flag in RLN3nLEST register

Note 1. If a bit error is detected, the process is canceled after a stop bit is sent. If a bit error is detected in a non-data area, such as an inter-byte space, the transmission is canceled immediately after that area. If a bit error is detected during the transmission of a wake-up, the transmission of the wake-up is canceled after the bit which had the error is sent.

Note 2. In a multi-byte response transmission, bit errors are detected also between data groups.

Note 3. The timeout time depends on the response field data length (the RFDL [3:0] bits in the RLN3nLDFC register) and the checksum selection (the CSM bit in the RLN3nLDFC register), and this can be calculated according to the following formula:
When the FSM bit in the RLN3nLDFC register is 1 (frame separate mode), the time-out interval until setting of the RTS bit in the RLN3nLTRC register is the interval for receiving eight bytes of data. Once the RTS bit is set, the time-out time is reset to the time corresponding to the response field data length (determined by the RFDL[3:0] bits of the RLN3nLDFC register).
[Frame timeout]
When classic is selected (when the CSM bit in RLN3nLDFC is 0): Timeout time = 49 + (number of data bytes + 1) × 14 [Tbit]
When enhanced is selected (when the CSM bit in RLN3nLDFC is 1): Timeout time = 48 + (number of data bytes + 1) × 14 [Tbit]
The aforementioned timeout time is a time longer than the TFRAME_MAX of LIN Specification Package Revision 1.3 when classic is selected, or the TFRAME_MAX of LIN Specification Package Revision 2.x when enhanced is selected.

[Response timeout]
Timeout time = (number of data bytes + 1) × 14 [Tbit]

When an error is detected, the timeout error detection function stops.

The error status is cleared when the next communication is started (when the FTS bit in the RLN3nLTRC register is set), by software, or at a transition to LIN reset mode.

(2) Target Time Area for LIN Error Detection

Figure 16.13 shows the time domain in which the LIN/UART interface in LIN master mode performs monitoring for error detection.

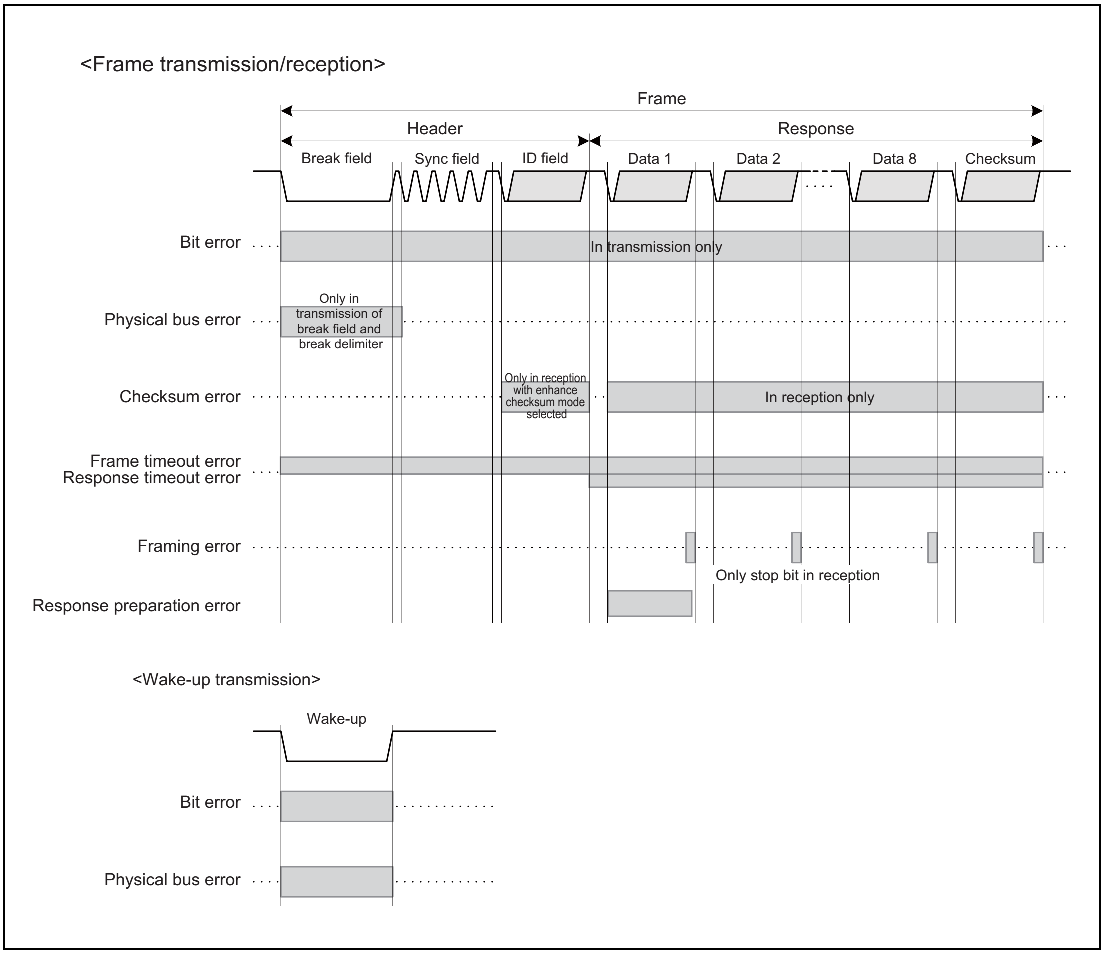

Figure 16.13 Target Time Area for LIN Error Detection (LIN Master Mode)

16.8 UART Mode

In LIN reset mode, setting the LMD bits in the RLN3nLMD register to 01_B (UART mode) and the OM0 bit in the RLN3nLCUC register to 1 changes the mode to UART mode, turning the OMM0 bit in the RLN3nLMST register to 1.

16.8.1 Transmission

Figure 16.14 shows LIN/UART interface (in UART mode) transmission operations; **Table 16.65** shows LIN/UART interface (in UART mode) transmission processing.

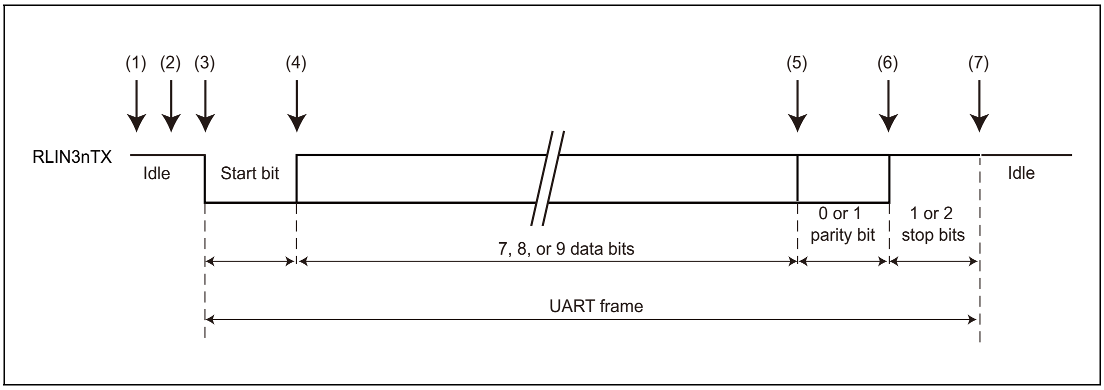

Figure 16.14 LIN/UART Interface (in UART Mode) Transmission Operation

Table 16.65 LIN/UART Interface (UART Mode) Transmission Processing (1/2)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Enables error detection. • Sets data format. • Sets an interrupt generation timing. • Clears the LIN/UART interface from LIN reset mode. • Sets the transmit enable bit (UTOE bit) to 1.	• Waits for a transmission trigger (RLN3nLUTDR register) by software.
(2)	• Sets the transmit data to the UART transmit data register (RLN3nLUTDR) or UART wait transmit data register (RLN3nLUWTDR).	• Sets the transmit status flag.
(3)	• Waits an interrupt request. [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • When transmitting data continuously, sets another piece of transmission data in the UART transmit data register (RLN3nLUTDR register), waits for the generation of an interrupt request.	• Transmits a start bit (for switching between transmission and reception in half duplex communication, transmits a start bit after receiving 1 stop bit. For details about this function, see **Section 16.8.1.4, Transmission Start Wait Function**. [When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • Outputs a transmission interrupt.
(4)		Transmits the data set in the UART (for wait) transmit data register.
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits.

Table 16.65 LIN/UART Interface (UART Mode) Transmission Processing (2/2)

	Software Processing	LIN/UART Interface Processing
(7)	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another item of transmission data is set, goes to step (3).	[When the UTIGTS bit is 0 (a transmission interrupt request is generated upon start of transmission)] • If another piece of transmission data is set, goes to step (3). • If another piece of transmission data is not set, clears the transmit status flag.
	[When the UTIGTS bit is 1 (a transmission interrupt is generated upon end of transmission)] • When transmitting data continuously, goes to step (2).	[When the UTIGTS bit is 1 (a transmission interrupt is generated upon end of transmission)] • Generates RLIN3n transmission interrupt request. • Clears the transmission status flag.

16.8.1.1 Continuous Transmission

The LIN/UART interface (in UART mode) can transmit multiple sets of data continuously by using the RLN3nLUTDR register. **Figure 16.15** shows an operation example where the transmission interrupt generation timing is the start of transmission and an operation example where the transmission interrupt generation timing is the end of transmission.

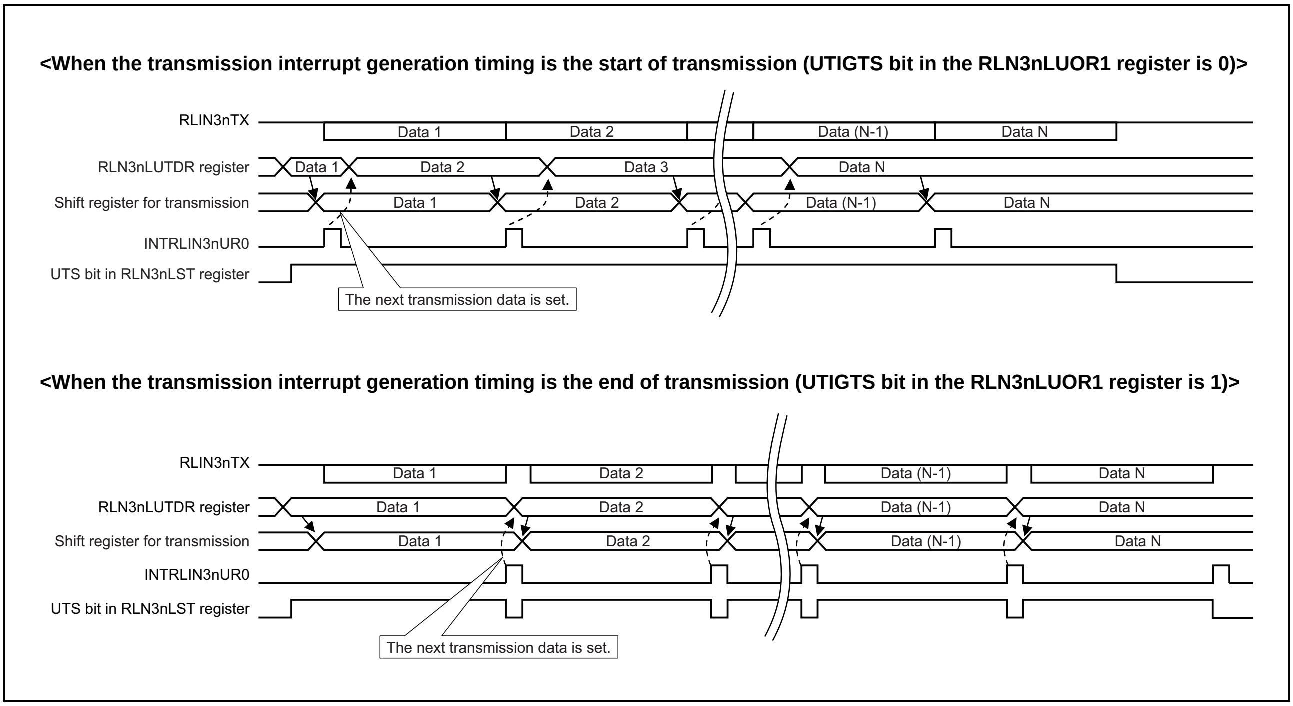

Figure 16.15 Operation Example of LIN/UART Interface (UART Mode) Continuous Transmission

An interrupt can be generated at the end of a transmission by changing the UTIGTS bit in the RLN3nLUOR1 register from 0 to 1 after the start of transmission of final data, provided that the transmission interrupt generation timing is the start of transmission and the end of transmission of final data needs to be known.

16.8.1.2 UART Buffer Transmission

The LIN/UART interface (in UART mode) has a maximum of nine bytes of UART buffers, and thus it is capable of performing continuous transmissions through the use of UART buffers.

Figure 16.16 shows the UART buffer transmission operation of the LIN/UART interface (in UART mode). **Table 16.66** shows the UART buffer transmission processing.

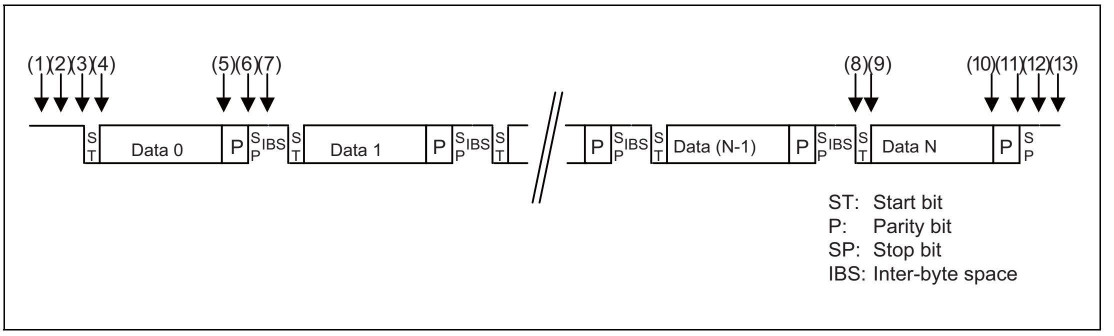

Figure 16.16 UART Buffer Transmission of LIN/UART Interface (in UART Mode)

Table 16.66 UART Buffer Transmission Processing of LIN/UART Interface (in UART Mode) (1/2)

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate • Sets noise filter ON/OFF • Enables error detection • Sets data format • Sets an interrupt generation timing to the end of transmission. • Clears the LIN/UART interface from LIN reset mode. • Sets the transmit enable bit (UTOE bit) to 1	• Waits for a transmission trigger (RTS bit) by software
(2)	• Sets the UART buffer data length and whether the system must wait for the start of transmission. • Sets the transmission data in the UART data 0 buffer register (RLN3nLUDB0) and the LIN data buffer b register (RLN3nLDBRb). (b =1 to 8) • Sets the UART buffer transmission start bit (RTS).	• Sets the transmit status flag.
(3)	Waits for an interrupt request.	Transmits a start bit. (When switching from reception to transmission during half-duplex communication, transmits the start bit upon completion of the stop bit for reception. For details about this function, see **Section 16.8.1.4, Transmission Start Wait Function**.)
(4)		Transmits the data set in the UART data buffer 0 register (RLN3nLUDB0) and the LIN/UART data buffer b register (RLN3nLDBRb).
(5)		Transmits a parity bit when parity is used.
(6)		Transmits 1 or 2 stop bits (When the number of data set in UART buffer data length select bits is 1, proceeds to (12).)
(7)		Transmits an inter-byte space (idle).
		Repeats steps (3) to (7) until number of data set in the UART buffer data length select bits -1 is reached.

Table 16.66 UART Buffer Transmission Processing of LIN/UART Interface (in UART Mode) (2/2)

	Software Processing	LIN/UART Interface Processing
(8)		Transmits a start bit.
(9)		Transmits the data set in the LIN/UART data buffer b register (RLN3nLDBRb).
(10)		Transmits a parity bit when parity is used.
(11)		Transmits 1 or 2 stop bits.
(12)		• Sets the successful buffer transmission flag. • Clears the UART buffer transmit start bit (RTS). • A transmission interrupt request signal. • Clears the transmission status flag.
(13)	• Checks the RLN3nLST register, and clears flags • In the case of continuous data transmission, goes to step (2).	

(1) UART Buffer Transmission

For a 9-byte transmission, the contents stored in the RLN3nLUDB0 and RLN3nLDBR1 to RLN3nLDBR8 registers are transmitted to data areas 0 to 8. The RLN3nLUDB0 register is used only if 9-byte transmission is set. In other cases, the RLN3nLDBR1 to RLN3nLDBR8 registers are selected depending upon the length of data involved. For a 4-byte transmission, the contents stored in the RLN3nLDBR1 to RLN3nLDBR4 registers are transmitted to data areas 1 to 4, but the contents of the RLN3nLDBR5 to RLN3nLDBR8 registers are not transmitted. An RLIN3n transmission interrupt is generated after the number of data specified in the MDL [3:0] bits of the RLN3nLDFC register is transmitted. The spaces between transmission data items can be set in the IBS bit in the RLN3nLSC register.

Figure 16.17 shows a 9-byte UART buffer and the transmission processing.

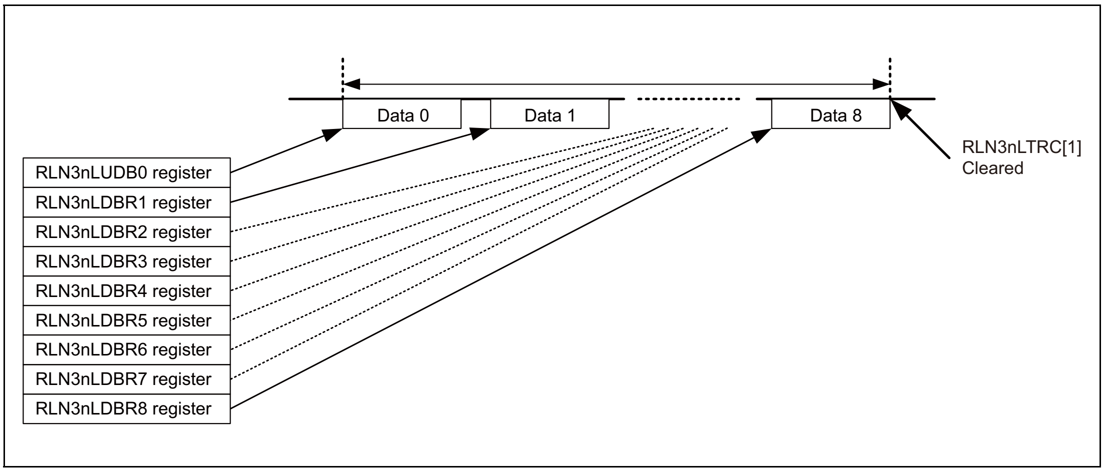

Figure 16.17 UART Buffer and Transmission Processing (for 9-Byte Transmission)

16.8.1.3 Data Transmission

One bit of data is transmitted per Tbit.

In half-duplex communication, if the BERE bit in the RLN3nLEDE register is 1 (bit error detection enabled), the transmission data and the input pin level are compared bit by bit during data transmission, and the results are stored in the BER flag in the RLN3nLEST register (see **Section 16.8.5, Error Status**). The timing at which the input pin is sampled during data transmission can vary depending upon the settings of the LPRS[2:0] and NSPB[3:0] bits in the RLN3nLWBR register.

The bit error detection timing in UART mode is shown in **Table 16.67**.

Table 16.67 Error Detection Timing in UART Mode

Sampling Count Per Bit	Bit Error Detection Timing
6 samples	3rd clock cycle + 1 prescaler clock
7 samples	4th clock cycle + 1 prescaler clock
8 samples	4th clock cycle + 1 prescaler clock
9 samples	5th clock cycle + 1 prescaler clock
10 samples	5th clock cycle + 1 prescaler clock
11 samples	6th clock cycle + 1 prescaler clock
12 samples	6th clock cycle + 1 prescaler clock
13 samples	7th clock cycle + 1 prescaler clock
14 samples	7th clock cycle + 1 prescaler clock
15 samples	8th clock cycle + 1 prescaler clock
16 samples	8th clock cycle + 1 prescaler clock

Example of Data Transmission Timing (when 1 Tbit = 16 Sampling) is shown in **Figure 16.18**

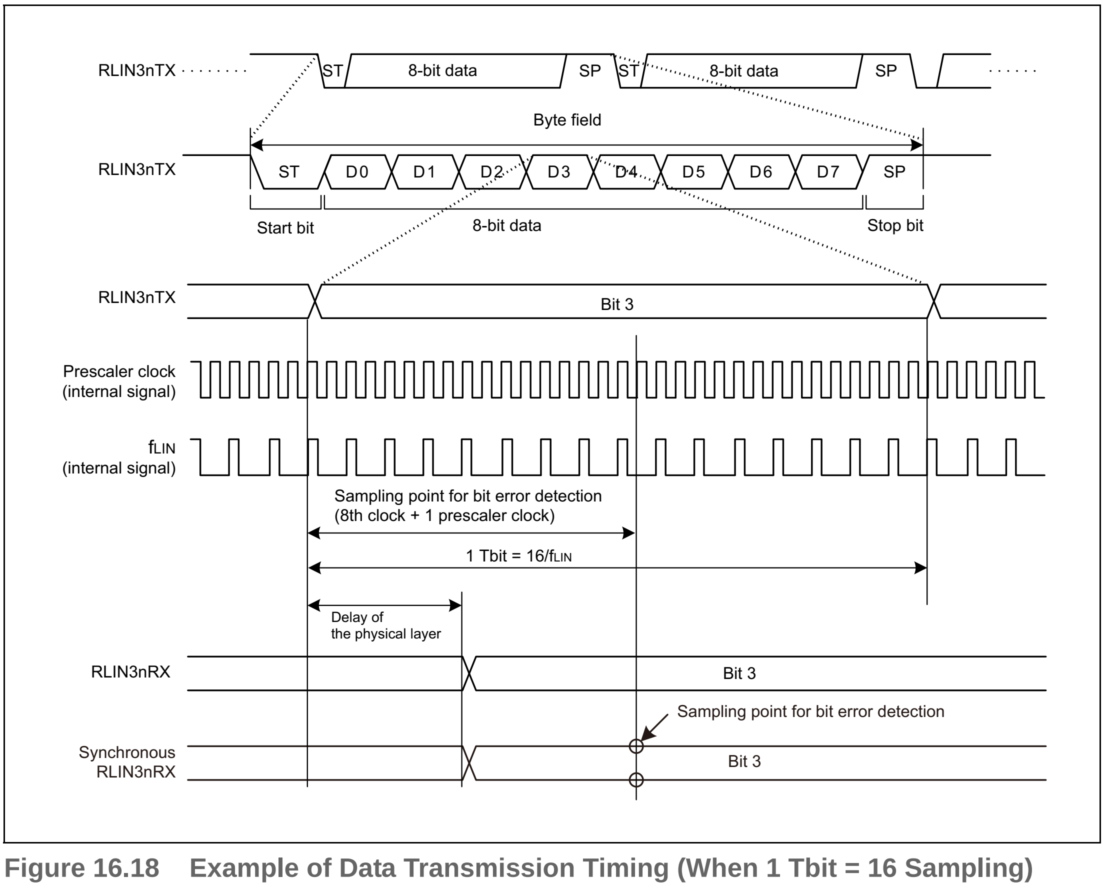

Figure 16.18 Example of Data Transmission Timing (When 1 Tbit = 16 Sampling)

16.8.1.4 Transmission Start Wait Function

For performing half-duplex communication, the LIN/UART interface (in UART mode) has the function of securing the reception stop bit length when switching from reception to transmission.

If it is desired to delay the start of transmission until the stop bits for the reception are completed, set data in the RLN3nLUWTDR register, which is used only for the wait function, instead of setting transmission data in the RLN3nLUTDR register as a start-of-transmission request. When transmitting from the UART buffer, set 1 (UART buffer transmission started) in the RTS bit in the RLN3nLTRC register with 1 set in the UTSW bit in the RLN3nLDFC register.

In such a case, the LIN/UART interface delays the start of transmission until the stop bits of reception data are completed.

Note that even if the UART stop bit length selection bit (USBLS) in RLN3nBLFC register is 1 (stop bits = 2 bits), there is only a 1-bit delay.

Figure 16.19 shows the operation of transmission wait function.

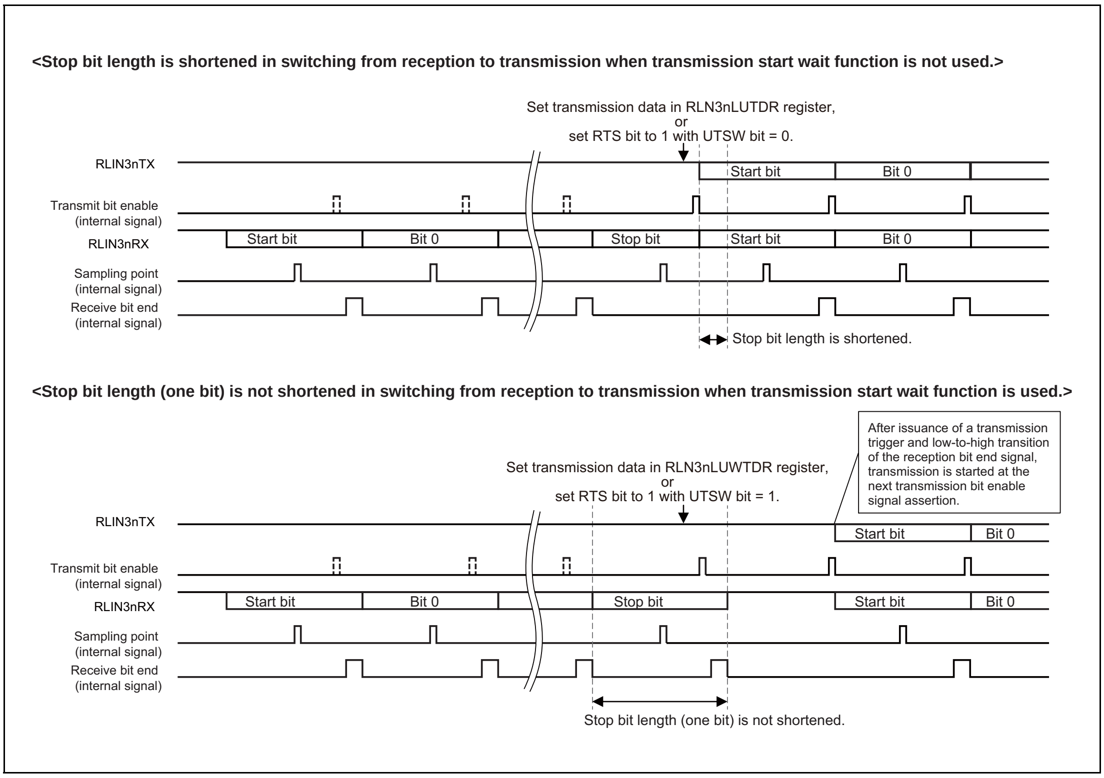

Figure 16.19 Example of Data Transmission Timing (When 1 Tbit = 16 samplings)

16.8.2 Reception

Figure 16.20 shows the LIN/UART interface (in UART mode) reception operation. **Table 16.68** shows the LIN/UART interface (in UART mode) reception processing.

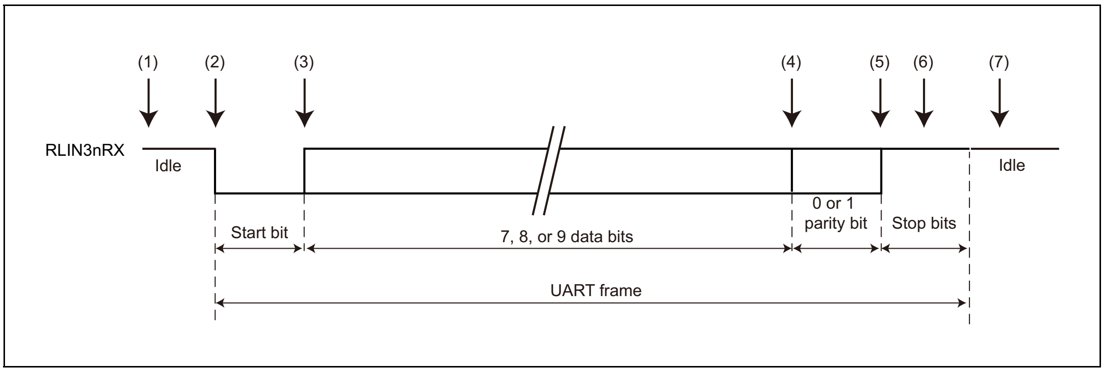

Figure 16.20 LIN/UART Interface (in UART Mode) Reception Operation

Table 16.68 LIN/UART Interface (in UART Mode) Reception Processing

	Software Processing	LIN/UART Interface Processing
(1)	• Sets a baud rate. • Sets noise filter ON/OFF. • Enables error detection. • Sets data format. • Clears the LIN/UART interface from LIN reset mode. • Sets the receive enable bit (UROE bit) to 1.	• Waits for the reception to be enabled by software. • Waits for detection of a start bit.
(2)	Waits for an interrupt request.	• Waits for a falling edge from the reception pin, and detects a start bit. • Sets the reception status flag.
(3)		Receives data.
(4)		Receives a parity bit when parity is used.
(5)		Receives only 1 stop bit.
(6)		• Generates a RLIN3n reception complete interrupt request. • Clears the reception status flag.
(7)	Checks the RLN3nLST register, and clears flags	Waits for a falling edge from the reception pin.

16.8.2.1 Data Reception

Data reception is performed by using the synchronized RLIN3nRX (an internal signal) that is the input from the RLIN3nRX pin synchronized with the prescaler clock.

The byte field is synchronized at the falling edge of the start bit for the synchronized RLIN3nRX signal. After the falling edge is detected, resampling is performed 0.5 Tbits later when the number of sampling per 1 Tbit is even and {(the number of sampling + 1) / 2} / (the number of sampling) Tbits later when the number is odd. If the synchronized RLIN3nRX signal is low level, the bit is recognized as a start bit. The bit is not recognized as a start bit if the RLIN3nRX signal after the reset is de-asserted is fixed to low level or if a high level is detected during the resampling.

After the start bit is detected, 1 bit is sampled per Tbit.

However, when the BERE bit in the RLN3nLEDE register is 1, the sampling point is the same as the bit error detection timing.

The LIN/UART interface has a noise filter function for received data. If the LRDNFS bit in the RLN3nLMD register is 0, the noise filter is used. For a sampling value, the value determined by a 3-sampling majority rule by the prescaler clock is used. If the LRDNFS bit in the RLN3nLMD register is 1, the noise filter is not used. In this case, for a sampling value, the synchronized RLIN3nRX value at the sampling position is used as is.

Figure 16.21 shows an example of data reception timing.

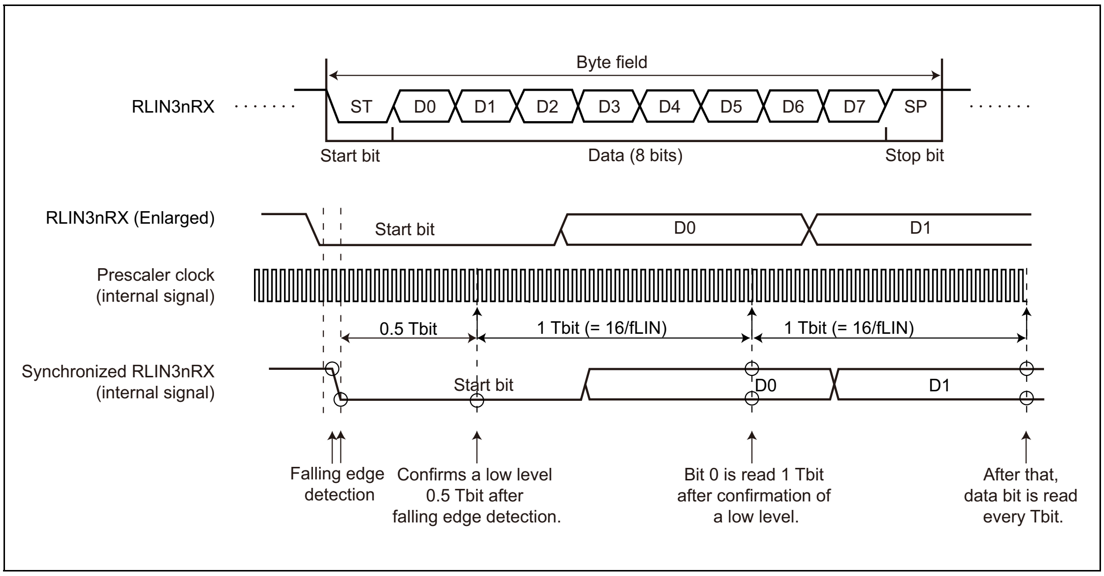

Figure 16.21 Example of Data Reception Timing (When Sampling Count is 16 in 1 Tbit)

16.8.3 Expansion Bits

The LIN/UART interface (in UART mode) can transmit and receive 9-bit long data by setting the UEBE bit in the RLN3nLUOR1 register to 1.

16.8.3.1 Expansion Bit Transmission

The LIN/UART interface (in UART mode) can transmit 9-bit long data when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1 and by writing the 9-bit data to either the UART transmission data register (RLN3nLUTDR) or the UART wait transmission data register (RLN3nLUWTDR).

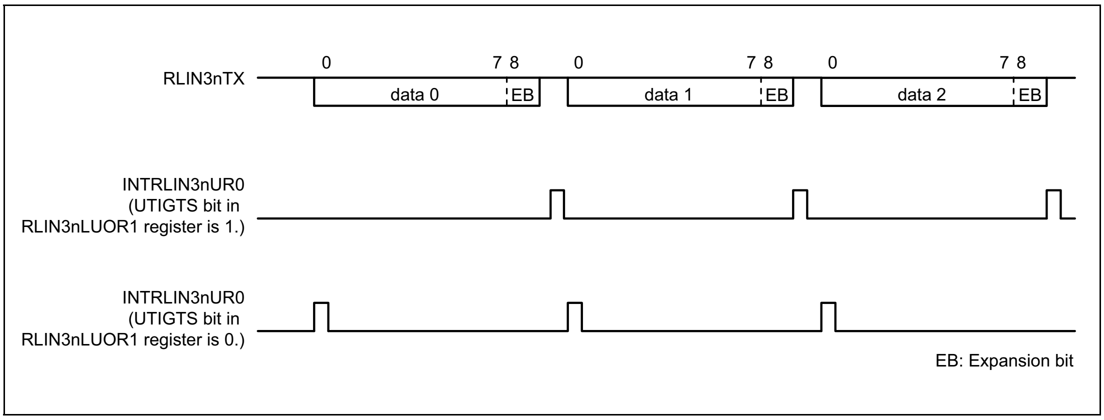

Figure 16.22 Transmission Example When Expansion Bit is Enabled (LSB First)

16.8.3.2 Expansion Bit Reception

With the LIN/UART interface (in UART mode), 9-bit data can always be received without requiring a comparison of expansion bits, provided that the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 1, and the expansion bit data comparison enable bit (UEBDCE) is 0. Irrespective of the particular setting of the expansion bit detection level select bit (UEBDL) in the UART option register 1 (RLN3nLUOR1), a successful RLIN3n reception interrupt is generated when 9-bit data is received.

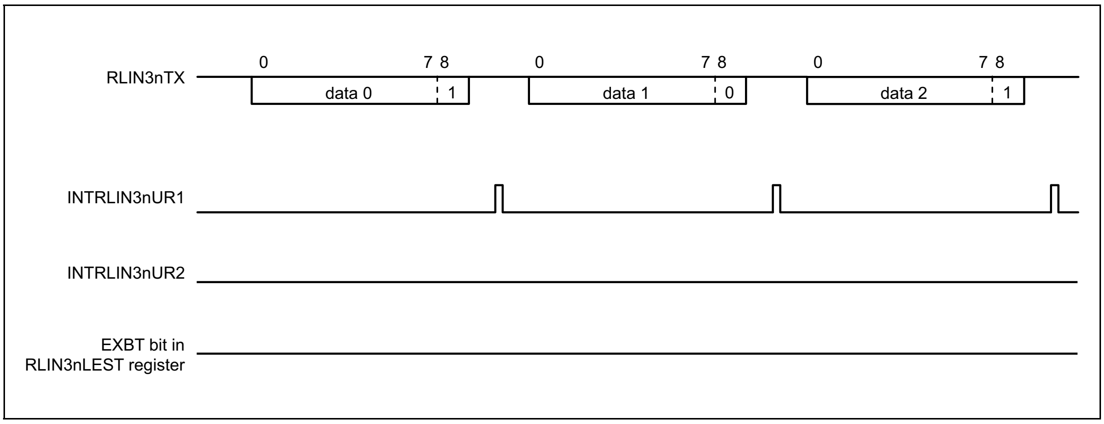

Figure 16.23 Expansion Bit Reception Example (LSB First)

16.8.3.3 Expansion Bit Reception (with Expansion Bit Comparison)

The LIN/UART interface (in UART mode) can compare received expansion bits and the UEBDL bits when the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 0.

If the level that was set in the expansion bit detection level select bit (UEBDL) is detected, an RLIN3n status interrupt request is generated upon completion of data reception, and the expansion bit detection flag (EXBT) in the LIN error status register (RLN3nLEST) is set. If the reversed value of an expansion bit detection level is detected, RLIN3n reception complete interrupt request is generated. In either case, the received data is stored in the UART reception data register (RLN3nLURDR), unless there was an overrun error.

Figure 16.24 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

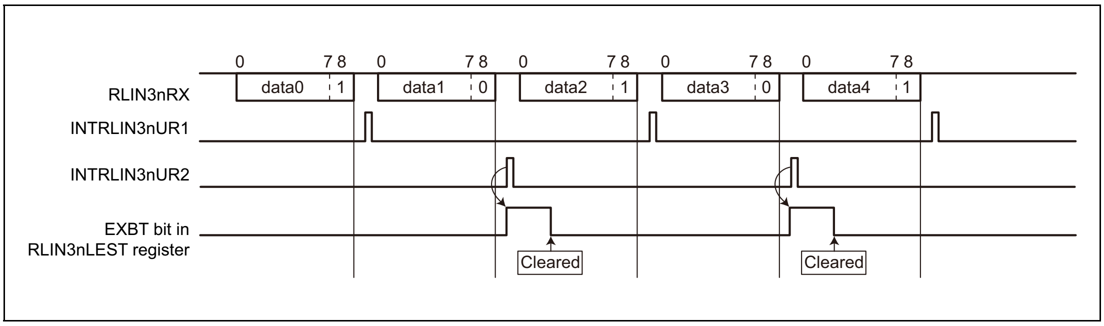

Figure 16.24 Expansion Bit Reception Example (with Expansion Bit Comparison) (LSB First, UEBDL = 0)

NOTE

- If a reception error (parity error, framing error, or overrun error) occurs in received data 0, 2, or 4 (if a reversed value of an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. In this case, a successful RLIN3n reception interrupt is not generated.
- If a reception error (parity error, framing error, or overrun error) occurs in received data 1 or 3 (if an expansion bit detection level is detected), an RLIN3n status interrupt is generated, and the error flag is updated. If the overrun error occurs, the expansion bit detection flag (EXBT) is also set.

16.8.3.4 Expansion Bit Reception (with Data Comparison)

If the expansion bit enable bit (UEBE) in the UART option register 1 (RLN3nLUOR1) is 1, the expansion bit comparison disable bit (UECD) is 0 and the expansion bit/data comparison enable bit (UEBDCE) is 1, and if the level that was set by the expansion bit detection level select bit (UEBDL) is detected, the LIN/UART interface (in UART mode) compares the 8 bits, exclusive of the expansion bit in the received data, with the a pre-set RLN3nLIDB register value.

If the result of the comparison is a match, the LIN/UART interface performs the following operations:

- Generates an RLIN3n status interrupt
- Sets an expansion bit detection flag (EXBT)
- Sets an ID match flag (IDMT)
- Stores the received data in the UART reception data register (RLN3nLURDR)

Even when the result of the comparison is a match, successful RLIN3n reception interrupt is not generated.

If the result of the comparison is not a match, no successful RLIN3n reception interrupt or RLIN3n status interrupt is generated, and the EXBT and IDMT flags are not set to 1. The received data is not stored in the UART reception data register (RLN3nLURDR).

When changing the UEBDCE bit to 0, make the change before the reception of another set of data is finished.

Figure 16.25 shows an example when the expansion bit detection level select bit (UEBDL) is set to 0.

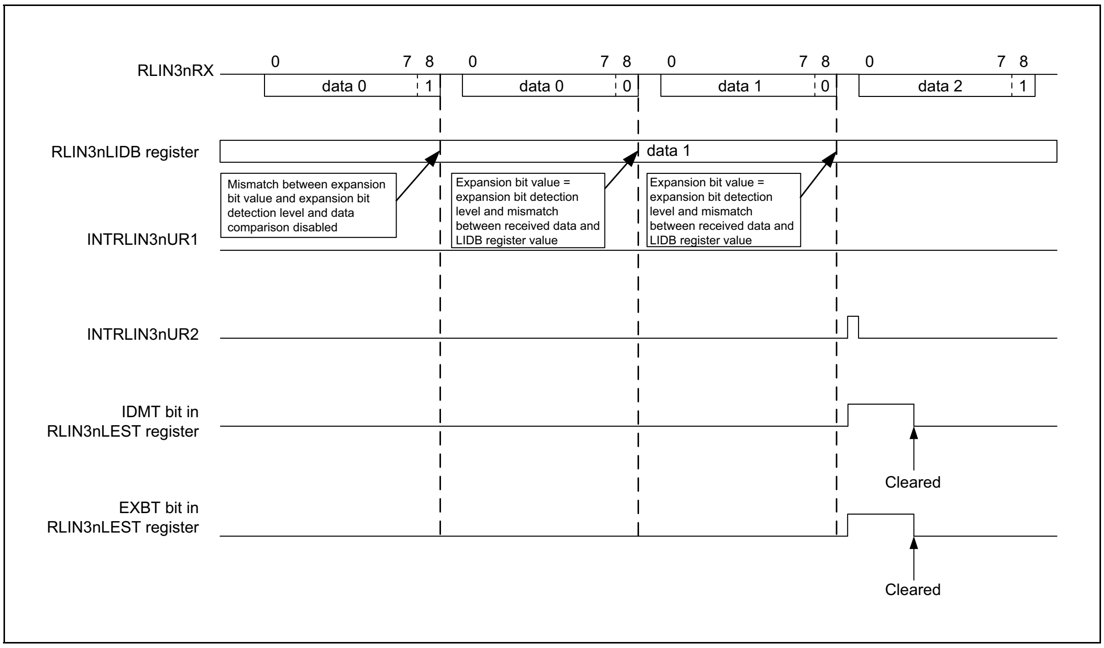

Figure 16.25 Expansion Bit Reception Example (with Data Comparison) (LSB First, UEBDL = 0)

NOTE

When a reception error (parity, framing, or overrun) occurs, a status interrupt of RLIN3n is generated and the error flag is updated. When the overrun error occurs and the comparison result matches, the EXBT and IDMT flags are also set.

16.8.4 Status

In UART mode, the LIN/UART interface can detect five types of statuses.

Two statuses, successful UART buffer transmission and error detection, can generate interrupt requests.

Table 16.69 shows the types of statuses available in UART mode.

Table 16.69 Types of Statuses in UART Mode

Status	Status Set Condition	Status Clear Condition	Corresponding Bit	Interrupt
Reset	After the OM0 bit in the RLN3nLCUC register is set to not-LIN-reset-mode, if actually the LIN/UART interface is cleared from LIN reset mode.	After the OM0 bit in the RLN3nLCUC register is set to LIN reset mode, if actually the LIN/UART interface enters LIN reset mode.	OMM0 bit in RLN3nLMST register	—
Successful UART buffer transmission	• When the UTIGTS bit in the RLN3nLUOR1 register is 0 (transmission interrupt request is generated upon start of transmission), the transmission of the last data of the data length set by the MDL bit in the RLN3nLDFC register is started. • When the UTIGTS bit in the RLN3nLUOR1 register is 1 (transmission interrupt request is generated upon end of transmission), the transmission of the data length set by the MDL bit in the RLN3nLDFC register is ended.	• When cleared by software • Transition to LIN reset mode	FTC flag in RLN3nLST register	√
Error detection	If any of the UPER flag, IDMT flag, EXBT flag, FER flag, OER flag, and BER flag in the RLN3nLEST register is set to 1 (error detected).	• When cleared by software*1 • Transition to LIN reset mode	ERR flag in RLN3nLST register	√
Transmission status	• When data is written to the RLN3nLUTDR or RLN3nLUWTDR register. • When 1 is written to the RTS bit in the RLN3nLTRC register.	• The transmission of the data set in the RLN3nLUTDR or RLN3nLUWTDR register is complete, but another transmission data item is not set • The transmission of the data in the UART buffer is complete, and the RTS bit in the RLN3nLTRC register is cleared • Transition to LIN reset mode	UTS flag in RLN3nLST register	—
Reception status	• When a start bit is detected.	• When a sampling point for stop bits is detected • Transition to LIN reset mode	URS flag in RLN3nLST register	—

Note 1. Writing a 0 to the UPER, IDMT, EXBT, FER, OER, and BER flags in the RLN3nLEST register when the LIN reset mode is being canceled sets the ERR flag in the RLN3nLST register to 0.

16.8.5 Error Status

Types of Error Statuses

In UART mode, the LIN/UART interface can detect four types of errors and two types of statuses. The condition of these statuses can be verified by using the corresponding bits in the RLN3nLEST register.

Table 16.70 shows available status types.

Table 16.70 Types of Statuses in UART Mode

Status	Error Detection Condition	Communication	Enable/ Disable Detection	Corresponding Bit
Bit error	The transmitted data and the data monitored on the receive pin do not match*1	Continues until the transmission of the set transmission data is finished.	Enabled	BER flag in RLN3nLEST register
Overrun error	After received data is stored in the RLN3nLURDR register, another data item is received before the data is read. (In this case, no data is stored in the RLN3nLURDR register).	— (Reception is finished by the time this error is detected)	Enabled	OER flag in RLN3nLEST register
Framing error	When the first stop bit is low level in the reception processing.	— (Reception is finished by the time this error is detected)	Enabled	FER flag in RLN3nLEST register
Parity error	The received parity value fails to match the parity value calculated from the received data	Continues until the data reception is finished.	Disabled *2	UPER flag in RLN3nLEST register
Expansion bit detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register.	—	Enabled	EXBT flag in RLN3nLEST register
ID match detection	The value of the received expansion bit matches the value of the UEBDL bit in the RLN3nLUOR1 register and the 8-bit receive data excluding the expansion bit matches the value of the RLN3nLIDB register.	—	Enabled	IDMT flag in RLN3nLEST register

Note 1. In the case of transmission from the UART buffer, bit errors are detected even in the space between UART frames (inter-byte space).

Note 2. Setting the UPS[1:0] bits in the RLN3nLBFC register to 10_B (0 parity) disables the checking of parity bit values. In this case, no parity error is generated.

The error status is cleared by software or at a transition to LIN reset mode.

16.9 LIN Self-Test Mode

The LIN/UART interface provides a LIN self-test mode.
When the LIN/UART interface enters the LIN self-test mode, RLIN3nTX and RLIN3nRX are disconnected from external pins and RLIN3nTX and RLIN3nRX are connected to the LIN/UART interface internally. Therefore, the frame transmitted from RLIN3nTX is looped back to RLIN3nRX. The LIN self-test mode can perform tests exclusively in LIN mode.

The self-test can be performed in the following two modes:

- LIN master self-test mode (transmission): Header transmission and response transmission
- LIN master self-test mode (reception): Header transmission and response reception

In LIN self-test mode, operation is performed at the fastest baud rate, regardless of the setting of the baud rate generator.

Regardless of the setting of the baud rate related registers, the baud rate setting is the LIN communication clock source/16 [bps]. (The NSPB bits in the RLN3nLWBR register should be set to 0000_B or 1111_B.)

In addition, in LIN self-test mode, the following functions are not supported.

- LIN wake-up mode
- Frame separate mode
- Multi-byte response transmission/reception
- Frame/response timeout error

Do not use these functions.

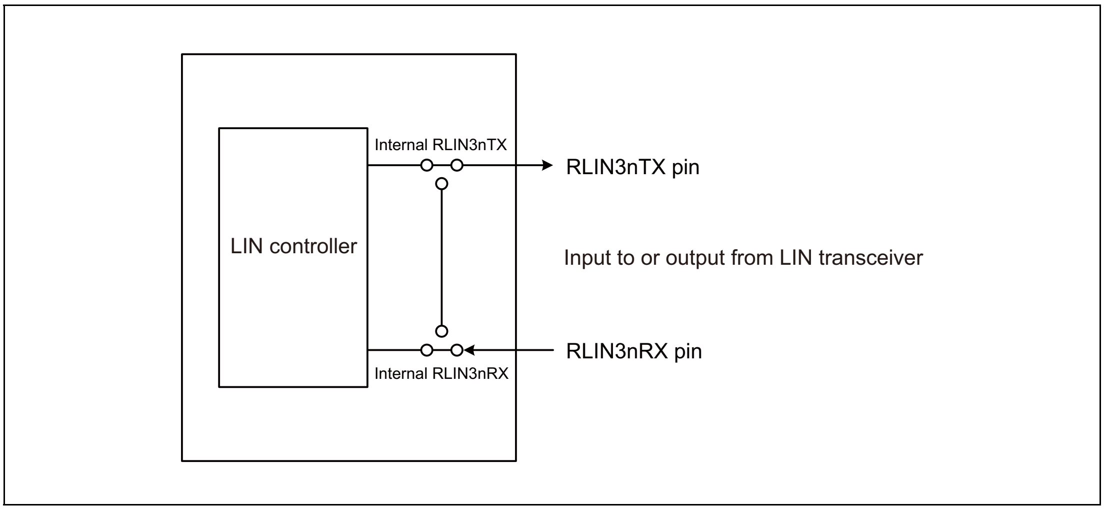

Figure 16.26 Connection in LIN Reset Mode, LIN Mode, and UART Mode

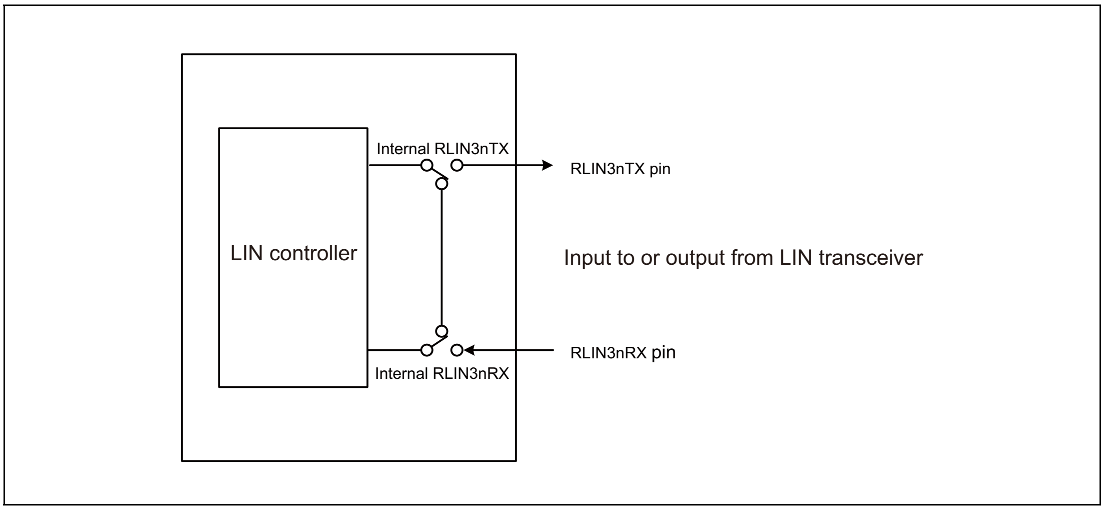

Figure 16.27 Connection in LIN Self-Test Mode

16.9.1 Transitioning to LIN Self-Test Mode

Writing to the RLN3nLSTC register makes a transition to the LIN self-test mode.
The LSTM bit in the RLN3nLSTC register set to 1 indicates that the mode has transitioned to the LIN self-test mode.

To transition to LIN self-test mode, be sure to execute a specific sequence. In that sequence, information must be written three times consecutively to the LIN self-test control register, as shown below:

- Transition to LIN reset mode
  Set the OM0 bit in the RLN3nLCUC register to 0 (LIN reset mode).
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).
- Select a LIN mode
  LMD bits in RLN3nLMD = 00_B (LIN master mode)
  1st write: RLN3nLSTC register = 1010 0111 ($A7_H$)
- 2nd write: RLN3nLSTC register = 0101 1000 (58_H)
- 3rd write: RLN3nLSTC register = $0000\ 0001_B$ (01_H)
- Verify the transition to LIN self-test mode
  Read the LSTM bit in the RLN3nLSTC register; verify that it is 1 (LIN self-test mode).

If the key of the first write ($A7_H$) is written twice by mistake, the transition to LIN self-test mode is canceled. The above sequence should be retried from the step of first write. In addition, if a write to another LIN-related register is performed during transition to LIN self-test mode (three consecutive write operations to the RLN3nLSTC register), the transition is also canceled.

16.9.2 Transmission in LIN Master Self-Test Mode

To execute a self-test on LIN master transmission, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 x0xx
- Set the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the transmit frame related registers.
  RLN3nLDFC register = 00x1 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
- Header transmission → response transmission started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/ reception started).
  The LIN master self-test mode (transmission) is executed. In this mode, interrupt are generated, and status and error status are also updated. The checksum is automatically calculated by the LIN/ UART interface.
  To suspend the transmission during LIN master self-test mode (transmission), write 0 to the OM0 bit of the RLN3nLCUC register (LIN reset mode) and transition to LIN reset mode.
- When the transmission is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is stored as a reversed value because the transmitted value should be compared with the looped-back value).
  Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the transmission fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don’t care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register and the LCKS bit in the RLN3nLMD register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. When the successful header transmission interrupt and the successful frame transmission interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame transmission interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).

The time required from the setting of the successful header transmission flag to the setting of the successful frame/wake-up transmission flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/frequency of LIN system clock source (fLIN) × 16

16.9.3 Reception in LIN Master Self-Test Mode

To execute a self-test on LIN master reception, perform the procedure below:

- Set the baud rate, noise filter, and interrupt output related registers.
  RLN3nLWBR register = 0000 $xxxx_B$*1
  RLN3nLBRP0 register = xxxx $xxxx_B$*1
  RLN3nLBRP1 register = xxxx $xxxx_B$*1
  RLN3nLMD register = 00xx $xx00_B$*1
- Set the interrupt enable and error enable related registers.
  RLN3nLIE register = 0000 $xxxx_B$*2
  RLN3nLEDE register = x000 $x0xx_B$
- Set the break field and space related registers.
  RLN3nLBFC register = 00xx $xxxx_B$
  RLN3nLSC register = 00xx $0xxx_B$*1
- Cancel the LIN reset mode.
  Write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register, and check that the OMM1 and OMM0 bits in the RLN3nLMST register are 11_B.
- Set the reception frame related registers.
  RLN3nLDFC register = 00x0 $xxxx_B$
  RLN3nLIDB register = xxxx $xxxx_B$
  RLN3nLDRB1 to RLN3nLDRB8 registers = xxxx $xxxx_B$
  RLN3nCBR register = xxxx $xxxx_B$
  Since the checksum value to be transmitted is not automatically calculated, users must calculate it and set it to the RLN3nLCBR register. A checksum test can be performed by setting an incorrect checksum value here.
- Header transmission → response reception started
  Set the FTS bit in the RLN3nLTRC register to 1 (frame transmission or wake-up transmission/reception started).
  The LIN master self-test mode (reception) is executed. In this mode, interrupt are generated, and status and error status are also updated.
  To suspend the transmission during LIN master self-test mode (reception), write 0 to the OM0 bit of the RLN3nLCUC register (LIN reset mode) and transition to LIN reset mode.
- When the reception is completed, the reversed value of the looped-back frame data is stored in the RLN3nLIDB, RLN3nLDBRb (b = 1 to 8), and RLN3nLCBR registers (the data is stored as a reversed value because the set value should be compared with the looped-back value). Then, the FTS bit in the RLN3nLTRC register is cleared.
- If the reception fails to complete due to an error, the corresponding error flag is set and the FTS bit in the RLN3nLTRC register is cleared.

Note: x: Don’t care

Note 1. The following register settings are not reflected to the operation of the LIN self-test mode. The LPRS bit in the RLN3nLWBR register, the RLN3nLBRP0 register, the RLN3nLBRP1 register, the LCKS bit in the RLN3nLMD register, and the IBS bit in the RLN3nLSC register. Therefore, those settings are not necessary.

Note 2. If necessary, set the related registers described in **Section 6, Interrupt**.

Note 3. When the successful header transmission interrupt and the successful frame reception interrupt are used in the same interrupt processing, if the software processing of the successful header transmission interrupt is not completed before the generation of the successful frame reception interrupt, the SHIE bit in the RLN3nLIE register should not be set to 1 (successful header transmission interrupt enabled).
The time required from the setting of the successful header transmission flag to the setting of the successful frame/wake-up reception flag is calculated by the following formula.

10 × (number of data bytes + 1) [Tbit]

1 Tbit = 1/LIN system clock source (fLIN) × 16

16.9.4 Terminating LIN Self-Test Mode

To terminate LIN self-test mode, perform the procedure below:

- Write 0 (LIN reset mode) to the OM0 bit in the RLN3nLCUC register.
  If the OMM1 and OMM0 bits in the RLN3nLMST register are not 11_B, write 11_B to the OM1 and OM0 bits in the RLN3nLCUC register. After confirming that the OMM1 and OMM0 bits in the RLN3nLMST register are set to 11_B, transition to LIN reset mode.
- Verify the cancelation of LIN self-test mode.
  Read the LSTM bit in the RLN3nLSTC register; confirm that it is 0 (not in LIN self-test mode).
- Verify the transition to LIN reset mode.
  Read the OMM0 bit in the RLN3nLMST register; verify that it is 0 (LIN reset mode).

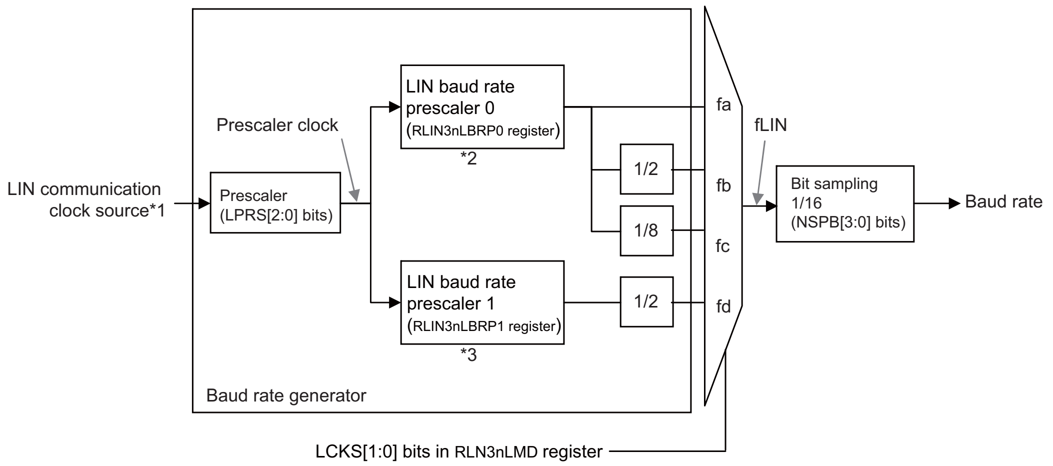
16.10 Baud Rate Generator

The prescaler clock is obtained by frequency-dividing the LIN communication clock source by the prescaler, and the LIN system clock (fLIN) is obtained by frequency-dividing the prescaler clock by the baud rate generator. The clock obtained by frequency-dividing the LIN system clock (fLIN) by the number of samplings is the baud rate. The reciprocal of this baud rate is called the bit time (Tbit).

The LIN/UART interface has two types of baud rate generators. The baud rate generator to be used is switched according to the mode.

16.10.1 LIN Master Mode

Figure 16.28 shows a block diagram of baud rate generation in LIN master mode.



Note 1. For the LIN communication clock source, see **Section 12, Clock Controller**.
Note 2. When the value in RLN3nLBRP0 register is N (N = 0 to 255), the clock frequency is divided by N + 1.
Note 3. When the value in RLN3nLBRP1 register is M (M = 0 to 255), the clock frequency is divided by M + 1.

Figure 16.28 Block Diagram of Baud Rate Generation in LIN Master Mode

By setting the RLN3nLBRP0 register so that fa is 307200 Hz (= 19200 × 16), the resulting fLIN are fa = 19200 × 16, fb = 9600 × 16, and fc = 2400 × 16. These fLIN by 16 in the bit timing generator, enabling bit rates of 19200 bps, 9600 bps and 2400 bps, to be generated. Also, by setting the RLN3nLBRP1 register so that fd is 166672 Hz (= 10417 × 16), the resulting fLIN is fd = 10417 × 16. This fLIN by 16 in the bit timing generator, enabling 10417 bps to be generated.

Table 16.71 shows examples of baud rate generation for each frequency of the LIN communications clock source (19200, 10417, 9600, and 2400 bps) in LIN master mode and the sizes of errors in the rates.

Table 16.71 Example of Baud Rate Generation in LIN master mode (19200 bps, 10417 bps, 9600 bps, and 2400 bps)

LIN Communication Clock Source	Prescaler	Baud Rate Generator 0 (N + 1) Dividing	Baud Rate Generator 0 (N + 1) Dividing	System Clock	Baud Rate	Error
80 MHz	1/2	130	—	fa	19230.77	+0.16%
	1/1	—	240	fd	10416.67	–0.003%
	1/2	130	—	fb	9615.38	+0.16%
	1/2	130	—	fc	2403.85	+0.16%

NOTE

The number of samples per bit is 16 (when RLN3nLWBR.NSPB[3:0] = 0000_B or 1111_B).

Baud rate is calculated by the following formula:

Baud rate of LIN slave

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)

÷ (RLN3nLBRP0+ 1) ÷ 16 [bps] (When fa is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)

÷ (RLN3nLBRP0 + 1) ÷ 2 or 16 [bps] (When fb is selected for fLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)

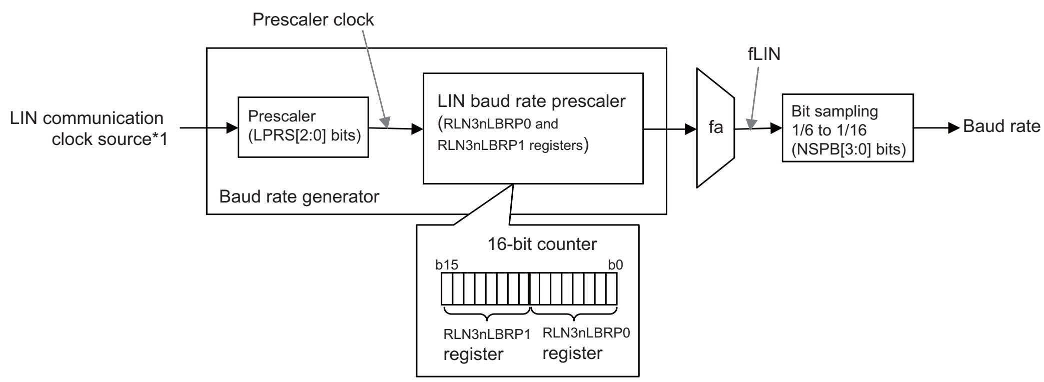
÷ (RLN3nLBRP0 + 1) ÷ 8 ÷ 16 [bps] (When fc is selected for fLLIN)

= {Frequency of LIN communication clock source} × (RLN3nLWBR.LPRS[2:0] selection clock)

÷ (RLN3nLBRP1 + 1) ÷ 2 ÷ 16 [bps] (When fd is selected for fLIN)

16.10.2 UART Mode

Figure 16.29 shows a block diagram of baud rate generation in UART mode.



Note 1. For the LIN communication clock source, see **Section 12, Clock Controller**.

Figure 16.29 Block Diagram of Baud Rate Generation in UART Mode

UART baud rate is calculated with the following formula:

UART baud rate
= {LIN communication clock source frequency} × (RLN3nLWBR.LPRS[2:0] select clock) ÷ (RLN3nLBRP01 + 1) ÷ {RLN3nLWBR.NSPB[3:0] select count} [bps]

Table 16.72 shows examples of baud rate generation for each frequency of the LIN communications clock source (19200, 9600, 2400, and 10417 bps) and the sizes of the errors in the rates.

Table 16.72 Examples of UART Baud Rate Setting (When LIN Communication Clock Source is 80 MHz)

UART Baud Rate (Target)	Prescaler	Baud Rate Generator 01 (L + 1) Dividing	Baud Rate	Error
1200 bps	1/2	2084	1199.616	–0.03%
2400 bps	1/2	1042	2399.232	–0.03%
4800 bps	1/2	520	4807.692	+0.16%
9600 bps	1/2	260	9615.385	+0.16%
19200 bps	1/2	130	19230.77	+0.16%
31250 bps	1/2	80	31250.00	0.00%
38400 bps	1/2	66	37878.79	–1.36%

NOTE

The number of samples per bit in **Table 16.72** is 16 (when RLN3nLWBR.NSPB[3:0] = 0000_B or 1111_B).

16.11 Noise Filter

The LIN/UART interface has a noise filter for reducing erroneous receiving of data due to noise. By setting the LRDNFS bit in the RLN3nLMD register to 0 (use the noise filter), the noise filter is enabled. The noise filter samples the level of the synchronized RLIN3nRX with the prescaler clock, and outputs the sampling value determined by a 3-sampling majority rule. The value of each bit of the receive data is determined based on the noise filter output.

Figure 16.30 shows the configuration of the noise filter, **Figure 16.31** shows an example of a noise filter circuit, and **Figure 16.32** shows the determination of the received data when the noise filter is used.

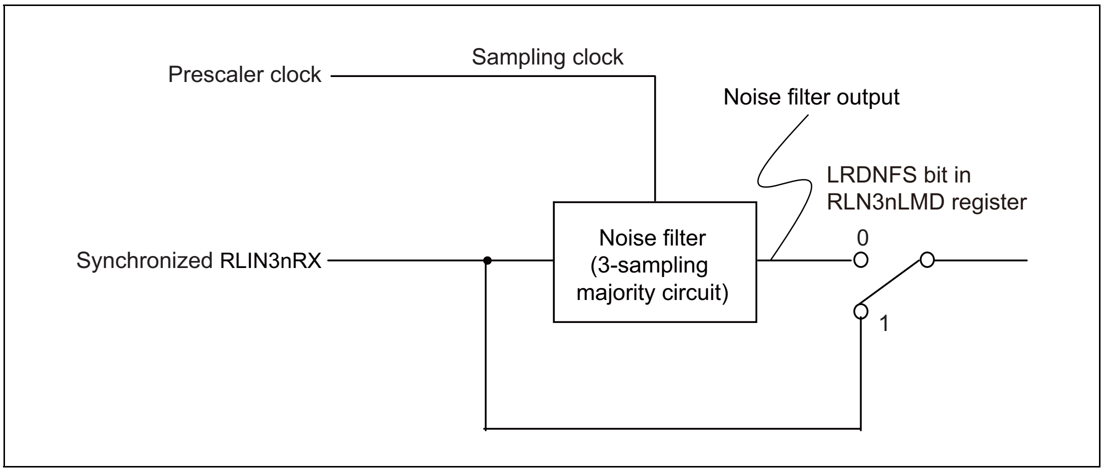


Figure 16.30 Configuration of Noise Filter

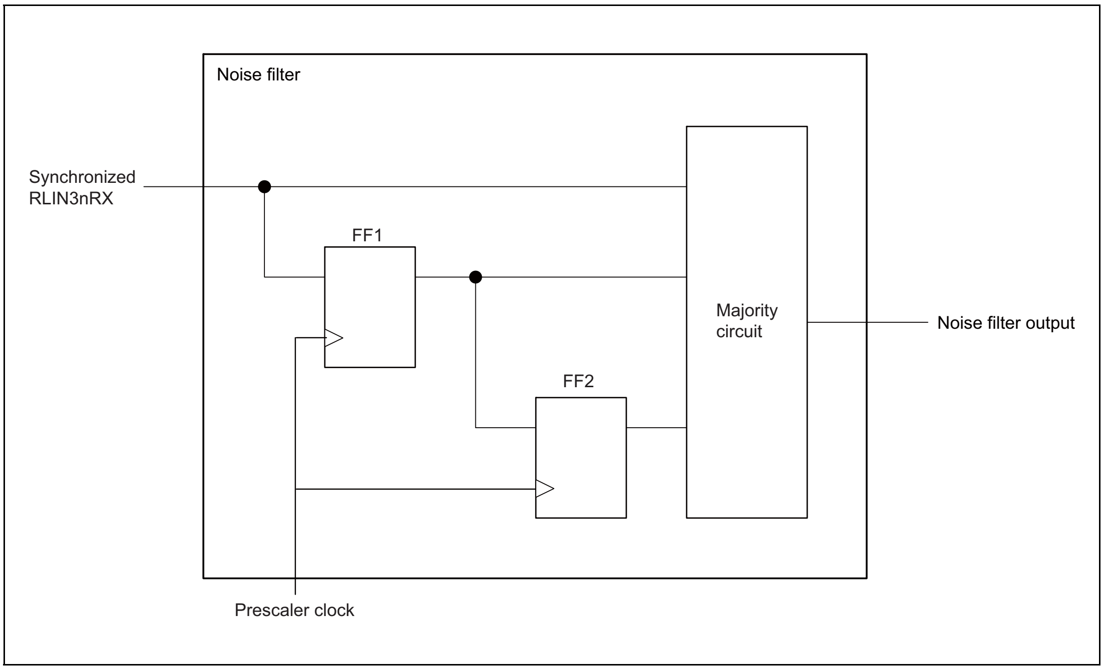

Figure 16.31 Example of Noise Filter Circuit

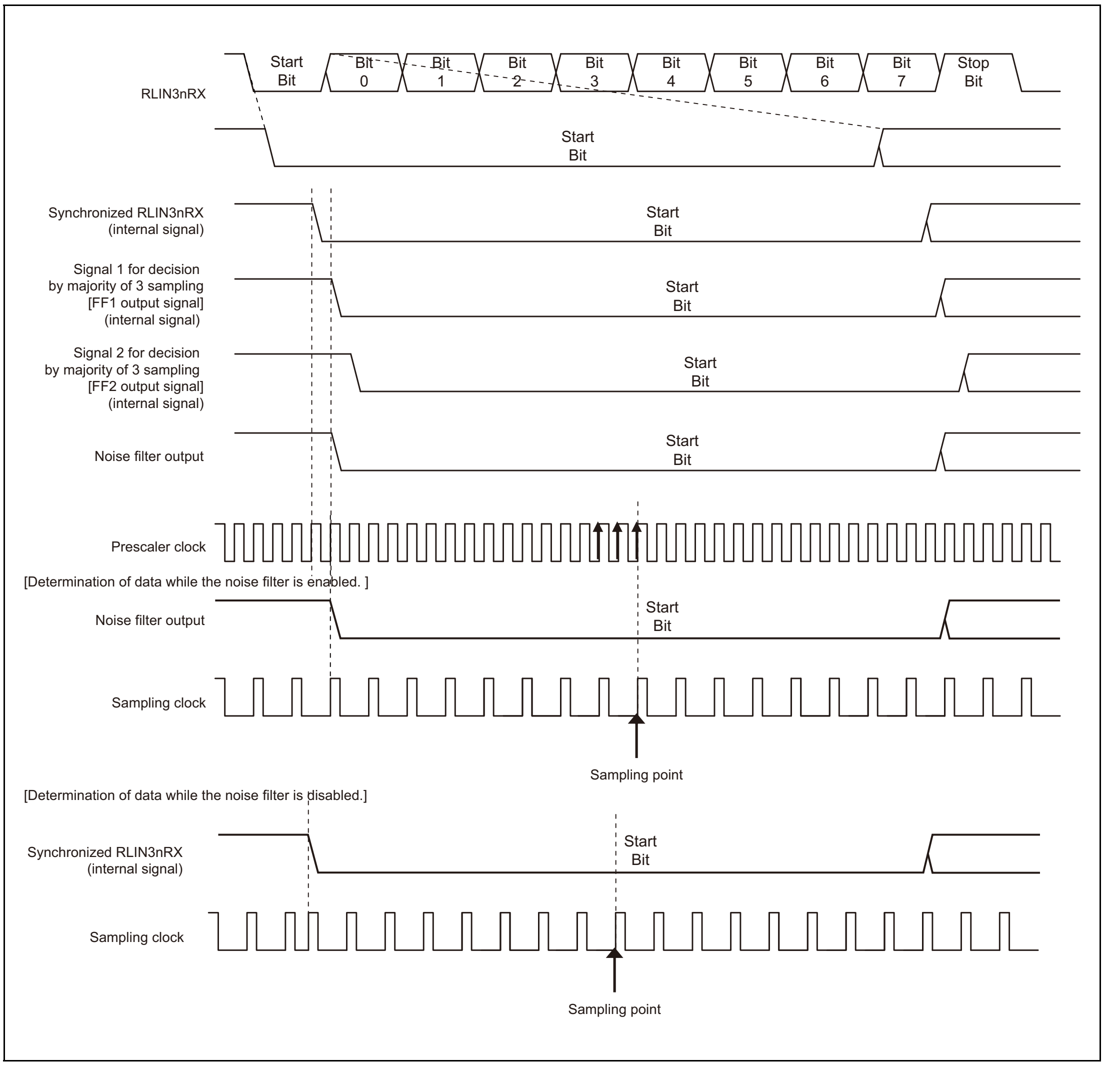

Figure 16.32 Determination of Received Data when Noise Filter is Used

Section 17 CANFD Interface (RS-CANFD)

This section contains a generic description of the CANFD Interface (RS-CANFD).

The first part of this section describes all RH850/P1M-E specific properties, such as the number of units, register base addresses, etc. The remainder of the section describes the functions and registers of RS-CANFD.

17.1 Features of RH850/P1M-E RS-CANFD

17.1.1 Number of Units and Channels

This microcontroller has the following number of RS-CANFD units.

Table 17.1 Number of Units

Product Name	RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of Units	1	
Name	RSCFDn (n = 0)	

The individual products have the CANFD Interface Channels listed below.

Table 17.2 Unit Configurations and Channels

Unit Name	Channel Name	RH850/P1M-E 100 pins		RH850/P1M-E 144 pins	
		1 MB (3 ch)	2 MB (3 ch)	1 MB (3 ch)	2 MB (3 ch)
RSCFD0	CAN0	√	√	√	√
	CAN1	√	√	√	√
	CAN2	√	√	√	√

The RS-CANFD has two interface modes (classical CAN mode and CAN FD mode) and uses different registers for each mode. There are two types of register names RSCANnXXX and RSCFDnCFDXXX (XXX: arbitrary) depending on interface modes. When explaining specifications common to two registers, register names are described as RSCFDn(CFD)XXX.

Table 17.3 Indices

Index	Meaning
n	Throughout this section, the individual RS-CANFD units are generically indicated by the index "n" (n = 0); for example, RSCFDn(CFD)GCTR is the global control register of the RSCFDn unit.
m	Throughout this section, the individual channels of RS-CANFD units are generically indicated by the index "m" (m = 0 to 2); for example, RSCFDn(CFD)CmSTS is the channel m status register.
j	The individual registers associated with receive rule table are generically indicated by the index "j" (j = 0 to 15); for example, RSCFDn(CFD)GAFLIDj is the receive rule ID register.
k	The individual transmit/receive FIFO buffers are generically indicated by the index "k" (k = 0 to [channel m × 3 + 2]); for example, RSCFDn(CFD)CFCCk is the transmit/receive FIFO buffer configuration/control register.
x	The individual receive FIFO buffers are generically identified by the index "x" (x = 0 to 7); for example, RSCFDn(CFD)RFSTSx is the receive FIFO buffer status register.
d	Data field registers of transmit/receive FIFO buffers and receive FIFO buffers are identified by "d" (classical CAN mode: d = 0 to 1, CAN FD mode: d = 0 to 15). For example, the transmit/receive FIFO buffer data field register is described as RSCFDn(CFD)CFDFd_k.
q	The individual receive buffers are generically indicated by the index "q" (q = 0 to [channel m × 16 + 15]); for example, RSCFDn(CFD)RMIDq is the receive buffer ID register.
p	The individual transmit buffers are generically indicated by the index "p" (p = 0 to [channel m × 16 + 15]; for example, RSCFDn(CFD)TMCp is the transmit buffer control register.
b	Data field registers of receive buffers and transmit buffers are identified by "b" (classical CAN mode: b = 0 to 1, CAN FD mode: b = 0 to 4). For example, the receive buffer data field register is described as RSCFDn(CFD)RMDFb_q.
r	The individual RAM tests for CAN are generically indicated by the index "r" (r = 0 to 63); for example, RSCFDn(CFD)RPGACCr is the RAM test page access register.
y	The registers not covered above are indicated by the letter "y" (y = 0, 1); for example, RSCFDn(CFD)RMNDy is a receive buffer new data register.

Note: The functions and descriptions of registers in this section are for the RS-CANFDs that has 3 channels (m = 0 to 2). When referring to information with indices, regard the index values as the ones corresponding to your target product.

The following table lists the values of indices for individual products.

Table 17.4 Indices for Individual Products (1/2)

	Index Correspondence of Each Product			
	RH850/P1M-E 100 pins		RH850/P1M-E 144 pins	
	1 MB (3 ch)	2 MB (3 ch)	1 MB (3 ch)	2 MB (3 ch)
j	0 to 15	0 to 15	0 to 15	0 to 15
k	0 to 8	0 to 8	0 to 8	0 to 8
x	0 to 7	0 to 7	0 to 7	0 to 7
d	0, 1*1 0 to 15*2	0, 1*1 0 to 15*2	0, 1*1 0 to 15*2	0, 1*1 0 to 15*2
q	0 to 47	0 to 47	0 to 47	0 to 47
p	0 to 47	0 to 47	0 to 47	0 to 47

Table 17.4 Indices for Individual Products (2/2)

Index Correspondence of Each Product				
	RH850/P1M-E 100 pins		RH850/P1M-E 144 pins	
	1 MB (3 ch)	2 MB (3 ch)	1 MB (3 ch)	2 MB (3 ch)
b	0, 1*1 0 to 4*2	0, 1*1 0 to 4*2	0, 1*1 0 to 4*2	0, 1*1 0 to 4*2
r	0 to 63	0 to 63	0 to 63	0 to 63
y	0, 1	0, 1	0, 1	0, 1

Note 1. In classical CAN mode

Note 2. In CAN FD mode

17.1.2 Register Base Address

RSCFDn base addresses are listed in the following table.

RSCFDn register addresses are given as offsets from the base addresses in general.

Table 17.5 Register Base Address

Base Address Name	Base Address
<RSCFD0_base>	FFD2 0000_H

17.1.3 Clock Supply

The RSCFDn clock supply is shown in the following table.

Table 17.6 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
RSCFDn	clk_xincan	Main OSC clock CLK_MOSC
	clkc	Low-speed peripheral clock CLK_LSB
	pclk	High-speed peripheral clock CLK_HSB

The operating frequency of the RSCFDn depends on the transfer rate and the number of channels in use. **Table 17.7** shows the range of the frequency.

Table 17.7 Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E

Condition		Range of Operating Frequency		
Transfer Rate	No. of Channels in Use	pclk	clk_xincan*1	clkc*1
(Transfer Rate) ≤ 2Mbps	max. 3ch	80 MHz (fixed)	16 MHz (fixed)	40 MHz (fixed)
2Mbps < (Transfer Rate) ≤ 8Mbps	max. 3ch	80 MHz (fixed)	(do not select)	40 MHz (fixed)

Note 1. Setting the DCS bit in the RSCFDn(CFD)GCFG register enables to select either clk_xincan or clkc.

17.1.4 Interrupt Requests

The RSCFDn interrupt requests are listed in the following table.

Table 17.8 Interrupt Requests

Unit Interrupt Signal		Outline	Interrupt Number	DMA Trigger Number
RSCFDn				
INTRCANGERR		CAN global error interrupt	ch189	—
INTRCANGRECC		CAN receive FIFO interrupt	ch190	—
CAN0	INTRCAN0ERR	CAN0 error interrupt	ch183	—
	INTRCAN0REC	CAN0 transmit/receive FIFO receive completion interrupt	ch184	—
	INTRCAN0TRX	CAN0 transmit interrupt	ch185	—
CAN1	INTRCAN1ERR	CAN1 error interrupt	ch186	—
	INTRCAN1REC	CAN1 transmit/receive FIFO receive completion interrupt	ch187	—
	INTRCAN1TRX	CAN1 transmit interrupt	ch188	—
CAN2	INTRCAN2ERR	CAN2 error interrupt	ch191	—
	INTRCAN2REC	CAN2 transmit/receive FIFO receive completion interrupt	ch192	—
	INTRCAN2TRX	CAN2 transmit interrupt	ch193	—
DMACANRF0		RX FIFO DMA request 0	—	ch13*1 or ch34*2
DMACANRF1		RX FIFO DMA request 1	—	ch14*1 or ch35*2
DMACANRF2		RX FIFO DMA request 2	—	ch15*1 or ch36*2
DMACANRF3		RX FIFO DMA request 3	—	ch16*1 or ch37*2
DMACANRF4		RX FIFO DMA request 4	—	ch17*1 or ch38*2
DMACANRF5		RX FIFO DMA request 5	—	ch18*1 or ch39*2
DMACANRF6		RX FIFO DMA request 6	—	ch19*1 or ch40*2
DMACANRF7		RX FIFO DMA request 7	—	ch20*1 or ch41*2
DMACANCF0		COM FIFO DMA request 0	—	ch21*1 or ch42*2
DMACANCF1		COM FIFO DMA request 1	—	ch22*1 or ch43*2
DMACANCF2		COM FIFO DMA request 2	—	ch23*1 or ch44*2

Note 1. Exclusively used with INTTAUD0Ii (i = 0 to 10)
Note 2. Exclusively used with INTTAUD1Ii (i = 0 to 10)

NOTE

For selecting the DMA requests, see **Section 7.11.1, DTS Trigger Select Register Descriptions.**

17.1.5 Reset Source

Please refer to **Section 8, Reset Controller**.

17.1.6 External Input/Output Signals

External input/output signals of RSCFDn are listed below.

Table 17.9 External Input/Output Signals

Unit Signal Name	Outline	Alternative Port Pin Signal
RSCFD0		
CANmRX (m = 0 to 2)	CANm receive data input	CANmRX (m = 0 to 2)
CANmTX (m = 0 to 2)	CANm transmit data output	CANmTX (m = 0 to 2)

17.1.7 Combinations of Pins and Ports

Combinations of RS-CANFD0 pins and ports are listed in the following table.

Table 17.10 Combinations of Pins and Ports

Function	Channel Name	Pin Name	Port Name			
			Group 1	Group 2	Group 3	Group 4
RSCFD0	CAN0	RSCAN0RX0	P2_0	P3_7	P4_5	—
		RSCAN0TX0	P2_1	P3_8	P4_6	—
	CAN1	RSCAN0RX1	P2_2	P3_12	P4_2	P4_7*1
		RSCAN0TX1	P2_3	P3_13	P4_3	P4_3
	CAN2	RSCAN0RX2	P5_6	P5_6	—	—
		RSCAN0TX2	P5_7*1	P5_5	—	—

Note 1. Usable in the 144-pin product

17.2 Overview

17.2.1 Functional Overview

Table 17.11 shows the RS-CANFD module specifications. **Figure 17.1** shows the RS-CANFD module block diagram.

Table 17.11 RS-CANFD Module Specifications (1/3)

Item	Specification
Number of channels	3
Protocol	ISO11898-1 compliant Using CAN FD frames is selectable by switching interface modes.
Communication speed	Classical CAN mode: • Maximum 1 Mbps $\text{Communication speed (CANm bit time clock)} = \dfrac{1}{\text{CANm bit time}}$ CANm bit time = CANmTq × Tq count per bit $\text{CANmTq} = \dfrac{\text{(BRP[9:0] bits in the RSCANnCmCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCANnGCFG register) CAN FD mode: • Nominal bit rate: max.1 Mbps, data bit rate: max. 8 Mbps $\text{Transmission rate (CANm nominal bit time clock)} = \dfrac{1}{\text{CANm nominal bit time}}$ $\text{Transmission rate (CANm data bit time clock)} = \dfrac{1}{\text{CANm data bit time}}$ CANm nominal bit time = CANmTq(N) × Tq count per nominal bit CANm data bit time = CANmTq(D) × Tq count per data bit $\text{CANmTq(N)} = \dfrac{\text{(NBRP[9:0] bits in the RSCFDnCFDCmNCFG register + 1)}}{\text{fCAN}}$ $\text{CANmTq(D)} = \dfrac{\text{(DBRP[7:0] bits in the RSCFDnCFDCmDCFG register + 1)}}{\text{fCAN}}$ fCAN: Frequency of CAN clock (selected by the DCS bit in the RSCFDnCFDGCFG register) m = 0 to 2 Tq: Time quantum
Buffer	240 buffers in total • Individual buffers: 48 buffers (16 buffers × 3 channels) Transmit buffer: 16 buffers per channel Transmit queue: Single queue per channel (shared with the transmit buffer; up to 16 buffers allocatable) • Shared buffers: 192 buffers for all channels Receive buffer: 0 to 48 buffers Receive FIFO buffer: 8 FIFO buffers (up to 128 buffers allocatable to each) Transmit/receive FIFO buffer: 3 FIFO buffers per channel (up to 128 buffers allocatable to each) • ECC included
Reception function	• Receives data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be received. • Sets interrupt enable/disable for each FIFO. • Mirror function (reception of messages transmitted from the own CAN node) • Timestamp function (to record message reception time as a 16-bit timer value)

Table 17.11 RS-CANFD Module Specifications (2/3)

Item	Specification
Reception filter function	• Selects receive messages according to 192 receive rules. • Sets the number of receive rules (0 to 128) for each channel. • Acceptance filter processing: Sets ID and mask for each receive rule. • DLC filter processing: Enables DLC filter check for each acceptance rule.
Receive message transfer function	• Routing function Transfers receive messages to arbitrary destinations (can be transferred to up to 8 buffers) Transfer destination: Receive buffer, receive FIFO buffer, and/or transmit/receive FIFO buffer • Label addition function Stores label information together with a message in a receive buffer and FIFO buffer.
Transmission function	• Transmits data frames and remote frames. • Selects ID format (standard ID, extended ID, or both IDs) to be transmitted. • Sets interrupt enable/disable for each transmit buffer and transmit/receive FIFO buffer. • Selects ID priority transmission or transmit buffer number priority transmission. • Transmit request can be aborted (possible to confirm with a flag) • One-shot transmission function
Interval transmission function	Transmits messages at configurable intervals (transmit mode or gateway mode of transmit/receive FIFO buffers)
Transmit queue function	Transmits all stored messages according to the ID priority.
Transmit history function	Stores the history information of transmission-completed messages Adds timestamp (recording message transmission time as a 16-bit timer value) to the history information.
Gateway function	Transmits a received message automatically.
Bus off recovery mode selection	Selects the method for returning from bus off state. • ISO11898-1 compliant • Automatic entry to channel halt mode at bus-off entry • Automatic entry to channel halt mode at bus-off end • Transition to channel halt mode by program request • Transition to the error-active state by program request (forcible return from the bus off state)
Error status monitoring	• Monitors CAN protocol errors (stuff error, form error, ACK error, CRC error, bit error, ACK delimiter error, and bus lock). • Detects error status transitions (error warning, error passive, bus off entry, and bus off recovery) • Reads the error counter. • Monitors DLC errors.
Interrupt source	11 sources • Global interrupts (2 sources) Receive FIFO interrupt Global error interrupt • Channel interrupts (3 sources/channel) CANm transmit interrupt (m = 0 to 2) – CANm transmit complete interrupt – CANm transmit abort interrupt – CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode) – CANm transmit history interrupt – CANm transmit queue interrupt CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode) CANm error interrupt
CAN stop mode	Reduces power consumption by stopping clock supply to the RS-CANFD module.
CAN clock source	Selects the clkc or the clk_xincan. As for the range of operating frequency, see **Table 17.7**.

Table 17.11 RS-CANFD Module Specifications (3/3)

Item	Specification
Test function	Test function for user evaluation • Listen-only mode • Self-test mode 0 (external loopback) • Self-test mode 1 (internal loopback) • Restricted operation mode • RAM test (read/write test) • Inter-channel communication test [CRC error test enabled]

17.2.2 Interface Modes

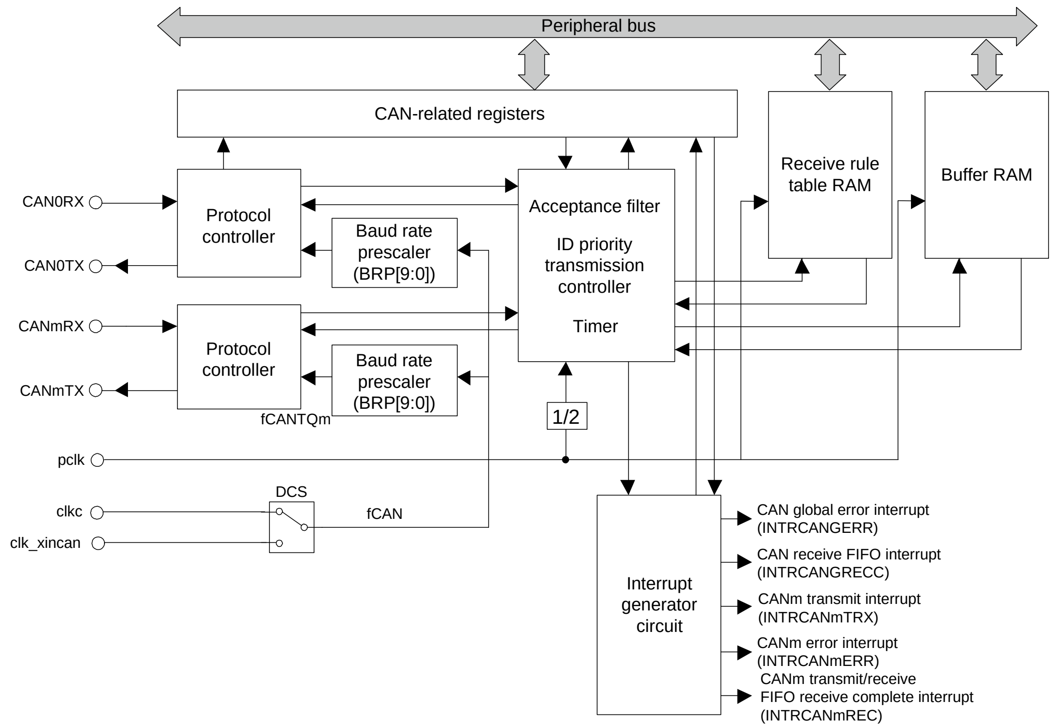
The RS-CANFD has two interface modes.

- Classical CAN mode: Handles only classical CAN frames.
- CAN FD mode: Handles classical CAN frames and CAN FD frames.

These two modes use different register maps with the same base address. Register maps change by switching interface modes.

Interface modes are switched by the RCMC bit in the RSCFDn(CFD)GRMCFG register.

17.2.3 Block Diagram



Note: m = 0 to 2
BRP[9:0]: Bits in the RSCANnCmCFG register
DCS: Bits in the RSCANnGCFG register
fCANTQm: CANmTq clock
fCAN: CAN clock

Figure 17.1 RS-CANFD Module Block Diagram (Classical CAN Mode)

In CAN FD mode, different clock signals are input to the baud rate prescaler and the protocol controller respectively. See **Section 17.11.1.3, Communication Speed Setting**.

17.3 Registers (Classical CAN Mode)

17.3.1 List of Registers

The following tables list RS-CANFD registers to be used in classical CAN mode.

For details about <RSCFDn_base>, see **Section 17.1.2, Register Base Address**.

For details about registers initialized in Global reset mode or Channel reset mode, see following.

- **Table 17.180, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 17.181, Registers Initialized Only in Global Reset Mode**

Table 17.12 Registers (1/2)

Module	Register	Symbol	Address
Interface mode-related registers			
RSCANn	Global interface mode select register	RSCANnGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCANn	Channel m Configuration Register	RSCANnCmCFG	<RSCFDn_base> + 0000_H + (10_H × m)
RSCANn	Channel m control register	RSCANnCmCTR	<RSCFDn_base> + 0004_H + (10_H × m)
RSCANn	Channel m status register	RSCANnCmSTS	<RSCFDn_base> + 0008_H + (10_H × m)
RSCANn	Channel m error flag register	RSCANnCmERFL	<RSCFDn_base> + $000C_H$ + (10_H × m)
Global-related registers			
RSCANn	Global configuration register	RSCANnGCFG	<RSCFDn_base> + 0084_H
RSCANn	Global control register	RSCANnGCTR	<RSCFDn_base> + 0088_H
RSCANn	Global status register	RSCANnGSTS	<RSCFDn_base> + $008C_H$
RSCANn	Global error flag register	RSCANnGERFL	<RSCFDn_base> + 0090_H
RSCANn	Global timestamp counter register	RSCANnGTSC	<RSCFDn_base> + 0094_H
RSCANn	Global TX Interrupt Status Register 0	RSCANnGTINTSTS0	<RSCFDn_base> + 0460_H
RSCANn	Global FD configuration register	RSCANnGFDCFG	<RSCFDn_base> + 0474_H
Receive rule-related registers			
RSCANn	Receive Rule Entry Control Register	RSCANnGAFLECTR	<RSCFDn_base> + 0098_H
RSCANn	Receive Rule Configuration Register 0	RSCANnGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCANn	Receive Rule ID Register j	RSCANnGAFLIDj	<RSCFDn_base> + 0500_H + (10_H × j)
RSCANn	Receive Rule Mask Register j	RSCANnGAFLMj	<RSCFDn_base> + 0504_H + (10_H × j)
RSCANn	Receive Rule Pointer 0 Register j	RSCANnGAFLP0_j	<RSCFDn_base> + 0508_H + (10_H × j)
RSCANn	Receive Rule Pointer 1 Register j	RSCANnGAFLP1_j	<RSCFDn_base> + $050C_H$ + (10_H × j)
Receive buffer-related registers			
RSCANn	Receive Buffer Number Register	RSCANnRMNB	<RSCFDn_base> + $00A4_H$
RSCANn	Receive Buffer New Data Register y	RSCANnRMNDy	<RSCFDn_base> + $00A8_H$ + (04_H × y)
RSCANn	Receive Buffer ID Register q	RSCANnRMIDq	<RSCFDn_base> + 0600_H + (10_H × q)
RSCANn	Receive Buffer Pointer Register q	RSCANnRMPTRq	<RSCFDn_base> + 0604_H + (10_H × q)
RSCANn	Receive Buffer Data Field 0 Register q	RSCANnRMDF0_q	<RSCFDn_base> + 0608_H + (10_H × q)
RSCANn	Receive Buffer Data Field 1 Register q	RSCANnRMDF1_q	<RSCFDn_base> + $060C_H$ + (10_H × q)
Receive FIFO buffer-related registers			
RSCANn	Receive FIFO Buffer Configuration and Control Register x	RSCANnRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Status Register x	RSCANnRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Pointer Control Register x	RSCANnRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCANn	Receive FIFO Buffer Access ID Register x	RSCANnRFIDx	<RSCFDn_base> + $0E00_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Pointer Register x	RSCANnRFPTRx	<RSCFDn_base> + $0E04_H$ + (10_H × x)
RSCANn	Receive FIFO Buffer Access Data Field 0 Register x	RSCANnRFDF0_x	<RSCFDn_base> + $0E08_H$ + (10_H × x)

Table 17.12 Registers (2/2)

Module	Register	Symbol	Address
RSCANn	Receive FIFO Buffer Access Data Field 1 Register x	RSCANnRFDF1_x	<RSCFDn_base> + $0E0C_H$ + (10_H × x)
Transmit/Receive FIFO buffer related registers			
RSCANn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCANnCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Status Register k	RSCANnCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Pointer Control Register k	RSCANnCFPCTRk	<RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCANn	Transmit/receive FIFO Buffer Access ID Register k	RSCANnCFIDk	<RSCFDn_base> + $0E80_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Pointer Register k	RSCANnCFPTRk	<RSCFDn_base> + $0E84_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Data Field 0 Register k	RSCANnCFDF0_k	<RSCFDn_base> + $0E88_H$ + (10_H × k)
RSCANn	Transmit/receive FIFO Buffer Access Data Field 1 Register k	RSCANnCFDF1_k	<RSCFDn_base> + $0E8C_H$ + (10_H × k)
FIFO status-related registers			
RSCANn	FIFO Empty Status Register	RSCANnFESTS	<RSCFDn_base> + 0238_H
RSCANn	FIFO Full Status Register	RSCANnFFSTS	<RSCFDn_base> + $023C_H$
RSCANn	FIFO Message Lost Status Register	RSCANnFMSTS	<RSCFDn_base> + 0240_H
RSCANn	Receive FIFO Buffer Interrupt Flag Status Register	RSCANnRFISTS	<RSCFDn_base> + 0244_H
RSCANn	Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register	RSCANnCFRISTS	<RSCFDn_base> + 0248_H
RSCANn	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register	RSCANnCFTISTS	<RSCFDn_base> + $024C_H$
Transmit buffer-related registers			
RSCANn	Transmit Buffer Control Register p	RSCANnTMCp	<RSCFDn_base> + 0250_H + (01_H × p)
RSCANn	Transmit Buffer Status Register p	RSCANnTMSTSp	<RSCFDn_base> + $02D0_H$ + (01_H × p)
RSCANn	Transmit Buffer ID Register p	RSCANnTMIDp	<RSCFDn_base> + 1000_H + (10_H × p)
RSCANn	Transmit Buffer Pointer Register p	RSCANnTMPTRp	<RSCFDn_base> + 1004_H + (10_H × p)
RSCANn	Transmit Buffer Data Field 0 Register p	RSCANnTMDF0_p	<RSCFDn_base> + 1008_H + (10_H × p)
RSCANn	Transmit Buffer Data Field 1 Register p	RSCANnTMDF1_p	<RSCFDn_base> + $100C_H$ + (10_H × p)
RSCANn	Transmit Buffer Interrupt Enable Configuration Register y	RSCANnTMIECy	<RSCFDn_base> + 0390_H + (04_H × y)
Transmit buffer status-related registers			
RSCANn	Transmit Buffer Transmit Request Status Register y	RSCANnTMTRSTSy	<RSCFDn_base> + 0350_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Abort Request Status Register y	RSCANnTMTARSTSy	<RSCFDn_base> + 0360_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Complete Status Register y	RSCANnTMTCSTSy	<RSCFDn_base> + 0370_H + (04_H × y)
RSCANn	Transmit Buffer Transmit Abort Status Register y	RSCANnTMTASTSy	<RSCFDn_base> + 0380_H + (04_H × y)
Transmit queue-related registers			
RSCANn	Transmit Queue Configuration and Control Register m	RSCANnTXQCCm	<RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCANn	Transmit Queue Status Register m	RSCANnTXQSTSm	<RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCANn	Transmit Queue Pointer Control Register m	RSCANnTXQPCTRm	<RSCFDn_base> + $03E0_H$ + (04_H × m)
Transmit history-related registers			
RSCANn	Transmit History Configuration and Control Register m	RSCANnTHLCCm	<RSCFDn_base> + 0400_H + (04_H × m)
RSCANn	Transmit History Status Register m	RSCANnTHLSTSm	<RSCFDn_base> + 0420_H + (04_H × m)
RSCANn	Transmit History Pointer Control Register m	RSCANnTHLPCTRm	<RSCFDn_base> + 0440_H + (04_H × m)
RSCANn	Transmit History Access Register m	RSCANnTHLACCm	<RSCFDn_base> + 1800_H + (04_H × m)
Test-related registers			
RSCANn	Global Test Configuration Register	RSCANnGTSTCFG	<RSCFDn_base> + 0468_H
RSCANn	Global Test Control Register	RSCANnGTSTCTR	<RSCFDn_base> + $046C_H$
RSCANn	Global Lock Key Register	RSCANnGLOCKK	<RSCFDn_base> + $047C_H$
RSCANn	RAM Test Page Access Register r	RSCANnRPGACCr	<RSCFDn_base> + 1900_H + (04_H × r)
Mode read registers			
RSCANn	CAN FD Mode Read Register	RSCANnCANFDMDR	<RSCFDn_base> + 8000_H

Table 17.13 Transmit Buffer p Allocated to Each Channel

17.3.2 Details of Interface Mode-Related Registers

17.3.2.1 RSCANnGRMCFG — Global Interface Mode Select Register

Access: RSCANnGRMCFG register can be read/written in 32-bit units
RSCANnGRMCFGL, RSCANnGRMCFGH registers can be read/written in 16-bit units
RSCANnGRMCFGLL, RSCANnGRMCFGLH, RSCANnGRMCFGHL, RSCANnGRMCFGHH registers can be read/written in 8-bit units

Address: RSCANnGRMCFG: <RSCFDn_base> + $04FC_H$

RSCANnGRMCFGL: <RSCFDn_base> + $04FC_H$,
RSCANnGRMCFGH: <RSCFDn_base> + $04FE_H$

RSCANnGRMCFGLL: <RSCFDn_base> + $04FC_H$,
RSCANnGRMCFGLH: <RSCFDn_base> + $04FD_H$,
RSCANnGRMCFGHL: <RSCFDn_base> + $04FE_H$,
RSCANnGRMCFGHH: <RSCFDn_base> + $04FF_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCMC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 17.17 RSCANnGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCANnGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. Setting this bit to 1 causes the RS-CANFD module to transition to CAN FD mode. To switch the RS-CANFD module from CAN FD mode to classical CAN mode, set the values after reset to all respective registers and bits allocated only to the register map in CAN FD mode, and then modify the value of RSCANnGRMCFG register.

17.3.3 Details of Channel-Related Registers

17.3.3.1 RSCANnCmCFG — Channel m Configuration Register (m = 0 to 2)

Access: RSCANnCmCFG register can be read/written in 32-bit units
RSCANnCmCFGL, RSCANnCmCFGH registers can be read/written in 16-bit units

15 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9 to 0	BRP[9:0]	Prescaler Division Ratio setting When these bits are set to P (0 to 1023), the baud rate prescaler divides fCAN by P + 1.

Modify the RSCANnCmCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode before transitioning to channel communication mode or channel halt mode. For a description of the bit timing parameters and settings, see **Section 17.11.1, Initial Settings**.

SJW[1:0] Bits

These bits are used to specify a Tq value for the resynchronization jump width. Allowed values are 1 Tq to 4 Tq, inclusive.
Set a value less than or equal to the value of the TSEG2 bits.

TSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2).
Allowed values are 2 Tq to 8 Tq, inclusive.
Set a value smaller than the value of the TSEG1 bits.

TSEG1[3:0] Bits

These bits are used to specify a Tq value for the total length of the propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1).
Allowed values are 4 Tq to 16 Tq, inclusive.

BRP[9:0] Bits

The CANmTq clock (fCANTQm) is calculated by dividing the CAN clock (fCAN) by the baud rate prescaler, ((BRP[9:0]) + 1). One clock cycle of the CANmTq clock is 1 Time Quantum (Tq).

17.3.3.2 RSCANnCmCTR — Channel m Control Register (m = 0 to 2)

Access: RSCANnCmCTR register can be read/written in 32-bit units
RSCANnCmCTRL, RSCANnCmCTRH registers can be read/written in 16-bit units
RSCANnCmCTRLL, RSCANnCmCTRLH, RSCANnCmCTRHL, RSCANnCmCTRHH registers can be read/written in 8-bit units

Address: RSCANnCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)

1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCANnCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCANnCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCANnGTSTCFG register is 1).

- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify this bit in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCANnCmERFL register.
When this bit is cleared to 0, if any error is detected while the flags of bits 14-8 in the RSCANnCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCANnCmCTR register (m = 0 to 2) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bits at the same time as the RS-CANFD module transitions to channel halt mode (at bus off entry when the BOM[1:0] bits are 01_B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCANnCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCANnCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCANnCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCANnCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCANnCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCANnCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCANnCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCANnCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly changes the state from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCANnCmSTS register to 00_H and also clears the BOSTS flag in the RSCANnCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCANnCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 17.6.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the RSCAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to 10_B.

17.3.3.3 RSCANnCmSTS — Channel m Status Register (m = 0 to 2)

Access: RSCANnCmSTS register can be read only in 32-bit units
RSCANnCmSTSL, RSCANnCmSTSH registers can be read only in 16-bit units
RSCANnCmSTSLL, RSCANnCmSTSLH, RSCANnCmSTSHL, RSCANnCmSTSHH registers can be read only in 8-bit units

Address: RSCANnCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)

RSCANnCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),

Table 17.20 RSCANnCmSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 8	Reserved	These bits are read as the value after reset.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specification (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

17.3.3.4 RSCANnCmERFL — Channel m Error Flag Register (m = 0 to 2)

Access: RSCANnCmERFL register can be read/written in 32-bit units
RSCANnCmERFLL, RSCANnCmERFLH registers can be read/written in 16-bit units
RSCANnCmERFLLL, RSCANnCmERFLLH, RSCANnCmERFLHL, RSCANnCmERFLHH registers can be read/written in 8-bit units

Address: RSCANnCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)

RSCANnCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),

7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is still set to 1. The channel reset mode transition clears all of these flags to 0.

If the ERRD bit in the RSCANnCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCANnCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCANnCmCTR register is set to 1 (communication test mode is enabled), the CRC value calculated based on the transmit or receive message can be read. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, a bus lock can be detected again when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCANnCmCTR register is set to 1 (forcible return from the bus off state is made).
- The BOM[1:0] bits in the RSCANnCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCANnCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCANnCmCTR register (m = 0 to 2) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag is set to 1 when the error passive state is entered ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])).
This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCANnCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write "0" to the given flag and "1" to the other flags.

17.3.4 Details of Global-Related Registers

17.3.4.1 RSCANnGCFG — Global Configuration Register

Access: RSCANnGCFG register can be read/written in 32-bit units
RSCANnGCFGL, RSCANnGCFGH registers can be read/written in 16-bit units
RSCANnGCFGLL, RSCANnGCFGLH, RSCANnGCFGHL, RSCANnGCFGHH registers can be read/written in 8-bit units

Address: RSCANnGCFG: <RSCFDn_base> + 0084_H

RSCANnGCFGL: <RSCFDn_base> + 0084_H, RSCANnGCFGH: <RSCFDn_base> + 0086_H

RSCANnGCFGLL: <RSCFDn_base> + 0084_H, RSCANnGCFGLH: <RSCFDn_base> + 0085_H,
RSCANnGCFGHL: <RSCFDn_base> + 0086_H, RSCANnGCFGHH: <RSCFDn_base> + 0087_H

Value after reset: 0000 0000_H

5	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

Modify the RSCANnGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 17.8.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the bit time clock that will be the clock source of the timestamp counter.

TSSS Bit

This bit is used to select a clock source of the timestamp counter.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

TMTSCE Bit

Setting this bit to 1 makes it possible to store the timestamp of a transmitted message in the transmit history buffer. The timestamp is stored in TMTS[15:0] bits in the RSCANnTHLACCm register.

EEFE Bit

Setting this bit to 1 sets the EEFm bit in the RSCANnGERFL register to 1 when a 2-bit ECC error is detected during the transmission priority determination. At this time, the message in which a 2-bit ECC error was detected is not transmitted.

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCANnGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCANnGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0.

17.3.4.2 RSCANnGCTR — Global Control Register

Access: RSCANnGCTR register can be read/written in 32-bit units
RSCANnGCTRL, RSCANnGCTRH registers can be read/written in 16-bit units
RSCANnGCTRLL, RSCANnGCTRLH, RSCANnGCTRHL, RSCANnGCTRHH registers can be read/written in 8-bit units

Address: RSCANnGCTR: <RSCFDn_base> + 0088$_H$

RSCANnGCTRL: <RSCFDn_base> + 0088$_H$, RSCANnGCTRH: <RSCFDn_base> + 008A$_H$

RSCANnGCTRLL: <RSCFDn_base> + 0088$_H$, RSCANnGCTRLH: <RSCFDn_base> + 0089$_H$,
RSCANnGCTRHL: <RSCFDn_base> + 008A$_H$, RSCANnGCTRHH: <RSCFDn_base> + 008B$_H$

Value after reset: 0000 0005$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.23 RSCANnGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCANnGTSC register is cleared to 0000_H.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCANnGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RSCAN module into global stop mode.
Clearing this bit to 0 release the RSCAN module from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 17.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module in global stop mode.

17.3.4.3 RSCANnGSTS — Global Status Register

Access: RSCANnGSTS register can be read only in 32-bit units
RSCANnGSTSL, RSCANnGSTSH registers can be read only in 16-bit units
RSCANnGSTSLL, RSCANnGSTSLH, RSCANnGSTSHL, RSCANnGSTSHH registers can be read only in 8-bit units

Address: RSCANnGSTS: <RSCFDn_base> + $008C_H$

RSCANnGSTSL: <RSCFDn_base> + $008C_H$, RSCANnGSTSH: <RSCFDn_base> + $008E_H$

RSCANnGSTSLL: <RSCFDn_base> + $008C_H$, RSCANnGSTSLH: <RSCFDn_base> + $008D_H$,
RSCANnGSTSHL: <RSCFDn_base> + $008E_H$, RSCANnGSTSHH: <RSCFDn_base> + $008F_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.24 RSCANnGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has exited global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

17.3.4.4 RSCANnGERFL — Global Error Flag Register

Access: RSCANnGERFL register can be read/written in 32-bit units
RSCANnGERFLL, RSCANnGERFLH registers can be read/written in 16-bit units
RSCANnGERFLLL, RSCANnGERFLLH, RSCANnGERFLHL, RSCANnGERFLHH registers can be read/written in 8-bit units

Address: RSCANnGERFL: <RSCFDn_base> + 0090_H

RSCANnGERFLL: <RSCFDn_base> + 0090_H, RSCANnGERFLH: <RSCFDn_base> + 0092_H

RSCANnGERFLLL: <RSCFDn_base> + 0090_H, RSCANnGERFLLH: <RSCFDn_base> + 0091_H,
RSCANnGERFLHL: <RSCFDn_base> + 0092_H, RSCANnGERFLHH: <RSCFDn_base> + 0093_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.25 RSCANnGERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
15, 14	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
13 to 8	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
7, 6	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
5	Reserved	When read, the undefined value is returned. When writing this bit, write the value after reset.
4, 3	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.

Table 17.25 RSCANnGERFL Register Contents (2/2)

Bit Position	Bit Name	Function
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCANnGERFL register are cleared to 0 in global reset mode.

EEFm Flag

While the EEFE bit in the RSCANnGCFG register is 1, when a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 2), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCANnTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCANnRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCANnCFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

NOTE

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

17.3.4.5 RSCANnGTSC — Global Timestamp Counter Register

Access: RSCANnGTSC register can be read only in 32-bit units.
RSCANnGTSCL, RSCANnGTSCH registers can be read only in 16-bit units.

Address: RSCANnGTSC: <RSCFDn_base> + 0094_H

RSCANnGTSCL: <RSCFDn_base> + 0094_H, RSCANnGTSCH: <RSCFDn_base> + 0096_H

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer.

Furthermore, while the TMTSCE bit in the RSCANnGCFG register is 1, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter start timing and stop timing depend on the count source.

- When the TSSS bit in the RSCANnGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

17.3.4.6 RSCANnGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCANnGTINTSTS0 register can be read only in 32-bit units
RSCANnGTINTSTS0L, RSCANnGTINTSTS0H registers can be read only in 16-bit units
RSCANnGTINTSTS0LL, RSCANnGTINTSTS0LH, RSCANnGTINTSTS0HL, RSCANnGTINTSTS0HH registers can be read only in 8-bit units

Address: RSCANnGTINTSTS0: <RSCFDn_base> + 0460_H

RSCANnGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0H: <RSCFDn_base> + 0462_H

RSCANnGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCANnGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCANnGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCANnGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 17.27 RSCANnGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.

Table 17.27 RSCANnGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCANnTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCANnCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCANnTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCANnTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCANnTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCANnTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCANnCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCANnTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCANnTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCANnTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

17.3.4.7 RSCANnGFDCFG — Global FD Configuration Register

Access: RSCANnGFDCFG register can be read/written in 32-bit unit
RSCANnGFDCFGL and RSCANnGFDCFGH registers can be read/written in 16-bit unit
RSCANnGFDCFGLL, RSCANnGFDCFGLH, RSCANnGFDCFGHL, RSCANnGFDCFGHH registers can be read/written in 8-bit unit

Address: RSCANnGFDCFG: <RSCFDn_base> + 0474_H

RSCANnGFDCFGL: <RSCFDn_base> + 0474_H, RSCANnGFDCFGH: <RSCFDn_base> + 0476_H

RSCANnGFDCFGLL: <RSCFDn_base> + 0474_H, RSCANnGFDCFGLH: <RSCFDn_base> + 0475_H,
RSCANnGFDCFGHL: <RSCFDn_base> + 0476_H, RSCANnGFDCFGHH: <RSCFDn_base> + 0477_H

Value after reset: $0000\ 0000_H$

Table 17.28 RSCANnGFDCFG Register contents

Bit Position	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Setting prohibited 1 1: Setting prohibited
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

17.3.5 Details of Receive Rule-related Registers

17.3.5.1 RSCANnGAFLECTR — Receive Rule Entry Control Register

Access: RSCANnGAFLECTR register can be read/written in 32-bit units
RSCANnGAFLECTRL, RSCANnGAFLECTRH registers can be read/written in 16-bit units
RSCANnGAFLECTRLL, RSCANnGAFLECTRLH, RSCANnGAFLECTRHL, RSCANnGAFLECTRHH registers can be read/written in 8-bit units

Address: RSCANnGAFLECTR: <RSCFDn_base> + 0098_H

RSCANnGAFLECTRL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRH: <RSCFDn_base> + $009A_H$

RSCANnGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCANnGAFLECTRLH: <RSCFDn_base> + 0099_H, RSCANnGAFLECTRHL: <RSCFDn_base> + $009A_H$, RSCANnGAFLECTRHH: <RSCFDn_base> + $009B_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 17.29 RSCANnGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (00000_B) to page 11 (01011_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

17.3.5.2 RSCANnGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCANnGAFLCFG0 register can be read/written in 32-bit units
RSCANnGAFLCFG0L, RSCANnGAFLCFG0H registers can be read/written in 16-bit units
RSCANnGAFLCFG0LL, RSCANnGAFLCFG0LH, RSCANnGAFLCFG0HL, RSCANnGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCANnGAFLCFG0: <RSCFDn_base> + $009C_H$

RSCANnGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCANnGAFLCFG0H: <RSCFDn_base> + $009E_H$

RSCANnGAFLCFG0LL: <RSCFDn_base> + $009C_H$, RSCANnGAFLCFG0LH: <RSCFDn_base> + $009D_H$, RSCANnGAFLCFG0HL: <RSCFDn_base> + $009E_H$, RSCANnGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Table 17.30 RSCANnGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules used for channel 2.
7 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

Modify the RSCANnGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total number of rules allocated to each channel is not larger than the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

17.3.5.3 RSCANnGAFLIDj — Receive Rule ID Register j (j = 0 to 15)

Access: RSCANnGAFLIDj register can be read/written in 32-bit units
RSCANnGAFLIDjL, RSCANnGAFLIDjH registers can be read/written in 16-bit units
RSCANnGAFLIDjLL, RSCANnGAFLIDjLH, RSCANnGAFLIDjHL, RSCANnGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLIDj: <RSCFDn_base> + 0500_H + (10_H × j)

RSCANnGAFLIDjL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjH: <RSCFDn_base> + 0502_H + (10_H × j)

RSCANnGAFLIDjLL: <RSCFDn_base> + 0500_H + (10_H × j),
RSCANnGAFLIDjLH: <RSCFDn_base> + 0501_H + (10_H × j),
RSCANnGAFLIDjHL: <RSCFDn_base> + 0502_H + (10_H × j),
RSCANnGAFLIDjHH: <RSCFDn_base> + 0503_H + (10_H × j)

Value after reset: 0000 0000_H

Table 17.31 RSCANnGAFLIDj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID setting Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCANnGAFLIDj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

17.3.5.4 RSCANnGAFLMj — Receive Rule Mask Register j (j = 0 to 15)

Access: RSCANnGAFLMj register can be read/written in 32-bit units
RSCANnGAFLMjL, RSCANnGAFLMjH registers can be read/written in 16-bit units
RSCANnGAFLMjLL, RSCANnGAFLMjLH, RSCANnGAFLMjHL, RSCANnGAFLMjHH registers can be read/written in 8-bit units

Address: RSCANnGAFLMj: <RSCFDn_base> + 0504_H + (10_H × j)

RSCANnGAFLMjL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjH: <RSCFDn_base> + 0506_H + (10_H × j)

RSCANnGAFLMjLL: <RSCFDn_base> + 0504_H + (10_H × j),
RSCANnGAFLMjLH: <RSCFDn_base> + 0505_H + (10_H × j),
RSCANnGAFLMjHL: <RSCFDn_base> + 0506_H + (10_H × j),
RSCANnGAFLMjHH: <RSCFDn_base> + 0507_H + (10_H × j)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	GAFLIDEM	GAFLRTRM	—	GAFLIDM[28:16]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.32 RSCANnGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared.
29	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCANnGAFLMj register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCANnGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set all the GAFLIDM[28:0] bits to 0s at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

17.3.5.5 RSCANnGAFLP0_j — Receive Rule Pointer 0 Register j (j = 0 to 15)

Access: RSCANnGAFLP0_j register can be read/written in 32-bit units
RSCANnGAFLP0_jL, RSCANnGAFLP0_jH registers can be read/written in 16-bit units
RSCANnGAFLP0_jLL, RSCANnGAFLP0_jLH, RSCANnGAFLP0_jHL, RSCANnGAFLP0_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP0_j: <RSCFDn_base> + 0508_H + (10_H × j)

RSCANnGAFLP0_jL: <RSCFDn_base> + 0508_H + (10_H × j),
RSCANnGAFLP0_jH: <RSCFDn_base> + $050A_H$ + (10_H × j)

RSCANnGAFLP0_jLL: <RSCFDn_base> + 0508_H + (10_H × j),
RSCANnGAFLP0_jLH: <RSCFDn_base> + 0509_H + (10_H × j),
RSCANnGAFLP0_jHL: <RSCFDn_base> + $050A_H$ + (10_H × j),
RSCANnGAFLP0_jHH: <RSCFDn_base> + $050B_H$ + (10_H × j)

Value after reset: 0000 0000_H

Table 17.33 RSCANnGAFLP0_j Register Contents

Bit Position	Bit Name	Function
31 to 28	GAFLDLC[3:0]	Receive Rule DLC b31 b30 b29 b28 0 0 0 0: DLC check is disabled. 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCANnGAFLP0_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCANnRMNB register.

17.3.5.6 RSCANnGAFLP1_j — Receive Rule Pointer 1 Register j (j = 0 to 15)

Access: RSCANnGAFLP1_j register can be read/written in 32-bit units
RSCANnGAFLP1_jL, RSCANnGAFLP1_jH registers can be read/written in 16-bit units
RSCANnGAFLP1_jLL, RSCANnGAFLP1_jLH, RSCANnGAFLP1_jHL, RSCANnGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCANnGAFLP1_j: <RSCFDn_base> + $050C_H$ + (10_H × j)

RSCANnGAFLP1_jL: <RSCFDn_base> + $050C_H$ + (10_H × j),
RSCANnGAFLP1_jH: <RSCFDn_base> + $050E_H$ + (10_H × j)

RSCANnGAFLP1_jLL: <RSCFDn_base> + $050C_H$ + (10_H × j),
RSCANnGAFLP1_jLH: <RSCFDn_base> + $050D_H$ + (10_H × j),
RSCANnGAFLP1_jHL: <RSCFDn_base> + $050E_H$ + (10_H × j),
RSCANnGAFLP1_jHH: <RSCFDn_base> + $050F_H$ + (10_H × j)

Value after reset: $0000\ 0000_H$

Table 17.34 RSCANnGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
16 to 8	GAFLFDP[16:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCANnGAFLP1_j register when the AFLDAE bit in the RSCANnGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[16:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCANnGAFLP0_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCANnCFCCk register are set to 00_B (receive mode) or 10_B (gateway mode) are selectable.

17.3.6 Details of Receive Buffer-Related Registers

17.3.6.1 RSCANnRMNB — Receive Buffer Number Register

Access: RSCANnRMNB register can be read/written in 32-bit units
RSCANnRMNBL, RSCANnRMNBH registers can be read/written in 16-bit units
RSCANnRMNBLL, RSCANnRMNBLH, RSCANnRMNBHL, RSCANnRMNBHH registers can be read/written in 8-bit units

Address: RSCANnRMNB: <RSCFDn_base> + $00A4_H$

RSCANnRMNBL: <RSCFDn_base> + $00A4_H$, RSCANnRMNBH: <RSCFDn_base> + $00A6_H$

RSCANnRMNBLL: <RSCFDn_base> + $00A4_H$, RSCANnRMNBLH: <RSCFDn_base> + $00A5_H$,
RSCANnRMNBHL: <RSCFDn_base> + $00A6_H$, RSCANnRMNBHH: <RSCFDn_base> + $00A7_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 17.35 RSCANnRMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48.

Modify the RSCANnRMNB register only in global reset mode.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

17.3.6.2 RSCANnRMNDy — Receive Buffer New Data Register y (y = 0, 1)

Access: RSCANnRMNDy register can be read/written in 32-bit units
RSCANnRMNDyL, RSCANnRMNDyH registers can be read/written in 16-bit units
RSCANnRMNDyLL, RSCANnRMNDyLH, RSCANnRMNDyHL, RSCANnRMNDyHH registers can be read/written in 8-bit units

Address: RSCANnRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)

RSCANnRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)

RSCANnRMNDyLL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCANnRMNDyLH: <RSCFDn_base> + $00A9_H$ + (04_H × y),
RSCANnRMNDyHL: <RSCFDn_base> + $00AA_H$ + (04_H × y),

Table 17.36 RSCANnRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q. When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCANnRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write “0” to the flag and “1” to other flags. These bits cannot be set to 0 while a message is being stored. It takes ten pclk clock cycles to store a message.

These flags are cleared to 0 in global reset mode.

17.3.6.3 RSCANnRMIDq — Receive Buffer ID Register q (q = 0 to 47)

Access: RSCANnRMIDq register can be read only in 32-bit units
RSCANnRMIDqL, RSCANnRMIDqH registers can be read only in 16-bit units
RSCANnRMIDqLL, RSCANnRMIDqLH, RSCANnRMIDqHL, RSCANnRMIDqHH registers can be read only in 8-bit units

Address: RSCANnRMIDq: <RSCFDn_base> + 0600_H + (10_H × q)

RSCANnRMIDqL: <RSCFDn_base> + 0600_H + (10_H × q),
RSCANnRMIDqH: <RSCFDn_base> + 0602_H + (10_H × q)

Table 17.37 RSCANnRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	These bits are read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

17.3.6.4 RSCANnRMPTRq — Receive Buffer Pointer Register q (q = 0 to 47)

Access: RSCANnRMPTRq register can be read only in 32-bit units
RSCANnRMPTRqL, RSCANnRMPTRqH registers can be read only in 16-bit units
RSCANnRMPTRqLL, RSCANnRMPTRqLH, RSCANnRMPTRqHL, RSCANnRMPTRqHH registers can be read only in 8-bit units

Address: RSCANnRMPTRq: <RSCFDn_base> + 0604_H + (10_H × q)

RSCANnRMPTRqL: <RSCFDn_base> + 0604_H + (10_H × q),

Table 17.38 RSCANnRMPTRq Register Contents

Bit Position	Bit Name	Function
31 to 28	RMDLC[3:0]	Receive Buffer DLC Data b31 b30 b29 b28 0 0 0 0: No data byte 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

17.3.6.5 RSCANnRMDF0_q — Receive Buffer Data Field 0 Register q (q = 0 to 47)

Access: RSCANnRMDF0_q register can be read only in 32-bit units
RSCANnRMDF0_qL, RSCANnRMDF0_qH registers can be read only in 16-bit units
RSCANnRMDF0_qLL, RSCANnRMDF0_qLH, RSCANnRMDF0_qHL, RSCANnRMDF0_qHH registers can be read only in 8-bit units

Address: RSCANnRMDF0_q: <RSCFDn_base> + 0608_H + (10_H × q)

RSCANnRMDF0_qL: <RSCFDn_base> + 0608_H + (10_H × q),
RSCANnRMDF0_qH: <RSCFDn_base> + $060A_H$ + (10_H × q)

Table 17.40 RSCANnRMDF1_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB7[7:0]	Receive Buffer Data Byte 7 Receive Buffer Data Byte 6 Receive Buffer Data Byte 5 Receive Buffer Data Byte 4 Data for a message stored in the receive buffer can be read.
23 to 16	RMDB6[7:0]	
15 to 8	RMDB5[7:0]	
7 to 0	RMDB4[7:0]	

When the RMDLC[3:0] value in the RSCANnRMPTRq register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

17.3.7 Details of Receive FIFO Buffer-Related Registers

17.3.7.1 RSCANnRFCCx — Receive FIFO Buffer Configuration and Control Register x (x = 0 to 7)

Access: RSCANnRFCCx register can be read/written in 32-bit units
RSCANnRFCCxL, RSCANnRFCCxH registers can be read/written in 16-bit units
RSCANnRFCCxLL, RSCANnRFCCxLH, RSCANnRFCCxHL, RSCANnRFCCxHH registers can be read/written in 8-bit units

Address: RSCANnRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)

RSCANnRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxH: <RSCFDn_base> + $00BA_H$ + (04_H × x)

RSCANnRFCCxLL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCANnRFCCxLH: <RSCFDn_base> + $00B9_H$ + (04_H × x),
RSCANnRFCCxHL: <RSCFDn_base> + $00BA_H$ + (04_H × x),
RSCANnRFCCxHH: <RSCFDn_base> + $00BB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 17.41 RSCANnRFCCx Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
15 to 13	RFIGCV[2:0]	Receive FIFO Interrupt Request Timing Select b15 b14 b13 0 0 0: When FIFO is 1/8 full. 0 0 1: When FIFO is 2/8 full. 0 1 0: When FIFO is 3/8 full. 0 1 1: When FIFO is 4/8 full. 1 0 0: When FIFO is 5/8 full. 1 0 1: When FIFO is 6/8 full. 1 1 0: When FIFO is 7/8 full. 1 1 1: When FIFO is full.
12	RFIM	Receive FIFO Interrupt Source Select 0: An interrupt occurs when the condition set by the RFIGCV[2:0] bits is met. 1: An interrupt occurs each time a message has been received.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	RFDC[2:0]	Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages

Table 17.41 RSCANnRFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
7 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 enables the use of receive FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RSCANnRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode.

Set this bit to 1 with another instruction after the settings to all bits in the RSCANnRFCCx register have been done.

This bit is cleared to 0 in global reset mode.

17.3.7.2 RSCANnRFSTSx — Receive FIFO Buffer Status Register x (x = 0 to 7)

Access: RSCANnRFSTSx register can be read/written in 32-bit units
RSCANnRFSTSxL, RSCANnRFSTSxH registers can be read/written in 16-bit units
RSCANnRFSTSxLL, RSCANnRFSTSxLH, RSCANnRFSTSxHL, RSCANnRFSTSxHH registers can be read/written in 8-bit units

Address: RSCANnRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)

RSCANnRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxH: <RSCFDn_base> + $00DA_H$ + (04_H × x)

RSCANnRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCANnRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x),
RSCANnRFSTSxHL: <RSCFDn_base> + $00DA_H$ + (04_H × x),
RSCANnRFSTSxHH: <RSCFDn_base> + $00DB_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.42 RSCANnRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCANnRFCCx register is set to 0.

This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCANnRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCANnRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCANnRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCANnRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when even a single received message is stored in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

17.3.7.3 RSCANnRFPCTRx — Receive FIFO Buffer Pointer Control Register x (x = 0 to 7)

Access: RSCANnRFPCTRx register can only be written in 32-bit units
RSCANnRFPCTRxL, RSCANnRFPCTRxH registers can only be written in 16-bit units
RSCANnRFPCTRxLL, RSCANnRFPCTRxLH, RSCANnRFPCTRxHL, RSCANnRFPCTRxHH registers can only be written in 8-bit units

Address: RSCANnRFPCTRx: <RSCFDn_base> + $00F8_H$ + (04_H × x)

RSCANnRFPCTRxL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCANnRFPCTRxH: <RSCFDn_base> + $00FA_H$ + (04_H × x)

RSCANnRFPCTRxLL: <RSCFDn_base> + $00F8_H$ + (04_H × x),
RSCANnRFPCTRxLH: <RSCFDn_base> + $00F9_H$ + (04_H × x),
RSCANnRFPCTRxHL: <RSCFDn_base> + $00FA_H$ + (04_H × x),
RSCANnRFPCTRxHH: <RSCFDn_base> + $00FB_H$ + (04_H × x)

Value after reset: $0000\ 0000_H$

Table 17.43 RSCANnRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF_H, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCANnRFSTSx register is decremented by 1. Read the RSCANnRFIDx, RSCANnRFPTRx, RSCANnRFDF0_x, and RSCANnRFDF1_x registers to read messages in the receive FIFO buffer, and then write FF_H to the RFPC[7:0] bits.

When writing FF_H to these bits, make sure that the RFE bit in the RSCANnRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCANnRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

17.3.7.4 RSCANnRFIDx — Receive FIFO Buffer Access ID Register x (x = 0 to 7)

Access: RSCANnRFIDx register can be read only in 32-bit units
RSCANnRFIDxL, RSCANnRFIDxH registers can be read only in 16-bit units
RSCANnRFIDxLL, RSCANnRFIDxLH, RSCANnRFIDxHL, RSCANnRFIDxHH registers can be read only in 8-bit units

Address: RSCANnRFIDx: <RSCFDn_base> + $0E00_H$ + (10_H × x)

RSCANnRFIDxL: <RSCFDn_base> + $0E00_H$ + (10_H × x),

31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	Reserved	These bits are read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

This bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

17.3.7.5 RSCANnRFPTRx — Receive FIFO Buffer Access Pointer Register x (x = 0 to 7)

Access: RSCANnRFPTRx register can be read only in 32-bit units
RSCANnRFPTRxL, RSCANnRFPTRxH registers can be read only in 16-bit units
RSCANnRFPTRxLL, RSCANnRFPTRxLH, RSCANnRFPTRxHL, RSCANnRFPTRxHH registers can be read only in 8-bit units

Address: RSCANnRFPTRx: <RSCFDn_base> + $0E04_H$ + (10_H × x)

Table 17.48 RSCANnCFCCk Register Contents (2/2)

Bit Position	Bit Name	Function
12	CFIM	Transmit/Receive FIFO Interrupt Source Select 0: • Receive mode/gateway mode When the number of received messages meets the condition set by the CFIGCV[2:0] bits, a FIFO receive interrupt request is generated. • Transmit mode/gateway mode When the buffer becomes empty upon completion of message transmission, a FIFO transmit interrupt request is generated. 1: • Receive mode/gateway mode A FIFO receive interrupt request is generated each time a message has been received. • Transmit mode/gateway mode A FIFO transmit interrupt request is generated each time a message has been transmitted.
11	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
10 to 8	CFDC[2:0]	Transmit/Receive FIFO Buffer Depth Configuration b10 b9 b8 0 0 0: 0 messages 0 0 1: 4 messages 0 1 0: 8 messages 0 1 1: 16 messages 1 0 0: 32 messages 1 0 1: 48 messages 1 1 0: 64 messages 1 1 1: 128 messages
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]) (see **Table 17.15**).

See **Table 17.13** and **Table 17.14**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCANnGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCANnGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the bit time clock of the channel to which the FIFO is linked is the count source of the interval timer.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit when the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCANnCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit when the CFE bit is set to 0.

CFE Bit

Setting this bit to 1 enables the transmit/receive FIFO buffers.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCANnCFCCk register have been set, set this bit to 1 by using another instruction.

17.3.8.2 RSCANnCFSTSk — Transmit/receive FIFO Buffer Status Register k (k = 0 to 8)

Access: RSCANnCFSTSk register can be read/written in 32-bit units
RSCANnCFSTSkL, RSCANnCFSTSkH registers can be read/written in 16-bit units
RSCANnCFSTSkLL, RSCANnCFSTSkLH, RSCANnCFSTSkHL, RSCANnCFSTSkHH registers can be read/written in 8-bit units

Address: RSCANnCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)

RSCANnCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkH: <RSCFDn_base> + $017A_H$ + (04_H × k)

RSCANnCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCANnCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
RSCANnCFSTSkHL: <RSCFDn_base> + $017A_H$ + (04_H × k),
RSCANnCFSTSkHH: <RSCFDn_base> + $017B_H$ + (04_H × k)

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

	CFMC[7:0]								—	—	—	CFTXIF	CFRXIF	CFMLT	CFFLL	CFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.49 RSCANnCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RSCANnCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCANnCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the interrupt source selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the interrupt source selected by the CFIM bit in the RSCANnCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCANnCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCANnCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCANnCFPCTRk register after data was written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

17.3.8.3 RSCANnCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register k (k = 0 to 8)

Access: RSCANnCFPCTRk register can only be written in 32-bit units
RSCANnCFPCTRkL, RSCANnCFPCTRkH registers can only be written in 16-bit units
RSCANnCFPCTRkLL, RSCANnCFPCTRkLH, RSCANnCFPCTRkHL, RSCANnCFPCTRkHH registers can only be written in 8-bit units

Address: RSCANnCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)

RSCANnCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCANnCFPCTRkH: <RSCFDn_base> + $01DA_H$ + (04_H × k)

RSCANnCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCANnCFPCTRkLH: <RSCFDn_base> + $01D9_H$ + (04_H × k),
RSCANnCFPCTRkHL: <RSCFDn_base> + $01DA_H$ + (04_H × k),
RSCANnCFPCTRkHH: <RSCFDn_base> + $01DB_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Table 17.50 RSCANnCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCANnCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCANnCFSTSk register is decremented by 1. Read the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).

- Transmit mode (CFM[1:0] value in the RSCANnCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the RSCANnCFIDk, RSCANnCFPTRk, RSCANnCFDF0_k, and RSCANnCFDF1_k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCANnCFCCk register is set to 1 and the CFFLL flag in the RSCANnCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCANnCFCCk register is 10_B):
  Setting prohibited

17.3.8.4 RSCANnCFIDk — Transmit/receive FIFO Buffer Access ID Register k (k = 0 to 8)

Access: RSCANnCFIDk register can be read/written in 32-bit units
RSCANnCFIDkL, RSCANnCFIDkH registers can be read/written in 16-bit units
RSCANnCFIDkLL, RSCANnCFIDkLH, RSCANnCFIDkHL, RSCANnCFIDkHH registers can be read/written in 8-bit units

Address: RSCANnCFIDk: <RSCFDn_base> + 0E80$_H$ + (10$_H$ × k)

RSCANnCFIDkL: <RSCFDn_base> + 0E80$_H$ + (10$_H$ × k),
RSCANnCFIDkH: <RSCFDn_base> + 0E82$_H$ + (10$_H$ × k)

RSCANnCFIDkLL: <RSCFDn_base> + 0E80$_H$ + (10$_H$ × k),
RSCANnCFIDkLH: <RSCFDn_base> + 0E81$_H$ + (10$_H$ × k),
RSCANnCFIDkHL: <RSCFDn_base> + 0E82$_H$ + (10$_H$ × k),
RSCANnCFIDkHH: <RSCFDn_base> + 0E83$_H$ + (10$_H$ × k)

Value after reset: 0000 0000$_H$

Table 17.51 RSCANnCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01$_B$ (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01$_B$ (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00$_B$ (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register can be written only when the CFM[1:0] value in the RSCANnCFCCk register is 01$_B$ (transmit mode). This register can be read only when the CFM[1:0] value is 00$_B$ (receive mode). This register should not be read or written when the CFM[1:0] value is 10$_B$ (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

This bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, and buffer type) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

These bits set the ID of the message to be transmitted from the transmit/receive FIFO buffer when the CFM[1:0] value is 01_B.

17.3.8.5 RSCANnCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register k (k = 0 to 8)

Access: RSCANnCFPTRk register can be read/written in 32-bit units
RSCANnCFPTRkL, RSCANnCFPTRkH registers can be read/written in 16-bit units
RSCANnCFPTRkLL, RSCANnCFPTRkLH, RSCANnCFPTRkHL, RSCANnCFPTRkHH registers can be read/written in 8-bit units

Address: RSCANnCFPTRk: <RSCFDn_base> + $0E84_H + (10_H \times k)$

RSCANnCFPTRkL: <RSCFDn_base> + $0E84_H + (10_H \times k)$,
RSCANnCFPTRkH: <RSCFDn_base> + $0E86_H + (10_H \times k)$

RSCANnCFPTRkLL: <RSCFDn_base> + $0E84_H + (10_H \times k)$,
RSCANnCFPTRkLH: <RSCFDn_base> + $0E85_H + (10_H \times k)$,

Table 17.52 RSCANnCFPTRk Register Contents

Bit Position	Bit Name	Function
31 to 28	CFDLC[3:0]	Transmit/Receive FIFO Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 16	CFPTR[11:0]	Transmit/Receive FIFO Buffer Label Data • When CFM[1:0] value is 01_B (transmit mode): Set the label information to be stored in the transmit history buffer. Only bits CFPTR[7:0] are valid. • When CFM[1:0] value is 00_B (receive mode): The label information of the received message can be read.
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode). This register is readable only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer. If the data length is set to 1001_B or more, the actual transmit data defaults to 8 bytes.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

17.3.8.6 RSCANnCFDF0_k — Transmit/receive FIFO Buffer Access Data Field 0 Register k (k = 0 to 8)

Access: RSCANnCFDF0_k register can be read/written in 32-bit units
RSCANnCFDF0_kL, RSCANnCFDF0_kH registers can be read/written in 16-bit units
RSCANnCFDF0_kLL, RSCANnCFDF0_kLH, RSCANnCFDF0_kHL, RSCANnCFDF0_kHH registers can be read/written in 8-bit units

Address: RSCANnCFDF0_k: <RSCFDn_base> + $0E88_H$ + (10_H × k)

RSCANnCFDF0_kL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kH: <RSCFDn_base> + $0E8A_H$ + (10_H × k)

RSCANnCFDF0_kLL: <RSCFDn_base> + $0E88_H$ + (10_H × k),
RSCANnCFDF0_kLH: <RSCFDn_base> + $0E89_H$ + (10_H × k),
RSCANnCFDF0_kHL: <RSCFDn_base> + $0E8A_H$ + (10_H × k),
RSCANnCFDF0_kHH: <RSCFDn_base> + $0E8B_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 17.53 RSCANnCFDF0_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB3[7:0]	Transmit/Receive FIFO Buffer Data Byte 3
23 to 16	CFDB2[7:0]	Transmit/Receive FIFO Buffer Data Byte 2
15 to8	CFDB1[7:0]	Transmit/Receive FIFO Buffer Data Byte 1
7 to 0	CFDB0[7:0]	Transmit/Receive FIFO Buffer Data Byte 0 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.

This register can be written only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register can be read only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

17.3.8.7 RSCANnCFDF1_k — Transmit/receive FIFO Buffer Access Data Field 1 Register k (k = 0 to 8)

Access: RSCANnCFDF1_k register can be read/written in 32-bit units
RSCANnCFDF1_kL, RSCANnCFDF1_kH registers can be read/written in 16-bit units
RSCANnCFDF1_kLL, RSCANnCFDF1_kLH, RSCANnCFDF1_kHL, RSCANnCFDF1_kHH registers can be read/written in 8-bit units

Address: RSCANnCFDF1_k: <RSCFDn_base> + $0E8C_H$ + (10_H × k)

RSCANnCFDF1_kL: <RSCFDn_base> + $0E8C_H$ + (10_H × k),
RSCANnCFDF1_kH: <RSCFDn_base> + $0E8E_H$ + (10_H × k)

RSCANnCFDF1_kLL: <RSCFDn_base> + $0E8C_H$ + (10_H × k),
RSCANnCFDF1_kLH: <RSCFDn_base> + $0E8D_H$ + (10_H × k),
RSCANnCFDF1_kHL: <RSCFDn_base> + $0E8E_H$ + (10_H × k),
RSCANnCFDF1_kHH: <RSCFDn_base> + $0E8F_H$ + (10_H × k)

Value after reset: $0000\ 0000_H$

Table 17.54 RSCANnCFDF1_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB7[7:0]	Transmit/Receive FIFO Buffer Data Byte 7 Transmit/Receive FIFO Buffer Data Byte 6 Transmit/Receive FIFO Buffer Data Byte 5 Transmit/Receive FIFO Buffer Data Byte 4 • When CFM[1:0] value is 01_B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00_B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB6[7:0]	
15 to 8	CFDB5[7:0]	
7 to 0	CFDB4[7:0]	

This register is writable only when the CFM[1:0] value in the RSCANnCFCCk register is 01_B (transmit mode).

This register is readable only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCANnCFPTRk register is smaller than 1000_B, data bytes for which no data is set are read as 00_H.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

17.3.9 Details of FIFO Status-Related Registers

17.3.9.1 RSCANnFESTS — FIFO Empty Status Register

Access: RSCANnFESTS registers can be read only in 32-bit units
RSCANnFESTSL, RSCANnFESTSH registers can be read only in 16-bit units
RSCANnFESTSLL, RSCANnFESTSLH, RSCANnFESTSHL, RSCANnFESTSHH registers can be read only in 8-bit units

Address: RSCANnFESTS: <RSCFDn_base> + 0238_H

RSCANnFESTSL: <RSCFDn_base> + 0238_H, RSCANnFESTSH: <RSCFDn_base> + $023A_H$

RSCANnFESTSLL: <RSCFDn_base> + 0238_H, RSCANnFESTSLH: <RSCFDn_base> + 0239_H,
RSCANnFESTSHL: <RSCFDn_base> + $023A_H$, RSCANnFESTSHH: <RSCFDn_base> + $023B_H$

Value after reset: 03FF $FFFF_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.55 RSCANnFESTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 8)
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message (buffer empty). (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCANnFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 8)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

17.3.9.2 RSCANnFFSTS — FIFO Full Status Register

Access: RSCANnFFSTS register can be read only in 32-bit units
RSCANnFFSTSL, RSCANnFFSTSH registers can be read only in 16-bit units
RSCANnFFSTSLL, RSCANnFFSTSLH, RSCANnFFSTSHL, RSCANnFFSTSHH registers can be read only in 8-bit units

Address: RSCANnFFSTS: <RSCFDn_base> + 023C$_H$

RSCANnFFSTSL: <RSCFDn_base> + 023C$_H$, RSCANnFFSTSH: <RSCFDn_base> + 023E$_H$

RSCANnFFSTSLL: <RSCFDn_base> + 023C$_H$, RSCANnFFSTSLH: <RSCFDn_base> + 023D$_H$, RSCANnFFSTSHL: <RSCFDn_base> + 023E$_H$, RSCANnFFSTSHH: <RSCFDn_base> + 023F$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8FLL

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.56 RSCANnFFSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 8)
15	CF7FLL	
14	CF6FLL	
13	CF5FLL	
12	CF4FLL	
11	CF3FLL	
10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCANnFFSTS register is cleared to 0000 0000$_H$ in global reset mode.

CFkFLL Flag (k = 0 to 8)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCANnCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCANnRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

17.3.9.3 RSCANnFMSTS — FIFO Message Lost Status Register

Access: RSCANnFMSTS register can be read only in 32-bit units
RSCANnFMSTSL, RSCANnFMSTSH registers can be read only in 16-bit units
RSCANnFMSTSLL, RSCANnFMSTSLH, RSCANnFMSTSHL, RSCANnFMSTSHH registers can be read only in 8-bit units

Address: RSCANnFMSTS: <RSCFDn_base> + 0240_H

RSCANnFMSTSL: <RSCFDn_base> + 0240_H, RSCANnFMSTSH: <RSCFDn_base> + 0242_H

RSCANnFMSTSLL: <RSCFDn_base> + 0240_H, RSCANnFMSTSLH: <RSCFDn_base> + 0241_H,
RSCANnFMSTSHL: <RSCFDn_base> + 0242_H, RSCANnFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: 0000 0000_H

Table 17.57 RSCANnFMSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8MLT	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 8)
15	CF7MLT	
14	CF6MLT	
13	CF5MLT	
12	CF4MLT	
11	CF3MLT	
10	CF2MLT	
9	CF1MLT	
8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCANnFMSTS register is cleared to 0000 0000_H in global reset mode.

CFkMLT Flag (k = 0 to 8)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

17.3.9.4 RSCANnRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCANnRFISTS register can be read only in 32-bit units
RSCANnRFISTSL, RSCANnRFISTSH registers can be read only in 16-bit units
RSCANnRFISTSLL, RSCANnRFISTSLH, RSCANnRFISTSHL, RSCANnRFISTSHH registers can be read only in 8-bit units

Address: RSCANnRFISTS: <RSCFDn_base> + 0244_H

RSCANnRFISTSL: <RSCFDn_base> + 0244_H, RSCANnRFISTSH: <RSCFDn_base> + 0246_H

RSCANnRFISTSLL: <RSCFDn_base> + 0244_H, RSCANnRFISTSLH: <RSCFDn_base> + 0245_H,
RSCANnRFISTSHL: <RSCFDn_base> + 0246_H, RSCANnRFISTSHH: <RSCFDn_base> + 0247_H

Value after reset: $0000\ 0000_H$

Table 17.58 RSCANnRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCANnRFISTS register is cleared to $0000\ 0000_H$ in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCANnRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

17.3.9.5 RSCANnCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCANnCFRISTS register can be read only in 32-bit units
RSCANnCFRISTSL, RSCANnCFRISTSH registers can be read only in 16-bit units
RSCANnCFRISTSLL, RSCANnCFRISTSLH, RSCANnCFRISTSHL, RSCANnCFRISTSHH registers can be read only in 8-bit units

Address: RSCANnCFRISTS: <RSCFDn_base> + 0248_H

RSCANnCFRISTSL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSH: <RSCFDn_base> + $024A_H$

RSCANnCFRISTSLL: <RSCFDn_base> + 0248_H, RSCANnCFRISTSLH: <RSCFDn_base> + 0249_H,
RSCANnCFRISTSHL: <RSCFDn_base> + $024A_H$, RSCANnCFRISTSHH: <RSCFDn_base> + $024B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.59 RSCANnCFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 8)
7	CF7RXIF	
6	CF6RXIF	
5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCANnCFRISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkRXIF Flag (k = 0 to 8)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

17.3.9.6 RSCANnCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCANnCFTISTS register can be read only in 32-bit units
RSCANnCFTISTSL, RSCANnCFTISTSH registers can be read only in 16-bit units
RSCANnCFTISTSLL, RSCANnCFTISTSLH, RSCANnCFTISTSHL, RSCANnCFTISTSHH registers can be read only in 8-bit units

Address: RSCANnCFTISTS: <RSCFDn_base> + $024C_H$

RSCANnCFTISTSL: <RSCFDn_base> + $024C_H$, RSCANnCFTISTSH: <RSCFDn_base> + $024E_H$

RSCANnCFTISTSLL: <RSCFDn_base> + $024C_H$, RSCANnCFTISTSLH: <RSCFDn_base> + $024D_H$, RSCANnCFTISTSHL: <RSCFDn_base> + $024E_H$, RSCANnCFTISTSHH: <RSCFDn_base> + $024F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.60 RSCANnCFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 8)
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCANnCFTISTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkTXIF Flag (k = 0 to 8)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCANnCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

17.3.10 Details of Transmit Buffer-Related Registers

17.3.10.1 RSCANnTMCp — Transmit Buffer Control Register p (p = 0 to 47)

Access: RSCANnTMCp register can be read/written in 8-bit units

Address: RSCANnTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 17.61 RSCANnTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCANnTMCp register meets any of the following conditions, set it to 00_H.

- The RSCANnTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCANnCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCANnTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCANnTXQCCm (m = 0 to 2) register (p = (m × 16 + 15) to (m × 16 + 15 – the value of TXQDC[3:0] bits)).

All of the bits in the RSCANnTMCp register are cleared to 0 in channel reset mode. Modify the RSCANnTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCANnTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCANnTMSTSp register is 00_B.

17.3.10.2 RSCANnTMSTSp — Transmit Buffer Status Register p (p = 0 to 47)

Access: RSCANnTMSTSp register can be read/written in 8-bit units

Address: RSCANnTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 17.62 RSCANnTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

All of the bits in the RSCANnTMSTSp register are cleared to 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCANnTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCANnTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCANnTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCANnTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCANnTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

17.3.10.3 RSCANnTMIDp — Transmit Buffer ID Register p (p = 0 to 47)

Access: RSCANnTMIDp register can be read/written in 32-bit units
RSCANnTMIDpL, RSCANnTMIDpH registers can be read/written in 16-bit units
RSCANnTMIDpLL, RSCANnTMIDpLH, RSCANnTMIDpHL, RSCANnTMIDpHH registers can be read/written in 8-bit units

Address: RSCANnTMIDp: <RSCFDn_base> + 1000_H + (10_H × p)

RSCANnTMIDpL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpH: <RSCFDn_base> + 1002_H + (10_H × p)

RSCANnTMIDpLL: <RSCFDn_base> + 1000_H + (10_H × p),
RSCANnTMIDpLH: <RSCFDn_base> + 1001_H + (10_H × p),
RSCANnTMIDpHL: <RSCFDn_base> + 1002_H + (10_H × p),
RSCANnTMIDpHH: <RSCFDn_base> + 1003_H + (10_H × p)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.63 RSCANnTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR 0: Data frame 1: Remote frame
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp (timestamp is included if the TMTSCE bit in the RSCANnGCFG register is 1)) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

17.3.10.4 RSCANnTMPTRp — Transmit Buffer Pointer Register p (p = 0 to 47)

Access: RSCANnTMPTRp register can be read/written in 32-bit units
RSCANnTMPTRpL, RSCANnTMPTRpH registers can be read/written in 16-bit units
RSCANnTMPTRpLL, RSCANnTMPTRpLH, RSCANnTMPTRpHL, RSCANnTMPTRpHH registers can be read/written in 8-bit units

Address: RSCANnTMPTRp: <RSCFDn_base> + 1004_H + (10_H × p)

RSCANnTMPTRpL: <RSCFDn_base> + 1004_H + (10_H × p),
RSCANnTMPTRpH: <RSCFDn_base> + 1006_H + (10_H × p)

RSCANnTMPTRpLL: <RSCFDn_base> + 1004_H + (10_H × p),
RSCANnTMPTRpLH: <RSCFDn_base> + 1005_H + (10_H × p),
RSCANnTMPTRpHL: <RSCFDn_base> + 1006_H + (10_H × p),
RSCANnTMPTRpHH: <RSCFDn_base> + 1007_H + (10_H × p)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.64 RSCANnTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data b31 b30 b29 b28 0 0 0 0: 0 data bytes 0 0 0 1: 1 data byte 0 0 1 0: 2 data bytes 0 0 1 1: 3 data bytes 0 1 0 0: 4 data bytes 0 1 0 1: 5 data bytes 0 1 1 0: 6 data bytes 0 1 1 1: 7 data bytes 1 X X X: 8 data bytes
27 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

Modify this register when the TMTRM bit in the corresponding RSCANnTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCANnTMIDp register is set to 0 (data frame). If the data length is set to 1001_B or more, the transmit data is 8 bytes long.

When the TMRTR bit is set to 1 (remote frame), these bits set the data length of the message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

17.3.10.5 RSCANnTMDF0_p — Transmit Buffer Data Field 0 Register p (p = 0 to 47)

Access: RSCANnTMDF0_p register can be read/written in 32-bit units
RSCANnTMDF0_pL, RSCANnTMDF0_pH registers can be read/written in 16-bit units
RSCANnTMDF0_pLL, RSCANnTMDF0_pLH, RSCANnTMDF0_pHL, RSCANnTMDF0_pHH registers can be read/written in 8-bit units

Address: RSCANnTMDF0_p: <RSCFDn_base> + 1008_H + (10_H × p)

RSCANnTMDF0_pL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pH: <RSCFDn_base> + $100A_H$ + (10_H × p)

RSCANnTMDF0_pLL: <RSCFDn_base> + 1008_H + (10_H × p),
RSCANnTMDF0_pLH: <RSCFDn_base> + 1009_H + (10_H × p),
RSCANnTMDF0_pHL: <RSCFDn_base> + $100A_H$ + (10_H × p),

Table 17.67 RSCANnTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset.
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 47)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCANnTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

Table 17.68 shows the bit assignment.

17.3.11 Details of Transmit Buffer Status-Related Registers

17.3.11.1 RSCANnTMTRSTSy — Transmit Buffer Transmit Request Status Register y (y = 0, 1)

Access: RSCANnTMTRSTSy register can be read only in 32-bit units
RSCANnTMTRSTSyL, RSCANnTMTRSTSyH registers can be read only in 16-bit units
RSCANnTMTRSTSyLL, RSCANnTMTRSTSyLH, RSCANnTMTRSTSyHL, RSCANnTMTRSTSyHH registers can be read only in 8-bit units

Address: RSCANnTMTRSTSy: <RSCFDn_base> + 0350_H + (04_H × y)

RSCANnTMTRSTSyL: <RSCFDn_base> + 0350_H + (04_H × y),
RSCANnTMTRSTSyH: <RSCFDn_base> + 0352_H + (04_H × y)

RSCANnTMTRSTSyLL: <RSCFDn_base> + 0350_H + (04_H × y),
RSCANnTMTRSTSyLH: <RSCFDn_base> + 0351_H + (04_H × y),
RSCANnTMTRSTSyHL: <RSCFDn_base> + 0352_H + (04_H × y),
RSCANnTMTRSTSyHH: <RSCFDn_base> + 0353_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present. When y = 1, these bits are reserved. When read, the value after reset is read. When writing, write the value after reset.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTR bit in the RSCANnTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 17.70 shows the bit assignment.

Table 17.77 RSCANnTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g + 1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0) (see **Table 17.16**). For examples of how buffer allocation is done, see **Figure 17.9**. Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

17.3.12.2 RSCANnTXQSTSm — Transmit Queue Status Register m (m = 0 to 2)

Access: RSCANnTXQSTSm register can be read/written in 32-bit units
RSCANnTXQSTSmL, RSCANnTXQSTSmH registers can be read/written in 16-bit units
RSCANnTXQSTSmLL, RSCANnTXQSTSmLH, RSCANnTXQSTSmHL, RSCANnTXQSTSmHH registers can be read/written in 8-bit units

Address: RSCANnTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)

RSCANnTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCANnTXQSTSmH: <RSCFDn_base> + $03C2_H$ + (04_H × m)

RSCANnTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCANnTXQSTSmLH: <RSCFDn_base> + $03C1_H$ + (04_H × m),
RSCANnTXQSTSmHL: <RSCFDn_base> + $03C2_H$ + (04_H × m),
RSCANnTXQSTSmHH: <RSCFDn_base> + $03C3_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.78 RSCANnTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the interrupt source specified by the TXQIM bit in the RSCANnTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCANnTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCANnTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message is stored in the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

17.3.12.3 RSCANnTXQPCTRm — Transmit Queue Pointer Control Register m (m = 0 to 2)

Access: RSCANnTXQPCTRm register can only be written in 32-bit units
RSCANnTXQPCTRmL, RSCANnTXQPCTRmH registers can only be written in 16-bit units
RSCANnTXQPCTRmLL, RSCANnTXQPCTRmLH, RSCANnTXQPCTRmHL, RSCANnTXQPCTRmHH registers can only be written in 8-bit units

Address: RSCANnTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)

RSCANnTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCANnTXQPCTRmH: <RSCFDn_base> + $03E2_H$ + (04_H × m)

RSCANnTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCANnTXQPCTRmLH: <RSCFDn_base> + $03E1_H$ + (04_H × m),
RSCANnTXQPCTRmHL: <RSCFDn_base> + $03E2_H$ + (04_H × m),
RSCANnTXQPCTRmHH: <RSCFDn_base> + $03E3_H$ + (04_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 17.79 RSCANnTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request for the message. Write transmit messages to the RSCANnTMIDp, RSCANnTMPTRp, RSCANnTMDF0_p, and RSCANnTMDF1_p registers (p = 15, 31, 47) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCANnTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCANnTXQSTSm register is 0 (The transmit queue is not full).

17.3.13 Details of Transmit history-related Registers

17.3.13.1 RSCANnTHLCCm — Transmit History Configuration and Control Register m (m = 0 to 2)

Access: RSCANnTHLCCm register can be read/written in 32-bit units
RSCANnTHLCCmL, RSCANnTHLCCmH registers can be read/written in 16-bit units
RSCANnTHLCCmLL, RSCANnTHLCCmLH, RSCANnTHLCCmHL, RSCANnTHLCCmHH registers can be read/written in 8-bit units

Address: RSCANnTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)

RSCANnTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)

RSCANnTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCANnTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m),
RSCANnTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m),
RSCANnTHLCCmHH: <RSCFDn_base> + 0403_H + (04_H × m)

Value after reset: 0000 0000_H

Table 17.80 RSCANnTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entries from transmit/receive FIFO buffers and transmit queue 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 items of data have been stored in the transmit history buffer 1: Each time transmit history data is stored in the transmit history buffer
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

THLE Bit

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

17.3.13.2 RSCANnTHLSTSm — Transmit History Status Register m (m = 0 to 2)

Access: RSCANnTHLSTSm register can be read/written in 32-bit units
RSCANnTHLSTSmL, RSCANnTHLSTSmH register can be read/written in 16-bit units
RSCANnTHLSTSmLL, RSCANnTHLSTSmLH, RSCANnTHLSTSmHL, RSCANnTHLSTSmHH registers can be read/written in 8-bit units

Address: RSCANnTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)

RSCANnTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)

RSCANnTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCANnTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m),
RSCANnTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m),
RSCANnTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THL EMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.81 RSCANnTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer.

These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCANnTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCANnTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

17.3.13.3 RSCANnTHLPCTRm — Transmit History Pointer Control Register m (m = 0 to 2)

Access: RSCANnTHLPCTRm register can only be written in 32-bit units
RSCANnTHLPCTRmL, RSCANnTHLPCTRmH registers can only be written in 16-bit units
RSCANnTHLPCTRmLL, RSCANnTHLPCTRmLH, RSCANnTHLPCTRmHL, RSCANnTHLPCTRmHH registers can only be written in 8-bit units

Address: RSCANnTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)

RSCANnTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCANnTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)

RSCANnTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCANnTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m),
RSCANnTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m),
RSCANnTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 17.82 RSCANnTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCANnTHLSTSm register is decremented by 1. Write FF_H to the THLPC[7:0] bits after reading from the RSCANnTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCANnTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCANnTHLSTSm register is 0.

17.3.13.4 RSCANnTHLACCm — Transmit History Access Register m (m = 0 to 2)

Access: RSCANnTHLACCm register can be read only in 32-bit units
RSCANnTHLACCmL, RSCANnTHLACCmH registers can be read only in 16-bit units
RSCANnTHLACCmLL, RSCANnTHLACCmLH, RSCANnTHLACCmHL, RSCANnTHLACCmHH registers can be read only in 8-bit units

Address: RSCANnTHLACCm: <RSCFDn_base> + 1800_H + (04_H × m)

RSCANnTHLACCmL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmH: <RSCFDn_base> + 1802_H + (04_H × m)

RSCANnTHLACCmLL: <RSCFDn_base> + 1800_H + (04_H × m),
RSCANnTHLACCmLH: <RSCFDn_base> + 1801_H + (04_H × m),
RSCANnTHLACCmHL: <RSCFDn_base> + 1802_H + (04_H × m),
RSCANnTHLACCmHH: <RSCFDn_base> + 1803_H + (04_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.83 RSCANnTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

When the TMTSCE bit in the RSCANnGCFG register is 1, timestamp values in transmit history data stored in the transmit history buffer are displayed. When the TMTSCE bit is 0, these bits are always read as 0.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

17.3.14 Details of Test-Related Registers

17.3.14.1 RSCANnGTSTCFG — Global Test Configuration Register

Access: RSCANnGTSTCFG register can be read/written in 32-bit units
RSCANnGTSTCFGL, RSCANnGTSTCFGH registers can be read/written in 16-bit units
RSCANnGTSTCFGLL, RSCANnGTSTCFGLH, RSCANnGTSTCFGHL, RSCANnGTSTCFGHH registers can be read/written in 8-bit units

Address: RSCANnGTSTCFG: <RSCFDn_base> + 0468_H

RSCANnGTSTCFGL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGH: <RSCFDn_base> + $046A_H$

RSCANnGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCANnGTSTCFGLH: <RSCFDn_base> + 0469_H,
RSCANnGTSTCFGHL: <RSCFDn_base> + $046A_H$, RSCANnGTSTCFGHH: <RSCFDn_base> + $046B_H$

Value after reset: $0000\ 0000_H$

Table 17.84 RSCANnGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 29 ($1D_H$).
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCANnGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to $1D_H$, inclusive.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

17.3.14.2 RSCANnGTSTCTR — Global Test Control Register

Access: RSCANnGTSTCTR register can be read/written in 32-bit units
RSCANnGTSTCTRL, RSCANnGTSTCTRH registers can be read/written in 16-bit units
RSCANnGTSTCTRLL, RSCANnGTSTCTRLH, RSCANnGTSTCTRHL, RSCANnGTSTCTRHH registers can be read/written in 8-bit units

Address: RSCANnGTSTCTR: <RSCFDn_base> + $046C_H$

RSCANnGTSTCTRL: <RSCFDn_base> + $046C_H$, RSCANnGTSTCTRH: <RSCFDn_base> + $046E_H$

RSCANnGTSTCTRLL: <RSCFDn_base> + $046C_H$, RSCANnGTSTCTRLH: <RSCFDn_base> + $046D_H$, RSCANnGTSTCTRHL: <RSCFDn_base> + $046E_H$, RSCANnGTSTCTRHH: <RSCFDn_base> + $046F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 17.85 RSCANnGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICBCTME	Inter-Channel Communication Test Enable 0: Inter-channel communication test is disabled 1: Inter-channel communication test is enabled

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (see **Figure 17.37**).

1. Set the GMDC[1:0] bits in the RSCANnGCTR register to 10_B (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 2) in the RSCANnGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

17.3.14.3 RSCANnGLOCKK — Global Lock Key Register

Access: RSCANnGLOCKK register can be write only in 32-bit units.
RSCANnGLOCKKL, RSCANnGLOCKKH registers can be write only in 16-bit units.

Address: RSCANnGLOCKK: <RSCFDn_base> + $047C_H$

RSCANnGLOCKKL: <RSCFDn_base> + $047C_H$, RSCANnGLOCKKH: <RSCFDn_base> + $047E_H$

Value after reset: $0000\ 0000_H$

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 17.86 RSCANnGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCANnGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 17.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCANnGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $04FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

17.3.14.4 RSCANnRPGACCr— RAM Test Page Access Register r (r = 0 to 63)

Access: RSCANnRPGACCr register can be read/written in 32-bit units
RSCANnRPGACCrL, RSCANnRPGACCrH registers can be read/written in 16-bit units
RSCANnRPGACCrLL, RSCANnRPGACCrLH, RSCANnRPGACCrHL, RSCANnRPGACCrHH registers can be read/written in 8-bit units

Address: RSCANnRPGACCr: <RSCFDn_base> + 1900_H + (04_H × r)

RSCANnRPGACCrL: <RSCFDn_base> + 1900_H + (04_H × r)),
RSCANnRPGACCrH: <RSCFDn_base> + 1902_H + (04_H × r))

RSCANnRPGACCrLL: <RSCFDn_base> + 1900_H + (04_H × r)),
RSCANnRPGACCrLH: <RSCFDn_base> + 1901_H + (04_H × r)),
RSCANnRPGACCrHL: <RSCFDn_base> + 1902_H + (04_H × r)),
RSCANnRPGACCrHH: <RSCFDn_base> + 1903_H + (04_H × r))

Value after reset: 0000 0000_H

Table 17.87 RSCANnRPGACCr Register Contents

Bit Position	Bit Name	Function
31 to 0	RDTA [31:0]	RAM Data Test Access Data can be read and written in RSCAN RAM.

Modify the RSCANnRPGACCr register in global test mode with the RTME bit in the RSCANnGTSTCTR register set to 1 (RAM test is enabled).

The RSCANnRPGACCr register can be read and written when the RTME bit is set to 1.

17.3.15 Details of Mode Read Register

17.3.15.1 RSCANnCANFDMDR — CAN FD Mode Read Register

Access: This register can be read in 32-bit units

Address: <RSCFDn_base> + 8000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.88 RSCANnCANFDMDR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	FDMDR	CAN FD mode read 0: classical CAN mode is selected. 1: CAN FD mode is selected.

17.4 Registers (CAN FD Mode)

This section describes all registers to be used when the RS-CANFD is used in CAN FD mode.

17.4.1 List of Registers

The following tables list RS-CANFD registers to be used in CAN FD mode.

For details about <RSCFDn_base>, see **Section 17.1.2, Register Base Address**.

For details about registers initialized in Global reset mode or Channel reset mode, see following.

- **Table 17.180, Registers Initialized in Global Reset Mode or Channel Reset Mode**
- **Table 17.181, Registers Initialized Only in Global Reset Mode**

Table 17.89 Registers (1/3)

Module Name	Register Name	Symbol	Address
Interface mode-related registers			
RSCFDn	Global interface mode select register	RSCFDnCFDGRMCFG	<RSCFDn_base> + $04FC_H$
Channel-related registers			
RSCFDn	Channel m nominal bit rate configuration register	RSCFDnCFDCmNCFG	<RSCFDn_base> + 0000_H + $(10_H \times m)$
RSCFDn	Channel m control register	RSCFDnCFDCmCTR	<RSCFDn_base> + 0004_H + $(10_H \times m)$
RSCFDn	Channel m status register	RSCFDnCFDCmSTS	<RSCFDn_base> + 0008_H + $(10_H \times m)$
RSCFDn	Channel m error flag register	RSCFDnCFDCmERFL	<RSCFDn_base> + $000C_H$ + $(10_H \times m)$
RSCFDn	Channel m data bit rate configuration register	RSCFDnCFDCmDCFG	<RSCFDn_base> + 0500_H + $(20_H \times m)$
RSCFDn	Channel m CAN FD configuration register	RSCFDnCFDCmFDCFG	<RSCFDn_base> + 0504_H + $(20_H \times m)$
RSCFDn	Channel m CAN FD control register	RSCFDnCFDCmFDCTR	<RSCFDn_base> + 0508_H + $(20_H \times m)$
RSCFDn	Channel m CAN FD status register	RSCFDnCFDCmFDSTS	<RSCFDn_base> + $050C_H$ + $(20_H \times m)$
RSCFDn	Channel m CAN FD CRC register	RSCFDnCFDCmFDCRC	<RSCFDn_base> + 0510_H + $(20_H \times m)$
Global-related registers			
RSCFDn	Global configuration register	RSCFDnCFDGCFG	<RSCFDn_base> + 0084_H
RSCFDn	Global control register	RSCFDnCFDGCTR	<RSCFDn_base> + 0088_H
RSCFDn	Global status register	RSCFDnCFDGSTS	<RSCFDn_base> + $008C_H$
RSCFDn	Global error flag register	RSCFDnCFDGERFL	<RSCFDn_base> + 0090_H
RSCFDn	Global timestamp counter register	RSCFDnCFDGTSC	<RSCFDn_base> + 0094_H
RSCFDn	Global TX Interrupt Status Register 0	RSCFDnCFDGTINTSTS0	<RSCFDn_base> + 0460_H
RSCFDn	Global FD configuration register	RSCFDnCFDGFDCFG	<RSCFDn_base> + 0474_H
Receive rule-related registers			
RSCFDn	Receive Rule Entry Control Register	RSCFDnCFDGAFLECTR	<RSCFDn_base> + 0098_H
RSCFDn	Receive Rule Configuration Register 0	RSCFDnCFDGAFLCFG0	<RSCFDn_base> + $009C_H$
RSCFDn	Receive Rule ID Register j	RSCFDnCFDGAFLIDj	<RSCFDn_base> + 1000_H + $(10_H \times j)$
RSCFDn	Receive Rule Mask Register j	RSCFDnCFDGAFLMj	<RSCFDn_base> + 1004_H + $(10_H \times j)$
RSCFDn	Receive Rule Pointer 0 Register j	RSCFDnCFDGAFLP0_j	<RSCFDn_base> + 1008_H + $(10_H \times j)$
RSCFDn	Receive Rule Pointer 1 Register j	RSCFDnCFDGAFLP1_j	<RSCFDn_base> + $100C_H$ + $(10_H \times j)$
Receive buffer-related registers			
RSCFDn	Receive Buffer Number Register	RSCFDnCFDRMNB	<RSCFDn_base> + $00A4_H$
RSCFDn	Receive Buffer New Data Register y	RSCFDnCFDRMNDy	<RSCFDn_base> + $00A8_H$ + $(04_H \times y)$
RSCFDn	Receive Buffer ID Register q	RSCFDnCFDRMIDq	<RSCFDn_base> + 2000_H + $(20_H \times q)$
RSCFDn	Receive Buffer Pointer Register q	RSCFDnCFDRMPTRq	<RSCFDn_base> + 2004_H + $(20_H \times q)$
RSCFDn	Receive buffer CAN FD status register q	RSCFDnCFDRMFDSTSq	<RSCFDn_base> + 2008_H + $(20_H \times q)$
RSCFDn	Receive Buffer Data Field b Register q	RSCFDnCFDRMDFb_q	<RSCFDn_base> + $200C_H$ + $(04_H \times b)$ + $(20_H \times q)$

Table 17.89 Registers (2/3)

Module Name	Register Name	Symbol	Address
Receive FIFO buffer-related registers			
RSCFDn	Receive FIFO Buffer Configuration and Control Register x	RSCFDnCFDRFCCx	<RSCFDn_base> + $00B8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Status Register x	RSCFDnCFDRFSTSx	<RSCFDn_base> + $00D8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Pointer Control Register x	RSCFDnCFDRFPCTRx	<RSCFDn_base> + $00F8_H$ + (04_H × x)
RSCFDn	Receive FIFO Buffer Access ID Register x	RSCFDnCFDRFIDx	<RSCFDn_base> + 3000_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Pointer Register x	RSCFDnCFDRFPTRx	<RSCFDn_base> + 3004_H + (80_H × x)
RSCFDn	Receive FIFO CAN FD status register x	RSCFDnCFDRFFDSTSx	<RSCFDn_base> + 3008_H + (80_H × x)
RSCFDn	Receive FIFO Buffer Access Data Field d Register x	RSCFDnCFDRFDFd_x	<RSCFDn_base> + $300C_H$ + (04_H × d) + (80_H × x)
Transmit/Receive FIFO buffer related registers			
RSCFDn	Transmit/receive FIFO Buffer Configuration and Control Register k	RSCFDnCFDCFCCk	<RSCFDn_base> + 0118_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Status Register k	RSCFDnCFDCFSTSk	<RSCFDn_base> + 0178_H + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Pointer Control Register k	RSCFDnCFDCFPCTRk	<RSCFDn_base> + $01D8_H$ + (04_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access ID Register k	RSCFDnCFDCFIDk	<RSCFDn_base> + 3400_H + (80_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access Pointer Register k	RSCFDnCFDCFPTRk	<RSCFDn_base> + 3404_H + (80_H × k)
RSCFDn	Transmit/receive FIFO CAN FD configuration/status register k	RSCFDnCFDCFFDCSTSk	<RSCFDn_base> + 3408_H + (80_H × k)
RSCFDn	Transmit/receive FIFO Buffer Access Data Field d Register k	RSCFDnCFDCFDFd_k	<RSCFDn_base> + $340C_H$ + (04_H × d) + (80_H × k)
FIFO status-related registers			
RSCFDn	FIFO Empty Status Register	RSCFDnCFDFESTS	<RSCFDn_base> + 0238_H
RSCFDn	FIFO Full Status Register	RSCFDnCFDFFSTS	<RSCFDn_base> + $023C_H$
RSCFDn	FIFO Message Lost Status Register	RSCFDnCFDFMSTS	<RSCFDn_base> + 0240_H
RSCFDn	Receive FIFO Buffer Interrupt Flag Status Register	RSCFDnCFDRFISTS	<RSCFDn_base> + 0244_H
RSCFDn	Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register	RSCFDnCFDCFRISTS	<RSCFDn_base> + 0248_H
RSCFDn	Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register	RSCFDnCFDCFTISTS	<RSCFDn_base> + $024C_H$
FIFO DMA-related registers			
RSCFDn	DMA enable register	RSCFDnCFDCDTCT	<RSCFDn_base> + 0490_H
RSCFDn	DMA status register	RSCFDnCFDCDTSTS	<RSCFDn_base> + 0494_H
Transmit buffer-related registers			
RSCFDn	Transmit Buffer Control Register p	RSCFDnCFDTMCp	<RSCFDn_base> + 0250_H + (01_H × p)
RSCFDn	Transmit Buffer Status Register p	RSCFDnCFDTMSTSp	<RSCFDn_base> + $02D0_H$ + (01_H × p)
RSCFDn	Transmit Buffer ID Register p	RSCFDnCFDTMIDp	<RSCFDn_base> + 4000_H + (20_H × p)
RSCFDn	Transmit Buffer Pointer Register p	RSCFDnCFDTMPTRp	<RSCFDn_base> + 4004_H + (20_H × p)
RSCFDn	Transmit buffer CAN FD configuration register p	RSCFDnCFDTMFDCTRp	<RSCFDn_base> + 4008_H + (20_H × p)
RSCFDn	Transmit Buffer Data Field b Register p	RSCFDnCFDTMDFb_p	<RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)
RSCFDn	Transmit Buffer Interrupt Enable Configuration Register y	RSCFDnCFDTMIECy	<RSCFDn_base> + 0390_H + (04_H × y)
Transmit buffer status-related registers			
RSCFDn	Transmit Buffer Transmit Request Status Register y	RSCFDnCFDTMTRSTSy	<RSCFDn_base> + 0350_H + (04_H × y)
RSCFDn	Transmit Buffer Transmit Abort Request Status Register y	RSCFDnCFDTMTARSTSy	<RSCFDn_base> + 0360_H + (04_H × y)
RSCFDn	Transmit Buffer Transmit Complete Status Register y	RSCFDnCFDTMTCSTSy	<RSCFDn_base> + 0370_H + (04_H × y)
RSCFDn	Transmit Buffer Transmit Abort Status Register y	RSCFDnCFDTMTASTSy	<RSCFDn_base> + 0380_H + (04_H × y)
Transmit queue-related registers			
RSCFDn	Transmit Queue Configuration and Control Register m	RSCFDnCFDTXQCCm	<RSCFDn_base> + $03A0_H$ + (04_H × m)
RSCFDn	Transmit Queue Status Register m	RSCFDnCFDTXQSTSm	<RSCFDn_base> + $03C0_H$ + (04_H × m)
RSCFDn	Transmit Queue Pointer Control Register m	RSCFDnCFDTXQPCTRm	<RSCFDn_base> + $03E0_H$ + (04_H × m)

Table 17.89 Registers (3/3)

Module Name	Register Name	Symbol	Address
Transmit history-related registers			
RSCFDn	Transmit History Configuration and Control Register m	RSCFDnCFDTHLCCm	<RSCFDn_base> + 0400_H + (04_H × m)
RSCFDn	Transmit History Status Register m	RSCFDnCFDTHLSTSm	<RSCFDn_base> + 0420_H + (04_H × m)
RSCFDn	Transmit History Pointer Control Register m	RSCFDnCFDTHLPCTRm	<RSCFDn_base> + 0440_H + (04_H × m)
RSCFDn	Transmit History Access Register m	RSCFDnCFDTHLACCm	<RSCFDn_base> + 6000_H + (04_H × m)
Test-related registers			
RSCFDn	Global Test Configuration Register	RSCFDnCFDGTSTCFG	<RSCFDn_base> + 0468_H
RSCFDn	Global Test Control Register	RSCFDnCFDGTSTCTR	<RSCFDn_base> + $046C_H$
RSCFDn	Global Lock Key Register	RSCFDnCFDGLOCKK	<RSCFDn_base> + $047C_H$
RSCFDn	RAM Test Page Access Register r	RSCFDnCFDRPGACCr	<RSCFDn_base> + 6400_H + (04_H × r)
Mode read registers			
RSCFDn	CAN FD Mode Read Register	RSCFDnCANFDMDR	<RSCFDn_base> + 8000_H

Table 17.90 Transmit Buffer p Allocated to Each Channel

1001_B	Transmit buffer 16 × m + 15 to 16 × m + 6
1010_B	Transmit buffer 16 × m + 15 to 16 × m + 5
1011_B	Transmit buffer 16 × m + 15 to 16 × m + 4
1100_B	Transmit buffer 16 × m + 15 to 16 × m + 3
1101_B	Transmit buffer 16 × m + 15 to 16 × m + 2
1110_B	Transmit buffer 16 × m + 15 to 16 × m + 1
1111_B	Transmit buffer 16 × m + 15 to 16 × m + 0

17.4.2 Details of Interface Mode-Related Registers

17.4.2.1 RSCFDnCFDGRMCFG — Global Interface Mode Select Register

Access: RSCFDnCFDGRMCFG register can be read/written in 32-bit units
RSCFDnCFDGRMCFGL, RSCFDnCFDGRMCFGH registers can be read/written in 16-bit units
RSCFDnCFDGRMCFGLL, RSCFDnCFDGRMCFGLH, RSCFDnCFDGRMCFGHL, RSCFDnCFDGRMCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGRMCFG: <RSCFDn_base> + $04FC_H$

RSCFDnCFDGRMCFGL: <RSCFDn_base> + $04FC_H$,
RSCFDnCFDGRMCFGH: <RSCFDn_base> + $04FE_H$

RSCFDnCFDGRMCFGLL: <RSCFDn_base> + $04FC_H$,
RSCFDnCFDGRMCFGLH: <RSCFDn_base> + $04FD_H$,
RSCFDnCFDGRMCFGHL: <RSCFDn_base> + $04FE_H$,
RSCFDnCFDGRMCFGHH: <RSCFDn_base> + $04FF_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	RCMC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 17.94 RSCFDnCFDGRMCFG Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RCMC	Interface Mode Select 0: Classical CAN mode 1: CAN FD mode

Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Modify the RSCFDnCFDGRMCFG register only in global reset mode. Before setting other RS-CANFD registers, set this register.

RCMC Bit

Setting this bit to 0 makes classical CAN mode available. Setting this bit to 1 causes the RS-CANFD module to transition to CAN FD mode. To switch the RS-CAN FD module from classical CAN mode to CAN FD mode, set the values after reset to all respective registers and bits allocated only to the register map in classical CAN mode and then modify the value of RSCFDnCFDGRMCFG register.

17.4.3 Details of Channel-Related Registers

17.4.3.1 RSCFDnCFDCmNCFG — Channel m Nominal Bit Rate Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmNCFG register can be read/written in 32-bit units
RSCFDnCFDCmNCFGL, RSCFDnCFDCmNCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmNCFGLL, RSCFDnCFDCmNCFGLH, RSCFDnCFDCmNCFGHL, RSCFDnCFDCmNCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmNCFG: <RSCFDn_base> + 0000_H + $(10_H \times m)$

RSCFDnCFDCmNCFGL: <RSCFDn_base> + 0000_H + $(10_H \times m)$,
RSCFDnCFDCmNCFGH: <RSCFDn_base> + 0002_H + $(10_H \times m)$

RSCFDnCFDCmNCFGLL: <RSCFDn_base> + 0000_H + $(10_H \times m)$,
RSCFDnCFDCmNCFGLH: <RSCFDn_base> + 0001_H + $(10_H \times m)$,
RSCFDnCFDCmNCFGHL: <RSCFDn_base> + 0002_H + $(10_H \times m)$,
RSCFDnCFDCmNCFGHH: <RSCFDn_base> + 0003_H + $(10_H \times m)$

10	Reserved	This bit is read as the value after reset. The write value should be the value after reset.
9 to 0	NBRP[9:0]	Nominal Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 1023), the nominal bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmNCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. For the description and settings for bit timing parameters, see **Section 17.11.1, Initial Settings**.

NTSEG2[4:0] Bits

These bits specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of nominal bit rate.

Possible values are 2 to 32 Tq.

Set a value smaller than the value of the NTSEG1[6:0] bits.

NTSEG1[6:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of nominal bit rate as a Tq value.

Possible values are 4 to 128 Tq.

NSJW[4:0] Bits

These bits specify the resynchronization jump width of nominal bit rate as a Tq value. Possible values are 1 to 32 Tq. Specify a value equal to or smaller than the NTSEG2[4:0] value.

NBRP[9:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the nominal bit rate prescaler ((NBRP[9:0]) + 1) becomes CANmTq(N) clock (fCANTQ(N)m). One clock of the CANmTq(N) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].

To specify a different value for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFGCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

17.4.3.2 RSCFDnCFDCmCTR — Channel m Control Register (m = 0 to 2)

Access: RSCFDnCFDCmCTR register can be read/written in 32-bit units
RSCFDnCFDCmCTRL, RSCFDnCFDCmCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmCTRLL, RSCFDnCFDCmCTRLH, RSCFDnCFDCmCTRHL, RSCFDnCFDCmCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmCTR: <RSCFDn_base> + 0004_H + (10_H × m)

RSCFDnCFDCmCTRL: <RSCFDn_base> + 0004_H + (10_H × m),

1, 0	CHMDC[1:0]	Mode Select b1 b0 0 0: Channel communication mode 0 1: Channel reset mode 1 0: Channel halt mode 1 1: Setting prohibited

ROM Bit

When the ROM bit and the CTME bit in the RSCFDnCFDCmCTR register are set to 1, restricted operation mode is enabled. Use the restricted operation mode only when the CTMS[1:0] value in the RSCFDnCFDCmCTR register is 00_B (standard test mode). Modify this bit only in channel halt mode. This bit is always 0 in channel reset mode.

CRCT Bit

This bit is used to test the CRC generation circuit in the RS-CANFD module. Setting this bit to 1 inverts the first bit of the ID field when a message is received. With this inversion of bit, the CRC calculation result does not match the normal CRC value of the received frame, which can detect a CRC error (the CERR bit in the RSCFDnCFDCmERFL register is 1). When using this function, note the following.

- This function is available while the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled).
- This function cannot communicate with other CAN nodes. Use this function for inter-channel communication test (the CmICBCE bit in the RSCFDnCFDGTSTCFG register is 1).
- Bit inversion in the ID field may cause bit stuffing rule violation. In that case, no CRC error is detected but a stuff error is detected.

Modify this bit only in channel halt mode. This bit is set to 0 in channel reset mode.

CTMS[1:0] Bits

These bits are used to select a communication test mode. Modify these bits in channel halt mode only. These bits are set to 0 in channel reset mode.

CTME Bit

Setting this bit to 1 enables communication test mode. Modify these bits in channel halt mode. This bit is set to 0 in channel reset mode.

ERRD Bit

This bit is used to control the display mode of bits 14 to 8 in the RSCFDnCFDCmERFL register. When this bit is clear to 0, if any error is detected while the flags of bits 14 to 8 in the RSCFDnCFDCmERFL register are all 0, only the flags of the first error event are set to 1. If two or more errors occur in the first error event, all the flags of the detected errors are set to 1.

When this bit is set to 1, all the flags of errors that have occurred are set to 1 regardless of the error occurrence order.

Modify this bit only in channel reset mode or channel halt mode.

BOM[1:0] Bits

These bits are used to select the bus off recovery mode of the RS-CANFD module.

When the BOM[1:0] bits are set to 00_B, return from the bus off state to the error active state is compliant with the CAN specifications. That is, the RS-CANFD module reenters the CAN communication (error active state) after 11 consecutive recessive bits are detected 128 times. A bus off recovery interrupt request is generated at the time of return from the bus off state. Even if the CHMDC[1:0] bits are set to 10_B (channel halt mode) before recessive bits are detected 128 times, the RS-CANFD module does not transition to channel halt mode until recessive bits are detected 128 times.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 01_B, the CHMDC[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 2) are set to 10_B and the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated and the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register are cleared to 00_H.

When the RS-CANFD module reaches the bus off state when the BOM[1:0] bits are set to 10_B, the CHMDC[1:0] bits are set to 10_B and the RS-CANFD module transitions to channel halt mode after return from the bus off state (11 consecutive recessive bits are detected 128 times). A bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H.

When the BOM[1:0] bits are set to 11_B and the CHMDC[1:0] bits are set to 10_B while the RS-CANFD module is in the bus off state, the RS-CANFD module transitions to channel halt mode. No bus off recovery interrupt request is generated at the time of return from the bus off state and the TEC[7:0] and REC[7:0] bits are cleared to 00_H. However, if 11 consecutive recessive bits are detected 128 times and the RS-CANFD module has recovered to the error active state from the bus off state before the CHMDC[1:0] bits are set to 10_B, a bus off recovery interrupt request is generated.

If a program writes to the CHMDC[1:0] bit at the same time as the RS-CANFD module transition to channel halt mode (at bus off entry when the BOM[1:0] bits are 01B or at bus off end when the BOM[1:0] bits are 10_B), the program's writing takes precedence. Modify the BOM[1:0] bits only in channel reset mode.

TDCVFIE Bit

When the TDCVF flag in the RSCFDnCFDCmFDSTS register is set to 1 after the TDCVFIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

SOCOIE Bit

When the SOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the SOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

EOCOIE Bit

When the EOCO flag in the RSCFDnCFDCmFDSTS register is set to 1 after the EOCOIE bit is set to 1, an interrupt request occurs. Modify this bit only in channel reset mode.

TAIE Bit

When transmit abort of the transmit buffer is completed with the TAIE bit set to 1, an interrupt request is generated. Modify this bit only in channel reset mode.

ALIE Bit

When the ALF flag in the RSCFDnCFDCmERFL register is set to 1 with the ALIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BLIE Bit

When the BLF flag in the RSCFDnCFDCmERFL register is set to 1 with the BLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

OLIE Bit

When the OVLF flag in the RSCFDnCFDCmERFL register is set to 1 with the OLIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BORIE Bit

When the BORF flag in the RSCFDnCFDCmERFL register is set to 1 with the BORIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BOEIE Bit

When the BOEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BOEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EPIE Bit

When the EPF flag in the RSCFDnCFDCmERFL register is set to 1 with the EPIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

EWIE Bit

When the EWF flag in the RSCFDnCFDCmERFL register is set to 1 with the EWIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

BEIE Bit

When the BEF flag in the RSCFDnCFDCmERFL register is set to 1 with the BEIE bit set to 1, an error interrupt request is generated. Modify this bit only in channel reset mode.

RTBO Bit

Setting this bit to 1 in the bus off state forcibly returns from the bus off state to the error active state. This bit is automatically cleared to 0. Setting this bit to 1 clears the TEC[7:0] and REC[7:0] bits in the RSCFDnCFDCmSTS register to 00_H and also clears the BOSTS flag in the RSCFDnCFDCmSTS register to 0 (not in bus off state). The other registers remain unchanged. No bus off recovery interrupt request is generated upon return from the bus off state in this case. Use this bit only when the BOM[1:0] bits in the RSCFDnCFDCmCTR register are 00_B (ISO11898-1 compliant).

A delay of up to 1 CAN bit time occurs after the RTBO bit is set to 1 until the RSCAN module transitions to the error active state. Set this bit to 1 in channel communication mode.

CSLPR Bit

Setting this bit to 1 places the channel into channel stop mode.
Clearing this bit to 0 makes the channel exit channel stop mode.
This bit should not be modified in channel communication mode or channel halt mode.

CHMDC[1:0] Bits

These bits are used to select a channel mode (channel communication mode, channel reset mode, or channel halt mode). For details, see **Section 17.6.2, Channel Modes**. Setting the CSLPR bit to 1 in channel reset mode allows transition to channel stop mode. Do not set the CHMDC[1:0] bits to 11_B. When the CAN module has automatically transitioned to channel halt mode based on the setting of the BOM[1:0] bits, the CHMDC[1:0] bits are automatically set to 10_B.

17.4.3.3 RSCFDnCFDCmSTS — Channel m Status Register (m = 0 to 2)

Access: RSCFDnCFDCmSTS register can be read/written in 32-bit units
RSCFDnCFDCmSTSL, RSCFDnCFDCmSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmSTSLL, RSCFDnCFDCmSTSLH, RSCFDnCFDCmSTSHL, RSCFDnCFDCmSTSHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmSTS: <RSCFDn_base> + 0008_H + (10_H × m)

RSCFDnCFDCmSTSL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSH: <RSCFDn_base> + $000A_H$ + (10_H × m)

RSCFDnCFDCmSTSLL: <RSCFDn_base> + 0008_H + (10_H × m),
RSCFDnCFDCmSTSLH: <RSCFDn_base> + 0009_H + (10_H × m),
RSCFDnCFDCmSTSHL: <RSCFDn_base> + $000A_H$ + (10_H × m),
RSCFDnCFDCmSTSHH: <RSCFDn_base> + $000B_H$ + (10_H × m)

Value after reset: 0000 0005_H

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.97 RSCFDnCFDCmSTS Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 24	TEC[7:0]	The transmit error counter (TEC) can be read.
23 to 16	REC[7:0]	The receive error counter (REC) can be read.
15 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	ESIF	Error State Indication Flag 0: No CAN FD message whose ESI bit is recessive has been received. 1: At least one CAN FD message whose ESI bit is recessive has been received.
7	COMSTS	Communication Status Flag 0: Communication is not ready. 1: Communication is ready.
6	RECSTS	Receive Status Flag 0: Bus idle, in transmission or bus off state 1: In reception
5	TRMSTS	Transmit Status Flag 0: Bus idle or in reception 1: In transmission or bus off state
4	BOSTS	Bus Off Status Flag 0: Not in bus off state 1: In bus off state
3	EPSTS	Error Passive Status Flag 0: Not in error passive state 1: In error passive state
2	CSLPSTS	Channel Stop Status Flag 0: Not in channel stop mode 1: In channel stop mode

Table 17.97 RSCFDnCFDCmSTS Register Contents (2/2)

Bit Position	Bit Name	Function
1	CHLTSTS	Channel Halt Status Flag 0: Not in channel halt mode 1: In channel halt mode
0	CRSTSTS	Channel Reset Status Flag 0: Not in channel reset mode 1: In channel reset mode

TEC[7:0] Bits

These bits contain the transmit error counter value. For transmit error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

REC[7:0] Bits

These bits contain the receive error counter value. For receive error counter increment/decrement conditions, see the CAN specifications (ISO11898-1).

These bits are cleared to 0 in channel reset mode.

ESIF Flag

When the recessive ESI bit is detected in a successfully received message, this flag is set to 1. In loopback mode or mirror mode, the own transmission message is regarded as a received message. To clear this flag to 0, write 0 to this bit by the program. This bit cannot be set to 1 by the program. If the flag setting (to 1) timing matches the writing 0 (by the program) timing, this flag is set to 1.

This flag is set to 0 in channel reset mode.

COMSTS Flag

This bit indicates that communication is ready.

This flag is set to 1 when the CAN module has detected 11 consecutive recessive bits after it has transitioned from channel reset mode or channel halt mode to channel communication mode. This flag is cleared to 0 in channel reset mode or channel halt mode.

RECSTS Flag

This flag is set to 1 when reception has started, and is cleared to 0 when the bus has become idle or transmission has started.

TRMSTS Flag

This flag is set to 1 when transmission has started, and is cleared to 0 when the bus has become idle or reception has started. This flag remains 1 in the bus off state.

BOSTS Flag

This flag is set to 1 when the bus off state (TEC[7:0] > 255) is entered. It is cleared to 0 when the CAN module has exited the bus off state.

EPSTS Flag

This flag is set to 1 when the RS-CANFD module has entered the error passive state (($128 \leq$ TEC[7:0] ≤ 255) or ($128 \leq$ REC[7:0])), It is cleared to 0 when the RS-CANFD module has exited the error passive state or has entered channel reset mode.

CSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel stop mode, and is cleared to 0 when the CAN module has returned from channel stop mode.

CHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel halt mode, and is cleared to 0 when the CAN module has returned from channel halt mode.

CRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to channel reset mode, and is cleared to 0 when the CAN module has transitioned to channel communication mode or channel halt mode. This flag remains 1 when the CAN module transitions from channel reset mode to channel stop mode.

17.4.3.4 RSCFDnCFDCmERFL — Channel m Error Flag Register (m = 0 to 2)

Access: RSCFDnCFDCmERFL register can be read/written in 32-bit units
RSCFDnCFDCmERFLL, RSCFDnCFDCmERFLH registers can be read/written in 16-bit units
RSCFDnCFDCmERFLLL, RSCFDnCFDCmERFLLH, RSCFDnCFDCmERFLHL, RSCFDnCFDCmERFLHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmERFL: <RSCFDn_base> + $000C_H$ + (10_H × m)

RSCFDnCFDCmERFLL: <RSCFDn_base> + $000C_H$ + (10_H × m),

R/W	R	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.98 RSCFDnCFDCmERFL Register Contents (1/2)

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
30 to 16	CRCREG[14:0]	CRC Calculation Data (CRC length:15 bits) A CRC value calculated based on the transmit message or receive message is indicated.
15	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
14	ADERR	ACK Delimiter Error Flag 0: No ACK delimiter error is detected. 1: ACK delimiter error is detected.
13	B0ERR	Dominant Bit Error Flag 0: No dominant bit error is detected. 1: Dominant bit error is detected.
12	B1ERR	Recessive Bit Error Flag 0: No recessive bit error is detected. 1: Recessive bit error is detected.
11	CERR	CRC Error Flag 0: No CRC error is detected. 1: CRC error is detected.
10	AERR	ACK Error Flag 0: No ACK error is detected. 1: ACK error is detected.
9	FERR	Form Error Flag 0: No form error is detected. 1: Form error is detected.

Table 17.98 RSCFDnCFDCmERFL Register Contents (2/2)

Bit Position	Bit Name	Function
8	SERR	Stuff Error Flag 0: No stuff error is detected. 1: Stuff error is detected.
7	ALF	Arbitration-lost Flag 0: No arbitration-lost is detected. 1: Arbitration-lost is detected.
6	BLF	Bus Lock Flag 0: No channel bus lock is detected. 1: Channel bus lock is detected.
5	OVLF	Overload Flag 0: No overload is detected. 1: Overload is detected.
4	BORF	Bus Off Recovery Flag 0: No bus off recovery is detected. 1: Bus off recovery is detected.
3	BOEF	Bus Off Entry Flag 0: No bus off entry is detected. 1: Bus off entry is detected.
2	EPF	Error Passive Flag 0: No error passive is detected. 1: Error passive is detected.
1	EWF	Error Warning Flag 0: No error warning is detected. 1: Error warning is detected.
0	BEF	Bus Error Flag 0: No channel bus error is detected. 1: Channel bus error is detected.

See the CAN specification (ISO11898-1) for a description of error occurrence conditions. To clear each flag of this register, the program must write a 0 to the corresponding bit. These flags cannot be set to 1 by the program. If any of these flags is set to 1 at the same time that the program writes 0 to the flag, the flag is set to 1. Transition to channel reset mode resets these flags to 0.

If the ERRD bit in the RSCFDnCFDCmCTR register is set to 0 (ie, only the flags for the first error event are displayed) and an error related to bits 14 to 8 of RSCFDnCFDCmERFL is detected, the flag bits are only set to 1 by the error event if bits 14 to 8 were all 0 at the time when the error occurred.

CRCREG[14:0] Flag

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode is enabled), if transmit or receive message is a classical CAN frame (CRC length = 15 bits), this flag is updated and the CRC value calculated based on the message can be read. When a CAN FD frame is sent or received, the value of CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register is updated. When the CTME bit is set to 0 (communication test mode is disabled), these bits are always read as 0. This bit is always 0 in channel reset mode.

ADERR Flag

This flag is set to 1 when a form error has been detected in the ACK delimiter during transmission.

B0ERR Flag

This flag is set to 1 when a recessive bit has been detected even though a dominant bit was transmitted.

B1ERR Flag

This flag is set to 1 when a dominant bit has been detected even though a recessive bit was transmitted.

CERR Flag

This flag is set to 1 when a CRC error has been detected.

AERR Flag

This flag is set to 1 when an ACK error has been detected.

FERR Flag

This flag is set to 1 when a form error has been detected.

SERR Flag

This flag is set to 1 when a stuff error has been detected.

ALF Flag

This flag is set to 1 when an arbitration-lost has been detected.

BLF Flag

This flag is set to 1 when 32 consecutive dominant bits have been detected on the CAN bus in channel communication mode. After that, detection of a bus lock is restarted when either of the following conditions is met.

- A recessive bit is detected after the BLF bit has been cleared from 1 to 0.
- The CAN module transitions to channel reset mode and returns to channel communication mode after the BLF bit has been cleared from 1 to 0.

OVLF Flag

This flag is set to 1 when the overload frame transmit condition has been detected when performing reception or transmission.

BORF Flag

This flag is set to 1 when 11 consecutive recessive bits have been detected 128 times and the CAN module returns from the bus off state. However, this flag is not set to 1 if the CAN module returns from the bus off state in any of the following ways before 11 consecutive recessive bits are detected 128 times.

- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (channel reset mode).
- The RTBO bit in the RSCFDnCFDCmCTR register is set to 1 (forcible return from the bus off state).
- The BOM[1:0] bits in the RSCFDnCFDCmCTR register are set to 01_B (transition to channel halt mode at bus off entry).
- The CHMDC[1:0] bits in the RSCFDnCFDCmCTR register are set to 10_B (channel halt mode) before 11 consecutive recessive bits are detected 128 times with the BOM[1:0] bits set to 11_B (transition to channel halt mode upon a request from the program during bus off).

BOEF Flag

This flag is set to 1 when the bus off state is entered (TEC[7:0] value > 255). This flag is also set to 1 if the bus off state is entered when the BOM[1:0] bits in the RSCFDnCFDCmCTR register (m = 0 to 2) are set to 01_B (transition to channel halt mode at bus off entry).

EPF Flag

This flag is set to 1 when the error passive state is entered ((128 ≤ TEC[7:0] ≤ 255) or (128 ≤ REC[7:0])).
This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 127. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 127, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 127 or less and then the REC[7:0] or TEC[7:0] value exceeds 127 again.

EWF Flag

This flag is set to 1 only when the REC[7:0] or TEC[7:0] value first exceeds 95. Therefore, if the program writes 0 to this flag while the value of REC[7:0] or TEC[7:0] remains over 95, this bit is not set to 1 until both REC [7:0] and TEC[7:0] values become 95 or less and then the REC[7:0] or TEC[7:0] value exceeds 95 again.

BEF Flag

This flag is set to 1 when any one of the ADERR, B0ERR, B1ERR, CERR, AERR, FERR, and SERR flags in the RSCFDnCFDCmERFL register is set to 1.

NOTE

To clear the flag of this register to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

17.4.3.5 RSCFDnCFDCmDCFG — Channel m Data Bit Rate Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmDCFG register can be read/written in 32-bit units
RSCFDnCFDCmDCFGL, RSCFDnCFDCmDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmDCFGLL, RSCFDnCFDCmDCFGLH, RSCFDnCFDCmDCFGHL, RSCFDnCFDCmDCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmDCFG: <RSCFDn_base> + 0500_H + (20_H × m)

RSCFDnCFDCmDCFGL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGH: <RSCFDn_base> + 0502_H + (20_H × m)

RSCFDnCFDCmDCFGLL: <RSCFDn_base> + 0500_H + (20_H × m),
RSCFDnCFDCmDCFGLH: <RSCFDn_base> + 0501_H + (20_H × m),
RSCFDnCFDCmDCFGHL: <RSCFDn_base> + 0502_H + (20_H × m),

Table 17.99 RSCFDnCFDCmDCFG Register Contents (2/2)

Bit Position	Bit Name	Function
19 to 16	DTSEG1[3:0]	Data Bit Rate Time Segment 1 Control b19 b18 b17 b16 0 0 0 0: Setting prohibited 0 0 0 1: 2 Tq 0 0 1 0: 3 Tq 0 0 1 1: 4 Tq 0 1 0 0: 5 Tq 0 1 0 1: 6 Tq 0 1 1 0: 7 Tq 0 1 1 1: 8 Tq 1 0 0 0: 9 Tq 1 0 0 1: 10 Tq 1 0 1 0: 11 Tq 1 0 1 1: 12 Tq 1 1 0 0: 13 Tq 1 1 0 1: 14 Tq 1 1 1 0: 15 Tq 1 1 1 1: 16 Tq
15 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
7 to 0	DBRP[7:0]	Data Bit Rate Prescaler Division Ratio Setting When the set value = P (0 to 255), the data bit rate prescaler divides fCAN by (P + 1).

Modify the RSCFDnCFDCmDCFG register in channel reset mode or channel halt mode. Set this register in channel reset mode, and then transition to channel communication mode or channel halt mode. When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value. For the description and settings of bit timing parameters, see **Section 17.11.1, Initial Settings**.

DSJW[2:0] Bits

These bits specify the resynchronization jump width of data bit rate as a Tq value. Possible values are 1 to 8 Tq. Specify a value equal to or smaller than the DTSEG2[2:0] bits value.

DTSEG2[2:0] Bits

These bits are used to specify a Tq value for the length of phase segment 2 (PHASE_SEG2) of data bit rate.

Possible values are 2 to 8 Tq.

Specify a value equal to or smaller than the DTSEG1[3:0] bits value.

DTSEG1[3:0] Bits

These bits specify the total length of propagation segment (PROP_SEG) and phase segment 1 (PHASE_SEG1) of data bit rate as a Tq value.

Possible values are 2 to 16 Tq.

DBRP[7:0] Bits

The clock obtained by dividing the CAN clock (fCAN) by the data bit rate prescaler ((DBRP[7:0]) + 1) becomes CANmTq(D) clock (fCANTQ(D)m). One clock of the CANmTq(D) clock becomes one Time Quantum (Tq).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].

To specify different values for the nominal bit rate and the data bit rate, change the values of the RCFGDnCFGCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

17.4.3.6 RSCFDnCFDCmFDCFG — Channel m CAN FD Configuration Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCFG register can be read/written in 32-bit units
RSCFDnCFDCmFDCFGL, RSCFDnCFDCmFDCFGH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCFGLL, RSCFDnCFDCmFDCFGLH, RSCFDnCFDCmFDCFGHL, RSCFDnCFDCmFDCFGHH registers can be read/written in 8-bit units

REFE bit

Setting this bit to 1 enables reception data edge filtering when the idle condition is detected, and a dominant level with less than 2 time quanta is ignored. A dominant level with more than or equal to 2 time quanta is detected as an edge. Modify this bit only in channel reset mode.

FDOE bit

Setting this bit to 1 enables FD-only mode. When data is transmitted, a CAN FD frame will be sent regardless of the settings to the CFFDF bit in the RSCFDnCFDCFFDCSTSk register or the TMFDF bit in the RSCFDnCFDTMFDCTRp register. When a Classical CAN frame is received, a form error is detected. Modify this bit only in channel reset mode.

TMME Bit

Setting this bit to 1 enables transmit buffer merge mode. Modify this bit only in channel reset mode or channel halt mode.

GWBRS Bit

When the GWEN bit is 1, the BRS bit in a CAN FD frame to be transmitted by the gateway function is set. When the GWFDF bit is set to 0, write 0 to this bit. Modify this bit only in channel reset mode.

GWFDF Bit

When the GWEN bit is 1, the FDF bit in a CAN FD frame to be transmitted by the gateway function is set. Modify this bit only in channel reset mode.

GWEN Bit

This bit is used to control the operation of the transmit/receive FIFO buffer with the CFM[1:0] bits in the RSCFDnCFDCFCCk register set to 10_B (gateway mode).

Setting this bit to 1 enables the CAN-CAN FD gateway, enabling transmission in a format different from that of frames received by the gateway function. Received frames are replaced in accordance with the settings of the GWFDF bit and the GWBRS bit. When the DLC value in the received classical CAN frame is 1001_B or more and the GWFDF bit is set to 1 (CAN FD frame), the DLC value is replaced with 1000_B.

While this bit is set to 1, do not perform routing the following frames by using the gateway function.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

While this bit is set to 1, the following frame should be transmitted from the channel according to the setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

Modify this bit only in channel reset mode.

Table 17.101 shows the settings and formats of transmit frame and receive frame while the CAN-CAN FD gateway is enabled.

Table 17.101 Operation when the CAN-CAN FD Gateway is Enabled

Receive Frame				Transmit Frame		
Format	BRS Bit	Received DLC Value	GWFDF Bit	Format	BRS Bit	DLC Value to be Transmitted
Classical CAN	None	DLC ≤ 1000_B	0	Classical CAN	None	Not replaced
		DLC > 1000_B				
CAN FD	Arbitrary	DLC ≤ 1000_B				
Classical CAN	None	DLC ≤ 1000_B	1	CAN FD	According to GWBRS bit setting	Not replaced
		DLC >1000_B				Replaced with 1000_B
CAN FD	Arbitrary	DLC ≤ 1000_B				Not replaced

TDCO[6:0] Bits

These bits set the SSP offset value. How to use this value depends on the TDCOC bit in the RSCFDnCFDCmFDCFG register. These bits are based on CAN clock frequency (fCAN).

When the TDCOC bit is set to 0, the transmitter delay compensation result equals to the total value of the measured delay value and the TDCO[6:0] value (rounded down to the nearest integer Tq).

When the TDCOC bit is set to 1, the transmitter delay compensation result equals to the TDCO[6:0] value.

The SSP offset value = (set value of TDCO[6:0] bits + 1).

Modify these bits only in channel reset mode or channel halt mode.

ESIC Bit

When the ESIC bit is set to 1, if the channel is in the error active state, the ESI bit value (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register) set in the transmit/receive FIFO buffer or transmit buffer is transmitted as an ESI bit value of the transmit message. When the channel is in the error passive state or the ESIC bit is set to 0, the channel status is transmitted as an ESI bit value. Modify this bit only in channel reset mode or channel halt mode.

Table 17.102 ESI Value to Be Transmitted

ESIC Bit	Channel Status	ESI Value to be Transmitted
0	Error active	0 (error active node)
	Error passive	1 (error passive node)
1	Error active	ESI value set in the transmit/receive FIFO buffer or transmit buffer (CFESI bit in the RSCFDnCFDCFFDCSTSk register or TMESI bit in the RSCFDnCFDTMFDCTRp register)
	Error passive	1 (error passive node)

TDCE Bit

Setting this bit to 1 enables transmitter delay compensation. Modify this bit only in channel reset mode or channel halt mode.

TDCOC Bit

When this bit is set to 0, the SSP position is defined by the total of the measured delay value and the SSP offset value (fixed value).

When this bit is set to 1, the SSP position is defined only by the SSP offset value.

Modify this bit only in channel reset mode or channel halt mode.

EOCCFG[2:0] Bits

These bits are used to select a frame format and a transmission/reception direction when the error occurrence counter counts CAN bus errors.

Modify these bits only in channel reset mode or channel halt mode.

17.4.3.7 RSCFDnCFDCmFDCTR — Channel m CAN FD Control Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCTR register can be read/written in 32-bit units
RSCFDnCFDCmFDCTRL, RSCFDnCFDCmFDCTRH registers can be read/written in 16-bit units
RSCFDnCFDCmFDCTRLL, RSCFDnCFDCmFDCTRLH, RSCFDnCFDCmFDCTRHL, RSCFDnCFDCmFDCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDCTR: <RSCFDn_base> + 0508_H + (20_H × m)

RSCFDnCFDCmFDCTRL: <RSCFDn_base> + 0508_H + (20_H × m),
RSCFDnCFDCmFDCTRH: <RSCFDn_base> + $050A_H$ + (20_H × m)

Table 17.103 RSCFDnCFDCmFDCTR Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	SOCCLR	Successful Occurrence Counter Clear Setting the SOCCLR bit to 1 clears the successful occurrence counter. This bit is always read as 0.
0	EOCCLR	Error Occurrence Counter Clear Setting the EOCCLR bit to 1 clears the error occurrence counter. This bit is always read as 0.

SOCCLR Bit

Setting this bit to 1 clears the successful occurrence counter (SOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

EOCCLR Bit

Setting this bit to 1 clears the error occurrence counter (EOC[7:0] bits in the RSCFDnCFDCmFDSTS register). This bit is automatically cleared to 0.

17.4.3.8 RSCFDnCFDCmFDSTS — Channel m CAN FD Status Register (m = 0 to 2)

Access: RSCFDnCFDCmFDSTS register can be read/written in 32-bit units
RSCFDnCFDCmFDSTSL, RSCFDnCFDCmFDSTSH registers can be read/written in 16-bit units
RSCFDnCFDCmFDSTSLL, RSCFDnCFDCmFDSTSLH, RSCFDnCFDCmFDSTSHL, RSCFDnCFDCmFDSTSHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCmFDSTS: <RSCFDn_base> + 050C$_H$ + (20$_H$ × m)

RSCFDnCFDCmFDSTSL: <RSCFDn_base> + 050C$_H$ + (20$_H$ × m),
RSCFDnCFDCmFDSTSH: <RSCFDn_base> + 050E$_H$ + (20$_H$ × m)

RSCFDnCFDCmFDSTSLL: <RSCFDn_base> + 050C$_H$ + (20$_H$ × m),
RSCFDnCFDCmFDSTSLH: <RSCFDn_base> + 050D$_H$ + (20$_H$ × m),
RSCFDnCFDCmFDSTSHL: <RSCFDn_base> + 050E$_H$ + (20$_H$ × m),
RSCFDnCFDCmFDSTSHH: <RSCFDn_base> + 050F$_H$ + (20$_H$ × m)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SOC[7:0]								EOC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1	R	R	R	R	R	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.104 RSCFDnCFDCmFDSTS Register Contents

Bit Position	Bit Name	Function
31 to 24	SOC[7:0]	Successful Occurrence Counter The successful occurrence counter value can be read.
23 to 16	EOC[7:0]	Error Occurrence Counter The error occurrence counter value can be read.
15 to 10	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
9	SOCO	Successful Occurrence Counter Overflow Flag 0: The successful occurrence counter does not overflow. 1: The successful occurrence counter has overflowed.
8	EOCO	Error Occurrence Counter Overflow Flag 0: The error occurrence counter does not overflow. 1: The error occurrence counter has overflowed.
7	TDCVF	Transmitter Delay Compensation Violation Flag 0: No transmitter delay compensation violation is present. 1: A transmitter delay compensation violation is present.
6 to 0	TDCR[6:0]	Transmitter Delay Compensation Result Status The transmitter delay compensation result can be read.

SOC[7:0] Bits

These bits show the successful occurrence counter value. The successful occurrence counter is incremented upon completion of message reception or transmission without an error. This counter stops counting when it reaches FF_H. In loopback mode, this counter is incremented twice.

These bits are cleared to 0 by writing 1 to the SOCCLR bit in the RSCFDnCFDCmCTR register. These bits are set to 0 in channel reset mode.

EOC[7:0] Bits

These bits show the error occurrence counter value. The error occurrence counter is incremented each time an error occurs according to the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register. This counter stops counting when it reaches FF_H.

These bits are cleared to 0 by writing 1 to the EOCCLR bit in the RSCFDnCFDCmCTR register. These bits are set to 0 in channel reset mode.

SOCO Flag

This bit indicates that successful occurrence counter overflow has occurred.

This flag is set to 1 when message reception or transmission is completed while the SOC[7:0] value has reached FF_H. This flag is set to 0 in channel reset mode.

EOCO Flag

This bit indicates that error occurrence counter overflow has occurred.

This flag is set to 1 when a CAN bus error is detected under the condition specified by the EOCCFG[2:0] bits in the RSCFDnCFDCmFDCFG register when the EOC[7:0] value has reached FF_H. This flag is set to 0 in channel reset mode.

TDCVF Flag

This bit indicates violation of transmitter delay compensation.

The transmit data is compared with the reception CAN bus level delayed due to the transceiver’s loop delay. This delay changes due to physical factors such as temperature. Because the TDCR[6:0] flags are updated for each message, temporary maximum delay cannot be confirmed.

Ths bit is set to 1 when the transmitter delay compensation exceeds the maximum compensation 3 CANm bit times - 2 fCAN (CANm bit time is the value of data bit rate).

This flag is set to 0 in channel reset mode.

TDCR[6:0] Flags

These bits indicate the transmitter delay compensation result as a multiple of CAN clock frequency (fCAN).

This result depends on the settings of the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

These flags are updated at a falling edge between the FDF bit and res bit when the TDCE bit in the RSCFDnCFDCmFDCFG register is set to 1 (transmitter delay compensation enable) and also the TDCOC bit in the RSCFDnCFDCmFDCFG register is set to 0 (measurement and offset).

This flag is set to 0 in channel reset mode.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

17.4.3.9 RSCFDnCFDCmFDCRC — Channel m CAN FD CRC Register (m = 0 to 2)

Access: RSCFDnCFDCmFDCRC register can be read only in 32-bit units
RSCFDnCFDCmFDCRCL, RSCFDnCFDCmFDCRCH registers can be read only in 16-bit units
RSCFDnCFDCmFDCRCLL, RSCFDnCFDCmFDCRCLH, RSCFDnCFDCmFDCRCHL, RSCFDnCFDCmFDCRCHH registers can be read only in 8-bit units

Address: RSCFDnCFDCmFDCRC: <RSCFDn_base> + 0510_H + (20_H × m)

RSCFDnCFDCmFDCRCL: <RSCFDn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCH: <RSCFDn_base> + 0512_H + (20_H × m)

RSCFDnCFDCmFDCRCLL: <RSCFDn_base> + 0510_H + (20_H × m),
RSCFDnCFDCmFDCRCLH: <RSCFDn_base> + 0511_H + (20_H × m),
RSCFDnCFDCmFDCRCHL: <RSCFDn_base> + 0512_H + (20_H × m),
RSCFDnCFDCmFDCRCHH: <RSCFDn_base> + 0513_H + (20_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	SCNT[3:0]				—	—	—	CRCREG[20:16]

	CRCREG[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.105 RSCFDnCFDCmFDCRC Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	These bits are read as the value after reset.
27 to 24	SCNT[3:0]	Stuff count bit Indicate a value of the stuff count in a CAN FD frame. Bits 25 to 27 indicates the Gray-coded value of the stuff bit count modulo 8 in the transmitted/received frames. Bit 24 indicates an even parity value of bits 25 to 27.
23 to 21	Reserved	Thses bits are read as the value after reset.
20 to 0	CRCREG[20:0]	CRC Calculation Data (CRC Length:17 Bit or 21 Bit) These bits show the CRC value calculated based on the transmit message or receive message. When the CRC length is 17 bits, bits b20 to b17 are read as 0.

SCNT[3:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is set to 1 (communication test mode enabled), a stuff count bit value of the CAN FD frame can be read if a message transmitted/received is a CAN FD frame. When the CTME bit is 0 (communication test mode disabled), this flag is always read as 0. These flags are updated at the first bit in the CRC field of the CAN FD frame. These bits are cleared to 0 in channel reset mode.

CRCREG[20:0] Flags

When the CTME bit in the RSCFDnCFDCmCTR register is 1 (communication test mode enabled), if transmit or receive message is a CAN FD frame (CRC length = 17 or 21 bits), these flags are updated and the CRC value calculated based on the message can be read. When the CRC length of the message is 17 bits, bits b20 to b17 are always read as 0. When a classical CAN frame is transmitted or received, the CRCREG[14:0] value in the RSCFDnCFDCmERFL register is updated. When the CTME bit is 0 (communication test mode disabled), these bits are always read as 0.

17.4.4 Details of Global-Related Registers

17.4.4.1 RSCFDnCFDGCFG — Global Configuration Register

Access: RSCFDnCFDGCFG register can be read/written in 32-bit units
RSCFDnCFDGCFGL, RSCFDnCFDGCFGH registers can be read/written in 16-bit units
RSCFDnCFDGCFGLL, RSCFDnCFDGCFGLH, RSCFDnCFDGCFGHL, RSCFDnCFDGCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGCFG: <RSCFDn_base> + 0084_H

RSCFDnCFDGCFGL: <RSCFDn_base> + 0084_H, RSCFDnCFDGCFGH: <RSCFDn_base> + 0086_H

RSCFDnCFDGCFGLL: <RSCFDn_base> + 0084_H, RSCFDnCFDGCFGLH: <RSCFDn_base> + 0085_H, RSCFDnCFDGCFGHL: <RSCFDn_base> + 0086_H, RSCFDnCFDGCFGHH: <RSCFDn_base> + 0087_H

11 to 8	TSP[3:0]	Timestamp Clock Source Division b11 b10 b9 b8 0 0 0 0: Not divided 0 0 0 1: Divided by 2 0 0 1 0: Divided by 4 0 0 1 1: Divided by 8 0 1 0 0: Divided by 16 0 1 0 1: Divided by 32 0 1 1 0: Divided by 64 0 1 1 1: Divided by 128 1 0 0 0: Divided by 256 1 0 0 1: Divided by 512 1 0 1 0: Divided by 1024 1 0 1 1: Divided by 2048 1 1 0 0: Divided by 4096 1 1 0 1: Divided by 8192 1 1 1 0: Divided by 16384 1 1 1 1: Divided by 32768
7, 6	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
5	CMPOC	Payload Overflow Mode Select 0: No message is stored. 1: Messages are stored and payloads exceeding the buffer size are discarded.
4	DCS	CAN Clock Source Select*2 0: clkc 1: clk_xincan
3	MME	Mirror Function Enable 0: Mirror function is disabled. 1: Mirror function is enabled.
2	DRE	DLC Replacement Enable 0: DLC replacement is disabled. 1: DLC replacement is enabled.
1	DCE	DLC Check Enable 0: DLC check is disabled. 1: DLC check is enabled.
0	TPRI	Transmit Priority Select 0: ID priority 1: Transmit buffer number priority

Note 1. When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Note 2. For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

Modify the RSCFDnCFDGCFG register only in global reset mode.

ITRCP[15:0] Bits

These bits are used to set a clock source division value of the interval timer for FIFO buffers. See **Section 17.8.3.1, Interval Transmission Function**.

TSBTCS[2:0] Bits

When the TSSS bit is 1, these bits are used to select the channel of the nominal bit time clock that will be the clock source of the timestamp counter. However, do not select the channel that handles the CAN FD frames.

TSSS Bit

This bit is used to select a clock source of the timestamp counter. Select pclk if there is no channel that handles only classical CAN frames.

TSP[3:0] Bits

A clock obtained by dividing the clock source selected with the TSBTCS[2:0] bits and TSSS bit according to the TSP[3:0] bits is used as the timestamp counter count source.

CMPOC Bit

This bit is used to select operation in case the payload length of received message exceeds the payload storage size of the storage buffer.

When this bit is 0, the received message in which the payload overflows is not stored in the buffer.

When this bit is 1, the received message in which the payload overflows is stored in the buffer, and depending on the DRE bit the received DLC value or the DLC value of the receive rule is stored in the buffer. At this time, payloads exceeding the buffer's payload storage size are discarded.

The buffer’s payload storage size is set by the following bits.

- Receive buffer: RMPLS[1:0] bits in the RSCFDnCFDRMNB register
- Receive FIFO buffer: RFPLS[2:0] bits in the RSCFDnCFDRFCCx register
- Transmit/receive FIFO buffer: CFPLS[2:0] bits in the RSCFDnCFDCFCCk register

DCS Bit

When this bit is set to 0, clkc is used as the clock source of the CAN clock (fCAN).

When this bit is set to 1, clk_xincan is used as the clock source of the CAN clock (fCAN).

For the CAN clock frequency settings, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

MME Bit

Setting this bit to 1 makes the mirror function available.

DRE Bit

When the DRE bit is set to 1, the DLC value of the receive rule is stored in the buffer instead of the DLC value of the received message after the DLC value has passed through the DLC filter. In this case, a value of 00_H is stored in each data byte that exceeds the DLC value of the receive rule.

The DLC replacement function is only available when the DCE bit is set to 1 (DLC check is enabled).

DCE Bit

Setting this bit to 1 makes the DLC check function available. When disabling the DLC check function, set the GAFLDLC[3:0] bits in the RSCFDnCFDGAFLP0_j register to 0000_B before clearing the DCE bit in the RSCFDnCFDGCFG register to 0.

TPRI Bit

This bit is used to set the transmit priority.

When this bit is set to 0, ID priority is selected and the transmit priority complies with the CAN bus arbitration rule (ISO11898-1 specifications). When this bit is set to 1, transmit buffer number priority is selected and the transmit buffer with the smallest number has the highest priority.

When using the transmit queue, this bit should be set to 0.

17.4.4.2 RSCFDnCFDGCTR — Global Control Register

Access: RSCFDnCFDGCTR register can be read/written in 32-bit units
RSCFDnCFDGCTRL, RSCFDnCFDGCTRH registers can be read/written in 16-bit units
RSCFDnCFDGCTRLL, RSCFDnCFDGCTRLH, RSCFDnCFDGCTRHL, RSCFDnCFDGCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGCTR: <RSCFDn_base> + 0088_H

RSCFDnCFDGCTRL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRH: <RSCFDn_base> + $008A_H$

RSCFDnCFDGCTRLL: <RSCFDn_base> + 0088_H, RSCFDnCFDGCTRLH: <RSCFDn_base> + 0089_H, RSCFDnCFDGCTRHL: <RSCFDn_base> + $008A_H$, RSCFDnCFDGCTRHH: <RSCFDn_base> + $008B_H$

Value after reset: 0000 0005_H

Table 17.107 RSCFDnCFDGCTR Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
16	TSRST	Timestamp Counter Reset Setting the TSRST bit to 1 resets the timestamp counter. This bit is always read as 0.
15 to 12	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
11	CMPOFIE	Payload Overflow Interrupt Enable 0: A payload overflow interrupt is disabled. 1: A payload overflow interrupt is enabled.
10	THLEIE	Transmit History Buffer Overflow Interrupt Enable 0: Transmit history buffer overflow interrupt is disabled. 1: Transmit history buffer overflow interrupt is enabled.
9	MEIE	FIFO Message Lost Interrupt Enable 0: FIFO message lost interrupt is disabled. 1: FIFO message lost interrupt is enabled.
8	DEIE	DLC Error Interrupt Enable 0: DLC error interrupt is disabled. 1: DLC error interrupt is enabled.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	GSLPR	Global Stop Mode 0: Other than global stop mode 1: Global stop mode
1, 0	GMDC[1:0]	Global Mode Select b1 b0 0 0: Global operating mode 0 1: Global reset mode 1 0: Global test mode 1 1: Setting prohibited

TSRST Bit

This bit is used to reset the timestamp counter. When this bit is set to 1, the RSCFDnCFDGTSC register is cleared to 0000_H.

CMPOFIE Bit

When the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 after the CMPOFIE bit is set to 1, an interrupt request occurs. Modify this bit only in global reset mode.

THLEIE Bit

When the THLEIE bit is set to 1 and the THLES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

MEIE Bit

When the MEIE bit is set to 1 and the MES flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

DEIE Bit

When the DEIE bit is set to 1 and the DEF flag in the RSCFDnCFDGERFL register is set to 1, an interrupt request is generated. Modify this bit only in global reset mode.

GSLPR Bit

Setting this bit to 1 places the RS-CANFD module into global stop mode.
Clearing this bit to 0 releases the RS-CANFD module from global stop mode.
This bit should not be modified in global operating mode or global test mode.

GMDC[1:0] Bits

These bits are used to select the mode of entire RS-CANFD module (global operating mode, global reset mode, or global test mode). For details, see **Section 17.6.1, Global Modes**. Setting the GSLPR bit to 1 when in global reset mode places the RS-CANFD module in global stop mode.

17.4.4.3 RSCFDnCFDGSTS — Global Status Register

Access: RSCFDnCFDGSTS register can be read only in 32-bit units
RSCFDnCFDGSTSL, RSCFDnCFDGSTSH registers can be read only in 16-bit units
RSCFDnCFDGSTSLL, RSCFDnCFDGSTSLH, RSCFDnCFDGSTSHL, RSCFDnCFDGSTSHH registers can be read only in
8-bit units

Address: RSCFDnCFDGSTS: <RSCFDn_base> + $008C_H$

RSCFDnCFDGSTSL: <RSCFDn_base> + $008C_H$, RSCFDnCFDGSTSH: <RSCFDn_base> + $008E_H$

RSCFDnCFDGSTSLL: <RSCFDn_base> + $008C_H$, RSCFDnCFDGSTSLH: <RSCFDn_base> + $008D_H$,
RSCFDnCFDGSTSHL: <RSCFDn_base> + $008E_H$, RSCFDnCFDGSTSHH: <RSCFDn_base> + $008F_H$

Value after reset: $0000\ 000D_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.108 RSCFDnCFDGSTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is returned.
3	GRAMINIT	CAN RAM Initialization Status Flag 0: CAN RAM initialization is completed. 1: CAN RAM initialization is ongoing.
2	GSLPSTS	Global Stop Status Flag 0: Not in global stop mode 1: In global stop mode
1	GHLTSTS	Global Test Status Flag 0: Not in global test mode 1: In global test mode
0	GRSTSTS	Global Reset Status Flag 0: Not in global reset mode 1: In global reset mode

GRAMINIT Flag

This flag indicates the initialization status of the CAN RAM.

This flag is set to 1 after the MCU has been reset, and is cleared to 0 when CAN RAM initialization is completed.

GSLPSTS Flag

This flag is set to 1 when the CAN module has transitioned to global stop mode, and is cleared to 0 when the CAN module has returned from global stop mode.

GHLTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global test mode, and is cleared to 0 when the CAN module has exited global test mode.

GRSTSTS Flag

This flag is set to 1 when the CAN module has transitioned to global reset mode, and is cleared to 0 when the CAN module has transitioned to a mode other than global reset mode. This flag remains 1 even when the CAN module has transitioned from global reset mode to global stop mode.

17.4.4.4 RSCFDnCFDGERFL — Global Error Flag Register

Access: RSCFDnCFDGERFL register can be read/written in 32-bit units
RSCFDnCFDGERFLL, RSCFDnCFDGERFLH registers can be read/written in 16-bit units
RSCFDnCFDGERFLLL, RSCFDnCFDGERFLLH, RSCFDnCFDGERFLHL, RSCFDnCFDGERFLHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGERFL: <RSCFDn_base> + 0090_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	EEF2	EEF1	EEF0
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R/W*1

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	CMPOF	THLES	MES	DEF
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R	R/W*1

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.109 RSCFDnCFDGERFL Register Contents

Bit Position	Bit Name	Function
31 to 19, 15, 14, 7, 6, 4	Reserved	When read, the value after reset is returned. When writing these bits, write the value after reset.
18	EEF2	ECC Error Flag for Channel 2 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
17	EEF1	ECC Error Flag for Channel 1 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
16	EEF0	ECC Error Flag for Channel 0 0: No 2-bit ECC error when deciding transmission priority 1: A 2-bit ECC error when deciding transmission priority
13 to 8, 5	Reserved	When read, the undefined value is returned. When writing these bits, write the value after reset.
3	CMPOF	Payload Overflow Flag 0: No payload overflow has occurred. 1: A payload overflow has occurred.
2	THLES	Transmit History Buffer Overflow Status Flag 0: No transmit history buffer overflow has occurred. 1: A transmit history buffer overflow has occurred.
1	MES	FIFO Message Lost Status Flag 0: No FIFO message lost error has occurred. 1: A FIFO message lost error has occurred.
0	DEF	DLC Error Flag 0: No DLC error has occurred. 1: A DLC error has occurred.

All flags in the RSCFDnCFDGERFL register are cleared to 0 in global reset mode.

EEFm Flag

When a 2-bit ECC error is detected during the transmission priority determination of channel m (m = 0 to 2), the EEFm flag is set to 1, disabling message transmission. This flag can be cleared to 0 by writing 0 by the program.

CMPOF Flag

When a payload overflow occurs in any of channel m (m = 0 to 2), the CMPOF flag is set to 1. This flag can be cleared to 0 by writing 0 to this bit by the program.

THLES Flag

The THLES flag is set to 1 when any one of the THLELT flags in the RSCFDnCFDTHLSTSm register (m = 0 to 5) is set to 1.

This flag is cleared to 0 when the THLELT flags of all channels are set to 0.

MES Flag

The MES flag is set to 1 when any one of the RFMLT flags in the RSCFDnCFDRFSTSx register (x = 0 to 7) or the CFMLT flags in the RSCFDnCFDCFSTSk register (k = 0 to 8) is set to 1.

This flag is cleared to 0 when all RFMLT flags and CFMLT flags are set to 0.

DEF Flag

The DEF flag is set to 1 when an error has been detected during the DLC check. The program can clear this flag by writing 0 to this bit.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

NOTE

To clear the flag of this register to 0, use a store instruction to write 0 to the given flag and 1 to the other flags.

17.4.4.5 RSCFDnCFDGTSC — Global Timestamp Counter Register

Access: RSCFDnCFDGTSC register can be read only in 32-bit units.
RSCFDnCFDGTSCL, RSCFDnCFDGTSCH registers can be read only in 16-bit units.

Address: RSCFDnCFDGTSC: <RSCFDn_base> + 0094_H

RSCFDnCFDGTSCL: <RSCFDn_base> + 0094_H, RSCFDnCFDGTSCH: <RSCFDn_base> + 0096_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.110 RSCFDnCFDGTSC Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset.
15 to 0	TS[15:0]	Timestamp Value The timestamp counter value can be read. Counter Value: 0000_H to $FFFF_H$

TS[15:0] Bits

When the TS[15:0] bits are read, the read value shows the timestamp counter (16-bit free-running counter) value at that time. When the SOF is detected, the TS[15:0] value is captured and later stored in the receive buffer or the FIFO buffer. Furthermore, the TS[15:0] value is stored in the transmit history buffer. The timestamp counter is initialized in global reset mode.

The timestamp counter starts and stops counting differently, depending on the count source.

- When the TSSS bit in the RSCFDnCFDGCFG register is 0 (pclk):
  The timestamp counter starts counting when the RSCAN module has transitioned to global operating mode.
  This counter stops counting when the RSCAN module has transitioned to global stop mode or global test mode.
- When the TSSS bit is 1 (CANm nominal bit time clock):
  The timestamp counter starts counting when the corresponding channel has transitioned to channel communication mode.
  This counter stops counting when the corresponding channel has transitioned to channel reset mode or channel halt mode.

17.4.4.6 RSCFDnCFDGTINTSTS0 — Global TX Interrupt Status Register 0

Access: RSCFDnCFDGTINTSTS0 register can be read only in 32-bit units
RSCFDnCFDGTINTSTS0L, RSCFDnCFDGTINTSTS0H registers can be read only in 16-bit units
RSCFDnCFDGTINTSTS0LL, RSCFDnCFDGTINTSTS0LH, RSCFDnCFDGTINTSTS0HL, RSCFDnCFDGTINTSTS0HH registers can be read only in 8-bit units

Address: RSCFDnCFDGTINTSTS0: <RSCFDn_base> + 0460_H

RSCFDnCFDGTINTSTS0L: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0H: <RSCFDn_base> + 0462_H

RSCFDnCFDGTINTSTS0LL: <RSCFDn_base> + 0460_H, RSCFDnCFDGTINTSTS0LH: <RSCFDn_base> + 0461_H,
RSCFDnCFDGTINTSTS0HL: <RSCFDn_base> + 0462_H, RSCFDnCFDGTINTSTS0HH: <RSCFDn_base> + 0463_H

Value after reset: $0000\ 0000_H$

R/W	R	R	R	R*1	R*1	R*1	R*1	R*1	R	R	R	R*1	R*1	R*1	R*1	R*1

Note 1. This bit is automatically cleared in the global reset or channel reset mode.

Table 17.111 RSCFDnCFDGTINTSTS0 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 21	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
20	THIF2	Channel 2 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
19	CFTIF2	Channel 2 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
18	TQIF2	Channel 2 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
17	TAIF2	Channel 2 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
16	TSIF2	Channel 2 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
15 to 13	Reserved	These bits are read as the value after reset.
12	THIF1	Channel 1 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
11	CFTIF1	Channel 1 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
10	TQIF1	Channel 1 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.

Table 17.111 RSCFDnCFDGTINTSTS0 Register Contents (2/2)

Bit Position	Bit Name	Function
9	TAIF1	Channel 1 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
8	TSIF1	Channel 1 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.
7 to 5	Reserved	These bits are read as the value after reset.
4	THIF0	Channel 0 Transmit History Interrupt Status Flag 0: Transmit history interrupt is not requested. 1: Transmit history interrupt is requested.
3	CFTIF0	Channel 0 Transmit/receive FIFO Transmit Interrupt Status Flag 0: Transmit/receive FIFO transmit interrupt is not requested. 1: Transmit/receive FIFO transmit interrupt is requested.
2	TQIF0	Channel 0 Transmit Queue Interrupt Status Flag 0: Transmit queue interrupt is not requested. 1: Transmit queue interrupt is requested.
1	TAIF0	Channel 0 Transmit Buffer Abort Interrupt Status Flag 0: Transmit buffer abort interrupt is not requested. 1: Transmit buffer abort interrupt is requested.
0	TSIF0	Channel 0 Transmit Buffer Interrupt Status Flag 0: Transmit buffer transmit complete interrupt is not requested. 1: Transmit buffer transmit complete interrupt is requested.

TSIFm Bits

The TSIFm bit is set to 1 when the TMIEp bit in the RSCFDnCFDTMIECy register is set to 1 (transmit buffer interrupt enabled) and the TMTRF[1:0] flags in the corresponding RSCFDnCFDTMSTSp register are set to 10_B (transmit completed without abort request) or 11_B (transmit completed with abort request).

When the TMTRF[1:0] flags are cleared to 00_B under the condition that the TSIFm bit can be set to 1, this flag is cleared to 0. In addition, clearing the TMIEp bit to 0 also clears this flag to 0.

TAIFm Bits

The TAIFm bit is set to 1 when the TAIE bit in the RSCFDnCFDCmCTR register is 1 (transmit abort interrupt enabled) and the TMTRF[1:0] flags in the RSCFDnCFDTMSTSp register are set to 01_B (transmit abort completed).

This flag is cleared to 0 when the TMTRF[1:0] flags are cleared to 00_B after the transmit abort is completed.

TQIFm Bits

When the TXQIE bit in the RSCFDnCFDTXQCCm register is set to 1 (transmit queue interrupt enabled) and the TXQIF bit in the RSCFDnCFDTXQSTSm register is set to 1 (transmit queue interrupt request), the TQIFm bit is set to 1.

When the TXQIF bit (transmit queue interrupt request) in the RSCFDnCFDTXQSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the TXQIE bit is cleared to 0.

CFTIFm Bits

When the CFTXIE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO transmit interrupt enabled) and the CFTXIF bit in the RSCFDnCFDCFSTSk register is set to 1 (transmit/receive FIFO transmit interrupt request), the CFTIFm bit is set to 1.

When the CFTXIF bit is cleared to 0 under the conditions that the CFTIFm bit can be set to 1, this bit is cleared to 0. This flag is also cleared to 0 when the CFTXIE bit is cleared to 0.

THIFm Bits

When the THLIE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history interrupt enabled) and the THLIF bit in the RSCFDnCFDTHLSTSm register is set to 1 (transmit history interrupt request), the THIFm bit is set to 1.

When the THLIF bit in the RSCFDnCFDTHLSTSm register is cleared to 0, this bit is cleared to 0. This flag is also cleared to 0 when the THLIE bit is cleared to 0.

17.4.4.7 RSCFDnCFDGFDCFG — Global FD Configuration Register

Access: RSCFDnCFDGFDCFG register can be read/written in 32-bit unit
RSCFDnCFDGFDCFGL and RSCFDnCFDGFDCFGH registers can be read/written in 16-bit unit
RSCFDnCFDGFDCFGLL, RSCFDnCFDGFDCFGLH, RSCFDnCFDGFDCFGHL, RSCFDnCFDGFDCFGHH registers can be read/written in 8-bit unit

Address: RSCFDnCFDGFDCFG: <RSCFDn_base> + 0474_H

RSCFDnCFDGFDCFG L: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG H: <RSCFDn_base> + 0476_H

RSCFDnCFDGFDCFG LL: <RSCFDn_base> + 0474_H, RSCFDnCFDGFDCFG LH: <RSCFDn_base> + 0475_H,
RSCFDnCFDGFDCFGHL: <RSCFDn_base> + 0476_H, RSCFDnCFDGFDCFGHH: <RSCFDn_base> + 0477_H

Value after reset: $0000\ 0000_H$

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 17.112 RSCFDnCFDGFDCFG Register Contents

Bit Position	Bit Name	Function
31 to 10	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	TSCCFG[1:0]	Time-stamp capture setting bit b9 b8 0 0: Captured at a sample point in the SOF bit. 0 1: Captured when a valid frame has been transmitted/received. 1 0: Captured at a sample point of the res bit. Note 1 1 1: Setting prohibited.
7 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	RPED	Protocol exception event detection disabled bit 0: Protocol exception event detection is enabled. 1: Protocol exception event detection is disabled.

Note 1. When a Classical CAN frame is transmitted/received, a time-stamp value will be captured at the sample point in the SOF bit.

TSCCFG bit

Select a point where a time-stamp value is captured. Modify this bit only in global reset mode.

RPED bit

Setting this bit to 1 disables the protocol exception event detection. When a protocol exception event is detected while this bit is set to 1, the event is regarded as a form error and an error frame will be output. Modify this bit only in global reset mode.

17.4.5 Details of Receive Rule-related Registers

17.4.5.1 RSCFDnCFDGAFLECTR — Receive Rule Entry Control Register

Access: RSCFDnCFDGAFLECTR register can be read/written in 32-bit units
RSCFDnCFDGAFLECTRL, RSCFDnCFDGAFLECTRH registers can be read/written in 16-bit units
RSCFDnCFDGAFLECTRLL, RSCFDnCFDGAFLECTRLH, RSCFDnCFDGAFLECTRHL, RSCFDnCFDGAFLECTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLECTR: <RSCFDn_base> + 0098_H

RSCFDnCFDGAFLECTRL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRH: <RSCFDn_base> + $009A_H$

RSCFDnCFDGAFLECTRLL: <RSCFDn_base> + 0098_H, RSCFDnCFDGAFLECTRLH: <RSCFDn_base> + 0099_H,
RSCFDnCFDGAFLECTRHL: <RSCFDn_base> + $009A_H$, RSCFDnCFDGAFLECTRHH: <RSCFDn_base> + $009B_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 17.113 RSCFDnCFDGAFLECTR Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
8	AFLDAE	Receive Rule Table Write Enable 0: Receive rule table write is disabled. 1: Receive rule table write is enabled.
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4 to 0	AFLPN[4:0]	Receive Rule Table Page Number Configuration A page number can be selected in the range of page 0 (00000_B) to page 11 (01011_B).

AFLDAE Bit

Setting this bit to 0 disables the write to the receive rule table. After writes to the receive rule table are completed, set this bit to 0 to disable the write to the table. The receive rule table can be read regardless of the value of this bit.

Set the AFLDAE bit to 1 only in global reset mode.

AFLPN[4:0] Bits

These bits are used to set the page number of the receive rule table. Sixteen receive rules can be set per page.

Set these bits to a value within the range of 00000_B to 01011_B.

17.4.5.2 RSCFDnCFDGAFLCFG0 — Receive Rule Configuration Register 0

Access: RSCFDnCFDGAFLCFG0 register can be read/written in 32-bit units
RSCFDnCFDGAFLCFG0L, RSCFDnCFDGAFLCFG0H registers can be read/written in 16-bit units
RSCFDnCFDGAFLCFG0LL, RSCFDnCFDGAFLCFG0LH, RSCFDnCFDGAFLCFG0HL,
RSCFDnCFDGAFLCFG0HH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLCFG0: <RSCFDn_base> + $009C_H$

RSCFDnCFDGAFLCFG0L: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0H: <RSCFDn_base> + $009E_H$

RSCFDnCFDGAFLCFG0LL: <RSCFDn_base> + $009C_H$, RSCFDnCFDGAFLCFG0LH: <RSCFDn_base> + $009D_H$,
RSCFDnCFDGAFLCFG0HL: <RSCFDn_base> + $009E_H$, RSCFDnCFDGAFLCFG0HH: <RSCFDn_base> + $009F_H$

Value after reset: $0000\ 0000_H$

Table 17.114 RSCFDnCFDGAFLCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 24	RNC0[7:0]	Number of Rules for Channel 0 Set the number of receive rules used for channel 0.
23 to 16	RNC1[7:0]	Number of Rules for Channel 1 Set the number of receive rules used for channel 1.
15 to 8	RNC2[7:0]	Number of Rules for Channel 2 Set the number of receive rules used for channel 2.
7 to 0	Reserved	These bits are read as the value after reset. When writing, write the value after reset.

Modify the RSCFDnCFDGAFLCFG0 register only in global reset mode.

Up to 64 × (number of channels) rules can be registered in the receive rule table for the entire unit. The number of receive rules per channel should meet the following conditions.

- The maximum number of rules per channel is 128.
- The total number of rules allocated to each channel does not exceed the number of rules that can be registered for the entire unit.

RNC0[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 0 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC1[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 1 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

RNC2[7:0] Bits

These bits are used to set the number of rules to be registered in the channel 2 receive rule table.

Set these bits to a value within the range of 00_H to 80_H.

17.4.5.3 RSCFDnCFDGAFLIDj — Receive Rule ID Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLIDj register can be read/written in 32-bit units
RSCFDnCFDGAFLIDjL, RSCFDnCFDGAFLIDjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLIDjLL, RSCFDnCFDGAFLIDjLH, RSCFDnCFDGAFLIDjHL, RSCFDnCFDGAFLIDjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLIDj: <RSCFDn_base> + 1000_H + (10_H × j)

RSCFDnCFDGAFLIDjL: <RSCFDn_base> + 1000_H + (10_H × j),

Bit Position	Bit Name	Function
31	GAFLIDE	IDE Select 0: Standard ID 1: Extended ID
30	GAFLRTR	RTR Select 0: Data frame 1: Remote frame
29	GAFLLB	Receive Rule Target Message Select 0: When a message transmitted from another CAN node is received 1: When the own transmitted message is received
28 to 0	GAFLID[28:0]	ID Set the ID of the receive rule. For the standard ID, set the ID in bits b10 to b0 and set bits b28 to b11 to 0.

Modify the RSCFDnCFDGAFLIDj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDE Bit

This bit is used to select the ID format (standard ID or extended ID) of the receive rule. This bit is compared with the IDE bit in the received message during the acceptance filter processing.

GAFLRTR Bit

This bit is used to select the frame format (data frame or remote frame) of the receive rule. This bit is compared with the RTR bit in the received message during the acceptance filter processing.

GAFLLB Bit

When this bit is set to 0, data processing using the receive rule is performed when receiving messages transmitted from another CAN node.

When this bit is set to 1 when the mirror function is used, data processing using the receive rule is performed when the CAN node is receiving its own transmitted messages.

GAFLID[28:0] Bits

These bits are used to set the ID field of the receive rule. The ID value set by these bits is compared with the ID of the received message during the acceptance filter processing.

17.4.5.4 RSCFDnCFDGAFLMj — Receive Rule Mask Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLMj register can be read/written in 32-bit units
RSCFDnCFDGAFLMjL, RSCFDnCFDGAFLMjH registers can be read/written in 16-bit units
RSCFDnCFDGAFLMjLL, RSCFDnCFDGAFLMjLH, RSCFDnCFDGAFLMjHL, RSCFDnCFDGAFLMjHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLMj: <RSCFDn_base> + 1004_H + (10_H × j)

RSCFDnCFDGAFLMjL: <RSCFDn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjH: <RSCFDn_base> + 1006_H + (10_H × j)

RSCFDnCFDGAFLMjLL: <RSCFDn_base> + 1004_H + (10_H × j),
RSCFDnCFDGAFLMjLH: <RSCFDn_base> + 1005_H + (10_H × j),
RSCFDnCFDGAFLMjHL: <RSCFDn_base> + 1006_H + (10_H × j),
RSCFDnCFDGAFLMjHH: <RSCFDn_base> + 1007_H + (10_H × j)

Value after reset: 0000 0000_H

Table 17.116 RSCFDnCFDGAFLMj Register Contents

Bit Position	Bit Name	Function
31	GAFLIDEM	IDE Mask 0: The IDE bit is not compared. 1: The IDE bit is compared.
30	GAFLRTRM	RTR Mask 0: The RTR bit is not compared. 1: The RTR bit is compared.
29	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
28 to 0	GAFLIDM[28:0]	ID Mask 0: The corresponding ID bit is not compared. 1: The corresponding ID bit is compared.

Modify the RSCFDnCFDGAFLMj register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLIDEM Bit

When this bit is set to 1, filter processing is performed only for messages of the ID format specified by the GAFLIDE bit in the RSCFDnCFDGAFLIDj register.

When this bit is cleared to 0, the IDs of all the receive messages and the specified IDs are regarded as matched. To set the GAFLIDEM bit to 0, set all the GAFLIDM[28:0] bits to 0 at the same time.

GAFLRTRM Bit

This bit is used to mask the RTR bit of the receive rule.

GAFLIDM[28:0] Bits

These bits are used to mask the corresponding ID bit of the receive rule.

17.4.5.5 RSCFDnCFDGAFLP0_j — Receive Rule Pointer 0 Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLP0j register can be read/written in 32-bit units
RSCFDnCFDGAFLP0jL, RSCFDnCFDGAFLP0jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP0jLL, RSCFDnCFDGAFLP0jLH, RSCFDnCFDGAFLP0jHL, RSCFDnCFDGAFLP0jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP0j: <RSCFDn_base> + 1008_H + (10_H × j)

RSCFDnCFDGAFLP0jL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0jH: <RSCFDn_base> + $100A_H$ + (10_H × j)

RSCFDnCFDGAFLP0jLL: <RSCFDn_base> + 1008_H + (10_H × j),
RSCFDnCFDGAFLP0jLH: <RSCFDn_base> + 1009_H + (10_H × j),
RSCFDnCFDGAFLP0jHL: <RSCFDn_base> + $100A_H$ + (10_H × j),
RSCFDnCFDGAFLP0jHH: <RSCFDn_base> + $100B_H$ + (10_H × j)

1	1	1	1		64 data bytes

Bit Position	Bit Name	Function
27 to 16	GAFLPTR[11:0]	Receive Rule Label Set the 12-bit label information.
15	GAFLRMV	Receive Buffer Enable 0: No receive buffer is used. 1: A receive buffer is used.
14 to 8	GAFLRMDP[6:0]	Receive Buffer Number Select Set the receive buffer number to store receive messages.

Table 17.117 RSCFDnCFDGAFLP0_j Register Contents

Bit Position	Bit Name	Function
7 to 0	Reserved	These bits are read as the value after reset. The write value should be the value after reset.

Modify the RSCFDnCFDGAFLP0_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLDLC[3:0] Bits

These bits are used to set the minimum data length necessary for receiving messages. If the data length of a message that is being filtered is equal to or larger than the value set by the GAFLDLC[3:0] bits, the message passes the DLC check. Setting these bits to 0000_B disables the DLC check function allowing messages with any data length to pass the DLC check.

GAFLPTR[11:0] Bits

These bits are used to set a 12-bit label to be attached to messages that have passed through the filter. A label is attached when a message is stored in the receive buffer or the FIFO buffer.

GAFLRMV Bit

When this bit is set to 1, receive messages that have passed through the filter are stored in the receive buffer selected by the GAFLRMDP[6:0] bits.

GAFLRMDP[6:0] Bits

These bits are used to select the number of the receive buffer that stores receive messages that have passed through the filter when the GAFLRMV bit is set to 1. Set these bits to a value smaller than the value set by the NRXMB[7:0] bits in the RSCFDnCFDRMNB register.

17.4.5.6 RSCFDnCFDGAFLP1_j — Receive Rule Pointer 1 Register j (j = 0 to 15)

Access: RSCFDnCFDGAFLP1_j register can be read/written in 32-bit units
RSCFDnCFDGAFLP1_jL, RSCFDnCFDGAFLP1_jH registers can be read/written in 16-bit units
RSCFDnCFDGAFLP1_jLL, RSCFDnCFDGAFLP1_jLH, RSCFDnCFDGAFLP1_jHL,
RSCFDnCFDGAFLP1_jHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGAFLP1_j: <RSCFDn_base> + 100C$_H$ + (10$_H$ × j)

RSCFDnCFDGAFLP1_jL: <RSCFDn_base> +100C$_H$ + (10$_H$ × j),
RSCFDnCFDGAFLP1_jH: <RSCFDn_base> + 100E$_H$ + (10$_H$ × j)

RSCFDnCFDGAFLP1_jLL: <RSCFDn_base> + 100C$_H$ + (10$_H$ × j),
RSCFDnCFDGAFLP1_jLH: <RSCFDn_base> + 100D$_H$ + (10$_H$ × j),
RSCFDnCFDGAFLP1_jHL: <RSCFDn_base> + 100E$_H$ + (10$_H$ × j),
RSCFDnCFDGAFLP1_jHH: <RSCFDn_base> + 100F$_H$ + (10$_H$ × j)

Value after reset: 0000 0000$_H$

Table 17.118 RSCFDnCFDGAFLP1_j Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
16 to 8	GAFLFDP[16:8]	Transmit/Receive FIFO Buffer k Select (Bit position –8 = target transmit/receive FIFO buffer number k) 0: Transmit/receive FIFO buffer is not selected. 1: Transmit/receive FIFO buffer is selected.
7 to 0	GAFLFDP[7:0]	Receive FIFO Buffer x Select (Bit position = target receive FIFO buffer number x) 0: Receive FIFO buffer is not selected. 1: Receive FIFO buffer is selected.

Modify the RSCFDnCFDGAFLP1_j register when the AFLDAE bit in the RSCFDnCFDGAFLECTR register is set to 1 (receive rule table write is enabled) in global reset mode.

GAFLFDP[16:0] Bits

These bits are used to specify FIFO buffers that store receive messages that have passed through the filter. Up to eight FIFO buffers can be selected. However, when the GAFLRMV bit in the RSCFDnCFDGAFLP0_j register is set to 1 (messages are stored in the receive buffer), up to seven FIFO buffers can be selected. Only receive FIFO buffers and the transmit/receive FIFO buffer for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register are set to 00$_B$ (receive mode) or 10$_B$ (gateway mode) can be selected.

17.4.6 Details of Receive Buffer-related Registers

17.4.6.1 RSCFDnCFDRMNB — Receive Buffer Number Register

Access: RSCFDnCFDRMNB register can be read/written in 32-bit units
RSCFDnCFDRMNBL, RSCFDnCFDRMNBH registers can be read/written in 16-bit units
RSCFDnCFDRMNBLL, RSCFDnCFDRMNBLH, RSCFDnCFDRMNBHL, RSCFDnCFDRMNBHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNB: <RSCFDn_base> + $00A4_H$

RSCFDnCFDRMNBL: <RSCFDn_base> + $00A4_H$, RSCFDnCFDRMNBH: <RSCFDn_base> + $00A6_H$

RSCFDnCFDRMNBLL: <RSCFDn_base> + $00A4_H$, RSCFDnCFDRMNBLH: <RSCFDn_base> + $00A5_H$,
RSCFDnCFDRMNBHL: <RSCFDn_base> + $00A6_H$, RSCFDnCFDRMNBHH: <RSCFDn_base> + $00A7_H$

Value after reset: $0000\ 0000_H$

Table 17.119 RSCFDnCFDRMNB Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
9, 8	RMPLS[1:0]	Receive Buffer Payload Storage Size Select b9 b8 0 0: 8 bytes 0 1: 12 bytes 1 0: 16 bytes 1 1: 20 bytes
7 to 0	NRXMB[7:0]	Receive Buffer Number Configuration Set the number of receive buffers. Set a value of 0 to 48.

Modify the RSCFDnCFDRMNB register only in global reset mode.

RMPLS[1:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive buffer.

NRXMB[7:0] Bits

These bits are used to set the total number of receive buffers of the RS-CANFD module. The maximum value is 16 × (number of channels).

Setting all of these bits to 0 makes receive buffers unavailable.

17.4.6.2 RSCFDnCFDRMNDy — Receive Buffer New Data Register y (y = 0, 1)

Access: RSCFDnCFDRMNDy register can be read/written in 32-bit units
RSCFDnCFDRMNDyL, RSCFDnCFDRMNDyH registers can be read/written in 16-bit units
RSCFDnCFDRMNDyLL, RSCFDnCFDRMNDyLH, RSCFDnCFDRMNDyHL, RSCFDnCFDRMNDyHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRMNDy: <RSCFDn_base> + $00A8_H$ + (04_H × y)

RSCFDnCFDRMNDyL: <RSCFDn_base> + $00A8_H$ + (04_H × y),
RSCFDnCFDRMNDyH: <RSCFDn_base> + $00AA_H$ + (04_H × y)

Table 17.120 RSCFDnCFDRMNDy Register Contents

Bit Position	Bit Name	Function
31 to 16	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 31 to y × 32 + 16) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.
15 to 0	RMNSq	Receive Buffer Receive Complete Flag q (q = y × 32 + 15 to y × 32 + 0) 0: There is no new message in receive buffer q. 1: There is a new message in receive buffer q.

Write 0 to the RSCFDnCFDRMNDy register in global operating mode or global test mode.

RMNSq Flags (q = 0 to 47)

Each RMNSq flag is set to 1 when the processing for storing a message in the corresponding receive buffer starts.

To clear a flag to 0, the program must write 0 to the flag. Use a store instruction to write "0" to the flag and "1" to other flags. These bits cannot be set to 0 while a message is being stored. The message storing time depends on the storage payload size of the receive buffer. When the RMPLS[1:0] value in the RSCFDnCFDRMNB register is 00_B (8 bytes), the message storing time is 12 pclk clock cycles. When the RMPLS[1:0] value is 11_B (20 bytes), the message storing time is 18 pclk clock cycles. (2 pclk clock cycles per 4 bytes of storage payload size).

These flags are cleared to 0 in global reset mode.

17.4.6.3 RSCFDnCFDRMIDq — Receive Buffer ID Register q (q = 0 to 47)

Access: RSCFDnCFDRMIDq register can be read only in 32-bit units
RSCFDnCFDRMIDqL, RSCFDnCFDRMIDqH registers can be read only in 16-bit units
RSCFDnCFDRMIDqLL, RSCFDnCFDRMIDqLH, RSCFDnCFDRMIDqHL, RSCFDnCFDRMIDqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMIDq: <RSCFDn_base> + 2000_H + (20_H × q)

RSCFDnCFDRMIDqL: <RSCFDn_base> + 2000_H + (20_H × q),
RSCFDnCFDRMIDqH: <RSCFDn_base> + 2002_H + (20_H × q)

RSCFDnCFDRMIDqLL: <RSCFDn_base> + 2000_H + (20_H × q),

Table 17.121 RSCFDnCFDRMIDq Register Contents

Bit Position	Bit Name	Function
31	RMIDE	Receive Buffer IDE 0: Standard ID 1: Extended ID
30	RMRTR	Receive Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	These bits are read as the value after reset.
28 to 0	RMID[28:0]	Receive Buffer ID Data These bits contain the standard ID or extended ID of the received message. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RMIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive buffer.

RMRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RMID[28:0] Bits

These bits contain the ID of the message stored in the receive buffer.

17.4.6.4 RSCFDnCFDRMPTRq — Receive Buffer Pointer Register q (q = 0 to 47)

Access: RSCFDnCFDRMPTRq register can be read only in 32-bit units
RSCFDnCFDRMPTRqL, RSCFDnCFDRMPTRqH registers can be read only in 16-bit units
RSCFDnCFDRMPTRqLL, RSCFDnCFDRMPTRqLH, RSCFDnCFDRMPTRqHL, RSCFDnCFDRMPTRqHH registers can be read only in 8-bit units

0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

Bit Position	Bit Name	Function
27 to 16	RMPTR[11:0]	Receive Buffer Label Data Label information of the received message.
15 to 0	RMTS[15:0]	Receive Buffer Timestamp Data Timestamp value of the received message.

RMDLC[3:0] Bits

These bits indicate the data length of the message stored in the receive buffer. The number of bytes of the payload to be stored in the receive buffer is determined by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register.

RMPTR[11:0] Bits

These bits indicate the label information of the message stored in the receive buffer.

RMTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the receive buffer.

17.4.6.5 RSCFDnCFDRMFDSTSq — Receive Buffer CAN FD Status Register q (q = 0 to 47)

Access: RSCFDnCFDRMFDSTSq register can be read only in 32-bit units
RSCFDnCFDRMFDSTSqL, RSCFDnCFDRMFDSTSqH registers can be read only in 16-bit units
RSCFDnCFDRMFDSTSqLL, RSCFDnCFDRMFDSTSqLH, RSCFDnCFDRMFDSTSqHL,
RSCFDnCFDRMFDSTSqHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMFDSTSq: <RSCFDn_base> + 2008_H + (20_H × q)

RSCFDnCFDRMFDSTSqL: <RSCFDn_base> + 2008_H + (20_H × q),
RSCFDnCFDRMFDSTSqH: <RSCFDn_base> + $200A_H$ + (20_H × q)

RSCFDnCFDRMFDSTSqLL: <RSCFDn_base> + 2008_H + (20_H × q),
RSCFDnCFDRMFDSTSqLH: <RSCFDn_base> + 2009_H + (20_H × q),
RSCFDnCFDRMFDSTSqHL: <RSCFDn_base> + $200A_H$ + (20_H × q),
RSCFDnCFDRMFDSTSqHH: <RSCFDn_base> + $200B_H$ + (20_H × q)

Initial value: 0000 0000_H

1	RMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	RMESI	ESI 0: Error active node 1: Error passive node

RMFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive buffer.

RMBRS Bit

When the RMFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

RMESI Bit

When the RMFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive buffer. When the RMFDF bit is set to 0, this bit is always read as 0.

17.4.6.6 RSCFDnCFDRMDFb_q — Receive Buffer Data Field b Register q (b = 0 to 4, q = 0 to 47)

Access: RSCFDnCFDRMDFb_q register can be read only in 32-bit units
RSCFDnCFDRMDFb_qL, RSCFDnCFDRMDFb_qH registers can be read only in 16-bit units
RSCFDnCFDRMDFb_qLL, RSCFDnCFDRMDFb_qLH, RSCFDnCFDRMDFb_qHL, RSCFDnCFDRMDFb_qHH registers can be read only in 8-bit units

Address: RSCFDnCFDRMDFb_q: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q)

RSCFDnCFDRMDFb_qL: <RSCFDn_base> + $200C_H$ + (04_H × b) + (20_H × q),
RSCFDnCFDRMDFb_qH: <RSCFDn_base> + $200E_H$ + (04_H × b) + (20_H × q)

Table 17.124 RSCFDnCFDRMDFb_q Register Contents

Bit Position	Bit Name	Function
31 to 24	RMDB4 × b + 3 [7:0]	Receive Buffer Data Byte 4 × b + 3 Receive Buffer Data Byte 4 × b + 2 Receive Buffer Data Byte 4 × b + 1 Receive Buffer Data Byte 4 × b + 0 Data for a message stored in the receive buffer can be read.
23 to 16	RMDB4 × b + 2 [7:0]	
15 to 8	RMDB4 × b + 1 [7:0]	
7 to 0	RMDB4 × b + 0 [7:0]	

When the RMDLC[3:0] value in the RSCFDnCFDRMPTRq register is smaller than the payload storage size of the receive buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the receive buffer by the RMPLS[1:0] bits in the RSCFDnCFDRMNB register. Do not read or write the RSCFDnCFDRMDFb_q register corresponding to an area that exceeds the specified size.

17.4.7 Details of Receive FIFO Buffer-related Registers

17.4.7.1 RSCFDnCFDRFCCx — Receive FIFO Buffer Configuration and Control Register x (x = 0 to 7)

Access: RSCFDnCFDRFCCx register can be read/written in 32-bit units
RSCFDnCFDRFCCxL, RSCFDnCFDRFCCxH registers can be read/written in 16-bit units
RSCFDnCFDRFCCxLL, RSCFDnCFDRFCCxLH, RSCFDnCFDRFCCxHL, RSCFDnCFDRFCCxHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFCCx: <RSCFDn_base> + $00B8_H$ + (04_H × x)

RSCFDnCFDRFCCxL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCFDnCFDRFCCxH: <RSCFDn_base> + $00BA_H$ + (04_H × x)

RSCFDnCFDRFCCxLL: <RSCFDn_base> + $00B8_H$ + (04_H × x),
RSCFDnCFDRFCCxLH: <RSCFDn_base> + $00B9_H$ + (04_H × x),
RSCFDnCFDRFCCxHL: <RSCFDn_base> + $00BA_H$ + (04_H × x),

Table 17.125 RSCFDnCFDRFCCx Register Contents (2/2)

Bit Position	Bit Name	Function
7	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
6 to 4	RFPLS[2:0]	Receive FIFO Buffer Payload Storage Size Select b6 b5 b4 0 0 0: 8 bytes 0 0 1: 12 bytes 0 1 0: 16 bytes 0 1 1: 20 bytes 1 0 0: 24 bytes 1 0 1: 32 bytes 1 1 0: 48 bytes 1 1 1: 64 bytes
3, 2	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
1	RFIE	Receive FIFO Interrupt Enable 0: Receive FIFO interrupt is disabled. 1: Receive FIFO interrupt is enabled.
0	RFE	Receive FIFO Buffer Enable 0: No receive FIFO buffer is used. 1: Receive FIFO buffers are used.

RFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a receive FIFO interrupt request when the RFIM bit is set to 0 with a fraction for the total number of buffers (the setting of RFDC[2:0]).

When the RFDC[2:0] bits are set to 001_B (4 messages), set the RFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B. Modify these bits only in global reset mode.

RFIM Bit

This bit is used to select a FIFO interrupt source. Modify this bit only in global reset mode.

RFDC[2:0] Bits

These bits are used to select the number of messages that can be stored in a single receive FIFO buffer. When these bits are set to 000_B, no receive FIFO buffer should be used. Modify these bits only in global reset mode.

RFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the receive FIFO buffer. Modify these bits only in global reset mode.

RFIE Bit

Setting the RFIE bit to 1 enables receive FIFO interrupts. Modify this bit when the RFE bit is set to 0 (no receive FIFO buffer is used).

RFE Bit

Setting the RFE bit to 1 enables the use of FIFO buffers. Clearing this bit to 0 sets the RFEMP flag in the RSCFDnCFDRFSTSx register to 1 (buffer empty). Modify this bit in global operating mode or global test mode. Set this bit to 1 with another instruction after the settings to all bits in the RSCFDnCFDRFCCx register have been done. This bit is cleared to 0 in global reset mode.

17.4.7.2 RSCFDnCFDRFSTSx — Receive FIFO Buffer Status Register x (x = 0 to 7)

Access: RSCFDnCFDRFSTSx register can be read/written in 32-bit units
RSCFDnCFDRFSTSxL, RSCFDnCFDRFSTSxH registers can be read/written in 16-bit units
RSCFDnCFDRFSTSxLL, RSCFDnCFDRFSTSxLH, RSCFDnCFDRFSTSxHL, RSCFDnCFDRFSTSxHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRFSTSx: <RSCFDn_base> + $00D8_H$ + (04_H × x)

RSCFDnCFDRFSTSxL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCFDnCFDRFSTSxH: <RSCFDn_base> + $00DA_H$ + (04_H × x)

RSCFDnCFDRFSTSxLL: <RSCFDn_base> + $00D8_H$ + (04_H × x),
RSCFDnCFDRFSTSxLH: <RSCFDn_base> + $00D9_H$ + (04_H × x),
RSCFDnCFDRFSTSxHL: <RSCFDn_base> + $00DA_H$ + (04_H × x),
RSCFDnCFDRFSTSxHH: <RSCFDn_base> + $00DB_H$ + (04_H × x)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMC[7:0]								—	—	—	—	RFIF	RFMLT	RFFLL	RFEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.126 RSCFDnCFDRFSTSx Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
15 to 8	RFMC[7:0]	Receive FIFO Unread Message Counter The number of unread messages stored in the receive FIFO buffer is displayed.
7 to 4	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
3	RFIF	Receive FIFO Interrupt Request Flag 0: No receive FIFO interrupt request is present. 1: A receive FIFO interrupt request is present.
2	RFMLT	Receive FIFO Message Lost Flag 0: No receive FIFO message is lost. 1: A receive FIFO message is lost.
1	RFFLL	Receive FIFO Buffer Full Status Flag 0: The receive FIFO buffer is not full. 1: The receive FIFO buffer is full.
0	RFEMP	Receive FIFO Buffer Empty Status Flag 0: The receive FIFO buffer contains unread message. 1: The receive FIFO buffer contains no unread message (buffer empty).

RFMC[7:0] Flag

This flag indicates the number of unread messages in the receive FIFO buffer. This flag becomes 00_H when the RFE bit in the RSCFDnCFDRFCCx register is set to 0.

This flag is 00_H in global reset mode.

RFIF Flag

This flag is set to 1 when the receive FIFO interrupt request generation conditions set by the RFIGCV[2:0] bits and the RFIM bit in the RSCFDnCFDRFCCx register are met. This flag is cleared to 0 in global reset mode or by writing 0 to this flag. Modify this bit in global operating mode or global test mode.
To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFMLT Flag

This flag is set to 1 when an attempt is made to store a new message while the receive FIFO buffer is full. In this case, the new message is discarded.

This flag is cleared to 0 in global reset mode or by writing 0 to this flag.

Modify this bit in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flags to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

RFFLL Flag

This flag is set to 1 when the number of messages stored in the receive FIFO buffer matches the FIFO buffer depth set by the RFDC[2:0] bits in the RSCFDnCFDRFCCx register.

If the number of messages stored in the receive FIFO buffer becomes smaller than the FIFO buffer depth set by the RFDC[2:0] bits, this flag is cleared to 0. This flag is also cleared to 0 when the RFE bit in the RSCFDnCFDRFCCx register is set to 0 (no receive FIFO buffer is used) or in global reset mode.

RFEMP Flag

This flag is set to 1 when all messages in the receive FIFO buffer have been read. This flag is also set to 1 when the RFE bit in the RSCFDnCFDRFCCx register is 0 or in global reset mode.

This flag is cleared to 0 when a received message is in the receive FIFO buffer.

NOTE

To clear the RFMLT or RFIF flag to 0, use a store instruction to write “0” to the given flag and “1” to the other flags.

17.4.7.3 RSCFDnCFDRFPCTRx — Receive FIFO Buffer Pointer Control Register x (x = 0 to 7)

Access: RSCFDnCFDRFPCTRx register can only be written in 32-bit units
RSCFDnCFDRFPCTRxL, RSCFDnCFDRFPCTRxH registers can only be written in 16-bit units
RSCFDnCFDRFPCTRxLL, RSCFDnCFDRFPCTRxLH, RSCFDnCFDRFPCTRxHL, RSCFDnCFDRFPCTRxHH registers can only be written in 8-bit units

Address: RSCFDnCFDRFPCTRx: <RSCFDn_base> + 00F8$_H$ + (04$_H$ × x)

RSCFDnCFDRFPCTRxL: <RSCFDn_base> + 00F8$_H$ + (04$_H$ × x),
RSCFDnCFDRFPCTRxH: <RSCFDn_base> + 00FA$_H$ + (04$_H$ × x)

RSCFDnCFDRFPCTRxLL: <RSCFDn_base> + 00F8$_H$ + (04$_H$ × x),
RSCFDnCFDRFPCTRxLH: <RSCFDn_base> + 00F9$_H$ + (04$_H$ × x),
RSCFDnCFDRFPCTRxHL: <RSCFDn_base> + 00FA$_H$ + (04$_H$ × x),
RSCFDnCFDRFPCTRxHH: <RSCFDn_base> + 00FB$_H$ + (04$_H$ × x)

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	RFPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 17.127 RSCFDnCFDRFPCTRx Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	RFPC[7:0]	Receive FIFO Pointer Control When these bits are set to FF$_H$, the read pointer moves to the next unread message in the receive FIFO buffer.

When the RFDMAEx value in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

RFPC[7:0] Bits

When the RFPC[7:0] bits are set to FF$_H$, the read pointer moves to the next unread message in the receive FIFO buffer. At this time, the RFMC[7:0] (receive FIFO unread message counter) value in the RSCFDnCFDRFSTSx register is decremented by 1. Read the RSCFDnCFDRFIDx, RSCFDnCFDRFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDnCFDRFDFd_x registers to read messages in the receive FIFO buffer, and then write FF$_H$ to the RFPC[7:0] bits.

When writing FF$_H$ to these bits, make sure that the RFE bit in the RSCFDnCFDRFCCx register is set to 1 (receive FIFO buffers are used) and the RFEMP flag in the RSCFDnCFDRFSTSx register is 0 (the receive FIFO buffer contains unread messages).

17.4.7.4 RSCFDnCFDRFIDx — Receive FIFO Buffer Access ID Register x (x = 0 to 7)

Access: RSCFDnCFDRFIDx register can be read only in 32-bit units
RSCFDnCFDRFIDxL, RSCFDnCFDRFIDxH registers can be read only in 16-bit units
RSCFDnCFDRFIDxLL, RSCFDnCFDRFIDxLH, RSCFDnCFDRFIDxHL, RSCFDnCFDRFIDxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFIDx: <RSCFDn_base> + 3000_H + (80_H × x)

RSCFDnCFDRFIDxL: <RSCFDn_base> + 3000_H + (80_H × x),
RSCFDnCFDRFIDxH: <RSCFDn_base> + 3002_H + (80_H × x)

Table 17.128 RSCFDnCFDRFIDx Register Contents

Bit Position	Bit Name	Function
31	RFIDE	Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	RFRTR	Receive FIFO Buffer RTR/RRS • When the received message is a classical CAN frame 0: Data frame 1: Remote frame • When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	Reserved	These bits are read as the value after reset.
28 to 0	RFID[28:0]	Receive FIFO Buffer ID Data The standard ID or extended ID of received message can be read. Read bits b10 to b0 for standard ID. Bits b28 to b11 are read as 0.

RFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the message stored in the receive FIFO buffer.

RFRTR Bit

When the received message is a classical CAN frame, this bit indicates the frame format (data frame or remote frame) of the message stored in the receive FIFO buffer. When the received message is a CAN FD frame, this bit indicates the RRS bit value in the message.

RFID[28:0] Bits

These bits indicate the ID of the message stored in the receive FIFO buffer.

17.4.7.5 RSCFDnCFDRFPTRx — Receive FIFO Buffer Access Pointer Register x (x = 0 to 7)

Access: RSCFDnCFDRFPTRx register can be read only in 32-bit units
RSCFDnCFDRFPTRxL, RSCFDnCFDRFPTRxH registers can be read only in 16-bit units
RSCFDnCFDRFPTRxLL, RSCFDnCFDRFPTRxLH, RSCFDnCFDRFPTRxHL, RSCFDnCFDRFPTRxHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFPTRx: <RSCFDn_base> + 3004_H + (80_H × x)

RSCFDnCFDRFPTRxL: <RSCFDn_base> + 3004_H + (80_H × x),
RSCFDnCFDRFPTRxH: <RSCFDn_base> + 3006_H + (80_H × x)

RSCFDnCFDRFPTRxLL: <RSCFDn_base> + 3004_H + (80_H × x),
RSCFDnCFDRFPTRxLH: <RSCFDn_base> + 3005_H + (80_H × x),
RSCFDnCFDRFPTRxHL: <RSCFDn_base> + 3006_H + (80_H × x),
RSCFDnCFDRFPTRxHH: <RSCFDn_base> + 3007_H + (80_H × x)

Value after reset: $0000\ 0000_H$

RFFDF Bit

This bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the receive FIFO buffer.

RFBRS Bit

When the RFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0, this bit is always read as 0.

RFESI Bit

When the RFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the receive FIFO buffer. When the RFFDF bit is set to 0, this bit is always read as 0.

17.4.7.7 RSCFDnCFDRFDFd_x — Receive FIFO Buffer Access Data Field d Register x (d = 0 to 15, x = 0 to 7)

Access: RSCFDnCFDRFDFd_x register can be read only in 32-bit units
RSCFDnCFDRFDFdx_L, RSCFDnCFDRFDFdx_H registers can be read only in 16-bit units
RSCFDnCFDRFDFdx_LL, RSCFDnCFDRFDFd_xLH, RSCFDnCFDRFDFd_xHL, RSCFDnCFDRFDFd_xHH registers can be read only in 8-bit units

3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFTXIE	Transmit/Receive FIFO Transmit Interrupt Enable 0: Transmit/receive FIFO transmit interrupt is disabled. 1: Transmit/receive FIFO transmit interrupt is enabled.
1	CFRXIE	Transmit/Receive FIFO Receive Interrupt Enable 0: Transmit/receive FIFO receive interrupt is disabled. 1: Transmit/receive FIFO receive interrupt is enabled.
0	CFE	Transmit/Receive FIFO Buffer Enable 0: No transmit/receive FIFO buffer is used. 1: Transmit/receive FIFO buffers are used.

CFITT[7:0] Bits

These bits are used to set a message transmission interval when transmitting messages continuously from a transmit/receive FIFO buffer whose CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode).

Clear the CFE bit to 0 (no transmit/receive FIFO buffer is used) before modifying the CFITT[7:0] bits.

CFTML[3:0] Bits

These bits are used to set the number of transmit buffer on the channel which will be linked to transmit/receive FIFO buffer k when the CFM[1:0] bits are set to 01_B (transmit mode) or 10_B (gateway mode). There are three transmit/receive FIFO buffers per channel, so channel number m of FIFO buffer k is calculated as m = k/3 (integer division). The actual assigned transmit buffer number p linked to FIFO buffer k will be ((16 × m) + CFTML[3:0]) (see **Table 17.92**).

See **Table 17.90** and **Table 17.91**, as for the relationship between transmit/receive FIFO buffer k and transmit buffer p.

Setting the CFDC[2:0] bits to 001_B or more enables the setting of the CFTML[3:0] bits.

Do not link to any transmit buffer which is already allocated to a transmit queue on the same channel or to another transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFITR Bit

This bit is enabled when the CFITSS bit is 0.

When this bit is 0, the interval timer clock source is the pclk/2 clock divided by the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register.

When this bit is 1, the interval timer clock source is the pclk/2 clock divided by (the value of the ITRCP[15:0] bits in the RSCFDnCFDGCFG register × 10).

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFITSS Bit

When this bit is 0, the clock selected by the CFITR bit is the count source of the interval timer.

When this bit is 1, the nominal bit time clock of the channel to which the FIFO is linked is the count source of the interval timer. Use this count source only for the channel does not handle the CAN FD frames.

Modify this bit while the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

CFM[1:0] Bits

These bits are used to select transmit/receive FIFO mode. Modify these bits only in global reset mode.

CFIGCV[2:0] Bits

These bits are used to specify the number of received messages required to generate a transmit/receive FIFO receive interrupt request when the CFM[1:0] bits are set to 00_B (receive mode) or 10_B (gateway mode) and the CFIM bit is set to 0 with a fraction for the total number of buffers (the setting of CFDC[2:0]).

When the CFDC[2:0] bits are set to 001_B (4 messages), set the CFIGCV[2:0] bits to 001_B, 011_B, 101_B, or 111_B.

Modify these bits only in global reset mode.

CFIM Bit

This bit is used to select a transmit/receive FIFO interrupt source. Modify this bit only in global reset mode.

CFDC[2:0] Bits

These bits are used to set the number of messages that can be stored in a single transmit/receive FIFO buffer. When these bits are set to 000_B, do not use a transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFPLS[2:0] Bits

These bits are used to select the maximum payload size that can be stored in the transmit/receive FIFO buffer. Modify these bits only in global reset mode.

CFTXIE Bit

When this bit is set to 1 and the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO transmit interrupt request is generated.

Modify this bit with the CFE bit set to 0 (no transmit/receive FIFO buffer is used).

CFRXIE Bit

When this bit is set to 1 and the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1, a transmit/receive FIFO receive interrupt request is generated.

Modify this bit with the CFE bit set to 0.

CFE Bit

Setting this bit to 1 enables the transmit/receive FIFO buffers.

When this bit is set to 0 in transmit mode or gateway mode, if a message in the transmit/receive FIFO buffer is being transmitted or will be transmitted next, the transmit/receive FIFO buffer becomes empty after completion of transmission of that message, or upon detection of a CAN bus error, or arbitration-lost. In other cases or in receive mode, the transmit/receive FIFO buffer becomes empty immediately.

This bit is cleared to 0 when the following conditions are met.

- Receive mode: Global reset mode
- Transmit mode or gateway mode: Channel reset mode

Modify this bit in the following mode.

- Receive mode: Global operating mode or global test mode
- Transmit mode or gateway mode: Channel communication mode or channel halt mode

After all other bits in the RSCFDnCFDCFCCk register have been set, set this bit to 1 by using another instruction.

17.4.8.2 RSCFDnCFDCFSTSk — Transmit/receive FIFO Buffer Status Register k (k = 0 to 8)

Access: RSCFDnCFDCFSTSk register can be read/written in 32-bit units
RSCFDnCFDCFSTSkL, RSCFDnCFDCFSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFSTSkLL, RSCFDnCFDCFSTSkLH, RSCFDnCFDCFSTSkHL, RSCFDnCFDCFSTSkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFSTSk: <RSCFDn_base> + 0178_H + (04_H × k)

RSCFDnCFDCFSTSkL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkH: <RSCFDn_base> + $017A_H$ + (04_H × k)

RSCFDnCFDCFSTSkLL: <RSCFDn_base> + 0178_H + (04_H × k),
RSCFDnCFDCFSTSkLH: <RSCFDn_base> + 0179_H + (04_H × k),
RSCFDnCFDCFSTSkHL: <RSCFDn_base> + $017A_H$ + (04_H × k),
RSCFDnCFDCFSTSkHH: <RSCFDn_base> + $017B_H$ + (04_H × k)

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.133 RSCFDnCFDCFSTSk Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
15 to 8	CFMC[7:0]	Transmit/Receive FIFO Message Counter The number of messages stored in the transmit/receive FIFO buffer.
7 to 5	Reserved	These bits are read as the value after reset. When writing, write the value after reset.
4	CFTXIF	Transmit/Receive FIFO Transmit Interrupt Request Flag 0: No transmit/receive FIFO transmit interrupt request is present. 1: A transmit/receive FIFO transmit interrupt request is present.
3	CFRXIF	Transmit/Receive FIFO Receive Interrupt Request Flag 0: No transmit/receive FIFO receive interrupt request is present. 1: A transmit/receive FIFO receive interrupt request is present.
2	CFMLT	Transmit/Receive FIFO Message Lost Flag 0: No transmit/receive FIFO message is lost. 1: A transmit/receive FIFO message is lost.
1	CFFLL	Transmit/Receive FIFO Buffer Full Status Flag 0: The transmit/receive FIFO buffer is not full. 1: The transmit/receive FIFO buffer is full.
0	CFEMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: The transmit/receive FIFO buffer contains messages. 1: The transmit/receive FIFO buffer contains no message (buffer empty).

CFMC[7:0] Bits

The CFMC[7:0] bits indicate the following values according to the setting of the CFM[1:0] bits in the RSCFDnCFDCFCCk register.

- When CFM[1:0] value is 01_B (transmit mode): Number of untransmitted messages in the buffer
- When CFM[1:0] value is 00_B (receive mode): Number of unread received messages in the buffer
- When CFM[1:0] value is 10_B (gateway mode): Number of untransmitted received messages in the buffer

These bits are cleared to 0 when any of the following conditions is met.

- When CFM[1:0] value is 00_B: In global reset mode
- When CFM[1:0] value is 01_B or 10_B: In channel reset mode
- When the CFE bit in the RSCFDnCFDCFCCk register is cleared to 0.

CFTXIF Flag

The CFTXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 01_B or 10_B, and the interrupt source selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFTXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFTXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFRXIF Flag

The CFRXIF flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B, and the factor selected by the CFIM bit in the RSCFDnCFDCFCCk register occurs

The CFRXIF flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFRXIF flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

CFMLT Flag

The CFMLT flag is set to 1 when any of the following conditions is met.

- When an attempt is made to store a new message while the transmit/receive FIFO buffer is full. In this case, the new message is discarded.

The CFMLT flag is cleared to 0 when any of the following conditions is met.

- When 0 is written to the CFMLT flag
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

Write 0 to this flag in global operating mode or global test mode

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared. When writing 0, using store instruction, set the bit to be set to "0" to "0", and the bits not to be set to "0" to "1".

CFFLL Flag

The CFFLL flag is set to 1 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer matches the FIFO buffer depth set by the CFDC[2:0] bits in the RSCFDnCFDCFCCk register.

The CFFLL flag is cleared to 0 when any of the following conditions is met.

- When the number of messages stored in the transmit/receive FIFO buffer becomes smaller than the FIFO buffer depth set by the CFDC[2:0] bits.
- When the CFE bit in the RSCFDnCFDCFCCk register is 0 (no transmit/receive FIFO buffer is used): When not in the transmit abort
- When the CFM[1:0] bits are set to 00_B: In global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: In channel reset mode

CFEMP Flag

The CFEMP flag is set to 1 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B: All messages have been read, or in global reset mode
- When the CFM[1:0] bits are set to 01_B or 10_B: All messages have been transmitted, or in channel reset mode
- When the CFE bit is 0 (no transmit/receive FIFO buffer is used): Not in the transmit abort

The CFEMP flag is cleared to 0 when any of the following conditions is met.

- When the CFM[1:0] bits are set to 00_B or 10_B: At least one received message has been stored in the transmit/receive FIFO buffer.
- When the CFM[1:0] bits are set to 01_B: A value of FF_H has been written to the RSCFDnCFDCFPCTRk register after data was written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers.

NOTE

To clear CFTXIF, CFRXIF, or CFMLT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

17.4.8.3 RSCFDnCFDCFPCTRk — Transmit/receive FIFO Buffer Pointer Control Register k (k = 0 to 8)

Access: RSCFDnCFDCFPCTRk register can only be written in 32-bit units
RSCFDnCFDCFPCTRkL, RSCFDnCFDCFPCTRkH registers can only be written in 16-bit units
RSCFDnCFDCFPCTRkLL, RSCFDnCFDCFPCTRkLH, RSCFDnCFDCFPCTRkHL, RSCFDnCFDCFPCTRkHH registers can only be written in 8-bit units

Address: RSCFDnCFDCFPCTRk: <RSCFDn_base> + $01D8_H$ + (04_H × k)

RSCFDnCFDCFPCTRkL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCFDnCFDCFPCTRkH: <RSCFDn_base> + $01DA_H$ + (04_H × k)

RSCFDnCFDCFPCTRkLL: <RSCFDn_base> + $01D8_H$ + (04_H × k),
RSCFDnCFDCFPCTRkLH: <RSCFDn_base> + $01D9_H$ + (04_H × k),
RSCFDnCFDCFPCTRkHL: <RSCFDn_base> + $01DA_H$ + (04_H × k),
RSCFDnCFDCFPCTRkHH: <RSCFDn_base> + $01DB_H$ + (04_H × k)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CFPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 17.134 RSCFDnCFDCFPCTRk Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	CFPC[7:0]	Transmit/Receive FIFO Pointer Control • Receive mode: Writing FF_H to these bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. • Transmit mode: Writing FF_H to these bits moves the write pointer to the next stage of the transmit/receive FIFO buffer. • Gateway mode: Setting prohibited

When the corresponding transmit/receive FIFO buffer is the first transmit/receive FIFO buffer (k = 3 × m) allocated to channel m and when the CFDMAEm bit in the RSCFDnCFDCDTCT register is 1 (DMA transfer request enabled), do not write a value to this register.

CFPC[7:0] Bits

- Receive mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 00_B):
  Writing FF_H to the CFPC[7:0] bits moves the read pointer to the next unread message in the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value (transmit/receive FIFO message counter) in the RSCFDnCFDCFSTSk register is decremented by 1. Read the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers to read messages from the transmit/receive FIFO buffer, and then write FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 (transmit/receive FIFO buffers are used) and the CFEMP flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer contains messages).
- Transmit mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B):
  Writing FF_H to the CFPC[7:0] bits stores the data written to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers in the transmit/receive FIFO buffer and moves the write pointer to the next stage of the transmit/receive FIFO buffer. At this time, the CFMC[7:0] value is incremented by 1. Write transmit messages to the RSCFDnCFDCFIDk, RSCFDnCFDCFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDnCFDCFDFd_k registers before writing FF_H to the CFPC[7:0] bits.
  When writing FF_H to these bits, make sure that the CFE bit in the RSCFDnCFDCFCCk register is set to 1 and the CFFLL flag in the RSCFDnCFDCFSTSk register is 0 (the transmit/receive FIFO buffer is not full).
- Gateway mode (CFM[1:0] value in the RSCFDnCFDCFCCk register is 10_B):
  Setting prohibited

17.4.8.4 RSCFDnCFDCFIDk — Transmit/receive FIFO Buffer Access ID Register k (k = 0 to 8)

Table 17.135 RSCFDnCFDCFIDk Register Contents

Bit Position	Bit Name	Function
31	CFIDE	Transmit/Receive FIFO Buffer IDE 0: Standard ID 1: Extended ID
30	CFRTR	Transmit/Receive FIFO Buffer RTR/RRS • When the CFM[1:0] value is 01_B (transmit mode) – When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame – When the transmit message is a CAN FD frame Write 0 to this bit. • When the CFM[1:0] value is 00_B (receive mode) – When the received message is a classical CAN frame 0: Data frame 1: Remote frame – When the received message is a CAN FD frame The RRS bit value of the received message can be read.
29	THLEN	Transmit History Data Store Enable This bit is valid only when the CFM[1:0] value is 01_B (transmit mode). 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	CFID[28:0]	Transmit/Receive FIFO Buffer ID Data • When CFM[1:0] value is 01_B (transmit mode): Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11. • When CFM[1:0] value is 00_B (receive mode): Standard ID or extended ID in the received message can be read. For standard ID, read bits 10 to 0. Bits 28 to 11 are read as 0.

This register can be written only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). This RSCFDnCFDCFIDk register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFIDE Bit

This bit indicates the ID format (standard ID or extended ID) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, this bit is used to set the ID format of the message to be transmitted from the transmit/receive FIFO buffer.

CFRTR Bit

If the the received message is a classical CAN frame, this bit indicates the data format (data frame or remote frame) of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. If the received message is a CAN FD frame, this bit indicates the RRS bit value of the received message.

When the CFM[1:0] value is 01_B, this bit is used to set the data format of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 1 (CAN FD frame), set this bit to 0.

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

This bit is enabled when the CFM[1:0] value is 01_B (transmit mode).

CFID[28:0] Bits

These bits contain the ID of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the ID of the message to be transmitted from the transmit/receive FIFO buffer.

17.4.8.5 RSCFDnCFDCFPTRk — Transmit/receive FIFO Buffer Access Pointer Register k (k = 0 to 8)

Access: RSCFDnCFDCFPTRk register can be read/written in 32-bit units
RSCFDnCFDCFPTRkL, RSCFDnCFDCFPTRkH registers can be read/written in 16-bit units
RSCFDnCFDCFPTRkLL, RSCFDnCFDCFPTRkLH, RSCFDnCFDCFPTRkHL, RSCFDnCFDCFPTRkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFPTRk: <RSCFDn_base> + 3404$_H$ + (80$_H$ × k)

RSCFDnCFDCFPTRkL: <RSCFDn_base> + 3404$_H$ + (80$_H$ × k),

</table>

Table 17.136 RSCFDnCFDCFPTRk Register Contents (2/2)

Bit Position	Bit Name	Function
15 to 0	CFTS[15:0]	Transmit/Receive FIFO Buffer Timestamp Data These bits are valid only when the CFM[1:0] value is 00_B (receive mode). The timestamp value of the received message can be read.

This register can be written only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

CFDLC[3:0] Bits

These bits indicate the data length of the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B.

When the CFM[1:0] value is 01_B, these bits are used to set the data length of the message to be transmitted from the transmit/receive FIFO buffer.

When the CFDLC[3:0] bits are set to 1001_B or more while the CFFDF bit in the RSCFDnCFDCFFDCSTSk register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the CFFDF bit is 1 (CAN FD frame), the settable value range varies depending on the settings of the TMME bit in the RSCFDnCFDCmFDCFG register and the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

- When TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B is settable. If the specified data length exceeds the payload storage size specified by the CFPLS[2:0] bits, excessive payloads are padded by CCH.
- When TMME bit = 1 (transmit buffer merge mode enabled):
  Set the data length within the payload storage size specified by the CFPLS[2:0] bits.

CFPTR[11:0] Bits

These bits indicate the label information attached to the received message stored in the transmit/receive FIFO buffer when the CFM[1:0] value is 00_B. When the CFM[1:0] value is 01_B, the CFPTR[7:0] value is stored in the transmit history buffer when message transmission has been completed.

CFTS[15:0] Bits

These bits indicate the timestamp value of the message stored in the transmit/receive FIFO buffer.

These bits are valid when the CFM[1:0] value is 00_B.

17.4.8.6 RSCFDnCFDCFFDCSTSk — Transmit/Receive FIFO CAN FD Configuration/ Status Register k (k = 0 to 8)

Access: RSCFDnCFDCFFDCSTSk register can be read/written in 32-bit units
RSCFDnCFDCFFDCSTSkL, RSCFDnCFDCFFDCSTSkH registers can be read/written in 16-bit units
RSCFDnCFDCFFDCSTSkLL, RSCFDnCFDCFFDCSTSkLH, RSCFDnCFDCFFDCSTSkHL, RSCFDnCFDCFFDCSTSkHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCFFDCSTSk: <RSCFDn_base> + 3408_H + (80_H × k)

RSCFDnCFDCFFDCSTSkL: <RSCFDn_base> + 3408_H + (80_H × k),

Table 17.137 RSCFDnCFDCFFDCSTSk Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	CFFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	CFBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	CFBRS	ESI 0: Error active node 1: Error passive node

This register can be written only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode). This register can be read only when the CFM[1:0] value is 00_B (receive mode). Do not read or write this register when the CFM[1:0] value is 10_B (gateway mode).

CFFDF Bit

When the CFM[1:0] value is 00_B, this bit indicates the FD format (classical CAN frame or CAN FD frame) of the message stored in the transmit/receive FIFO buffer. When the CFM[1:0] value is 01_B, this bit is used to set the FD format of the message to be transmitted from the transmit/receive FIFO buffer.

CFBRS Bit

When the CFM[1:0] value is 00_B, if the CFFDF bit is set to 1, this bit indicates the BRS bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, this bit is always read as 0.

When the CFM[1:0] value is 01_B, if the CFFDF bit is set to 1, this bit is used to set the BRS bit value of the message to be transmitted from the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, write 0 to this bit.

CFESI Bit

When the CFM[1:0] value is 00B, if the CFFDF bit is set to 1, this bit indicates the ESI bit value of the message stored in the transmit/receive FIFO buffer. If the CFFDF bit is set to 0, this bit is always read as 0.

When the CFM[1:0] value is 01B, if the CFFDF bit is set to 1, this bit is used to set the ESI bit value of the message to be transmitted from the transmit/receive FIFO buffer. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the CFFDF bit is set to 0, write 0 to this bit.

17.4.8.7 RSCFDnCFDCFDFd_k — Transmit/receive FIFO Buffer Access Data Field d Register k (d = 0 to 15, k = 0 to 8)

Access: RSCFDnCFDCFDFd_k register can be read/written in 32-bit units
RSCFDnCFDCFDFd_kL, RSCFDnCFDCFDFd_kH registers can be read/written in 16-bit units
RSCFDnCFDCFDFd_kLL, RSCFDnCFDCFDFd_kLH, RSCFDnCFDCFDFd_kHL, RSCFDnCFDCFDFd_kHH registers can be read/written in 8-bit units

Table 17.138 RSCFDnCFDCFDFd_k Register Contents

Bit Position	Bit Name	Function
31 to 24	CFDB4 × d + 3 [7:0]	Transmit/Receive FIFO Buffer Data Byte 4 × d + 3 Transmit/Receive FIFO Buffer Data Byte 4 × d + 2 Transmit/Receive FIFO Buffer Data Byte 4 × d + 1 Transmit/Receive FIFO Buffer Data Byte 4 × d + 0 • When CFM[1:0] value is 01B (transmit mode): Set the transmit/receive FIFO buffer data. • When CFM[1:0] value is 00B (receive mode): The message data stored in the transmit/receive FIFO buffer can be read.
23 to 16	CFDB4 × d + 2 [7:0]	
15 to 8	CFDB4 × d + 1 [7:0]	
7 to 0	CFDB4 × d + 0 [7:0]	

This register can be written only when the CFM[1:0] value in the RSCFDnCFDCFCCk register is 01_B (transmit mode).

This register can be read only when the CFM[1:0] value is 00_B (receive mode). When the CFDLC[3:0] value in the RSCFDnCFDCFPTRk register is smaller than the payload storage size of the transmit/receive FIFO buffer, data bytes for which no data is set are read as 00_H.

Specify the payload storage size of the transmit/receive FIFO buffer by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register. Do not read or write the RSCFDnCFDCFDFd_k register corresponding to an area that exceeds the specified size.

This register should not be read or written when the CFM[1:0] value is 10_B (gateway mode).

17.4.9 Details of FIFO Status-related Registers

17.4.9.1 RSCFDnCFDFESTS — FIFO Empty Status Register

Access: RSCFDnCFDFESTS register can be read only in 32-bit units
RSCFDnCFDFESTSL, RSCFDnCFDFESTSH registers can be read only in 16-bit units
RSCFDnCFDFESTSLL, RSCFDnCFDFESTSLH, RSCFDnCFDFESTSHL, RSCFDnCFDFESTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDFESTS: <RSCFDn_base> + 0238_H

RSCFDnCFDFESTSL: <RSCFDn_base> + 0238_H, RSCFDnCFDFESTSH: <RSCFDn_base> + $023A_H$

RSCFDnCFDFESTSLL: <RSCFDn_base> + 0238_H, RSCFDnCFDFESTSLH: <RSCFDn_base> + 0239_H, RSCFDnCFDFESTSHL: <RSCFDn_base> + $023A_H$, RSCFDnCFDFESTSHH: <RSCFDn_base> + $023B_H$

Value after reset: 03FF $FFFF_H$

Table 17.139 RSCFDnCFDFESTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8EMP	Transmit/Receive FIFO Buffer Empty Status Flag 0: Transmit/receive FIFO buffer k contains a message. 1: Transmit/receive FIFO buffer k contains no message. (k = 0 to 8)
15	CF7EMP	
14	CF6EMP	
13	CF5EMP	
12	CF4EMP	
11	CF3EMP	
10	CF2EMP	
9	CF1EMP	
8	CF0EMP	
7	RF7EMP	Receive FIFO Buffer Empty Status Flag 0: Receive FIFO buffer x contains an unread message. 1: Receive FIFO buffer x contains no unread message. (x = 0 to 7)
6	RF6EMP	
5	RF5EMP	
4	RF4EMP	
3	RF3EMP	
2	RF2EMP	
1	RF1EMP	
0	RF0EMP	

The RSCFDnCFDFESTS register is set to 03FF $FFFF_H$ in global reset mode.

CFkEMP Flag (k = 0 to 8)

The CFkEMP flag is set to 1 when the CFEMP flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)). When the CFEMP flag is cleared to 0 (the transmit/receive FIFO buffer contains messages), the CFkEMP flag is cleared to 0.

RFxEMP Flag (x = 0 to 7)

The RFxEMP flag is set to 1 when the RFEMP flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer contains no unread message). When the RFEMP flag is cleared to 0 (the receive FIFO buffer contains unread messages), the RFxEMP flag is cleared to 0.

17.4.9.2 RSCFDnCFDFFSTS — FIFO Full Status Register

Access: RSCFDnCFDFFSTS register can be read only in 32-bit units
RSCFDnCFDFFSTSL, RSCFDnCFDFFSTSH registers can be read only in 16-bit units
RSCFDnCFDFFSTSLL, RSCFDnCFDFFSTSLH, RSCFDnCFDFFSTSHL, RSCFDnCFDFFSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDFFSTS: <RSCFDn_base> + $023C_H$

RSCFDnCFDFFSTSL: <RSCFDn_base> + $023C_H$, RSCFDnCFDFFSTSH: <RSCFDn_base> + $023E_H$

RSCFDnCFDFFSTSLL: <RSCFDn_base> + $023C_H$, RSCFDnCFDFFSTSLH: <RSCFDn_base> + $023D_H$, RSCFDnCFDFFSTSHL: <RSCFDn_base> + $023E_H$, RSCFDnCFDFFSTSHH: <RSCFDn_base> + $023F_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8FLL

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.140 RSCFDnCFDFFSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8FLL	Transmit/Receive FIFO Buffer Full Status Flag 0: Transmit/receive buffer k is not full. 1: Transmit/receive buffer k is full. (k = 0 to 8)
15	CF7FLL	
14	CF6FLL	
13	CF5FLL	
12	CF4FLL	
11	CF3FLL	
10	CF2FLL	
9	CF1FLL	
8	CF0FLL	
7	RF7FLL	Receive FIFO Buffer Full Status Flag 0: Receive FIFO buffer x is not full. 1: Receive FIFO buffer x is full. (x = 0 to 7)
6	RF6FLL	
5	RF5FLL	
4	RF4FLL	
3	RF3FLL	
2	RF2FLL	
1	RF1FLL	
0	RF0FLL	

The RSCFDnCFDFFSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkFLL Flag (k = 0 to 8)

The CFkFLL flag is set to 1 when the CFFLL flag in the RSCFDnCFDCFSTSk register is set to 1 (the transmit/receive FIFO buffer is full).
When the CFFLL flag is cleared to 0 (the transmit/receive FIFO buffer is not full), the CFkFLL flag is cleared to 0.

RFxFLL Flag (x = 0 to 7)

The RFxFLL flag is set to 1 when the RFFLL flag in the RSCFDnCFDRFSTSx register is set to 1 (the receive FIFO buffer is full). When the RFFLL flag is cleared to 0 (the receive FIFO buffer is not full), the RFxFLL flag is cleared to 0.

17.4.9.3 RSCFDnCFDFMSTS — FIFO Message Lost Status Register

Access: RSCFDnCFDFMSTS register can be read only in 32-bit units
RSCFDnCFDFMSTSL, RSCFDnCFDFMSTSH registers can be read only in 16-bit units
RSCFDnCFDFMSTSLL, RSCFDnCFDFMSTSLH, RSCFDnCFDFMSTSHL, RSCFDnCFDFMSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDFMSTS: <RSCFDn_base> + 0240_H

RSCFDnCFDFMSTSL: <RSCFDn_base> + 0240_H, RSCFDnCFDFMSTSH: <RSCFDn_base> + 0242_H

RSCFDnCFDFMSTSLL: <RSCFDn_base> + 0240_H, RSCFDnCFDFMSTSLH: <RSCFDn_base> + 0241_H, RSCFDnCFDFMSTSHL: <RSCFDn_base> + 0242_H, RSCFDnCFDFMSTSHH: <RSCFDn_base> + 0243_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CF8MLT

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.141 RSCFDnCFDFMSTS Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	These bits are read as the value after reset.
16	CF8MLT	Transmit/Receive FIFO Buffer Message Lost Status Flag 0: No transmit/receive FIFO buffer k message is lost. 1: A transmit/receive FIFO buffer k message is lost. (k = 0 to 8)
15	CF7MLT	
14	CF6MLT	
13	CF5MLT	
12	CF4MLT	
11	CF3MLT	
10	CF2MLT	
9	CF1MLT	
8	CF0MLT	
7	RF7MLT	Receive FIFO Buffer Message Lost Status Flag 0: No receive FIFO buffer x message is lost. 1: A receive FIFO buffer x message is lost. (x = 0 to 7)
6	RF6MLT	
5	RF5MLT	
4	RF4MLT	
3	RF3MLT	
2	RF2MLT	
1	RF1MLT	
0	RF0MLT	

The RSCFDnCFDFMSTS register is cleared to $0000\ 0000_H$ in global reset mode.

CFkMLT Flag (k = 0 to 8)

The CFkMLT flag is set to 1 when the CFMLT flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO message is lost). When the CFMLT flag is cleared to 0, the CFkMLT flag is cleared to 0.

RFxMLT Flag (x = 0 to 7)

The RFxMLT flag is set to 1 when the RFMLT flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO message is lost). When the RFMLT flag is cleared to 0, the RFxMLT flag is cleared to 0.

17.4.9.4 RSCFDnCFDRFISTS — Receive FIFO Buffer Interrupt Flag Status Register

Access: RSCFDnCFDRFISTS register can be read only in 32-bit units
RSCFDnCFDRFISTSL, RSCFDnCFDRFISTSH registers can be read only in 16-bit units
RSCFDnCFDRFISTSLL, RSCFDnCFDRFISTSLH, RSCFDnCFDRFISTSHL, RSCFDnCFDRFISTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDRFISTS: <RSCFDn_base> + 0244_H

RSCFDnCFDRFISTSL: <RSCFDn_base> + 0244_H, RSCFDnCFDRFISTSH: <RSCFDn_base> + 0246_H

RSCFDnCFDRFISTSLL: <RSCFDn_base> + 0244_H, RSCFDnCFDRFISTSLH: <RSCFDn_base> + 0245_H,
RSCFDnCFDRFISTSHL: <RSCFDn_base> + 0246_H, RSCFDnCFDRFISTSHH: <RSCFDn_base> + 0247_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 17.142 RSCFDnCFDRFISTS Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	These bits are read as the value after reset.
7	RF7IF	Receive FIFO Buffer Interrupt Request Status Flag 0: No receive FIFO buffer x interrupt request is present. 1: A receive FIFO buffer x interrupt request is present. (x = 0 to 7)
6	RF6IF	
5	RF5IF	
4	RF4IF	
3	RF3IF	
2	RF2IF	
1	RF1IF	
0	RF0IF	

The RSCFDnCFDRFISTS register is cleared to 0000 0000_H in global reset mode.

RFxIF Flag (x = 0 to 7)

The RFxIF flag is set to 1 when the RFIF flag in the RSCFDnCFDRFSTSx register is set to 1 (a receive FIFO interrupt request is present). When the RFIF flag is cleared to 0, the RFxIF flag is cleared to 0.

17.4.9.5 RSCFDnCFDCFRISTS — Transmit/receive FIFO Buffer Receive Interrupt Flag Status Register

Access: RSCFDnCFDCFRISTS register can be read only in 32-bit units
RSCFDnCFDCFRISTSL, RSCFDnCFDCFRISTSH registers can be read only in 16-bit units
RSCFDnCFDCFRISTSLL, RSCFDnCFDCFRISTSLH, RSCFDnCFDCFRISTSHL, RSCFDnCFDCFRISTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDCFRISTS: <RSCFDn_base> + 0248_H

RSCFDnCFDCFRISTSL: <RSCFDn_base> + 0248_H, RSCFDnCFDCFRISTSH: <RSCFDn_base> + $024A_H$

RSCFDnCFDCFRISTSLL: <RSCFDn_base> + 0248_H, RSCFDnCFDCFRISTSLH: <RSCFDn_base> + 0249_H,
RSCFDnCFDCFRISTSHL: <RSCFDn_base> + $024A_H$, RSCFDnCFDCFRISTSHH: <RSCFDn_base> + $024B_H$

Value after reset: 0000 0000_H

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.143 RSCFDnCFDCFRISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8RXIF	Transmit/Receive FIFO Buffer Receive Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k receive interrupt request is present. 1: A transmit/receive FIFO buffer k receive interrupt request is present. (k = 0 to 8)
7	CF7RXIF	
6	CF6RXIF	
5	CF5RXIF	
4	CF4RXIF	
3	CF3RXIF	
2	CF2RXIF	
1	CF1RXIF	
0	CF0RXIF	

The RSCFDnCFDCFRISTS register is cleared to 0000 0000_H in global reset mode.

CFkRXIF Flag (k = 0 to 8)

The CFkRXIF flag is set to 1 when the CFRXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). When the CFRXIF flag is cleared to 0, the CFkRXIF flag is cleared to 0.

17.4.9.6 RSCFDnCFDCFTISTS — Transmit/receive FIFO Buffer Transmit Interrupt Flag Status Register

Access: RSCFDnCFDCFTISTS register can be read only in 32-bit units
RSCFDnCFDCFTISTSL, RSCFDnCFDCFTISTSH registers can be read only in 16-bit units
RSCFDnCFDCFTISTSLL, RSCFDnCFDCFTISTSLH, RSCFDnCFDCFTISTSHL, RSCFDnCFDCFTISTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDCFTISTS: <RSCFDn_base> + $024C_H$

RSCFDnCFDCFTISTSL: <RSCFDn_base> + $024C_H$, RSCFDnCFDCFTISTSH: <RSCFDn_base> + $024E_H$

RSCFDnCFDCFTISTSLL: <RSCFDn_base> + $024C_H$, RSCFDnCFDCFTISTSLH: <RSCFDn_base> + $024D_H$,
RSCFDnCFDCFTISTSHL: <RSCFDn_base> + $024E_H$, RSCFDnCFDCFTISTSHH: <RSCFDn_base> + $024F_H$

Value after reset: 0000 0000_H

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.144 RSCFDnCFDCFTISTS Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	These bits are read as the value after reset.
8	CF8TXIF	Transmit/Receive FIFO Buffer Transmit Interrupt Request Status Flag 0: No transmit/receive FIFO buffer k transmit interrupt request is present. 1: A transmit/receive FIFO buffer k transmit interrupt request is present. (k = 0 to 8)
7	CF7TXIF	
6	CF6TXIF	
5	CF5TXIF	
4	CF4TXIF	
3	CF3TXIF	
2	CF2TXIF	
1	CF1TXIF	
0	CF0TXIF	

The RSCFDnCFDCFTISTS register is cleared to 0000 0000_H in global reset mode.

CFkTXIF Flag (k = 0 to 8)

The CFkTXIF flag is set to 1 when the CFTXIF flag in the RSCFDnCFDCFSTSk register is set to 1 (a transmit/receive FIFO transmit interrupt request is present). When the CFTXIF flag is cleared to 0, the CFkTXIF flag is cleared to 0.

17.4.10 Details of FIFO DMA-Related Registers

17.4.10.1 RSCFDnCFDCDTCT — DMA Enable Register

Access: RSCFDnCFDCDTCT register can be read/written in 32-bit units
RSCFDnCFDCDTCTL, RSCFDnCFDCDTCTH registers can be read/written in 16-bit units
RSCFDnCFDCDTCTLL, RSCFDnCFDCDTCTLH, RSCFDnCFDCDTCTHL, RSCFDnCFDCDTCTHH registers can be read/written in 8-bit units

Address: RSCFDnCFDCDTCT: <RSCFDn_base> + 0490_H

RSCFDnCFDCDTCTL: <RSCFDn_base> + 0490_H
RSCFDnCFDCDTCTH: <RSCFDn_base> + 0492_H

RSCFDnCFDCDTCTLL: <RSCFDn_base> + 0490_H,
RSCFDnCFDCDTCTLH: <RSCFDn_base> + 0491_H,
RSCFDnCFDCDTCTHL: <RSCFDn_base> + 0492_H,
RSCFDnCFDCDTCTHH: <RSCFDn_base> + 0493_H

Initial value: 0000 0000_H

2	RFDMAE2	
1	RFDMAE1	
0	RFDMAE0	

Modify the RSCFDnCFDCDTCT register in global operating mode or global test mode.

CFDMAEm Bit

This bit is used to enable DMA transfer for transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m). DMA transfer is enabled only for transmit/receive FIFO buffers for which the CFM[1:0] bits in the RSCFDnCFDCFCCk register is set to 00_B (receive mode). Set this bit to 0 when the CFM[1:0] value is 01_B (transmit mode) or 10_B (gateway mode).

RFDMAEx Bit

This bit is used to enable DMA transfer for receive FIFO buffer x.

17.4.10.2 RSCFDnCFDCDTSTS — DMA Status Register

Access: RSCFDnCFDCDTSTS register can be read only in 32-bit units
RSCFDnCFDCDTSTSL, RSCFDnCFDCDTSTSH registers can be read only in 16-bit units
RSCFDnCFDCDTSTSLL, RSCFDnCFDCDTSTSLH, RSCFDnCFDCDTSTSHL, RSCFDnCFDCDTSTSHH registers can be read only in 8-bit units

Address: RSCFDnCFDCDTSTS: <RSCFDn_base> + 0494_H

RSCFDnCFDCDTSTSL: <RSCFDn_base> + 0494_H
RSCFDnCFDCDTSTSH: <RSCFDn_base> + 0496_H

RSCFDnCFDCDTSTSLL: <RSCFDn_base> + 0494_H,
RSCFDnCFDCDTSTSLH: <RSCFDn_base> + 0495_H,
RSCFDnCFDCDTSTSHL: <RSCFDn_base> + 0496_H,
RSCFDnCFDCDTSTSHH: <RSCFDn_base> + 0497_H

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

5	RFDMASTS5	
4	RFDMASTS4	
3	RFDMASTS3	
2	RFDMASTS2	
1	RFDMASTS1	
0	RFDMASTS0	

CFDMASTSm Bit

When DMA transfer is enabled (CFDMAEm bit in the RSCFDnCFDCDTCT register is 1) for the transmit/receive FIFO buffer 3 × m (the first transmit/receive FIFO buffer allocated to channel m) while the transmit/receive FIFO buffer contains one of more messages, the CFDMASTSm bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the transmit/receive FIFO buffer have been transferred or DMA transfer is disabled (CFDMAEm bit is 0), the CFDMASTSm bit is cleared to 0 indicating that DMA transfer has been completed. If the CFDMAEm bit is set to 0 during DMA transfer, the CFDMASTSm bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area).

These bits are cleared to 0 in global reset mode.

RFDMASTSx Bit

When DMA transfer is enabled (corresponding RFDMAEx bit in the RSCFDnCFDCDTCT register is 1) for the receive FIFO buffer x and the receive FIFO buffer contains one of more messages, the RFDMASTSx bit is set to 1 indicating that DMA transfer is in progress.

When all messages in the receive FIFO buffer x have been transferred or DMA transfer is disabled (RFDMAEx bit = 0), the RFDMASTSx bit is cleared to 0 indicating that DMA transfer has been completed. If the RFDMAEx bit is set to 0 during DMA transfer, the RFDMASTSx bit is cleared to 0 after the ongoing DMA transfer has been completed (when the message that is being transferred has been transferred to the last byte in the payload storage area)

These bits are cleared to 0 in global reset mode.

17.4.11 Details of Transmit Buffer-related Registers

17.4.11.1 RSCFDnCFDTMCp — Transmit Buffer Control Register p (p = 0 to 47)

Access: RSCFDnCFDTMCp register can be read/written in 8-bit units

Address: RSCFDnCFDTMCp: <RSCFDn_base> + 0250_H + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	TMOM	TMTAR	TMTR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W*1	R/W*1

Note 1. The only effective value for writing to this bit is 1, which sets the bit. Otherwise writing to the bit results in retention of its state.

Table 17.147 RSCFDnCFDTMCp Register Contents

Bit Position	Bit Name	Function
7 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMOM	One-Shot Transmission Enable 0: One-shot transmission is disabled. 1: One-shot transmission is enabled.
1	TMTAR	Transmit Abort Request 0: Transmit abort is not requested. 1: Transmit abort is requested.
0	TMTR	Transmit Request 0: Transmission is not requested. 1: Transmission is requested.

When the RSCFDnCFDTMCp register meets any of the following conditions, set it to 00_H.

- The RSCFDnCFDTMCp register corresponds to the transmit buffer number selected by the CFTML[3:0] bits in the RSCFDnCFDCFCCk register (p = m × 16 + the value of CFTML[3:0] bits).
- The RSCFDnCFDTMCp register corresponds to the transmit buffer allocated to the transmit queue by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm (m = 0 to 2) register (p = (m × 16 + 15) to (m × 16 + 15 . the value of TXQDC[3:0] bits)).
- RSCFDnCFDTMCp register (p = (m × 16) + 1, (m × 16) + 2) corresponding to the transmit buffer allocated as a payload storage area when the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode)

All of the bits in the RSCFDnCFDTMCp register are cleared to 0 in channel reset mode. Modify the RSCFDnCFDTMCp register in channel communication mode or channel halt mode.

TMOM Bit

Setting this bit to 1 enables one-shot transmission. If transmission fails, retransmission defined in the CAN protocol is not performed.

Modify the TMOM bit when the TMTRM flag in the RSCFDnCFDTMSTSp register is set to 0. Set the TMOM bit to 1 together with the TMTR bit.

TMTAR Bit

Setting this bit to 1 generates a transmit abort request for the message stored in the transmit buffer. However, a message that is being transmitted or one that will be transmitted next cannot be aborted.

The TMTAR bit can be set to 1 when TMTR bit is 1.

The TMTAR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed.
- An error or arbitration-lost has been detected.

If this bit becomes 0 at the same time as the program writes 1 to this bit, this bit becomes 0.

TMTR Bit

Setting this bit to 1 transmits the message stored in the transmit buffer.

The TMTR bit is cleared to 0 when any of the following conditions is met, but cannot be cleared by the program writing 0 to the bit.

- Transmission has been completed.
- Transmit abort has been completed after the TMTAR bit was set to 1.
- An error or arbitration-lost has been detected with the TMOM bit set to 1.

Set the TMTR bit to 1 when the value of TMTRF[1:0] in the RSCFDnCFDTMSTSp register is 00_B.

17.4.11.2 RSCFDnCFDTMSTSp — Transmit Buffer Status Register p (p = 0 to 47)

Access: RSCFDnCFDTMSTSp register can be read/written in 8-bit units

Address: RSCFDnCFDTMSTSp: <RSCFDn_base> + $02D0_H$ + (01_H × p)

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	TMTARM	TMTRM	TMTRF[1:0]		TMTSTS
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R

Table 17.148 RSCFDnCFDTMSTSp Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
4	TMTARM	Transmit Buffer Transmit Abort Request Status Flag 0: No transmit abort request is present. 1: A transmit abort request is present.
3	TMTRM	Transmit Buffer Transmit Request Status Flag 0: No transmit request is present. 1: A transmit request is present.
2, 1	TMTRF[1:0]	Transmit Buffer Transmit Result Status Flag b2 b1 0 0: Transmission is in progress or no transmit request is present. 0 1: Transmit abort has been completed. 1 0: Transmission has been completed (without transmit abort request). 1 1: Transmission has been completed (with transmit abort request).
0	TMTSTS	Transmit Buffer Transmit Status Flag 0: Transmission is not in progress. 1: Transmission is in progress.

All of the bits in the RSCFDnCFDTMSTSp register are cleared to 0 in channel reset mode.

TMTARM Flag

The TMTARM flag is set to 1 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTARM flag is set to 0 when the TMTAR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRM Flag

The TMTRM flag is set to 1 when the TMTR bit in the RSCFDnCFDTMCp register is set to 1.

The TMTRM flag is set to 0 when the TMTR bit in the RSCFDnCFDTMCp register is set to 0.

TMTRF[1:0] Flag

This flag indicates the result of transmission from the transmit buffer.

00_B: Transmission is in progress or no transmit request is present.

01_B: Transmission from the transmit buffer was aborted.

10_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 0 (transmit abort is not requested).

11_B: Transmission has been completed with the TMTAR bit in the RSCFDnCFDTMCp register set to 1 (transmit abort is requested).

Write 00_B to the TMTRF[1:0] flag in channel communication mode or channel halt mode. Do not write any value other than 00_B to this flag.

TMTSTS Flag

This flag is set to 1 when transmission from the transmit buffer starts, and is cleared to 0 when transmission from the transmit buffer has been completed or terminated due to a bus error or arbitration lost.

17.4.11.3 RSCFDnCFDTMIDp — Transmit Buffer ID Register p (p = 0 to 47)

Access: RSCFDnCFDTMIDp register can be read/written in 32-bit units
RSCFDnCFDTMIDpL, RSCFDnCFDTMIDpH registers can be read/written in 16-bit units
RSCFDnCFDTMIDpLL, RSCFDnCFDTMIDpLH, RSCFDnCFDTMIDpHL, RSCFDnCFDTMIDpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMIDp: <RSCFDn_base> + 4000_H + (20_H × p)

RSCFDnCFDTMIDpL: <RSCFDn_base> + 4000_H + (20_H × p),
RSCFDnCFDTMIDpH: <RSCFDn_base> + 4002_H + (20_H × p)

RSCFDnCFDTMIDpLL: <RSCFDn_base> + 4000_H + (20_H × p),
RSCFDnCFDTMIDpLH: <RSCFDn_base> + 4001_H + (20_H × p),
RSCFDnCFDTMIDpHL: <RSCFDn_base> + 4002_H + (20_H × p),
RSCFDnCFDTMIDpHH: <RSCFDn_base> + 4003_H + (20_H × p)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TMIDE	TMRTR	THLEN	TMID[28:16]

Table 17.149 RSCFDnCFDTMIDp Register Contents

Bit Position	Bit Name	Function
31	TMIDE	Transmit Buffer IDE 0: Standard ID 1: Extended ID
30	TMRTR	Transmit Buffer RTR/RRS • When the transmit message is a classical CAN frame 0: Data frame 1: Remote frame • When the transmit message is a CAN FD frame Write 0 to this bit.
29	THLEN	Transmit History Data Store Enable 0: Transmit history data is not stored in the buffer. 1: Transmit history data is stored in the buffer.
28 to 0	TMID[28:0]	Transmit Buffer ID Data Set standard ID or extended ID. For standard ID, write an ID to bits 10 to 0 and write 0 to bits 28 to 11.

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write data to this register. If this register is allocated to the transmit queue, only write data to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

TMIDE Bit

This bit is used to set the ID format of the message to be transmitted from the transmit buffer.

TMRTR Bit

This bit is used to set the data format of the message to be transmitted from the transmit buffer.

Set this bit to 0 when the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 1 (CAN FD frame).

THLEN Bit

When this bit is set to 1, the transmit history data (label information, buffer number, buffer type, and timestamp) of transmit messages is stored in the transmit history buffer after transmission is completed.

TMID[28:0] Bits

These bits are used to set the ID of the message to be transmitted from the transmit buffer.

17.4.11.4 RSCFDnCFDTMPTRp — Transmit Buffer Pointer Register p (p = 0 to 47)

Access: RSCFDnCFDTMPTRp register can be read/written in 32-bit units
RSCFDnCFDTMPTRpL, RSCFDnCFDTMPTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMPTRpLL, RSCFDnCFDTMPTRpLH, RSCFDnCFDTMPTRpHL, RSCFDnCFDTMPTRpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMPTRp: <RSCFDn_base> + 4004_H + (20_H × p)

RSCFDnCFDTMPTRpL: <RSCFDn_base> + 4004_H + (20_H × p),
RSCFDnCFDTMPTRpH: <RSCFDn_base> + 4006_H + (20_H × p)

RSCFDnCFDTMPTRpLL: <RSCFDn_base> + 4004_H + (20_H × p),
RSCFDnCFDTMPTRpLH: <RSCFDn_base> + 4005_H + (20_H × p),
RSCFDnCFDTMPTRpHL: <RSCFDn_base> + 4006_H + (20_H × p),
RSCFDnCFDTMPTRpHH: <RSCFDn_base> + 4007_H + (20_H × p)

Value after reset: 0000 0000_H

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 17.150 RSCFDnCFDTMPTRp Register Contents

Bit Position	Bit Name	Function
31 to 28	TMDLC[3:0]	Transmit Buffer DLC Data
27 to 24	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
23 to 16	TMPTR[7:0]	Transmit Buffer Label Data Set the label information to be stored in the transmit history buffer.
15 to 0	Reserved	When read, the value after reset is returned. When writing, write the value after reset.

TMDLC[3:0]:

b31	b30	b29	b28	Classical CAN Frame	CAN FD Frame
0	0	0	0	0 data bytes	
0	0	0	1	1 data byte	
0	0	1	0	2 data bytes	
0	0	1	1	3 data bytes	
0	1	0	0	4 data bytes	
0	1	0	1	5 data bytes	
0	1	1	0	6 data bytes	
0	1	1	1	7 data bytes	
1	0	0	0	8 data bytes	
1	0	0	1	8 data bytes	12 data bytes
1	0	1	0		16 data bytes
1	0	1	1		20 data bytes
1	1	0	0		24 data bytes
1	1	0	1		32 data bytes
1	1	1	0		48 data bytes
1	1	1	1		64 data bytes

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p ($p = m \times 16 + 15$) for the corresponding channel.

TMDLC[3:0] Bits

These bits are used to set the data length of the message to be transmitted from the transmit buffer when the TMRTR bit in the RSCFDnCFDTMIDp register is set to 0 (data frame).

When the TMDLC[3:0] bits are set to 1001_B or more while the TMFDF bit in the RSCFDnCFDTMFDCTRp register is 0 (classical CAN frame), 8-byte data is transmitted actually. When the TMFDF bit is 1 (CAN FD frame), the settable value range varies depending on the setting of the TMME bit in the RSCFDnCFDCmFDCFG register.

- When the TMME bit = 0 (transmit buffer merge mode disabled):
  A value of 0000_B to 1111_B can be set. If a value larger than 1100_B is set, payloads exceeding 20 bytes are padded by CCH.
- When the TMME bit = 1 (transmit buffer merge mode enabled):
  When the corresponding transmit buffer number $p = (m \times 16) + 0$ or $(m \times 16) + 3$, a value of 0000_B to 1111_B can be set. In other cases, set a value of 0000_B to 1011_B (20 data bytes).

When the TMRTR bit is 1 (remote frame), these bits set the length of the message to be requested.

TMPTR[7:0] Bits

When message transmission has been completed, the TMPTR[7:0] value is stored in the transmit history buffer.

17.4.11.5 RSCFDnCFDTMFDCTRp — Transmit Buffer CAN FD Configuration Register p (p = 0 to 47)

Access: RSCFDnCFDTMFDCTRp register can be read/written in 32-bit units
RSCFDnCFDTMFDCTRpL, RSCFDnCFDTMFDCTRpH registers can be read/written in 16-bit units
RSCFDnCFDTMFDCTRpLL, RSCFDnCFDTMFDCTRpLH, RSCFDnCFDTMFDCTRpHL, RSCFDnCFDTMFDCTRpHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMFDCTRp: <RSCFDn_base> + 4008_H + (20_H × p)

RSCFDnCFDTMFDCTRpL: <RSCFDn_base> + 4008_H + (20_H × p),
RSCFDnCFDTMFDCTRpH: <RSCFDn_base> + $400A_H$ + (20_H × p)

RSCFDnCFDTMFDCTRpLL: <RSCFDn_base> + 4008_H + (20_H × p),
RSCFDnCFDTMFDCTRpLH: <RSCFDn_base> + 4009_H + (20_H × p),
RSCFDnCFDTMFDCTRpHL: <RSCFDn_base> + $400A_H$ + (20_H × p),
RSCFDnCFDTMFDCTRpHH: <RSCFDn_base> + $400B_H$ + (20_H × p)

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TMFDF	TMBRS	TMESI
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 17.151 RSCFDnCFDTMFDCTRp Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
2	TMFDF	FDF 0: Classical CAN frame 1: CAN FD frame
1	TMBRS	BRS 0: The bit rate in the data area does not change. 1: The bit rate in the data area changes.
0	TMESI	ESI 0: Error active node 1: Error passive node

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (transmission not requested). When this register is linked to the transmit/receive FIFO buffer, do not write data to this register. When this register is allocated to the transmit queue, write data only to transmit buffer p (p = m × 16 + 15) of the corresponding channel.

TMFDF Bit

This bit is used to set the FD format of the message to be transmitted from the transmit buffer.

TMBRS Bit

When this bit is set to 1 while the TMFDF bit is set to 1, the data area of a transmit message is transmitted at the data bit rate. When the TMFDF bit is set to 0, write 0 to this bit.

TMESI Bit

This bit is used to set the ESI bit value of the message to be transmitted from the transmit buffer when the TMFDF bit is set to 1. The set value is transmitted when the ESIC bit in the RSCFDnCFDCmFDCFG register is set to 1 and the channel is in the error active state. When the channel is in the error passive state, the ESI bit value that shows an error passive node is transmitted regardless of this bit value. When the TMFDF bit is set to 0, write 0 to this bit.

17.4.11.6 RSCFDnCFDTMDFb_p — Transmit Buffer Data Field b Register p (b = 0 to 4, p = 0 to 47)

Access: RSCFDnCFDTMDFb_p register can be read/written in 32-bit units
RSCFDnCFDTMDFb_pL, RSCFDnCFDTMDFb_pH registers can be read/written in 16-bit units
RSCFDnCFDTMDFb_pLL, RSCFDnCFDTMDFb_pLH, RSCFDnCFDTMDFb_pHL, RSCFDnCFDTMDFb_pHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMDFb_p: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p)

RSCFDnCFDTMDFb_pL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pH: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p)

RSCFDnCFDTMDFb_pLL: <RSCFDn_base> + $400C_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pLH: <RSCFDn_base> + $400D_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pHL: <RSCFDn_base> + $400E_H$ + (04_H × b) + (20_H × p),
RSCFDnCFDTMDFb_pHH: <RSCFDn_base> + $400F_H$ + (04_H × b) + (20_H × p)

Initial value: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 17.152 RSCFDnCFDTMDFb_p Register Contents

Bit Position	Bit Name	Function
31 to 24	TMDB4 × b + 3 [7:0]	Transmit Buffer Data Byte 4 × b + 3 Transmit Buffer Data Byte 4 × b + 2 Transmit Buffer Data Byte 4 × b + 1 Transmit Buffer Data Byte 4 × b + 0 Set the transmit buffer data.
23 to 16	TMDB4 × b + 2 [7:0]	
15 to 8	TMDB4 × b + 1 [7:0]	
7 to 0	TMDB4 × b + 0 [7:0]	

Modify this register when the TMTRM bit in the corresponding RSCFDnCFDTMSTSp register is set to 0 (no transmit request is present). If this register is linked to a transmit/receive FIFO buffer, do not write to this register. If this register is allocated to the transmit queue, only write to a transmit buffer p (p = m × 16 + 15) for the corresponding channel.

17.4.11.7 RSCFDnCFDTMIECy — Transmit Buffer Interrupt Enable Configuration Register y (y = 0, 1)

Access: RSCFDnCFDTMIECy register can be read/written in 32-bit units
RSCFDnCFDTMIECyL, RSCFDnCFDTMIECyH registers can be read/written in 16-bit units
RSCFDnCFDTMIECyLL, RSCFDnCFDTMIECyLH, RSCFDnCFDTMIECyHL, RSCFDnCFDTMIECyHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTMIECy: <RSCFDn_base> + 0390_H + (04_H × y)

RSCFDnCFDTMIECyL: <RSCFDn_base> + 0390_H + (04_H × y),
RSCFDnCFDTMIECyH: <RSCFDn_base> + 0392_H + (04_H × y)

RSCFDnCFDTMIECyLL: <RSCFDn_base> + 0390_H + (04_H × y),
RSCFDnCFDTMIECyLH: <RSCFDn_base> + 0391_H + (04_H × y),
RSCFDnCFDTMIECyHL: <RSCFDn_base> + 0392_H + (04_H × y),
RSCFDnCFDTMIECyHH: <RSCFDn_base> + 0393_H + (04_H × y)

Value after reset: $0000\ 0000_H$

Table 17.153 RSCFDnCFDTMIECy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 31 to y × 32 + 16) 0: Transmit buffer interrupt is disabled 1: Transmit buffer interrupt is enabled
15 to 0	TMIEp	Transmit Buffer Interrupt Enable p (p = y × 32 + 15 to y × 32 + 0) 0: Transmit buffer interrupt is disabled. 1: Transmit buffer interrupt is enabled.

TMIEp Bits (p = 0 to 47)

When any of these bits is set to 1 and the corresponding transmission has been completed, a transmit buffer interrupt request is generated.

Modify these bits when the TMTRM flag in the corresponding RSCFDnCFDTMSTSp register is 0 (no transmit request is present).

Write 0 to bits corresponding to transmit buffers linked to transmit/receive FIFO buffers or transmit buffers allocated to the transmit queue.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode enable), set the bit corresponding to the transmit buffer allocated as a payload storage area to 0.

Table 17.154 shows the bit assignment.

Table 17.155 RSCFDnCFDTMTRSTSy Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 31 to y × 32 + 16) 0: No transmit request is present. 1: A transmit request is present.
15 to 0	TMTRSTSp	Transmit Buffer Transmit Request Status Flag p (p = y × 32 + 15 to y × 32 + 0) 0: No transmit request is present. 1: A transmit request is present.

TMTRSTSp Flags (p = 0 to 47)

These flags indicate the status of the TMTR bit in the RSCFDnCFDTMCp register.

When the TMTR bit is set to 1 (transmission is requested), the corresponding TMTRSTSp flag is set to 1.

The corresponding TMTRSTSp flag is cleared to 0 when the TMTR bit is set to 0 (transmission is not requested) or in channel reset mode.

Table 17.156 shows the bit assignment.

Table 17.163 RSCFDnCFDTXQCCm Register Contents

Bit Position	Bit Name	Function
31 to 14	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
13	TXQIM	Transmit Queue Interrupt Source Select 0: When the transmit queue becomes empty upon completion of message transmission, a transmit queue interrupt request is generated. 1: A transmit queue interrupt request is generated each time a message has been transmitted.
12	TXQIE	Transmit Queue Interrupt Enable 0: Transmit queue interrupt is disabled. 1: Transmit queue interrupt is enabled.
11 to 8	TXQDC[3:0]	Transmit Queue Depth Configuration Setting these bits to g (g = 2 to 15) makes the (g+1) transmit queue available. Setting these bits to 0 disables the transmit queue. Setting these bits to 1 is prohibited. For transmit buffer merge mode, set g to 2 to 9.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	TXQE	Transmit Queue Enable 0: The transmit queue is not used. 1: The transmit queue is used.

TXQIM Bit

This bit is used to select a transmit queue interrupt source. Modify this bit in channel reset mode.

TXQIE Bit

When the TXQIE bit is set to 1 and the source selected by the TXQIM bit occurs, an interrupt request is generated.

Set the TXQE bit to 0 before modifying the TXQIE bit.

TXQDC[3:0] Bits

These bits are used to specify the number of transmit buffers to be allocated to the transmit queues. Transmit buffers are allocated to transmit queues in descending order of buffer number, that is, from (m × 16 + 15) to (m × 16 + 0) (see **Table 17.93**). For examples of how buffer allocation is done, see **Figure 17.9**.

When the TMME bit in the RSCFDnCFDCmFDCFG register is 1 (transmit buffer merge mode), transmit buffers (m × 16 + 5) to (m × 16 + 0) are merged and cannot be allocated to the transmit queue. Therefore, do not set TXQDC[3:0] bits to 10 to 15.

Modify these bits only in channel reset mode.

TXQE Bit

Setting this bit to 1 enables the transmit queue. Modify this bit in channel communication mode or channel halt mode. This bit is cleared to 0 in channel reset mode.

Before setting the TXQE bit to 1, set the TXQDC[3:0] bits to 0010_B or more.

17.4.13.2 RSCFDnCFDTXQSTSm — Transmit Queue Status Register m (m = 0 to 2)

Access: RSCFDnCFDTXQSTSm register can be read/written in 32-bit units
RSCFDnCFDTXQSTSmL, RSCFDnCFDTXQSTSmH registers can be read/written in 16-bit units
RSCFDnCFDTXQSTSmLL, RSCFDnCFDTXQSTSmLH, RSCFDnCFDTXQSTSmHL,
RSCFDnCFDTXQSTSmHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTXQSTSm: <RSCFDn_base> + $03C0_H$ + (04_H × m)

RSCFDnCFDTXQSTSmL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCFDnCFDTXQSTSmH: <RSCFDn_base> + $03C2_H$ + (04_H × m)

RSCFDnCFDTXQSTSmLL: <RSCFDn_base> + $03C0_H$ + (04_H × m),
RSCFDnCFDTXQSTSmLH: <RSCFDn_base> + $03C1_H$ + (04_H × m),
RSCFDnCFDTXQSTSmHL: <RSCFDn_base> + $03C2_H$ + (04_H × m),
RSCFDnCFDTXQSTSmHH: <RSCFDn_base> + $03C3_H$ + (04_H × m)

Value after reset: $0000\ 0001_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	TXQIF	TXQFLL	TXQEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.164 RSCFDnCFDTXQSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	Reserved	When read, the undefined value is returned. When writing, write the value after reset.
7 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	TXQIF	Transmit Queue Interrupt Request Flag 0: No transmit queue interrupt request is present. 1: A transmit queue interrupt request is present.
1	TXQFLL	Transmit Queue Full Status Flag 0: The transmit queue is not full. 1: The transmit queue is full.
0	TXQEMP	Transmit Queue Empty Status Flag 0: The transmit queue contains messages. 1: The transmit queue contains no message (transmit queue empty).

TXQIF Flag

The TXQIF flag is set to 1 when the interrupt source specified by the TXQIM bit in the RSCFDnCFDTXQCCm register has occurred.

The TXQIF flag is cleared to 0 in channel reset mode or by writing 0 to this flag. This flag is not cleared to 0 by setting the TXQE bit in the RSCFDnCFDTXQCCm register to 0 (the transmit queue is not used).

TXQFLL Flag

The TXQFLL flag is set to 1 when the number of messages stored in the transmit queue matches the transmit queue depth set by the TXQDC[3:0] bits in the RSCFDnCFDTXQCCm register.

This flag is cleared to 0 in any of the following cases.

- The number of messages set for the transmit queue is smaller than the transmit queue depth set by the TXQDC[3:0] bits.
- In channel reset mode

TXQEMP Flag

The TXQEMP flag is cleared to 0 when even a single message stored in the transmit queue.

This flag is set to 1 in any of the following cases.

- The TXQE bit is set to 0 (the transmit queue is not used).
- The transmit queue becomes empty.
- In channel reset mode

17.4.13.3 RSCFDnCFDTXQPCTRm — Transmit Queue Pointer Control Register m (m = 0 to 2)

Access: RSCFDnCFDTXQPCTRm register can only be written in 32-bit units
RSCFDnCFDTXQPCTRmL, RSCFDnCFDTXQPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTXQPCTRmLL, RSCFDnCFDTXQPCTRmLH, RSCFDnCFDTXQPCTRmHL, RSCFDnCFDTXQPCTRmHH registers can only be written in 8-bit units

Address: RSCFDnCFDTXQPCTRm: <RSCFDn_base> + $03E0_H$ + (04_H × m)

RSCFDnCFDTXQPCTRmL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCFDnCFDTXQPCTRmH: <RSCFDn_base> + $03E2_H$ + (04_H × m)

RSCFDnCFDTXQPCTRmLL: <RSCFDn_base> + $03E0_H$ + (04_H × m),
RSCFDnCFDTXQPCTRmLH: <RSCFDn_base> + $03E1_H$ + (04_H × m),
RSCFDnCFDTXQPCTRmHL: <RSCFDn_base> + $03E2_H$ + (04_H × m),
RSCFDnCFDTXQPCTRmHH: <RSCFDn_base> + $03E3_H$ + (04_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

	—	—	—	—	—	—	—	—	TXQPC[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	W	W	W	W	W	W	W	W

Table 17.165 RSCFDnCFDTXQPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	The write value should be the value after reset.
7 to 0	TXQPC[7:0]	Transmit Queue Pointer Control Writing FF_H to these bits moves the write pointer of the transmit queue to the next queue buffer.

TXQPC[7:0] Bits

Writing FF_H to the TXQPC[7:0] bits moves the write pointer to the next transmit queue buffer and generates a transmit request for the message. Write transmit messages to the RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDnCFDTMDFb_p registers (p = 15, 31, 47) before writing FF_H to the TXQPC[7:0] bits.

When writing FF_H to these bits, make sure that the TXQE bit in the RSCFDnCFDTXQCCm register is set to 1 (the transmit queue is used) and the TXQFLL flag in the RSCFDnCFDTXQSTSm register is 0 (he transmit queue is not full).

17.4.14 Details of Transmit History-related Registers

17.4.14.1 RSCFDnCFDTHLCCm — Transmit History Configuration and Control Register m (m = 0 to 2)

Access: RSCFDnCFDTHLCCm register can be read/written in 32-bit units
RSCFDnCFDTHLCCmL, RSCFDnCFDTHLCCmH registers can be read/written in 16-bit units
RSCFDnCFDTHLCCmLL, RSCFDnCFDTHLCCmLH, RSCFDnCFDTHLCCmHL, RSCFDnCFDTHLCCmHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTHLCCm: <RSCFDn_base> + 0400_H + (04_H × m)

RSCFDnCFDTHLCCmL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCFDnCFDTHLCCmH: <RSCFDn_base> + 0402_H + (04_H × m)

RSCFDnCFDTHLCCmLL: <RSCFDn_base> + 0400_H + (04_H × m),
RSCFDnCFDTHLCCmLH: <RSCFDn_base> + 0401_H + (04_H × m),
RSCFDnCFDTHLCCmHL: <RSCFDn_base> + 0402_H + (04_H × m),
RSCFDnCFDTHLCCmHH: <RSCFDn_base> + 0403_H + (04_H × m)

Table 17.166 RSCFDnCFDTHLCCm Register Contents

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
10	THLDTE	Transmit History Target Buffer Select 0: Entries from transmit/receive FIFO buffers and transmit queue 1: Entries from transmit buffers, transmit/receive FIFO buffers, and transmit queue
9	THLIM	Transmit History Interrupt Source Select 0: When 12 items of data have been stored in the transmit history buffer 1: Each time transmit history data is stored in the transmit history buffer
8	THLIE	Transmit History Interrupt Enable 0: Transmit history interrupt is disabled. 1: Transmit history interrupt is enabled.
7 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	THLE	Transmit History Buffer Enable 0: Transmit history buffer is not used. 1: Transmit history buffer is used.

THLDTE Bit

When this bit is set to 0, the transmit history data of messages transmitted from transmit/receive FIFO buffers and the transmit queue is stored in the transmit history buffer. When this bit is set to 1, the transmit history data of messages transmitted from transmit buffers, transmit/receive FIFO buffers, and the transmit queue is stored in the transmit history buffer.

Modify this bit only in channel reset mode.

THLIM Bit

This bit is used to select a transmit history interrupt source.

Modify this bit only in channel reset mode.

THLIE Bit

When the THLIE bit is set to 1 and the source selected by the THLIM bit has occurred, a transmit history interrupt request is generated. Modify the THLIE bit only when the THLE bit is set to 0.

THLE Bit

Setting this bit to 1 enables the transmit history buffer. When data transmission from the buffer selected by the THLDTE bit has been completed, the transmit history data of transmit messages is stored in the transmit history buffer.

Modify this bit in channel communication mode or channel halt mode.

This bit is cleared to 0 in channel reset mode.

17.4.14.2 RSCFDnCFDTHLSTSm — Transmit History Status Register m (m = 0 to 2)

Access: RSCFDnCFDTHLSTSm register can be read/written in 32-bit units
RSCFDnCFDTHLSTSmL, RSCFDnCFDTHLSTSmH register can be read/written in 16-bit units
RSCFDnCFDTHLSTSmLL, RSCFDnCFDTHLSTSmLH, RSCFDnCFDTHLSTSmHL,
RSCFDnCFDTHLSTSmHH registers can be read/written in 8-bit units

Address: RSCFDnCFDTHLSTSm: <RSCFDn_base> + 0420_H + (04_H × m)

RSCFDnCFDTHLSTSmL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCFDnCFDTHLSTSmH: <RSCFDn_base> + 0422_H + (04_H × m)

RSCFDnCFDTHLSTSmLL: <RSCFDn_base> + 0420_H + (04_H × m),
RSCFDnCFDTHLSTSmLH: <RSCFDn_base> + 0421_H + (04_H × m),
RSCFDnCFDTHLSTSmHL: <RSCFDn_base> + 0422_H + (04_H × m),
RSCFDnCFDTHLSTSmHH: <RSCFDn_base> + 0423_H + (04_H × m)

Value after reset: 0000 0001_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

	—	—	—	THLMC[4:0]					—	—	—	—	THLIF	THLELT	THLFLL	THLEMP
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W*1	R/W*1	R	R

Note 1. The only effective value for writing to this flag bit is 0, which clears the bit. Otherwise writing to the bit results in retention of its state.

Table 17.167 RSCFDnCFDTHLSTSm Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
12 to 8	THLMC[4:0]	Transmit History Buffer Unread Data Counter These bits indicate the number of unread data stored in the transmit history buffer.
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3	THLIF	Transmit History Interrupt Request Flag 0: No transmit history interrupt request is present. 1: A transmit history interrupt request is present.
2	THLELT	Transmit History Buffer Overflow Flag 0: Transmit history buffer overflow has not occurred. 1: Transmit history buffer overflow has occurred.
1	THLFLL	Transmit history Buffer Full Status Flag 0: Transmit history buffer is not full. 1: Transmit history buffer is full.
0	THLEMP	Transmit History Buffer Empty Status Flag 0: Transmit history buffer contains unread data. 1: Transmit history buffer contains no unread data (buffer empty).

THLMC[4:0] Bits

These bits indicate the number of unread data stored in the transmit history buffer. These bits are cleared to 0 in channel reset mode.

THLIF Flag

The THLIF flag is set to 1 when the interrupt source specified with the THLIM bit in the RSCFDnCFDTHLCCm register occurs.

This flag is cleared to 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLELT Flag

The THLELT flag is set to 1 when an attempt is made to store new transmit history data while the transmit history buffer is full. In this case, the new data is discarded. This flag becomes 0 in channel reset mode or by the program writing 0 to this flag.

To clear the flags of the register to 0, the program must write 0 to the corresponding flag to be cleared.

When writing 0, using store instruction, set the bit to be set to “0” to “0”, and the bits not to be set to “0” to “1”.

THLFLL Flag

The THLFLL flag is set to 1 when 16 items of data have been stored in the transmit history buffer, and is cleared to 0 when the number of data stored in the transmit history buffer has decreased to less than 16. This bit is also cleared to 0 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

THLEMP Flag

The THLEMP flag is cleared to 0 when even a single item of transmit history data has been stored in the transmit history buffer.

This flag is set to 1 when all the data in the transmit history buffer has been read. This flag is also set to 1 in channel reset mode or when the THLE bit in the RSCFDnCFDTHLCCm register is set to 0 (transmit history buffer is not used).

NOTE

To clear THLIF or THLELT flag to 0, the program must write 0. When writing, use a store instruction to write “0” to the given flag and “1” to other flags.

17.4.14.3 RSCFDnCFDTHLPCTRm — Transmit History Pointer Control Register m (m = 0 to 2)

Access: RSCFDnCFDTHLPCTRm register can only be written in 32-bit units
RSCFDnCFDTHLPCTRmL, RSCFDnCFDTHLPCTRmH registers can only be written in 16-bit units
RSCFDnCFDTHLPCTRmLL, RSCFDnCFDTHLPCTRmLH, RSCFDnCFDTHLPCTRmHL, RSCFDnCFDTHLPCTRmHH registers can only be written in 8-bit units

Address: RSCFDnCFDTHLPCTRm: <RSCFDn_base> + 0440_H + (04_H × m)

RSCFDnCFDTHLPCTRmL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCFDnCFDTHLPCTRmH: <RSCFDn_base> + 0442_H + (04_H × m)

RSCFDnCFDTHLPCTRmLL: <RSCFDn_base> + 0440_H + (04_H × m),
RSCFDnCFDTHLPCTRmLH: <RSCFDn_base> + 0441_H + (04_H × m),
RSCFDnCFDTHLPCTRmHL: <RSCFDn_base> + 0442_H + (04_H × m),
RSCFDnCFDTHLPCTRmHH: <RSCFDn_base> + 0443_H + (04_H × m)

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 17.168 RSCFDnCFDTHLPCTRm Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write the value after reset.
7 to 0	THLPC[7:0]	Transmit History List Pointer Control Writing FF_H to these bits moves the read pointer to the next unread data in the transmit history buffer.

THLPC[7:0] Bits

When the THLPC[7:0] bits are set to FF_H, the read pointer moves to the next data in the transmit history buffer. At this time, the THLMC[4:0] (transmit history buffer unread data counter) value in the RSCFDnCFDTHLSTSm register is decremented by 1. Write FF_H to the THLPC[7:0] bits after reading from the RSCFDnCFDTHLACCm register.

When writing FF_H to these bits, make sure that the THLE bit in the RSCFDnCFDTHLCCm register is set to 1 (transmit history buffer is used) and the THLEMP flag in the RSCFDnCFDTHLSTSm register is 0.

17.4.14.4 RSCFDnCFDTHLACCm — Transmit History Access Register m (m = 0 to 2)

Access: RSCFDnCFDTHLACCm register can be read only in 32-bit units
RSCFDnCFDTHLACCmL, RSCFDnCFDTHLACCmH registers can be read only in 16-bit units
RSCFDnCFDTHLACCmLL, RSCFDnCFDTHLACCmLH, RSCFDnCFDTHLACCmHL,
RSCFDnCFDTHLACCmHH registers can be read only in 8-bit units

Table 17.169 RSCFDnCFDTHLACCm Register Contents

Bit Position	Bit Name	Function
31 to 16	TMTS[15:0]	Timestamp Data The timestamp data of stored data can be read.
15 to 8	TID[7:0]	Label Data The label information of stored data can be read.
7	Reserved	When read, the value after reset is returned.
6 to 3	BN[3:0]	Buffer Number Data The buffer number of transmit source (transmit buffer, transmit/receive FIFO or transmit queue) can be read.
2 to 0	BT[2:0]	Buffer Type Data b2 b1 b0 0 0 1: Transmit buffer 0 1 0: Transmit/receive FIFO buffer 1 0 0: Transmit queue

TMTS[15:0] Bits

Timestamp values in transmit history data stored in the transmit history buffer are displayed.

TID[7:0] Bits

These bits indicate the label information of transmit history data stored in the transmit history buffer.

BN[3:0] Bits

These bits indicate the transmit source buffer number in the transmit history data stored in the transmit history buffer.

BT[2:0] Bits

These bits indicate the type of the transmit source buffer in the transmit history data stored in the transmit history buffer.

17.4.15 Details of Test-related Registers

17.4.15.1 RSCFDnCFDGTSTCFG — Global Test Configuration Register

Access: RSCFDnCFDGTSTCFG register can be read/written in 32-bit units
RSCFDnCFDGTSTCFGL, RSCFDnCFDGTSTCFGH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCFGLL, RSCFDnCFDGTSTCFGLH, RSCFDnCFDGTSTCFGHL, RSCFDnCFDGTSTCFGHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGTSTCFG: <RSCFDn_base> + 0468_H

RSCFDnCFDGTSTCFGL: <RSCFDn_base> + 0468_H, RSCFDnCFDGTSTCFGH: <RSCFDn_base> + $046A_H$

RSCFDnCFDGTSTCFGLL: <RSCFDn_base> + 0468_H, RSCFDnCFDGTSTCFGLH: <RSCFDn_base> + 0469_H,

Table 17.170 RSCFDnCFDGTSTCFG Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
22 to 16	RTMPS[6:0]	RAM Test Page Configuration Set a value within a range of page 0 (00_H) to page 41 (29_H).
15 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	C2ICBCE	CAN2 Inter-channel Communication Test Enable 0: CAN2 inter-channel communication test is disabled. 1: CAN2 inter-channel communication test is enabled.
1	C1ICBCE	CAN1 Inter-Channel Communication Test Enable 0: CAN1 inter-channel communication test is disabled. 1: CAN1 inter-channel communication test is enabled.
0	C0ICBCE	CAN0 Inter-Channel Communication Test Enable 0: CAN0 inter-channel communication test is disabled. 1: CAN0 inter-channel communication test is enabled.

Modify the RSCFDnCFDGTSTCFG register only in global test mode.

RTMPS[6:0] Bits

These bits are used to set the RAM test target page number for RAM test. Set a value in the range of 00_H to 29_H, inclusive. In CAN FD mode, do not access more than 160 bytes in the last page (RTMPS = 29_H) during RAM test.

C2ICBCE Bit

Setting this bit to 1 enables the channel 2 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C1ICBCE Bit

Setting this bit to 1 enables the channel 1 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

C0ICBCE Bit

Setting this bit to 1 enables the channel 0 inter-channel communication test.

This bit is cleared to 0 in global reset mode.

17.4.15.2 RSCFDnCFDGTSTCTR — Global Test Control Register

Access: RSCFDnCFDGTSTCTR register can be read/written in 32-bit units
RSCFDnCFDGTSTCTRL, RSCFDnCFDGTSTCTRH registers can be read/written in 16-bit units
RSCFDnCFDGTSTCTRLL, RSCFDnCFDGTSTCTRLH, RSCFDnCFDGTSTCTRHL, RSCFDnCFDGTSTCTRHH registers can be read/written in 8-bit units

Address: RSCFDnCFDGTSTCTR: <RSCFDn_base> + 046C$_H$

RSCFDnCFDGTSTCTRL: <RSCFDn_base> + 046C$_H$, RSCFDnCFDGTSTCTRH: <RSCFDn_base> + 046E$_H$

RSCFDnCFDGTSTCTRLL: <RSCFDn_base> + 046C$_H$, RSCFDnCFDGTSTCTRLH: <RSCFDn_base> + 046D$_H$,
RSCFDnCFDGTSTCTRHL: <RSCFDn_base> + 046E$_H$, RSCFDnCFDGTSTCTRHH: <RSCFDn_base> + 046F$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R/W

Table 17.171 RSCFDnCFDGTSTCTR Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
2	RTME	RAM Test Enable 0: RAM test is disabled. 1: RAM test is enabled.
1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	ICBCTME	Inter-Channel Communication Test Enable 0: Inter-channel communication test is disabled. 1: Inter-channel communication test is enabled.

RTME Bit

Setting this bit to 1 enables the RAM test. Modify this bit only in global test mode.

This bit is cleared to 0 in global reset mode (see **Figure 17.37**).

1. Set the GMDC[1:0] bits in the RSCFDnCFDGCTR register to 10$_B$ (Global test mode).
2. Set the RTME bit to 1.
3. Check that the RTME bit is set to 1.

ICBCTME Bit

When this bit is set to 1, a communication test is enabled between the channels for which the CmICBCE bit (m = 0 to 2) in the RSCFDnCFDGTSTCFG register has been set to 1. Modify the ICBCTME bit only in global test mode.

This bit is cleared to 0 in global reset mode.

17.4.15.3 RSCFDnCFDGLOCKK — Global Lock Key Register

Access: RSCFDnCFDGLOCKK register can be write only in 32-bit units.
RSCFDnCFDGLOCKKL, RSCFDnCFDGLOCKKH registers can be write only in 16-bit units.

Address: RSCFDnCFDGLOCKK: <RSCFDn_base> + $047C_H$

RSCFDnCFDGLOCKKL: <RSCFDn_base> + $047C_H$, RSCFDnCFDGLOCKKH: <RSCFDn_base> + $047E_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Note 1. Writing to these bits is effective only when the RS-CANFD module is in global test mode.

Table 17.172 RSCFDnCFDGLOCKK Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When writing these bits, write the value after reset.
15 to 0	LOCK[15:0]	Lock Key These bits are key bits to release protection of test mode.

The RSCFDnCFDGLOCKK register releases protection of special test bits and is write only.

For the protection release data, see **Section 17.11.4.2, Procedure for Releasing the Protection**.

LOCK[15:0] Bits

Writing the protection release data to the LOCK[15:0] bits in succession enables writing 1 to the RTME bit in the RSCFDnCFDGTSTCTR register.

After the protection has been released, writing to the I/O register area (<RSCFDn_base> + 0000_H to <RSCFDn_base> + $05FF_H$) of the CAN (except the RAM) enables the protection again.

Reading from the I/O register area of the CAN or reading from/writing to other areas does not enable the protection.

17.4.15.4 RSCFDnCFDRPGACCr — RAM Test Page Access Register r (r = 0 to 63)

Access: RSCFDnCFDRPGACCr register can be read/written in 32-bit units
RSCFDnCFDRPGACCrL, RSCFDnCFDRPGACCrH registers can be read/written in 16-bit units
RSCFDnCFDRPGACCrLL, RSCFDnCFDRPGACCrLH, RSCFDnCFDRPGACCrHL, RSCFDnCFDRPGACCrHH registers can be read/written in 8-bit units

Address: RSCFDnCFDRPGACCr: <RSCFDn_base> + 6400_H + (04_H × r)

RSCFDnCFDRPGACCrL: <RSCFDn_base> + 6400_H + (04_H × r)),
RSCFDnCFDRPGACCrH: <RSCFDn_base> + 6402_H + (04_H × r))

RSCFDnCFDRPGACCrLL: <RSCFDn_base> + 6400_H + (04_H × r)),
RSCFDnCFDRPGACCrLH: <RSCFDn_base> + 6401_H + (04_H × r)),
RSCFDnCFDRPGACCrHL: <RSCFDn_base> + 6402_H + (04_H × r)),
RSCFDnCFDRPGACCrHH: <RSCFDn_base> + 6403_H + (04_H × r))

Value after reset: 0000 0000_H

Table 17.174 RSCFDnCANFDMDR Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	These bits are read as the value after reset. The write value should be the value after reset.
0	FDMDR	CAN FD mode read 0: classical CAN mode is selected. 1: CAN FD mode is selected.

17.5 Interrupt Sources and DMA Trigger

17.5.1 Interrupt Sources

The RS-CANFD module has 11 interrupts that are grouped into global interrupts and channel interrupts.

- Global interrupts (2 sources):
  Receive FIFO interrupt
  Global error interrupt
- Channel interrupts (3 sources/channel):
  CANm transmit interrupt (m = 0 to 2)
  - CANm transmit complete interrupt
  - CANm transmit abort interrupt
  - CANm transmit/receive FIFO transmit complete interrupt (in transmit mode, gateway mode)
  - CANm transmit history interrupt
  - CANm transmit queue Interrupt

  CANm transmit/receive FIFO receive complete interrupt (in receive mode, gateway mode)
  CANm error interrupt

When an interrupt request is generated, the corresponding interrupt request flag is set to 1 (interrupt request present). In this case, when the interrupt enable bit is set to 1 (enabling interrupts), an interrupt request is output from the RS-CANFD module. (Generation of interrupts also depends on the interrupt control register settings of the interrupt controller.)

Setting the interrupt request flag to 0 (no interrupt request present) or setting the interrupt enable bit to 0 (disabling interrupts) clears the current interrupt request. The current interrupt request is still output until the interrupt request flag is cleared.

Table 17.175 lists the CAN interrupt sources. **Figure 17.2** shows the CAN global interrupt block diagram. **Figure 17.3** shows the CAN channel interrupt block diagram.

Table 17.175 List of CAN Interrupt Sources

	Interrupt Source		Corresponding Interrupt Request Flag	Corresponding Interrupt Enable Bit
Global interrupts	Receive FIFO	Receive FIFO 0	RFIF in the RSCFDn(CFD)RFSTS0 register	RFIE in the RSCFDn(CFD)RFCC0 register
		Receive FIFO 1	RFIF in the RSCFDn(CFD)RFSTS1 register	RFIE in the RSCFDn(CFD)RFCC1 register
		Receive FIFO 2	RFIF in the RSCFDn(CFD)RFSTS2 register	RFIE in the RSCFDn(CFD)RFCC2 register
		Receive FIFO 3	RFIF in the RSCFDn(CFD)RFSTS3 register	RFIE in the RSCFDn(CFD)RFCC3 register
		Receive FIFO 4	RFIF in the RSCFDn(CFD)RFSTS4 register	RFIE in the RSCFDn(CFD)RFCC4 register
		Receive FIFO 5	RFIF in the RSCFDn(CFD)RFSTS5 register	RFIE in the RSCFDn(CFD)RFCC5 register
		Receive FIFO 6	RFIF in the RSCFDn(CFD)RFSTS6 register	RFIE in the RSCFDn(CFD)RFCC6 register
		Receive FIFO 7	RFIF in the RSCFDn(CFD)RFSTS7 register	RFIE in the RSCFDn(CFD)RFCC7 register
	Global error		• DEF in the RSCFDn(CFD)GERFL register • MES in the RSCFDn(CFD)GERFL register • THLES in the RSCFDn(CFD)GERFL register • CMPOF in the RSCFDnCFDGERFL register	• DEIE in the RSCFDn(CFD)GCTR register • MEIE in the RSCFDn(CFD)GCTR register • THLEIE in the RSCFDn(CFD)GCTR register • CMPOFIE in the RSCFDnCFDGCTR register
Channel interrupts (m = 0 to 2)	CANm transmit	CANm transmit complete	TMTRF[1:0] in the RSCFDn(CFD)TMSTSp register	TMIEp in the RSCFDn(CFD)TMIECy register
		CANm transmit abort	TMTRF[1:0] in the RSCFDn(CFD)TMSTSp register	TAIE in the RSCFDn(CFD)CmCTR register
		CANm transmit/ receive FIFO transmit complete	CFTXIF in the RSCFDn(CFD)CFSTSk register	CFTXIE in the RSCFDn(CFD)CFCCk register
		CANm transmit queue	TXQIF in the RSCFDn(CFD)TXQSTSm register	TXQIE in the RSCFDn(CFD)TXQCCm register
		CANm transmit history	THLIF in the RSCFDn(CFD)THLSTSm register	THLIE in the RSCFDn(CFD)THLCCm register
	CANm transmit/receive FIFO receive complete		CFRXIF in the RSCFDn(CFD)CFSTSk register	CFRXIE in the RSCFDn(CFD)CFCCk register
	CANm error		• BEF in the RSCFDn(CFD)CmERFL register • ALF in the RSCFDn(CFD)CmERFL register • BLF in the RSCFDn(CFD)CmERFL register • OVLF in the RSCFDn(CFD)CmERFL register • BORF in the RSCFDn(CFD)CmERFL register • BOEF in the RSCFDn(CFD)CmERFL register • EPF in the RSCFDn(CFD)CmERFL register • EWF in the RSCFDn(CFD)CmERFL register • SOCO in the RSCFDnCFDCmFDSTS register • EOCO in the RSCFDnCFDCmFDSTS register • TDCVF in the RSCFDnCFDCmFDSTS register	• BEIE in the RSCFDn(CFD)CmCTR register • ALIE in the RSCFDn(CFD)CmCTR register • BLIE in the RSCFDn(CFD)CmCTR register • OLIE in the RSCFDn(CFD)CmCTR register • BORIE in the RSCFDn(CFD)CmCTR register • BOEIE in the RSCFDn(CFD)CmCTR register • EPIE in the RSCFDn(CFD)CmCTR register • EWIE in the RSCFDn(CFD)CmCTR register • SOCOIE in the RSCFDnCFDCmCTR register • EOCOIE in the RSCFDnCFDCmCTR register • TDCVFIE in the RSCFDnCFDCmCTR register

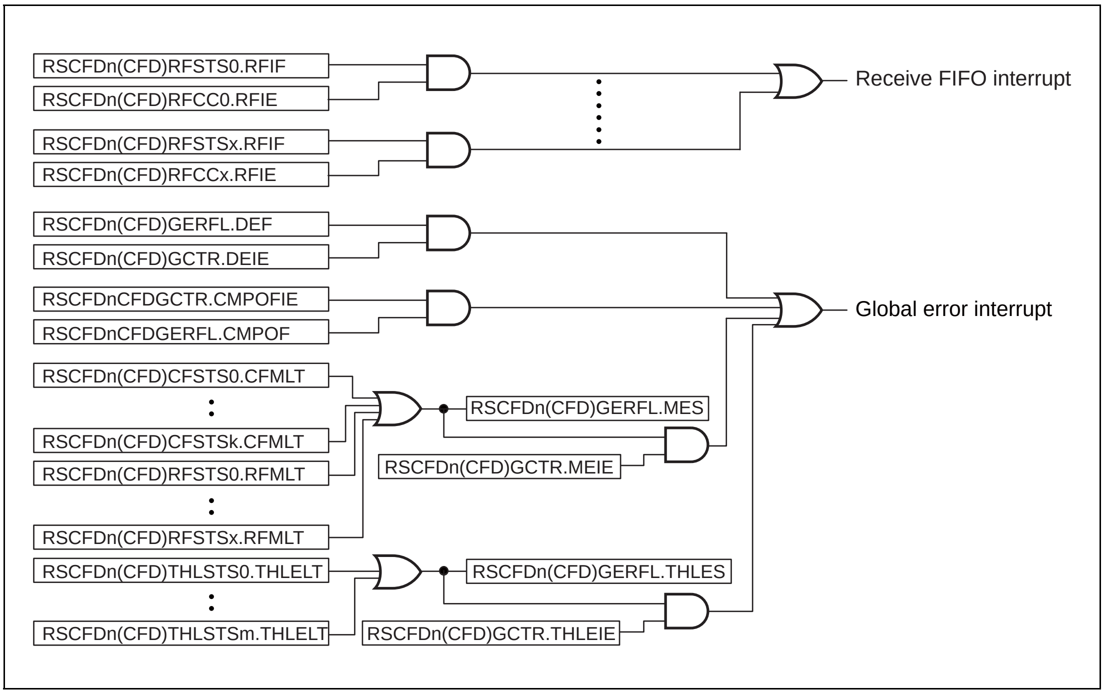

Figure 17.2 CAN Global Interrupt Block Diagram

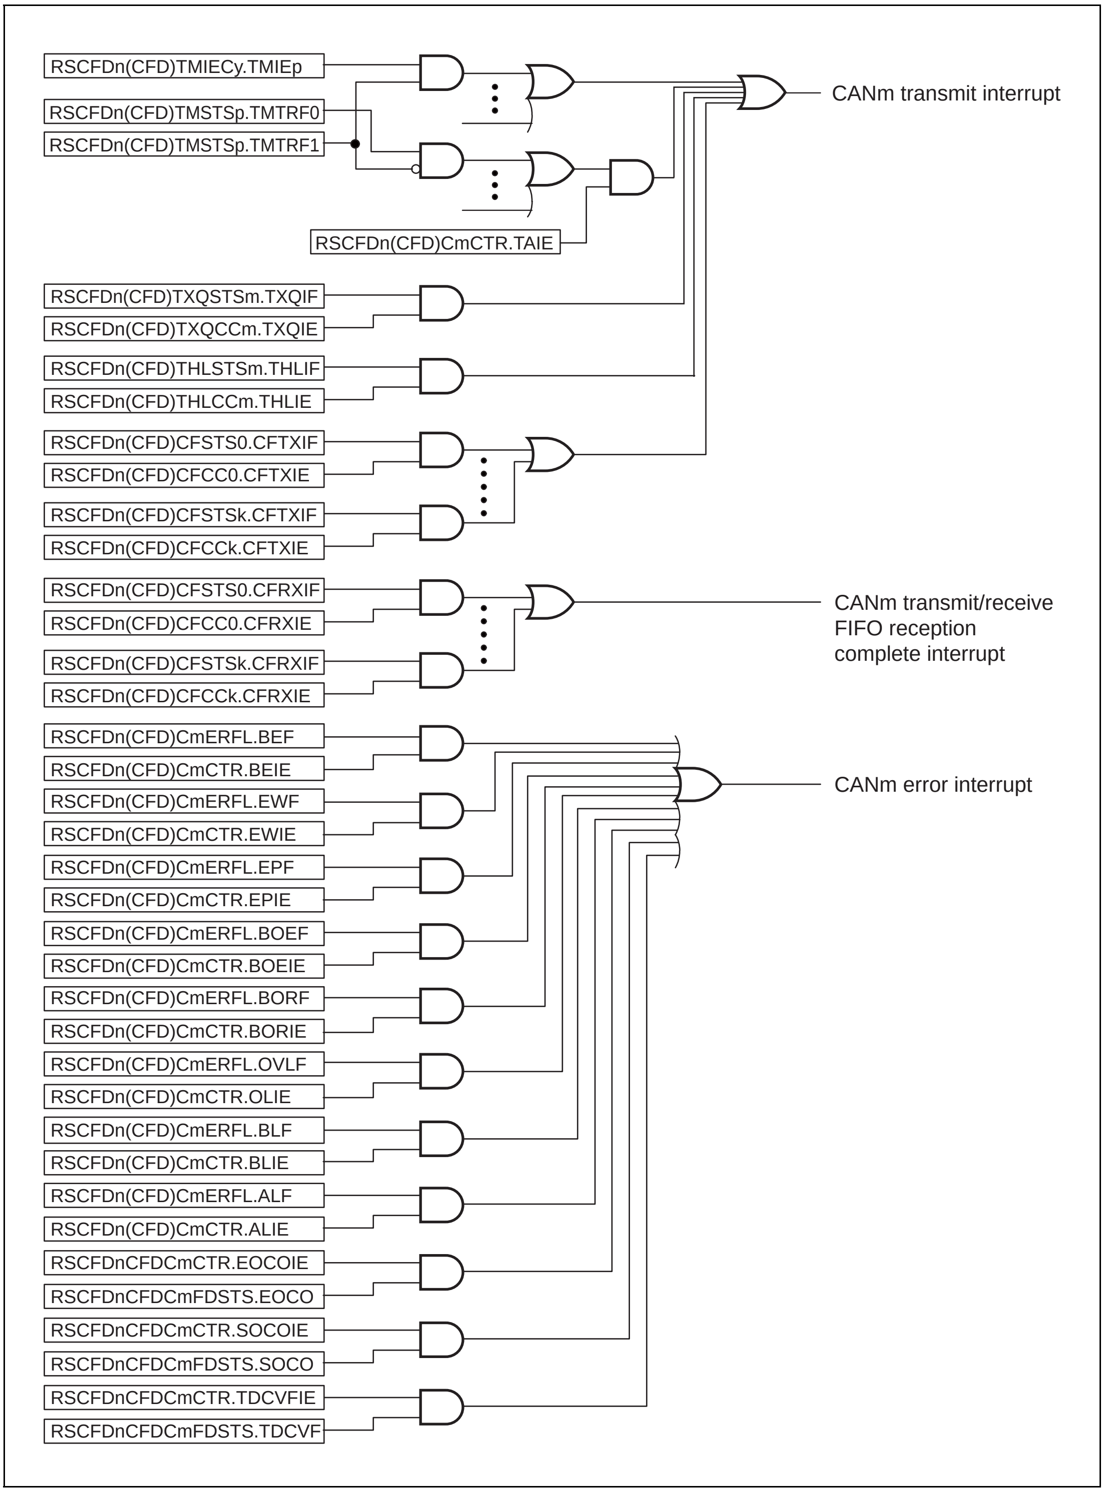

Figure 17.3 CAN Channel Interrupt Block Diagram

17.5.2 DMA Trigger (Only in CAN FD Mode)

In CAN FD mode, receive FIFO buffers can be related to DMA channels. The following 14 FIFO buffers can be related.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k (k = 3 × m, m = 0 to 2) allocated to channel m

When the DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) is set to 1 and an unread message is remaining in the related FIFO, a DMA transfer request trigger is generated.

17.6 CAN Modes

The RS-CANFD module has four global modes to control the entire RS-CANFD module status and four channel modes to control individual channel status. Details of global modes are described in **Section 17.6.1, Global Modes**, and details of channel modes are described in **Section 17.6.2, Channel Modes**.

- Global stop mode: Stops the clocks of the entire module to achieve low power consumption.
- Global reset mode: Performs initial settings for the entire module.
- Global test mode: Performs test settings and performs the RAM test.
- Global operating mode: Makes the entire module operable.
- Channel stop mode: Stops the channel clock.
- Channel reset mode: Performs initial settings for the channels.
- Channel halt mode: Stops CAN communication and allows channel testing.
- Channel communication mode: Performs CAN communication.

17.6.1 Global Modes

Figure 17.4 shows the transitions of global modes.

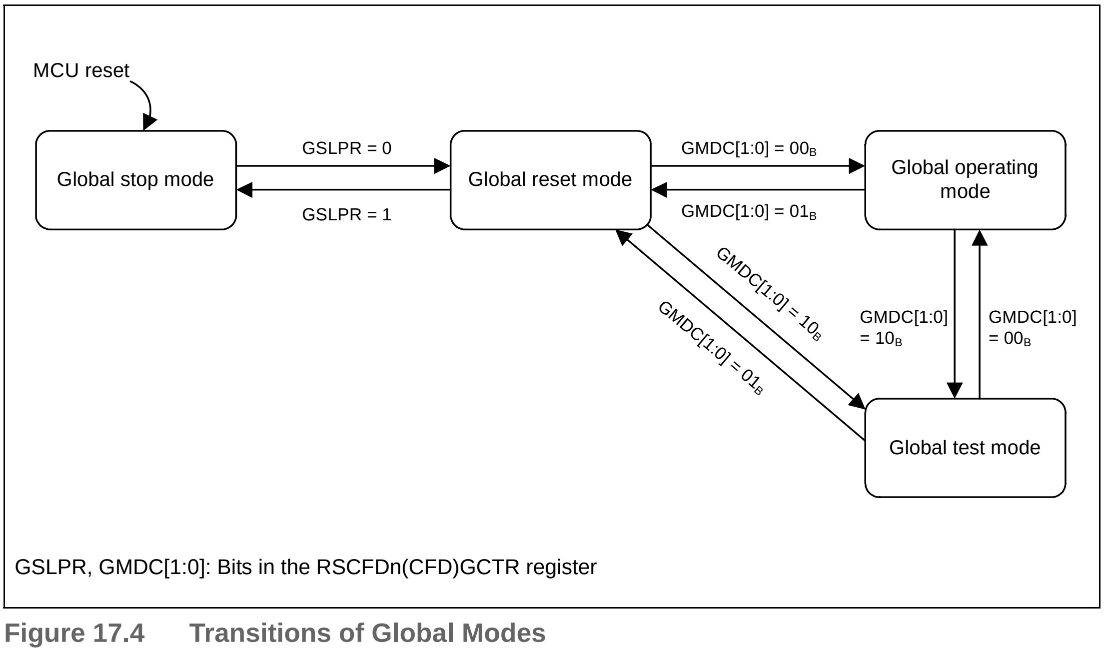

Figure 17.4 Transitions of Global Modes

In some cases, global mode transitions also force channel mode transitions. **Table 17.176** shows the channel mode transitions depending on the global mode setting dictated by the GMDC[1:0] bits and the GSLPR bit.

Table 17.176 Transitions of Channel Modes Depending on Global Mode Setting (GMDC[1:0] and GSLPR Bits)

Channel Mode before Setting	Channel Mode after Setting			
	GMDC[1:0] = 00_B GSLPR = 0 (Global Operation)	GMDC[1:0] = 10_B GSLPR = 0 (Global Test)	GMDC[1:0] = 01_B GSLPR = 0 (Global Reset)	GMDC[1:0] = 01_B GSLPR = 1 (Global Stop)
Channel communication	Channel communication	Channel halt	Channel reset	Transition prohibited
Channel halt	Channel halt	Channel halt	Channel reset	Transition prohibited
Channel reset	Channel reset	Channel reset	Channel reset	Channel stop
Channel stop	Channel stop	Channel stop	Channel stop	Channel stop

Note: GMDC[1:0], GSLPR: Bits in the RSCFDn(CFD)GCTR register

Table 17.177 shows the global mode transition time.

Table 17.177 Global Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Global stop	Global reset	Three pclk cycles
Global reset	Global stop	Three pclk cycles
Global reset	Global test	Ten pclk cycles
Global reset	Global operating	Ten pclk cycles
Global test	Global reset	Two CAN bit times*1,*2
Global test	Global operating	Three pclk cycles
Global operating	Global reset	Two CAN bit times*1,*2
Global operating	Global test	Two CAN frames*1

Note 1. CAN frame time and CAN bit time of the lowest communication speed of the channels in use

Note 2. In CAN FD mode, this time value is the CAN bit time of the nominal bit rate.

17.6.1.1 Global Stop Mode

In global stop mode, clocks of the CAN do not run and therefore power consumption is reduced. CAN registers can be read, but writing data to them is prohibited. Register values are retained. Only the clock used by the CPU for writing to the GSLPR bit runs in this mode.

After the MCU is reset, the CAN module transitions to global stop mode. Setting the GSLPR bit in the RSCFDn(CFD)GCTR register to 1 (in global stop mode) in global reset mode sets the CSLPR bit in each RSCFDn(CFD)CmCTR register to 1 (channel stop mode). Afterwards, if all channels are forced to transition to channel stop mode, the CAN module transitions to global stop mode. The GSLPR bit should not be modified in global operating mode or global test mode.

17.6.1.2 Global Reset Mode

In global reset mode, RS-CANFD module settings are performed. When the RS-CANFD module transitions to global reset mode, some registers are initialized. For registers to be initialized, see **Table 17.180, Registers Initialized in Global Reset Mode or Channel Reset Mode** and **Table 17.181, Registers Initialized Only in Global Reset Mode**.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 01_B sets the CHMDC[1:0] bits in each RSCFDn(CFD)CmCTR register (m = 0 to 2) to 01_B (channel reset mode). If all channels are forced to transition to channel reset mode, the CAN module transitions to global reset mode. Channels that are already in channel reset mode or channel stop mode do not transition (because the CHMDC[1:0] bits have already been set to 01_B).

17.6.1.3 Global Test Mode

In global test mode, settings for test-related registers are performed. When the CAN module transitions to global test mode, all CAN communications are disabled.

Setting the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register to 10_B sets the CHMDC[1:0] bits in each RSCFDn(CFD)CmCTR register to 10_B (channel halt mode). If all channels are forced to transition to channel halt mode, the CAN module transitions to global test mode. Channels that are in channel stop mode, channel reset mode, or channel halt mode do not transition.

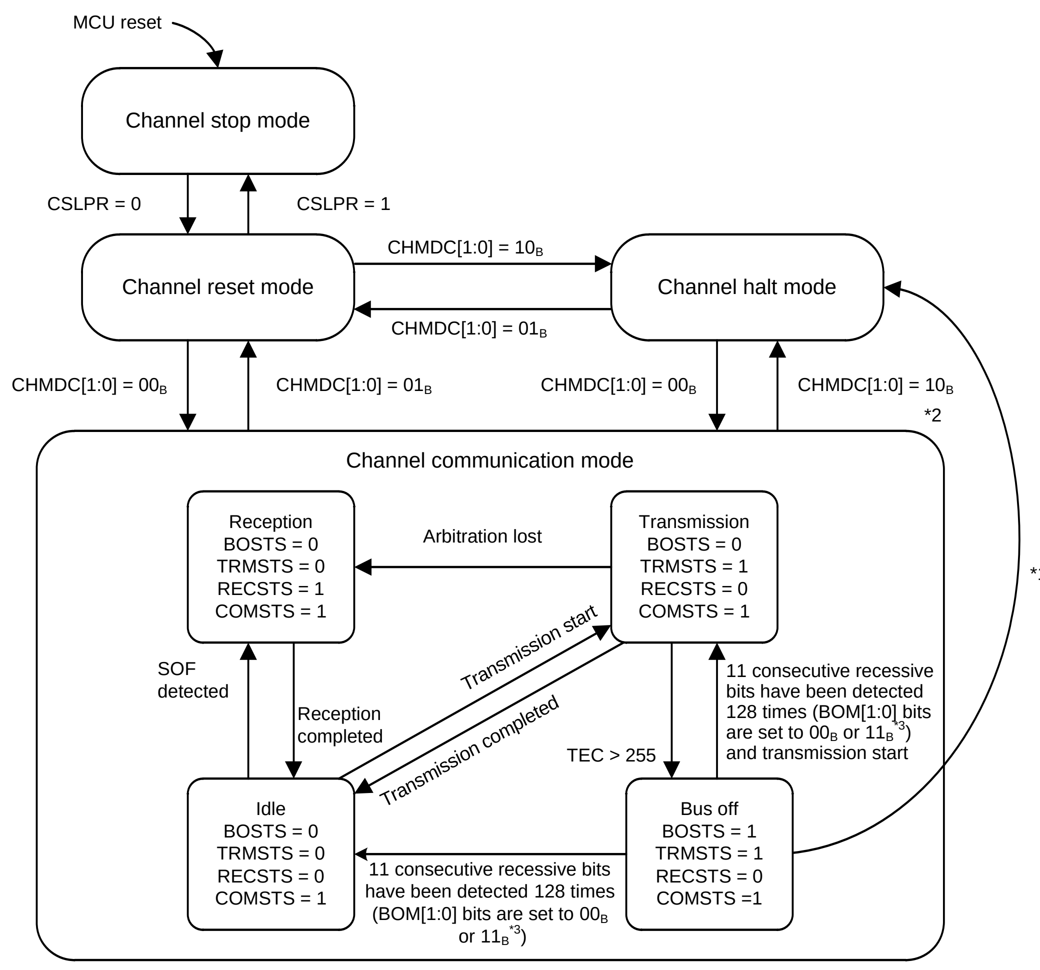
17.6.1.4 Global Operating Mode

The RS-CANFD module operates in global operating mode.

When the GMDC[1:0] bits in the RSCFDn(CFD)GCTR register are set to 00_B, the RS-CANFD module transitions to global operating mode.

17.6.2 Channel Modes

Figure 17.5 shows a channel mode state transition chart. **Table 17.178** shows the channel mode transition time.



Note: CHMDC[1:0], CSLPR, BOM[1:0]: Bits in the RSCFDn(CFD)CmCTR register (m = 0 to 2)
BOSTS, TRMSTS, RECSTS, COMSTS: Bits in the RSCFDn(CFD)CmSTS register

Note 1. Timing of transition from bus off state to channel halt mode
- When BOM[1:0] = 01_B: Transition to channel halt mode when TEC exceeds 255
- When BOM[1:0] = 10_B: Transition to channel halt mode when 11 consecutive recessive bits have been detected 128 times
- When BOM[1:0] = 11_B: Transition to channel halt mode when the CHMDC[1:0] bits are set to 10_B

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode.

Note 3. When 11 consecutive recessive bits are detected 128 times before the CHMDC[1:0] bits are set to 10_B.

Figure 17.5 Channel Mode State Transition Chart

Table 17.178 Channel Mode Transition Time

Mode before Transition	Mode after Transition	Maximum Transition Time
Channel stop	Channel reset	Three pclk cycles
Channel reset	Channel stop	Three pclk cycles
Channel reset	Channel halt	Three CANm bit times*1
Channel reset	Channel communication	Four CANm bit times*1
Channel halt	Channel reset	Two CANm bit times*1
Channel halt	Channel communication	Four CANm bit times*1
Channel communication	Channel reset	Two CANm bit times*1
Channel communication	Channel halt	Two CANm frames

Note 1. In CAN FD mode, this time value is the CANm bit time of the nominal bit rate.

17.6.2.1 Channel Stop Mode

In channel stop mode, clocks are not supplied to channels and therefore power consumption is reduced. Channel-related registers can be read, but writing data to them is prohibited (except write to CSLPR bit). Register values are retained.

Each channel enters channel stop mode after the MCU is reset. Channels also transition to channel stop mode when the CSLPR bit in the RSCFDn(CFD)CmCTR register (m = 0 to 2) is set to 1 (channel stop mode) in channel reset mode. The CSLPR bit should not be modified in channel communication mode and channel halt mode.

17.6.2.2 Channel Reset Mode

In channel reset mode, channel settings are performed. When a channel transitions to channel reset mode, some channel-related registers are initialized. For registers to be initialized, see **Table 17.180, Registers Initialized in Global Reset Mode or Channel Reset Mode**.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 01_B (channel reset mode) during CAN communication, communication is terminated before it is completed and the channel transitions to channel reset mode. **Table 17.179** shows the operation when the CHMDC[1:0] bits are set to 01_B (channel reset mode) during CAN communication.

17.6.2.3 Channel Halt Mode

In channel halt mode, settings for test-related registers of channels are performed. When a channel transitions to channel halt mode, CAN communication of the channel stops.

Table 17.179 shows operation when the CHMDC[1:0] bits are set to 10_B (channel halt mode) during CAN communication.

Table 17.179 Operation when a Channel Transitions to Channel Reset Mode/Channel Halt Mode

Mode	During Reception	During Transmission	Bus Off State
Channel reset (CHMDC[1:0] = 01_B)	Transitions to channel reset mode before reception is completed.*1	Transitions to channel reset mode before transmission is completed.*1	Transitions to channel reset mode before bus off recovery.
Channel halt*3 (CHMDC[1:0] = 10_B)	Transitions to channel halt mode after reception is completed.*2	Transitions to channel halt mode after transmission is completed.	[When BOM[1:0] = 00_B] Transitions to channel halt mode (CHMDC[1:0] = 10_B) only after bus off recovery. [When BOM[1:0] = 01_B] Transitions to channel halt mode automatically when the condition for transition to bus off state is met. [When BOM[1:0] = 10_B] Transitions to channel halt mode automatically after bus off recovery. [When BOM[1:0] = 11_B] Transitions to channel halt mode immediately after the CHMDC[1:0] bits are set to 10_B before bus off recovery.

Note 1. To allow transition to channel reset mode after communication is completed, set the CHMDC[1:0] bits to 10_B and confirm that communication has been completed and transition to channel halt mode has been made, and then set the CHMDC[1:0] bits to 01_B.

Note 2. While the CAN bus is locked at the dominant level, transition to channel halt mode is not made. In that case, enter channel reset mode. The CAN bus status can be confirmed with the BLF flag of the RSCFDn(CFD)CmERFL register that becomes 1 when bus lock is detected.

Note 3. In classical CAN mode, when the transition from channel reset mode to channel halt mode is to be made, set the RSCANnCmCFG register in channel reset mode and then transition to channel halt mode. In CAN FD mode, set the RSCFDnCFDCmNCFG register and the RSCFDnCFDCmDCFG register, and then make a transition.

17.6.2.4 Channel Communication Mode

In channel communication mode, CAN communication is performed. Each channel has the following communication states during CAN communication.

- Idle: Neither reception nor transmission is in progress.
- Reception: Receiving a message sent from another node.
- Transmission: Transmitting a message.
- Bus off: Isolated from CAN communication.

When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 00_B, the channel transitions to channel communication mode. After that, once 11 consecutive recessive bits have been detected, the COMSTS flag in the RSCFDn(CFD)CmSTS register (m = 0 to 2) is set to 1 (communication is ready) and transmission and reception are enabled on the CAN network as an active node. At this time, transmission and reception of messages can be started.

17.6.2.5 Bus Off State

A channel transitions to the bus off state according to the transmit/receive error counter increment/decrement rules of the CAN specifications.

The conditions for returning from the bus off state are determined by the BOM[1:0] bits in the RSCFDn(CFD)CmCTR register.

- When BOM[1:0] = 00_B:
  Bus off recovery is compliant with the CAN specifications. After 11 consecutive recessive bits have been detected 128 times, a channel returns from the bus off state to the CAN communication ready state (error active state). At that time, the TEC[7:0] and REC[7:0] bits in the RSCFDn(CFD)CmSTS register are initialized to 00_H, the BORF flag in the RSCFDn(CFD)CmERFL register is set to 1 (bus off recovery is detected), and a bus off recovery interrupt request is generated. When the CHMDC[1:0] bits in the RSCFDn(CFD)CmCTR register are set to 10_B (channel halt mode) in the bus off state, the channel transitions to channel halt mode after bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times).
- When BOM[1:0] = 01_B:
  When a channel transitions to the bus off state, the CHMDC[1:0] bits are set to 10_B and the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H. The BORF flag is not set to 1, and bus off recovery interrupt request is not generated.
- When BOM[1:0] = 10_B:
  When a channel has transitioned to the bus off state, the CHMDC[1:0] bits are set to 10_B. After bus off recovery has been completed (11 consecutive recessive bits have been detected 128 times), the channel transitions to channel halt mode. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, the BORF flag is set to 1, and a bus off recovery interrupt request is generated.
- When BOM[1:0] = 11_B:
  When the CHMDC[1:0] bits are set to 10_B in the bus off state, the channel transitions to channel halt mode before bus off recovery is completed. At that time, the TEC[7:0] and REC[7:0] bits are initialized to 00_H, but the BORF flag is not set to 1. Also, a bus off recovery interrupt is not generated.
  However, the BORF flag becomes 1 and a bus off recovery interrupt request is generated if a CAN module transitions to error active state (by detecting 11 consecutive recessive bits 128 times) before CHMDC[1:0] bits are set to 10_B.

If the RS-CANFD module causes the channel to transition to channel halt mode simultaneously with a program write to the CHMDC[1:0] bits, the program write takes precedence. An automatic transition to channel halt mode when the BOM[1:0] bits are set to 01_B or 10_B is made only when the CHMDC[1:0] bits are 00_B (channel communication mode).

Furthermore, setting the RTBO bit in the RSCFDn(CFD)CmCTR register to 1 allows a forced return from the bus off state. As soon as the RTBO bit is set to 1, the state changes to the error active state. After 11 consecutive recessive bits have been detected, the CAN module becomes ready for communication. In this case, the BORF flag is not set to 1 and the TEC[7:0] and REC[7:0] bits are initialized to 00_H. Write 1 to the RTBO bit only when the BOM[1:0] value is 00_B. Writing 1 to the RTBO bit in a state other than the bus off state is ignored, and the RTBO bit is immediately set to 0.

17.6.3 Initializing Registers by Transition to CAN Mode

Table 17.180 lists bits and flags to be initialized by a transition to channel reset mode. These bits and flags are also initialized by a transition to global reset mode. Furthermore, **Table 17.181** lists bits and flags to be initialized only by a transition to global reset mode.

Table 17.180 Registers Initialized in Global Reset Mode or Channel Reset Mode

Register	Bit / Flag
RSCFDn(CFD)CmCTR register	(ROM), CRCT, CTMS[1:0], CTME, CHMDC[1:0]
RSCFDn(CFD)CmSTS register	CHLTSTS, EPSTS, BOSTS, TRMSTS, RECSTS, COMSTS, (ESIF), REC[7:0], TEC[7:0]
RSCFDn(CFD)CmERFL register	CRCREG[14:0], ADERR, B0ERR, B1ERR, CERR, AERR, FERR, SERR, ALF, BLF, OVLF, BORF, BOEF, EPF, EWF, BEF
RSCFDnCFDCmFDCTR register	EOCCLR, SOCCLR
RSCFDnCFDCmFDSTS register	SOC[7:0], EOC[7:0], SOCO, EOCO, TDCVF, TDCR[6:0]
RSCFDnCFDCmFDCRC register	CRCREG[20:0],SCNT[3:0]
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in transmit mode or gateway mode: CFMC[7:0], CFFLL, CFEMP, CFMLT, CFRXIF, CFTXIF
RSCFDn(CFD)CFTISTS register	CFkTXIF
RSCFDn(CFD)TMCp register	TMOM, TMTAR, TMTR
RSCFDn(CFD)TMSTSp register	TMTARM, TMTRM, TMTRF[1:0], TMTSTS
RSCFDn(CFD)TMTRSTSy register	TMTRSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTARSTSy register	TMTARSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTCSTSy register	TMTCSTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TMTASTSy register	TMTASTSp (Bits of corresponding channel are initialized in channel reset mode.)
RSCFDn(CFD)TXQCCm register	TXQE
RSCFDn(CFD)TXQSTSm register	TXQIF, TXQFLL, TXQEMP
RSCFDn(CFD)THLCCm register	THLE
RSCFDn(CFD)THLSTSm register	THLMC[4:0], THLIF, THLELT, THLFLL, THLEMP
RSCFDn(CFD)GTINTSTS0 register	TSIFm, TAIFm, TQIFm, CFTIFm, THIFm (m = 0 to 2)

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

Table 17.181 Registers Initialized Only in Global Reset Mode

Register	Bit / Flag
RSCFDn(CFD)GSTS register	GHLTSTS
RSCFDn(CFD)GERFL register	EEF0, EEF1, EEF2, (CMPOF), THLES, MES, DEF
RSCFDn(CFD)GTSC register	TS[15:0]
RSCFDn(CFD)RMNDy register	RMNSq
RSCFDn(CFD)RFCCx register	RFE
RSCFDn(CFD)RFSTSx register	RFMC[7:0], RFIF, RFMLT, RFFLL, RFEMP
RSCFDn(CFD)CFCCk register	When transmit/receive FIFO buffer is in receive mode: CFE
RSCFDn(CFD)CFSTSk register	When transmit/receive FIFO buffer is in receive mode: CFMC[7:0], CFFLL, CFEMP, CFTXIF, CFRXIF, CFMLT
RSCFDn(CFD)FESTS register	CFkEMP, RFxEMP
RSCFDn(CFD)FFSTS register	CFkFLL, RFxFLL
RSCFDn(CFD)FMSTS register	CFkMLT, RFxMLT
RSCFDn(CFD)RFISTS register	RFxIF
RSCFDn(CFD)CFRISTS register	CFkRXIF
RSCFDnCFDCDTCT register	CFDMAEm, RFDMAEx
RSCFDnCFDCDTSTS register	CFDMASTSm, RFDMASTSx
RSCFDn(CFD)GTSTCFG register	RTMPS[6:0], C0ICBCE, C1ICBCE, C2ICBCE
RSCFDn(CFD)GTSTCTR register	RTME, ICBCTME

Note: Bits and flags in parentheses exist only in registers in CAN FD mode.

17.7 Reception Functions

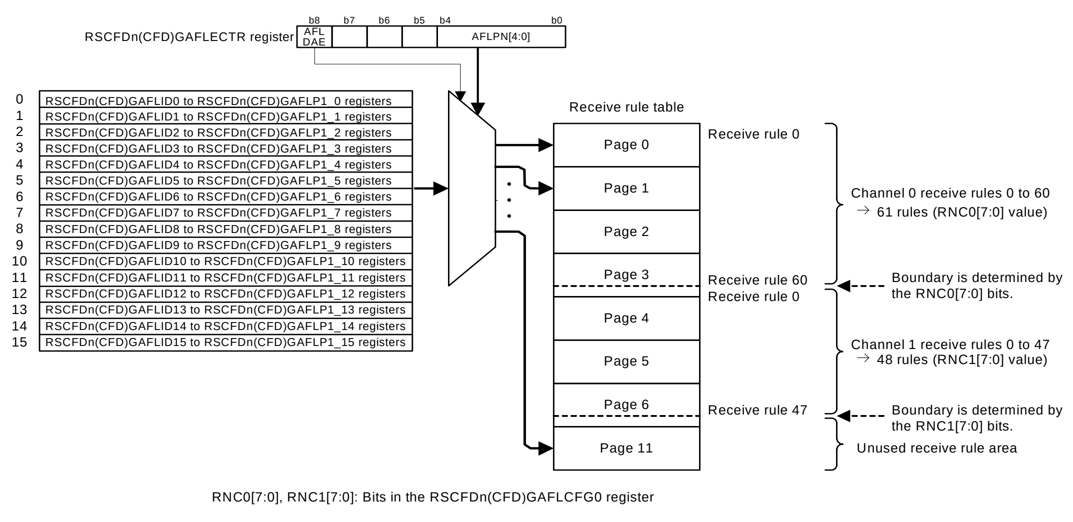
There are two reception types.

- Reception by receive buffers:
  0 to 47 receive buffers can be shared by all channels. Since messages stored in receive buffers are overwritten at each reception, the latest receive data can always be read.
- Reception by receive FIFO buffers and transmit/receive FIFO buffers (receive mode):
  Eight receive FIFO buffers can be shared by all channels and three dedicated transmit/receive FIFO buffers are provided for each channel. Messages of up to the number of buffer stages specified with the RFDC[2:0] and CFDC[2:0] bits can be stored in FIFO buffers and can be read sequentially from the oldest.

17.7.1 Data Processing Using the Receive Rule Table

Data processing using the receive rule table allows dispatching of selected messages to the specified buffer. Data processing includes acceptance filter processing, DLC filter processing, routing processing, label addition processing, and mirror function processing.

Up to 128 receive rules can be registered per channel and up to (64 × number of channels) total receive rules can be registered in the entire module. (Up to 192 receive rules can be registered in this module that has 3 channels.) Set receive rules for each channel. Receive rules cannot be shared with other channels. If receive rules are not set, no messages can be received. **Figure 17.6** illustrates how receive rules are registered.



RNC0[7:0], RNC1[7:0]: Bits in the RSCFDn(CFD)GAFLCFG0 register

Figure 17.6 Registration of Receive Rules (for Setting Channel 0 and 1)

CAUTION

Receive rules for each channel must be set in contiguous blocks.
Channel 1 rules and channel 0 rules must be set separately.

Each receive rule consists of 16 bytes in the RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, and RSCFDn(CFD)GAFLP1_j registers (j = 0 to 15). The RSCFDn(CFD)GAFLIDj register is used to set GAFLID, GAFLIDE bit, GAFLRTR bit, and the mirror function, the RSCFDn(CFD)GAFLMj register is used to set mask, the RSCFDn(CFD)GAFLP0_j register is used to set label information to be added, DLC value, and storage receive buffer, and the RSCFDn(CFD)GAFLP1_j register is used to set storage FIFO buffer. Up to 16 receive rules can be set per page.

17.7.1.1 Acceptance Filter Processing

In the acceptance filter processing, the ID data, IDE bit, and RTR bit in a received message are compared with the ID data, IDE bit, and RTR bit set in the receive rule of the corresponding channel. When all these bits match, the message passes through the acceptance filter processing. The ID data, IDE bit, and RTR bit in the received message which correspond to the bits set to 0 (bits are not compared) in the RSCFDn(CFD)GAFLMj register are not compared and are regarded as matched.

Check begins with the receive rule with the smallest number for the corresponding channel. When all the bits to be compared in a received message match the bits set in the receive rule or when all the receive rules are compared without any match, filter processing stops. If there is no matching receive rule, the received message is not stored in the receive buffer or FIFO buffer.

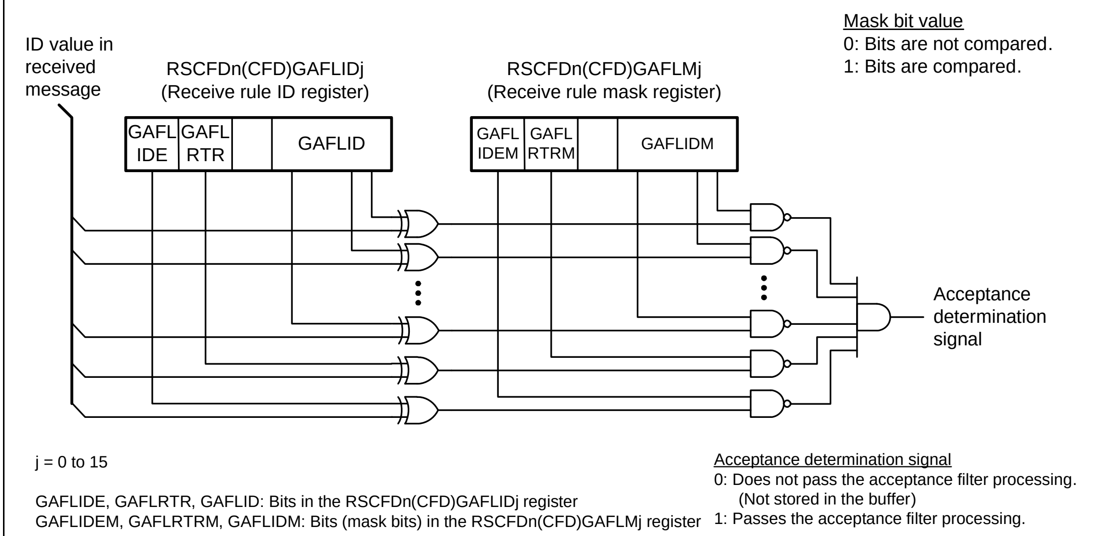


Figure 17.7 Acceptance Filter Function

17.7.1.2 DLC Filter Processing

When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), DLC filter processing is performed for messages that pass through the acceptance filter processing. When the DLC value in a message is equal to or larger than the DLC value set in the receive rule, the message passes through the DLC filter processing.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 0 (DLC replacement is disabled), the DLC value in the received message is stored in the buffer. In this case, all the data bytes in the received message are stored in the buffer.

When a message has passed through the DLC filter processing with the DRE bit in the RSCFDn(CFD)GCFG register set to 1 (DLC replacement is enabled), the DLC value in the receive rule is stored in the buffer instead of the DLC value in the received message. In this case, a value of 00_H is stored in each data byte beyond the number of bytes which is indicated by the DLC value in the receive rule.

When the DLC value in the received message is smaller than that in the receive rule, the message does not pass through the DLC filter processing. In this case, the message is not stored in the receive buffer or the FIFO buffer and the DEF flag in the RSCFDn(CFD)GERFL register is set to 1 (a DLC error is present).

17.7.1.3 Routing Processing

Messages that passed through the acceptance filter processing and the DLC filter processing are stored in receive buffers, receive FIFO buffers, and/or transmit/receive FIFO buffers (set to receive mode or gateway mode). Message storage destination is set by the GAFLRMV and GAFLRMDP[6:0] bits in the RSCFDn(CFD)GAFLP0_j register (j = 0 to 15) and by the RSCFDn(CFD)GAFLP1_j register. Messages that passed through the acceptance filter processing and the DLC filter processing can be stored in up to eight buffers.

In CAN FD mode, if the payload length of the received message exceeds the payload storage size of the storage buffer, the CMPOF flag in the RSCFDnCFDGERFL register is set to 1 (payload overflow) and the processing is handled according to the CMPOC bit in the RSCFDnCFDGCFG register. When the CMPOC bit is 0, the received message which exceeds the payload storage size is not stored in the buffer. When the CMPOC bit is 1, the received message is stored in the buffer with payloads exceeding the storage size being discarded, and depending on the DRE bit in the RSCFDnCFDGCFG register the received DLC value or the DLC value of the receive rule is stored in the buffer.

17.7.1.4 Label Addition Processing

It is possible to add 12-bit label information to messages that passed through the filter processing and store them in buffers. This label information is set in the GAFLPTR[11:0] bits in the RSCFDn(CFD)GAFLP0_j register.

17.7.1.5 Mirror Function Processing

The mirror function allows the CAN node to receive its own transmitted messages. The mirror function is enabled by setting the MME bit in the RSCFDn(CFD)GCFG register to 1 (mirror function is enabled).

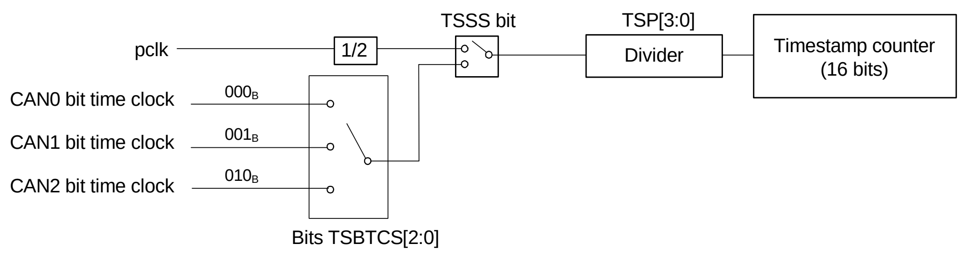
When the mirror function is in use, receive rules for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register is set to 0 are used for data processing when receiving messages transmitted from other CAN nodes. When the CAN node is receiving its own transmitted messages, receive rules for which the GAFLLB bit is set to 1 are used for data processing.

17.7.1.6 Timestamp

The timestamp counter is a 16-bit free-running counter used for recording message receive time and transmission time. The timestamp counter value is fetched at the timing set with the TSCCFG[1:0] bits in the RSCFDn(CFD)GCFG register and is then stored in a receive buffer or a FIFO buffer together with the message ID and data during data reception. The clock source of the timestamp counter is selected by the TSBTCS[2:0] and TSSS bits in the RSCFDn(CFD)GCFG register. In classical CAN mode, either pclk/2 or the CANm bit time clock (m = 0 to 2). In CAN FD mode, the clock source is selectable from pclk/2 or nominal CANm bit time clock. However, do not select the nominal CANm bit time clock of channels that handle CAN FD frames. The timestamp counter count source is obtained by dividing the selected clock source by the TSP[3:0] value in the RSCFDn(CFD)GCFG register.

When the CANm bit time clock or nominal CANm bit time clock is used as a clock source, the timestamp counter stops when the corresponding channel transitions to channel reset mode or channel halt mode. When the pclk/2 is used as a clock source, the timestamp function is not affected by channel mode.

The timestamp counter value is reset to 0000_H by setting the TSRST bit in the RSCFDn(CFD)GCTR register to 1.



TSBTCS[2:0], TSSS, TSP[3:0]: Bits in the RSCFDn(CFD)GCFG register

Note: When specifying pclk/2 as the timestamp counter count source, set bits TSBTCS[2:0] to 000_B.

Figure 17.8 Timestamp Function Block Diagram

17.8 Transmission Functions

There are three types of transmission. In classical CAN mode, transmittable payload length is 8 bytes in every transmission type. In CAN FD mode, transmittable payload length varies with transmission types.

- Transmission using transmit buffers:
  Each channel has 16 buffers. Transmittable payload length in CAN FD mode is 20 bytes. However, when transmit buffer merge mode is used, four buffers out of 16 buffers are allocated as a payload-only storage area and two buffers are able to transmit payloads with a length of more than 20 bytes.
- Transmission using transmit/receive FIFO buffers (transmit mode):
  Each channel has three FIFO buffers. Up to 128 messages can be contained in a single FIFO buffer. Transmittable payload length in CAN FD mode is 64 bytes. Each FIFO buffer is used with a link to a transmit buffer. Only the message to be transmitted next in a FIFO buffer becomes the target of transmit priority determination. Messages are transmitted sequentially on a first-in, first-out basis.
- Transmission using transmit queues:
  Up to 16 transmit buffers per channel can be allocated to the transmit queues. Transmittable payload length in CAN FD mode is 20 bytes. Transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel. Transmit buffers are allocated to transmit queues in descending order of buffer number. All messages in transmit queues, which are targets of priority determination, are transmitted in the order of ID number.

Figure 17.9 shows the allocation of transmit queues and transmit/receive FIFO buffer link.

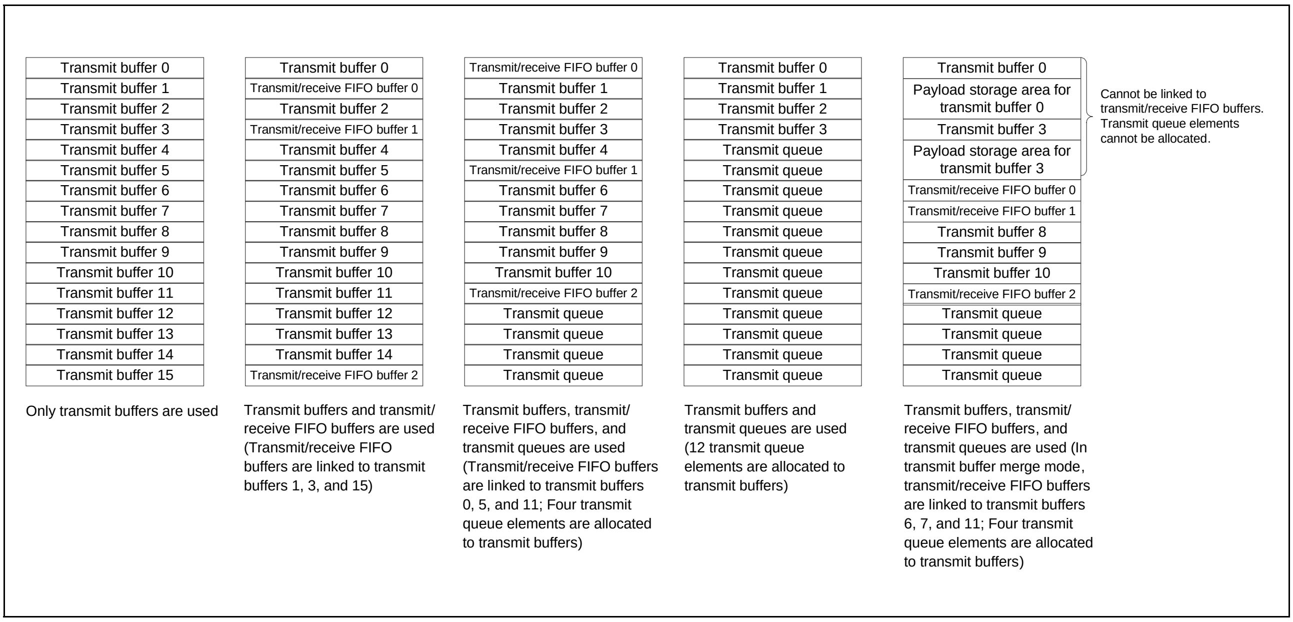


Figure 17.9 Allocation of Transmit Queues and Transmit/Receive FIFO Buffer Links

17.8.1 Transmit Priority Determination

If transmit requests are issued from multiple buffers or from the queue on the same channel, transmit priority is determined using one of the following methods.

- ID priority (TPRI bit = 0)
- Transmit buffer number priority (TPRI bit = 1)

All CAN channels use the setting of the TPRI bit in the RSCFDn(CFD)GCFG register.

When the TPRI bit is set to 0, messages are transmitted according to the priority of stored message IDs. ID priority conforms to the CAN bus arbitration specification defined in the CAN specifications. All IDs of pending transmit messages are targets of priority determination, regardless of whether they are stored in transmit buffers, transmit/receive FIFO buffers (set to transmit mode or gateway mode), or the transmit queue. If even a single transmit queue is used, select ID priority. When transmit/receive FIFO buffers are used, the oldest message in a FIFO buffer becomes the target of priority determination. When a message is being transmitted from a transmit/receive FIFO buffer, the next message in the FIFO buffer becomes the target of priority determination. When a transmit queue is used, all messages in the transmit queue are targets of priority determination. If the same ID is set for two or more buffers, the buffer with the smaller buffer number takes precedence.

When the TPRI bit is set to 1, the message in the transmit buffer with the smallest buffer number among all buffers with a transmit request is transmitted first. When transmit/receive FIFO buffers are linked to transmit buffers, transmit priority is determined according to linked transmit buffer numbers.

When messages are retransmitted due to an arbitration-lost or an error, transmit priority determination is made again regardless of the TPRI bit setting. When a 2-bit ECC error is detected in the priority determination processing, no message is transmitted (only when the EEFE bit in the RSCANnGCFG register is 1 in classical CAN mode).

17.8.2 Transmission Using Transmit Buffers

Setting the transmit request bit (TMTR bit in the RSCFDn(CFD)TMCp register) in a transmit buffer to 1 (transmission is requested) allows transmission of data frames or remote frames.

The transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register (p = 0 to 47). When transmit completes successfully, the TMTRF[1:0] flag is set to 10_B (transmission has been completed (without transmit abort request)) or 11_B (transmission has been completed (with transmit abort request)).

17.8.2.1 Transmit Abort Function

With respect to transmit buffers for which the TMTRM bit in the RSCFDn(CFD)TMSTSp register is set to 1 (a transmit request is present), when the TMTAR bit in the RSCFDn(CFD)TMCp register is set to 1 (transmit abort is requested), the transmit request is canceled. When transmit abort is completed, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSp register is set to 01_B (transmit abort has been completed) and the transmit request is canceled (clearing the TMTRM bit to 0).

A message that is being transmitted or a message to be transmitted next according to the transmit priority determination cannot be aborted. However, when an arbitration-lost or an error occurs during transmission of a message for which the TMTAR bit is set to 1, retransmission is not performed.

17.8.2.2 One-Shot Transmission Function (Retransmission Disabling Function)

When the TMOM bit in the RSCFDn(CFD)TMCp register is set to 1 (one-shot transmission is enabled), transmission is performed only once. Even if an arbitration-lost or an error occurs, retransmission is not performed.

The one-shot transmit result is shown by the TMTRF[1:0] flag in the corresponding RSCFDn(CFD)TMSTSp register. When one-shot transmission completes successfully, the TMTRF[1:0] flag is set to 10_B or 11_B. When an arbitration-lost or an error occurs, the TMTRF[1:0] flag is set to 01_B (transmit abort has been completed).

17.8.2.3 Transmit Buffer Merge Mode (Only in CAN FD Mode)

Transmit buffers can transmit messages with a payload length of 20 bytes, but can transmit messages with a payload length of up to 64 bytes by merging three transmit buffers in transmit buffer merge mode.

Setting the TMME bit to 1 in the RSCFDnCFDCmFDCFG register enables transmit buffer merge mode. In this mode, six buffers per channel become a merge area and two sets of transmit buffers (16 × m) + 0 to (16 × m) + 2 and transmit buffers (16 × m) + 3 to (16 × m) + 5 are merged. A transmission request is made by the first transmit buffer, and subsequent two buffers are used as a payload storage area. See **Section 17.11.3.1, Procedure for Transmission from Transmit Buffers** and **Table 17.188, Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)**. Do not set the transmission request bit (TMTR bit in the RSCFDnCFDTMCp register) and the transmission abort request bit (TMTAR bit in the RSCFDnCFDTMCp register) to 1 for transmit buffers except for the first buffer.

While transmit buffer merge mode is enabled, do not link the transmit/receive FIFO buffer to six merged buffers or allocate it to the transmit queue.

17.8.3 Transmission Using FIFO Buffers

Multiple messages can be stored in a single transmit/receive FIFO buffer, up to the number specified by the FIFO buffer depth, which is set by the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 8). Messages are transmitted sequentially on a first-in, first-out basis.

Each transmit/receive FIFO buffer is linked to a transmit buffer selected by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register. When the CFE bit in the RSCFDn(CFD)CFCCk register is set to 1 (transmit/receive FIFO buffers are used), transmit/receive FIFO buffers become targets of transmit priority determination. Priority of only the next transmit message is determined in the FIFO buffer.

When the CFE bit is set to 0 (no transmit/receive FIFO buffer is used), the CFEMP flag is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) at the timing below.

- The transmit/receive FIFO buffer becomes empty immediately if the message in it is not being transmitted or is not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, arbitration-lost or the transition to channel halt mode in the case that a message in it is being transmitted or to be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages cannot be stored in FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

17.8.3.1 Interval Transmission Function

A message transmission interval time can be set to space the transmission of messages from the same FIFO buffer when using a transmit/receive FIFO buffer set to transmit mode or gateway mode.

Immediately after the first message has been transmitted successfully from the FIFO buffer with the CFE bit in the RSCFDn(CFD)CFCCk register set to 1, the interval timer starts counting (after EOF7 of the CAN protocol). After that, when the interval time has passed, the next message is transmitted. The interval timer stops in channel reset mode or by clearing the CFE bit to 0.

The interval time is set by the CFITT[7:0] bits in the RSCFDn(CFD)CFCCk register. When the interval timer is not used, set the CFITT[7:0] bits to 00_H.

Select an interval timer count source using the CFITR and CFITSS bits in the RSCFDn(CFD)CFCCk register. When the CFITR and CFITSS bits are set to 00_B, the count source is obtained by dividing pclk/2 by the value of the ITRCP[15:0] bits. When the CFITR and CFITSS bits are set to 10_B, the count source is obtained by dividing pclk/2 by (the value of the ITRCP[15:0] bits × 10). When the CFITR and CFITSS bits are set to $x1_B$, the CANm bit time clock becomes a count source in classical CAN mode and the nominal CANm bit time clock becomes a count source in CAN FD mode (Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode).

The interval time is calculated by the following equations where M is the value of ITRCP[15:0] and N is the value of CFITT[7:0].

- When CFITR and CFITSS = 00_B:

  $$\frac{1}{\text{pclk frequency}} \times 2 \times M \times N$$

- When CFITR and CFITSS = 10_B:

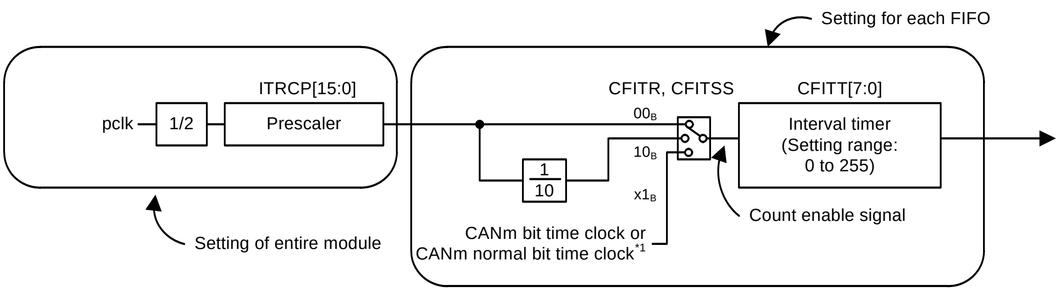
  $$\frac{1}{\text{pclk frequency}} \times 2 \times M \times 10 \times N$$

- When CFITR and CFITSS = $x1_B$:

  Classical CAN mode: $\frac{1}{\text{CANm bit time clock frequency}} \times N$

  CAN FD mode: $\frac{1}{\text{Nominal CANm bit time clock frequency}} \times N$

Figure 17.10 shows the interval timer block diagram.

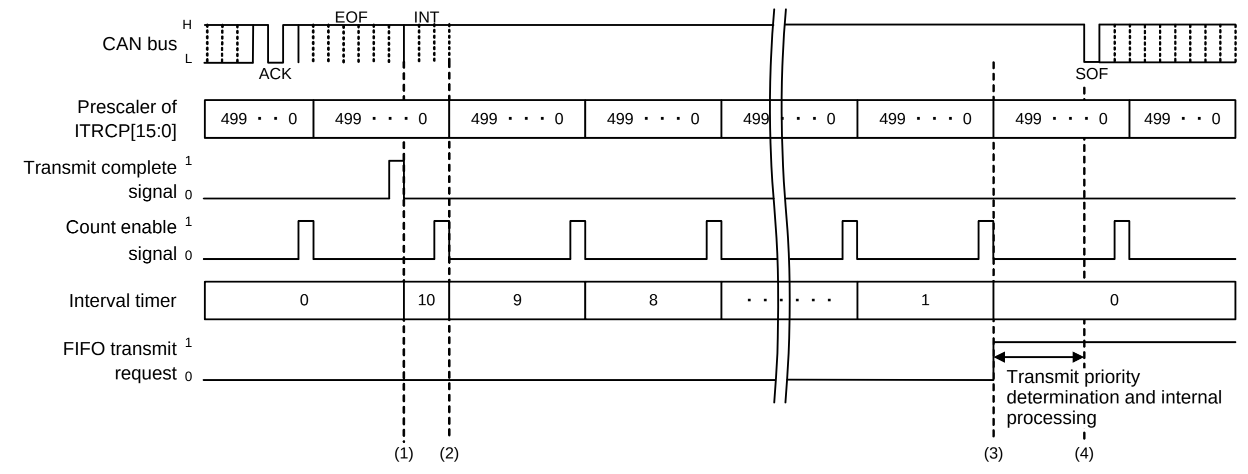


ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register
CFITR, CFITSS, CFITT[7:0] : Bits in the RSCFDn(CFD)CFCCk register
Note 1. Use this count source only for the channel does not handle the CAN FD frames in CAN FD mode.

Note: m = 0 to 2, k = 0 to 8

Figure 17.10 Interval Timer Block Diagram

Figure 17.11 shows the interval timer timing diagram.



Interval time (theoretical value) = $\frac{2}{\text{pclk frequency}}$ × (set ITRCP[15:0] value) × set CFITT[7:0] value

- ITRCP[15:0]: Bits in the RSCFDn(CFD)GCFG register (The set value is 500 in this figure.)
- CFITT[7:0]: Bits in the RSCFDn(CFD)CFCCk register (The set value is 10 in this figure.)

Figure 17.11 Interval Timer Timing Chart

(1) The interval timer starts counting upon completion of transmission. Since the prescaler is not initialized at the time of transmission completion, the first interval time contains an error of up to one count of the interval timer.

(2) The interval timer is decremented by 1 upon the next count enable signal.

(3) When the interval timer has decreased to 0, the transmit/receive FIFO buffer issues a transmit request.

(4) The transmit/receive FIFO buffer is determined for the next transmission by the priority determination, it starts transmitting data. Transmission starts usually with a delay of three CANm bit time clock cycles or less from the issue of transmit request. If multiple internal processes (such as receive filter processing, message routing, and transmit priority determination) take place in all channels, a delay of up to 774 pclk cycles may be generated.

17.8.4 Transmission Using Transmit Queues

Three to sixteen buffers (up to 10 buffers in transmit buffer merge mode) are allocated to a transmit queue for each channel, and transmit buffer ((16 × m) + 15) is used as an access window of a corresponding channel.

All messages in a transmit queue are targets of transmit priority determination and are transmitted in the ID priority order regardless of storage sequence. If two messages having the same ID are stored in a transmit queue, these messages are not always transmitted in the order of their storage in the transmit queue.

Setting the TXQE bit in the RSCFDn(CFD)TXQCCm register to 0 disables transmit queues. When the TXQE bit is set to 0, the TXQEMP flag in the RSCFDn(CFD)TXQSTSm register is set to 1 (the transmit queue contains no messages (transmit queue empty)) at the timing below.

- The transmit queue becomes empty immediately when no message in it is being transmitted or will be transmitted next.
- The transmit queue becomes empty after transmission completion, CAN bus error detection, arbitration-lost, or the transition to channel halt mode when a message in it is being transmitted or will be transmitted next.

When the TXQE bit is cleared to 0, all messages in transmit queues are lost and messages cannot be stored in transmit queues. Confirm that the TXQEMP flag is set to 1 before setting the TXQE bit to 1 again.

17.8.5 Transmit Data Padding (Only in CAN FD Mode)

When the payload length indicated by the set DLC value in a transmit message exceeds the payload storage area size of a buffer to be used for transmission, excessive payloads are padded by CC_H.

This processing is performed in the following cases when the transmit buffer merge mode is disabled (TMME bit in the RSCFDnCFDCmFDCFG register is 0).

- Transmit/receive FIFO set to transmission or gateway mode:
  When the payload length of the transmit DLC exceeds the transmit/receive FIFO payload storage area size set by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register
- Transmit buffer (including transmit queue):
  When the payload length of the transmit DLC exceeds 20 bytes

When the transmit buffer merge mode is enabled, no transmit data is padded in any transmission using a transmit buffer, transmit/receive FIFO buffer, or transmit queue. At this time, do not set a payload length more than the payload storage size of the buffer for transmitting as the DLC value in the transmit message.

17.8.6 Transmit History Function

Information about transmission-completed messages can be stored in the transmit history buffer. Each channel has a single transmit history buffer that can contain 16 sets of transmit history data.

A message transmit source buffer type can be selected by the THLDTE bit in the RSCFDn(CFD)THLCCm register. The THLEN bit in the RSCFDn(CFD)CFIDk register (k = 0 to 8) determines whether transmit history data is stored for each message.]

In classical CAN mode, the TMTSCE bit in the RSCANnGCFG register can be used to set whether to include a timestamp value in the transmit history data. In CAN FD mode, a timestamp value is always included.

The following information on a transmitted message will be stored in the transmit history buffer after the successful completion of transmission.

Storage of the transmit history data after the successful completion of transmission may take up to 134 cycles of pclk in classical CAN mode or 402 pclk cycles in CAN FD mode.

- Buffer type: 001_B: Transmit buffer
  010_B: Transmit/receive FIFO buffer
  100_B: Transmit queue
- Buffer number: Number of source transmit buffer, transmit queue, or transmit/receive FIFO buffer. This number depends on buffer types. See **Table 17.182**.
- Label data: Label information of the transmit message
- Timestamp: Timestamp value of the transmit message
  (When the TMTSCE bit is 1 in classical CAN mode)

Table 17.182 Transmit History Data Buffer Numbers

Buffer No. \ Buffer type	001_B	010_B	100_B
0000_B	Transmit buffer 16 × m + 0	Buffer numbers of the transmit buffer linked to the transmit/receive FIFO buffer by the CFTML[3:0] bits in the RSCFDn(CFD)CFCCk register (k = 0 to 8)	Buffer numbers of the transmit buffer allocated to the transmit queue that performed transmission
0001_B	Transmit buffer 16 × m + 1		
0010_B	Transmit buffer 16 × m + 2		
0011_B	Transmit buffer 16 × m + 3		
0100_B	Transmit buffer 16 × m + 4		
0101_B	Transmit buffer 16 × m + 5		
0110_B	Transmit buffer 16 × m + 6		
0111_B	Transmit buffer 16 × m + 7		
1000_B	Transmit buffer 16 × m + 8		
1001_B	Transmit buffer 16 × m + 9		
1010_B	Transmit buffer 16 × m + 10		
1011_B	Transmit buffer 16 × m + 11		
1100_B	Transmit buffer 16 × m + 12		
1101_B	Transmit buffer 16 × m + 13		
1110_B	Transmit buffer 16 × m + 14		
1111_B	Transmit buffer 16 × m + 15		

Label data is used to identify each message. Unique label data can be added to each message transmitted from a transmit buffer, transmit queue, or transmit/receive FIFO buffer.

The timestamp value is fetched from the timestamp counter at the SOF (start of frame) timing of the message. For details about the timestamp counter, see **Section 17.7.1.6, Timestamp**.

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. If an attempt is made to store new transmit history data while the buffer is full, the buffer overflows and the new data is discarded.

17.9 Gateway Function

When a transmit/receive FIFO buffer is set to gateway mode, receive messages can be transmitted from an arbitrary channel without CPU intervention.

When the CFM[1:0] bits in the RSCFDn(CFD)CFCCk register are set to 10_B (gateway mode) for the transmit/receive FIFO buffer selected by the RSCFDn(CFD)GAFLP1_j register of a channel being used for transmission, messages that pass through filter processing according to the receive rule are stored in the specified transmit/receive FIFO buffer and are automatically transmitted from the buffer.

Messages stored in a transmit/receive FIFO buffer are transmitted sequentially on a first-in, first-out basis. Only the message to be transmitted next becomes the target of transmit priority determination.

Transmit/receive FIFO buffers in the gateway mode are disabled by setting the CFE bit in the RSCFDn(CFD)CFCCk register to 0 and the CFEMP flag becomes 1 according to the timing below.

- The transmit/receive FIFO buffer becomes empty immediately when the message in it is not being transmitted and will not to be transmitted next.
- The transmit/receive FIFO buffer becomes empty after transmission completion, CAN bus error detection, or arbitration-lost when the message in it is being transmitted or will be transmitted next.

When the CFE bit is cleared to 0, all messages in transmit/receive FIFO buffers are lost and messages can no longer be stored in transmit/receive FIFO buffers. Confirm that the CFEMP flag is set to 1 before setting the CFE bit to 1 again.

17.9.1 CAN-CAN FD Gateway (Only in CAN FD Mode)

When the gateway function is used in CAN FD mode, a frame to be transmitted can be replaced with a classical CAN frame or a CAN FD frame.

Setting the GWEN bit in the RSCFDnCFDCmFDCFG register to 1 enables the CAN-CAN FD gateway. The FDF and BRS bits in the transmit frame can be selected by the GWFDF and GWBRS bits in the RSCFDnCFDCmFDCFG register. When the DLC value of the received CAN frame is 1001_B or more and the GWFDF bit is 1 (CAN FD frame), the DLC value is replaced with 1000_B.

When the CAN-CAN FD gateway is enabled, do not perform routing for the following frames.

- CAN FD frames with a payload length of more than 8 bytes
- Remote frames

When the CAN-CAN FD gateway is enabled, the following frame should be transmitted in the channel by setting of GWFDF.

- When GWFDF bit is set to 0, only classical CAN frame should be transmitted.
- When GWFDF bit is set to 1, only CAN FD frame should be transmitted.

17.10 Test Function

The test function is classified into communication tests and global tests.

- Communication tests: Performed for each channel.
  - Standard test mode
  - Listen-only mode
  - Self-test mode 0 (external loopback mode)
  - Self-test mode 1 (internal loopback mode)
  - Restricted operation mode (only in CAN FD mode)
- Global tests: Performed for the entire module
  - RAM test (read/write test)
  - Inter-channel communication test [CRC error test enabled]

17.10.1 Standard Test Mode

CRC tests are enabled in standard test mode. The CRC value calculated by the RS-CANFD module based on the transmit message or receive message is stored in the register. This CRC value is stored in the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register when the message is a classical CAN frame (CRC length = 15 bits) or in the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register when the message is a CAN FD frame (CRC length = 17 or 21 bits). Use the inter-channel communication test function for CRC error tests. For details, see **Section 17.10.6.1, CRC Error Test**.

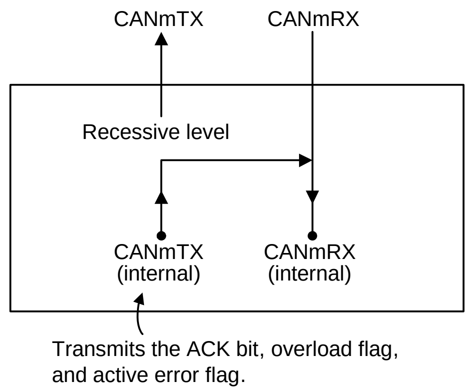
17.10.2 Listen-Only Mode

Listen-only mode allows reception of data frames and remote frames. Only recessive bits are transmitted on the CAN bus, and the ACK bit, overload flag, and active error flag are not transmitted.

Listen-only mode is available for detecting the communication speed.

Do not make a transmit request from any buffer or queue in listen-only mode.

Figure 17.12 shows the connection when listen-only mode is selected.



Note: m = 0 to 2

Figure 17.12 Connection when Listen-Only Mode is Selected

17.10.3 Self-Test Mode (Loopback Mode)

In self-test mode, transmitted messages are compared with the receive rule of the own channel and the messages are stored in a buffer if they have passed through the filter processing. Messages transmitted from other CAN nodes are compared only with the receive rule for which the GAFLLB bit in the RSCFDn(CFD)GAFLIDj register (j = 0 to 15) is set to 0 (when a message transmitted from another CAN node is received).

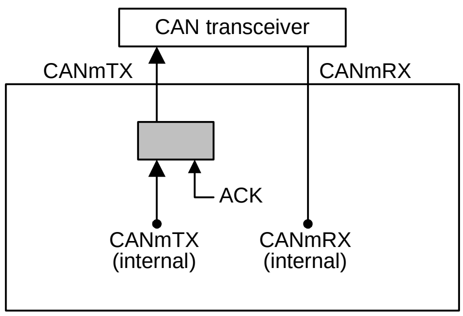
If the mirror function and self-test mode are both enabled, the self-test mode setting takes precedence.

17.10.3.1 Self-Test Mode 0 (External Loopback Mode)

Self-test mode 0 is used to perform a loopback test within a channel including the CAN transceiver.

In self-test mode 0, transmitted messages are handled as messages received through the CAN transceiver and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

Figure 17.13 shows the connection when self-test mode 0 is selected.



Note: m = 0 to 2

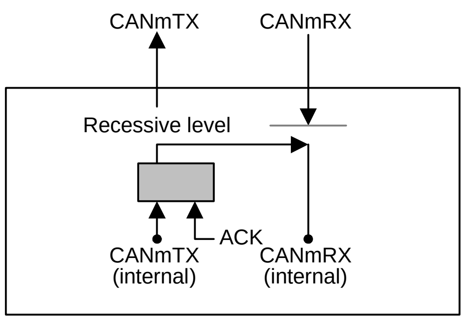
Figure 17.13 Connection when Self-Test Mode 0 is Selected

17.10.3.2 Self-Test Mode 1 (Internal Loopback Mode)

In self-test mode 1, transmitted messages are handled as received messages and are stored in a buffer. An ACK bit is generated to receive messages transmitted from the own CAN node.

In self-test mode 1, internal feedback from the internal CANmTX pin (m = 0 to 2) to the internal CANmRX pin is performed. The external CANmRX pin input is isolated. The external CANmTX pin outputs only recessive bits.

Figure 17.14 shows the connection when self-test mode 1 is selected.



Note: m = 0 to 2

Figure 17.14 Connection when Self-Test Mode 1 is Selected

17.10.4 Restricted Operation Mode (Only in CAN FD Mode)

In restricted operation mode, an ACK bit is generated when a valid data frame and a remote frame have been received, but these frames are not transmitted even if an error frame or an overload frame transmit condition is detected. When a condition is detected, operation is suspended until the bus idle state comes for resynchronization with the CAN communication. The receive error counter (REC) and the transmit error counter (TEC) do not change due to an error.

A desired transmission request can be made for transmission without restrictions.

17.10.5 RAM Test

The RAM test function allows accesses to all CAN RAM addresses.

When the RAM test function is used, the RAM is divided into pages of 256 bytes each. RAM test pages are set by the RTMPS[6:0] bits in the RSCFDn(CFD)GTSTCFG register. Data in the set page can be read from and written to the RSCFDn(CFD)RPGACCr register (r = 0 to 63). The available total RAM size is 7680 bytes ($1E00_H$) in classical CAN mode or 10656 bytes ($29A0_H$) in CAN FD mode.

In CAN FD mode, do not access more than 160 bytes in the last page (RTMPS = 29_H) during RAM test.

17.10.6 Inter-Channel Communication Test

The inter-channel communication test function allows communication test by internally connecting CAN channels to each other. During this test, channels are isolated from the external CAN bus.

Before starting data transmission/reception in channel communication mode, make transmission/reception settings for each channel. Set the channel(s) not participating in test to Channel halt mode.

Figure 17.15 shows the connection for inter-channel communication test.

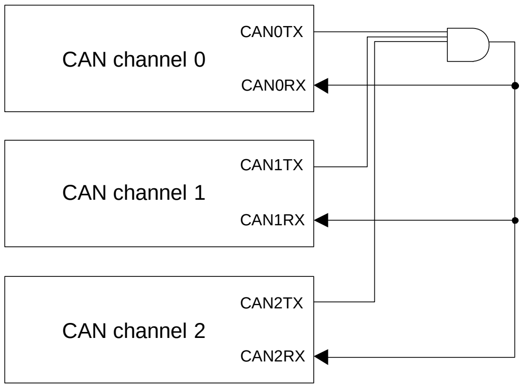


Figure 17.15 Connection for Inter-Channel Communication Test

17.10.6.1 CRC Error Test

A CRC error test is enabled during an inter-channel communication test. The following shows an example of channel 0 CRC error test procedure during a communication test between channel 0 and channel 1.

Preconditions

- Inter-channel communication test is enabled.
- Channel 0 and channel 1 are in standard test mode.

Procedure

1. Make a setting to send a message from the transmit buffer p of channel 1.
2. Set the CRCT bit in the RSCFDn(CFD)C0CTR register to 1 (to enable inversion of the first bit in the received ID field).
3. Set the TMTR bit in the RSCFDn(CFD)TMCp register to 1 (to issue a transmission request to the transmit buffer p of channel 1).
4. Wait for occurrence of a CAN0 error interrupt due to a channel bus error.
5. Read the CRCREG[14:0] bits in the RSCFDn(CFD)CmERFL register or the CRCREG[20:0] bits in the RSCFDnCFDCmFDCRC register of channel 0 and channel 1, and confirm that the CRC values are different on the transmission and the reception side.
6. Confirm that the CERR bit in RSCFDm(CFD)C0ERFL is 1 (CRC error detected).

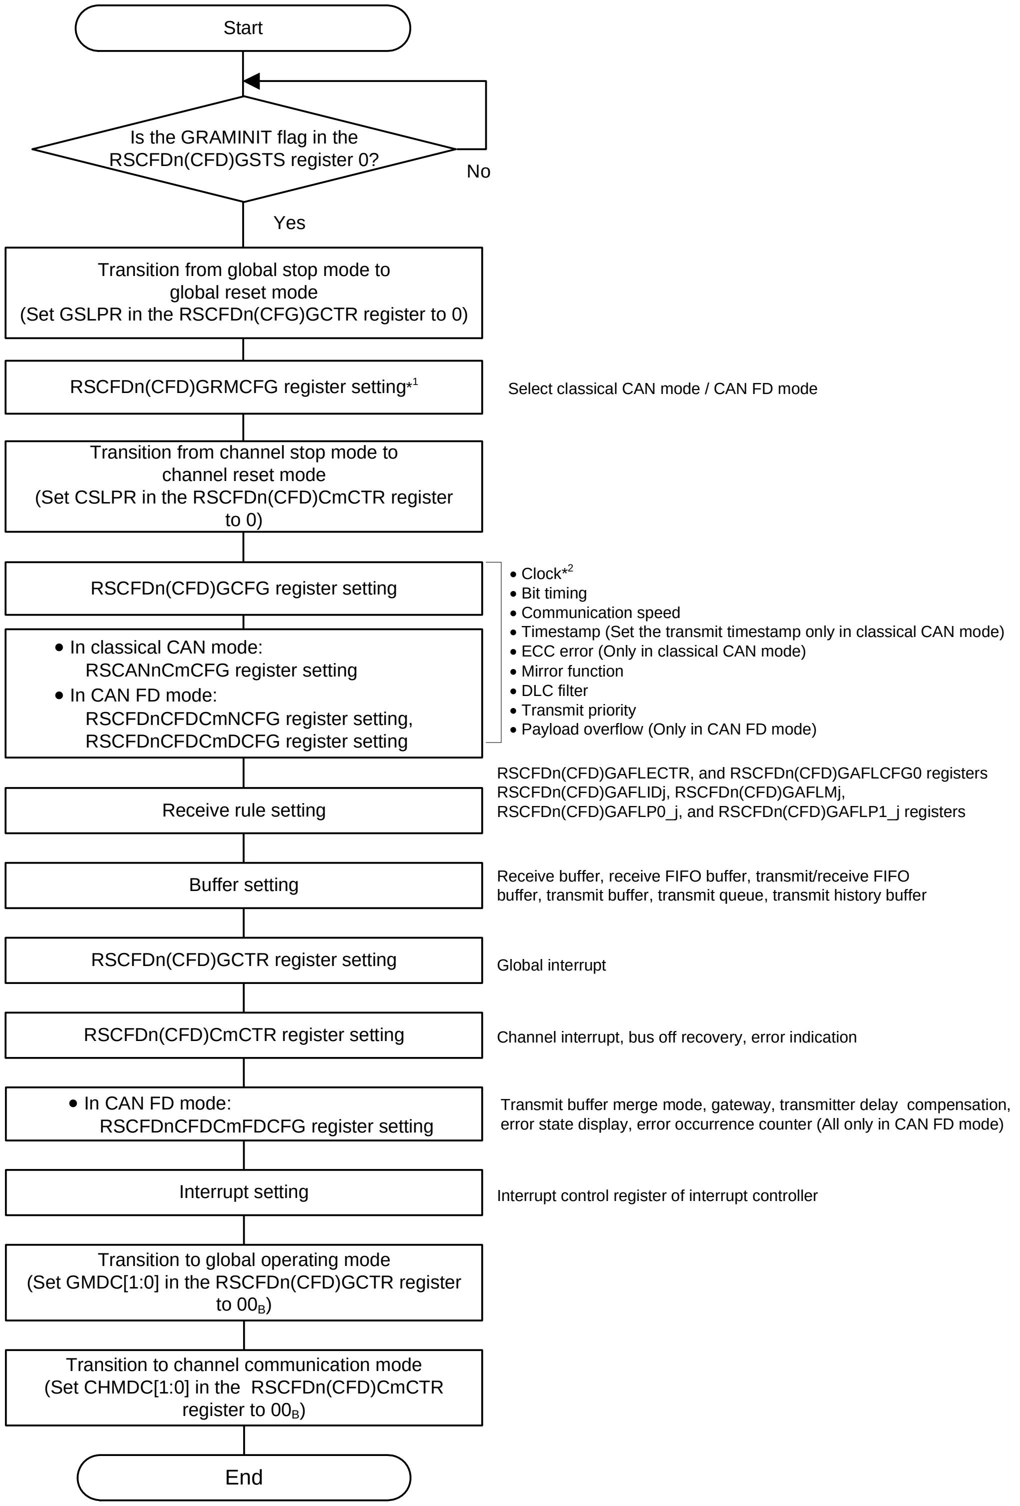
The CRC error test function generates an incorrect CRC value by inverting the first bit in the received ID field. Therefore, note that not a CRC error but a stuff error (continuous 6-bit data of the same level) is detected when a message in which ID’s upper 5-bit value is 10000_B or ID’s upper 6-bit value is 011111_B is received.

The CRC generation circuit of the RS-CANFD module is contained in the protocol controller of each channel. Another CRC calculation test is not necessary during transmission because the same circuit is used for both transmission and reception.

17.11 RS-CANFD Setting Procedure

17.11.1 Initial Settings

The RS-CANFD module initializes the CAN RAM after the MCU is reset. The RAM initialization time is 3794 pclk cycles. The GRAMINIT flag in the RSCFDn(CFD)GSTS register is set to 1 (CAN RAM initialization is ongoing) during the RAM initialization and is cleared to 0 (CAN RAM initialization is finished) when the initialization is completed. Make CAN settings after the GRAMINIT flag is cleared to 0. **Figure 17.16** shows the CAN setting procedure after the MCU is reset.



Note 1. The RSCANnGRMCFG register and the RSCFDnCFDGRMCFG register are the same register. Therefore, set either one of the registers.

Note 2. For the setting of CAN clock frequency, see **Table 17.7, Range of Operating Frequency Depending on the Transfer Rate and the Number of Channels in Use in the RH850/P1M-E**.

Note: m = 0 to 2, j = 0 to 15

Figure 17.16 CAN Setting Procedure after the MCU is Reset

17.11.1.1 Clock Setting

Set the CAN clock (fCAN) as a clock source of the RS-CANFD module. Select the clk_xincan or clkc using the DCS bit in the RSCFDn(CFD)GCFG register.

17.11.1.2 Bit Timing Setting

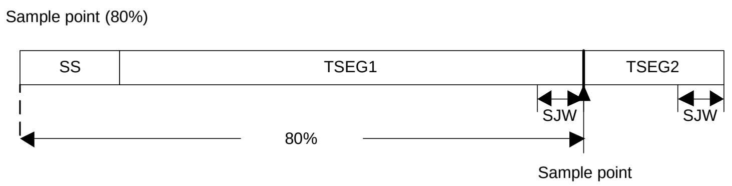
In the CAN protocol, one bit of a communication frame consists of three segments SS, TSEG1, and TSEG2, of which two segments TSEG1 and TSEG2 can be set by the corresponding registers for each channel. In classical CAN mode, set these two segments in the RSCANnCmCFG register. Two bit rates (nominal bit rate and data bit rate) are provided for CAN FD mode. Set the nominal bit rate in the RSCFDnCFDCmNCFG register and set the data bit rate in the RSCFDnCFDCmDCFG register. Sample point timing can be determined by setting these two segments. This timing can be adjusted in units of 1 Time Quantum (hereafter referred to as Tq). A single Tq is the cycle of clock obtained by dividing the clock selected by the DCS bit in the RSCFDn(CFD)GCFG register. Set a division ratio by the BRP[9:0] bits in the RSCANnCmCFG register in classical CAN mode (CANmTq clock), and by the NBRP[9:0] bits in the RSCFDnCFDCmNCFG register and the DBRP[7:0] bits in the RSCFDnCFDCmDCFG register in CAN FD mode (CANmTq(N) clock and CANmTq(D) clock).

Be sure to specify the same value for both NBRP[9:0] and DBRP[7:0].

To specify different values for the nominal bit rate and the data bit rate, change the values of the RSCFDnCFGCmNCFG.NTSEG1 and NTSEG2 bits and RSCFDnCFDCmDCFG.DTSEG1 and DTSEG2 bits, respectively.

When the TDCE bit is set to 1 (Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0] .

Figure 17.17 shows the bit timing chart. **Table 17.183** shows an example of bit timing setting.



Classical CAN mode:
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 4 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 25 Tq
- TSEG1 > TSEG2 ≥ SJW

CAN FD mode:

<Nominal bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 4 Tq to 128 Tq
- Set TSEG2 to a range of 2 Tq to 32 Tq
- Set SJW to a range of 1 Tq to 32 Tq
- Set SS + TSEG1 + TSEG2 to a range of 8 Tq to 161 Tq
- TSEG1 > TSEG2 ≥ SJW

<Data bit rate>
- SS = 1 Tq fixed
- Set TSEG1 to a range of 2 Tq to 16 Tq
- Set TSEG2 to a range of 2 Tq to 8 Tq
- Set SJW to a range of 1 Tq to 8 Tq
- Set SS + TSEG1 + TSEG2 to a range of 5 Tq to 25 Tq
- TSEG1 ≥ TSEG2 ≥ SJW

- SS (synchronization segment):
  The SS is a segment that performs synchronization by monitoring the edge from recessive to dominant bits in the Interframe Space. Interframe Space consists of Intermission, Suspend Transmission, and Bus Idle. All nodes can start transmission during Bus Idle.
- TSEG1 (Time segment 1):
  TSEG1 is a segment that absorbs physical delay on the CAN network. The physical delay on the CAN network is twice the total of the delay on the CAN bus, the delay in the input comparator, and the delay in the output driver.
- TSEG2 (Time segment 2):
  TSEG2 is a segment that compensates phase error due to an error in frequency.
- SJW (Resynchronization jump width)
  The SJW is a length to extend or reduce the time segment to compensate for an error in phase due to phase error.

Figure 17.17 Bit Timing Chart

Table 17.183 Example of Bit Timing Settings

	Set Value (Tq)				Sample Point (%)
1 Bit	SS	TSEG1	TSEG2	SJW	Note: See Figure 17.17.
5 Tq*1	1	2	2	1	60.00
8Tq	1	4	3	1	62.50
	1	5	2	1	75.00
10 Tq	1	6	3	1	70.00
	1	7	2	1	80.00
16 Tq	1	10	5	1	68.75
	1	11	4	1	75.00
20 Tq	1	12	7	1	65.00
	1	13	6	1	70.00
50 Tq*1	1	39	10	4	80.00

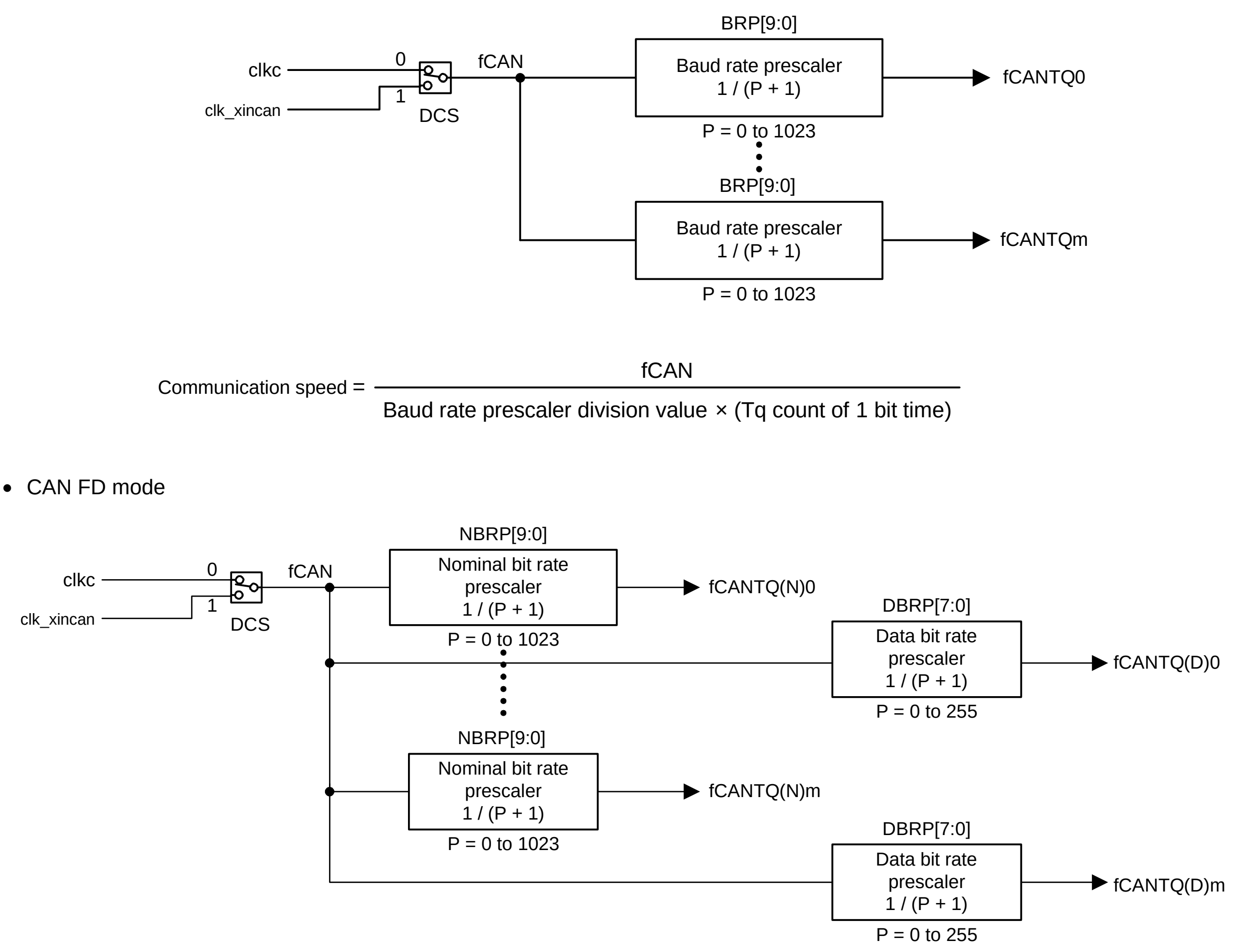
Note 1. Only in CAN FD mode

17.11.1.3 Communication Speed Setting

Set the CAN communication speed for each channel using the fCAN, baud rate prescaler division value, and Tq count per bit time. For CAN FD mode, set two types of transmission rate (arbitration phase and data phase) for each channel.

Figure 17.18 shows the CAN clock control block diagram, and **Table 17.184**, **Table 17.185** shows an example of the communication speed setting.

- Classical CAN mode



$$\text{Communication speed} = \frac{\text{fCAN}}{\text{Baud rate prescaler division value} \times (\text{Tq count of 1 bit time})}$$

- CAN FD mode

$$\text{Nominal bit rate} = \frac{\text{fCAN}}{\text{Nominal bit rate prescaler division value} \times (\text{Tq count of 1 nominal bit time})}$$

$$\text{Data bit rate} = \frac{\text{fCAN}}{\text{Data bit rate prescaler division value} \times (\text{Tq count of 1 data bit time})}$$

Note: m = 0 to 2
DCS: Bit in the RSCFDn(CFD)GCFG register
BRP[9:0]: Bits in the RSCANnCmCFG register
NBRP[9:0]: Bits in the RSCFDnCFDCmNCFG register
DBRP[7:0]: Bits in the RSCFDnCFDCmDCFG register
fCAN: CAN clock
fCANTQm: CANmTq clock
fCANTQ(N)m: CANmTq(N) clock
fCANTQ(D)m: CANmTq(D) clock

Nominal bit rate 1 Mbps Data bit rate 5 Mbps	Nominal bit rate 40 Tq (1) Data bit rate 8 Tq (1)
Nominal bit rate 500 kbps Data bit rate 2 Mbps	Nominal bit rate 80 Tq (1) Data bit rate 20 Tq (1)

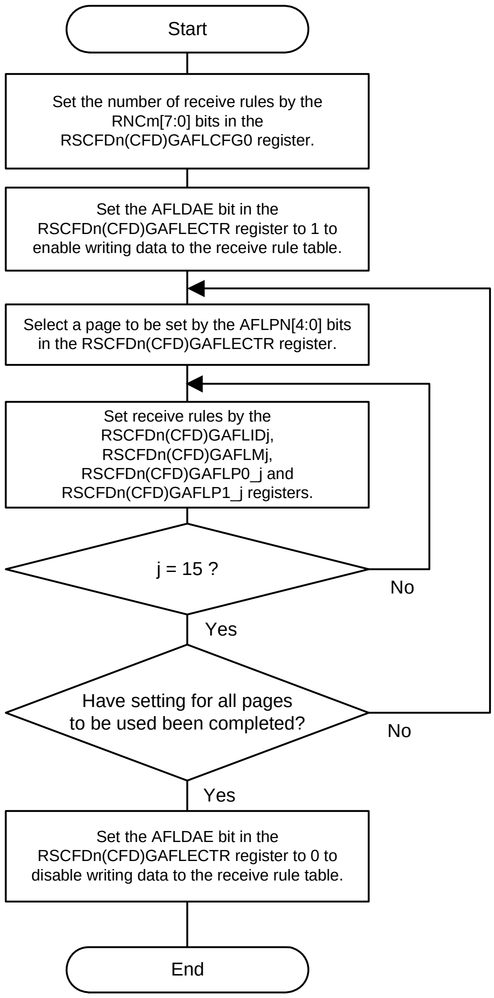
Note: Values in ( ) are baud rate prescaler division values.

17.11.1.4 Receive Rule Setting

Receive rules can be set using receive rule-related registers.

Up to 16 receive rules can be registered per page. Specify pages 0 to 11 by the AFLPN[4:0] bits in the RSCFDn(CFD)GAFLECTR register. Set receive rule table write enable/disable using the AFLDAE bit.

Figure 17.19 shows the receive rule setting procedure.



Note: m = 0 to 2, j = 0 to 15

Figure 17.19 Receive Rule Setting Procedure

17.11.1.5 Buffer Setting

Set the number of buffers to be used (number of messages to be stored) and interrupt sources. Also set the payload storage size for CAN FD mode. For transmit/receive FIFO buffers that are set to transmit mode, set transmit buffers to be linked.

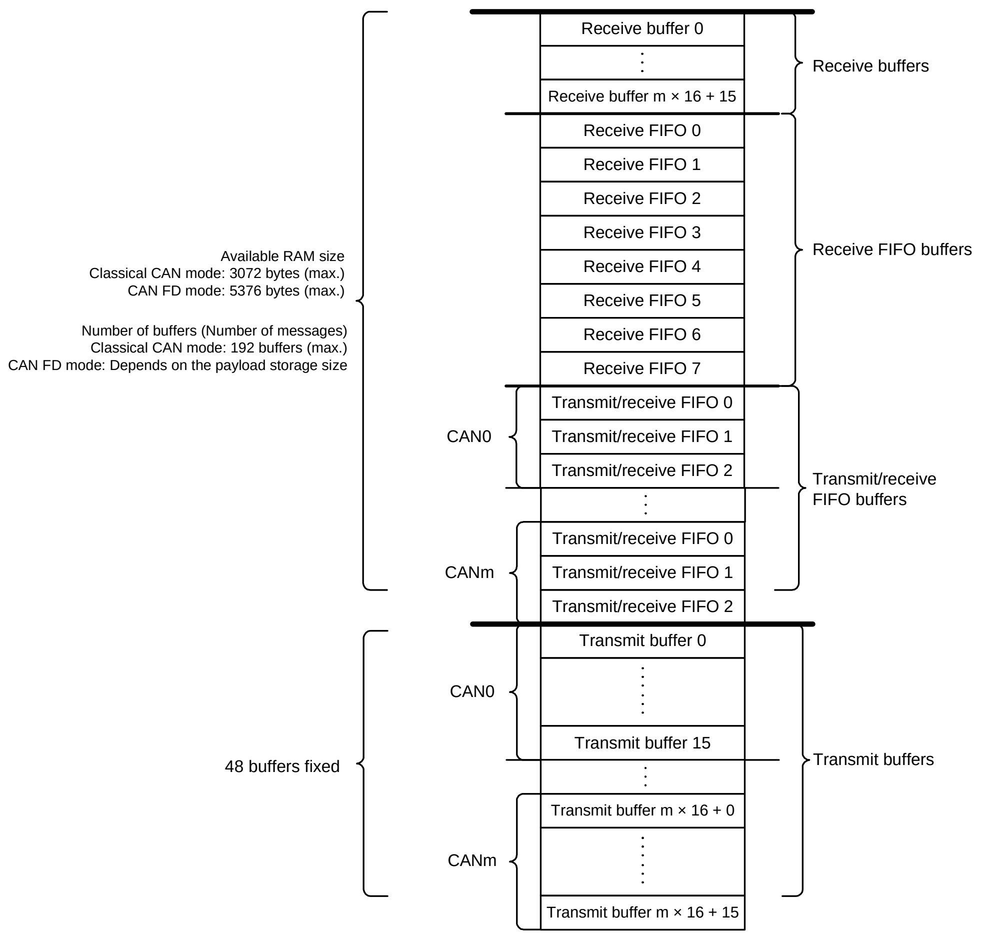
In classical CAN mode, up to 3072 bytes of the RAM can be used in receive buffers and FIFO buffers. Up to 192 buffers are available, and 16 bytes are used per buffer. Configure the buffers so that the following conditions are met.

> Number of receive buffers + total number of depth of receive FIFO buffers x +
> total number of depth of transmit/receive FIFO buffers k $\leq$ 192 buffers

In CAN FD mode, up to 5376 bytes of the RAM can be used in receive buffers and FIFO buffers. Configure the buffers so that the following conditions are met.

> Number of receive buffers × (12 + payload storage size) + total of (number of depth × (12 + payload storage size)) of receive FIFO buffers x + total of (number of depth × (12 + payload storage size)) of transmit/receive FIFO buffers k $\leq$ 5376 bytes

Figure 17.20 shows the buffer configuration. **Figure 17.21** shows the buffer setting procedure.

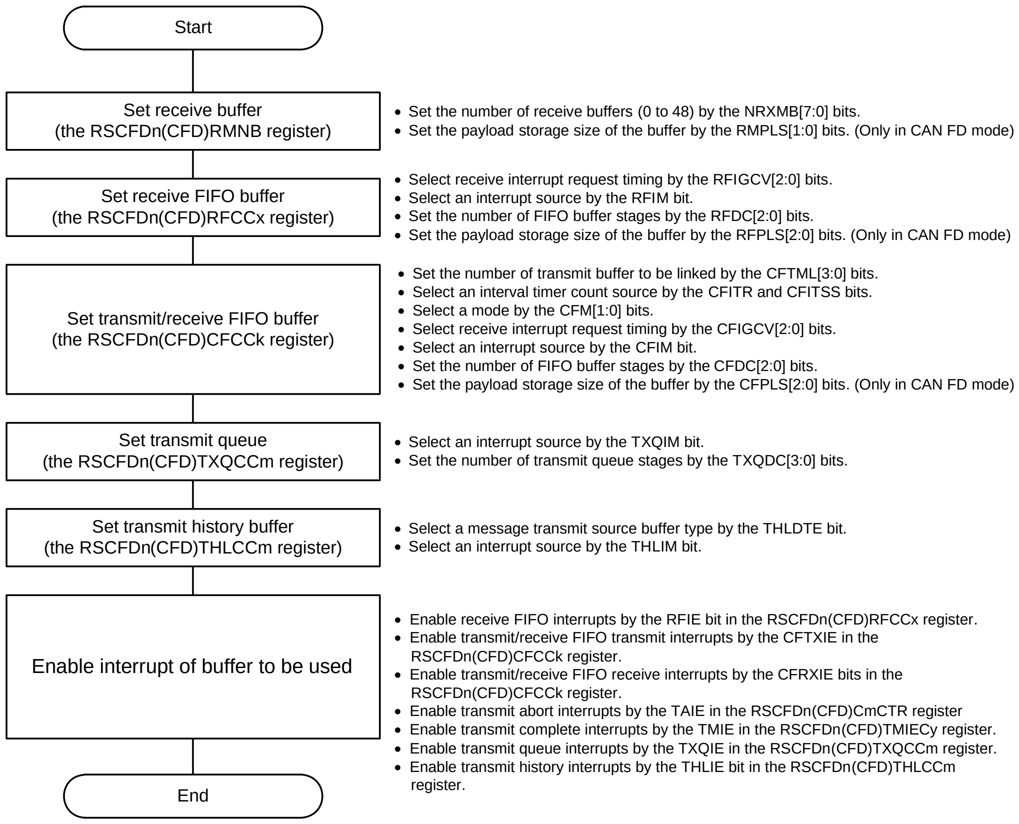


Note: m = 0 to 2

Figure 17.20 Buffer Configuration

CAUTION

Receive buffers, receive FIFO buffers, transmit/receive FIFO buffers, and transmit buffers are located in succession.



Note: k = 0 to 8, x = 0 to 7

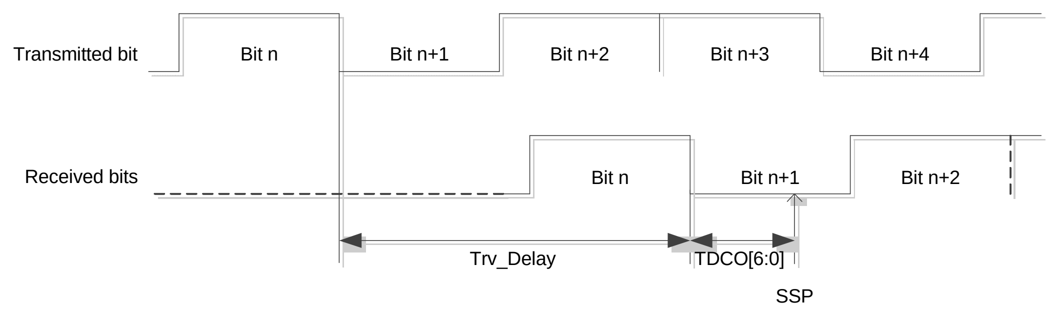
Figure 17.21 Buffer Setting Procedure

17.11.1.6 Transmitter Delay Compensation (Only in CAN FD Mode)

A high baud rate is used in the data phase in CAN FD mode. Transmitter delay compensation is provided as a function to accept propagation delay in this case.

To use this function, set the TDCE bit in the RSCFDnCFDCmFDCFG register to 1. Also set the secondary sample point (SSP) timing used in the data phase by the TDCOC bit and TDCO[6:0] bits in the RSCFDnCFDCmFDCFG register.

When the TDCOC bit is 0, the SSP timing equals the total value of the delay measured by the RS-CANFD module and the TDCO[6:0] value. (This value is rounded off to the nearest integer of Tq.) Usually, the TDCO[6:0] value must be equal to SS + TSEG1, the sample point timing



Note: Bit n: Bit in the data phase
TDCO[6:0]: Bits in the RSCFDnCFDCmFDCFG register

Figure 17.22 SSP timing

When the TDCOC bit is 1, the SSP timing is determined only by the TDCO[6:0] value. (When the DBRP[7:0] value in the RSCFDnCFDCmDCFG register is larger than 0, the TDCO[6:0] value is also rounded off to the nearest integer of Tq.)

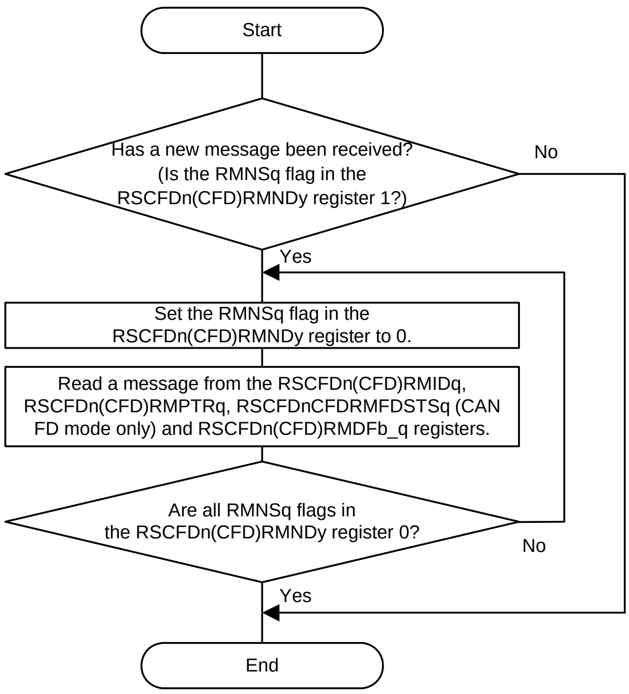
The RS-CANFD module compensates a delay up to (3 CANm bit time - 2 fCAN). (CANm bit time is data bit rate value.)

When the TDCE bit is set to 1(Transmitter delay compensation is enabled) in the RSCFDnCFDCmFDCFG register, set the equal value of 1 or less to the bits NBRP[9:0] and DBRP[7:0].

17.11.2 Reception Procedure

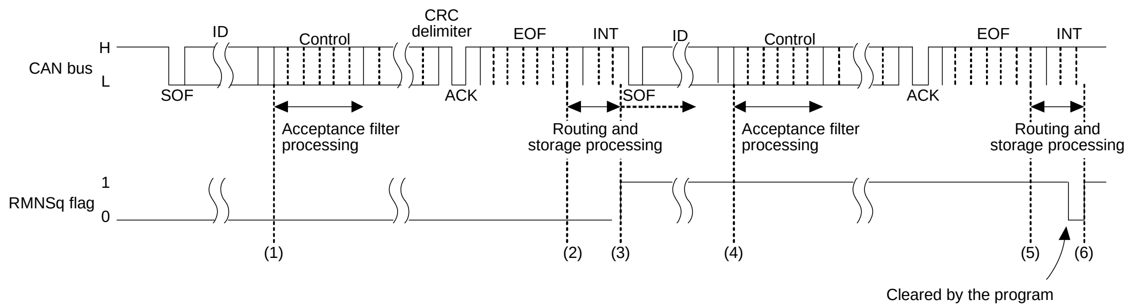
17.11.2.1 Receive Buffer Reading Procedure

When the processing to store received messages in a receive buffer starts, the RMNSq flag in the RSCFDn(CFD)RMNDy register (y = 0, 1, q = 0 to 47) is set to 1 (receive buffer q contains a new message). Messages can be read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq (only in CAN FD mode), and RSCFDn(CFD)RMDFb_q (b = 0 or 1 in classical CAN mode, b = 0 to 4 in CAN FD mode). **Figure 17.23** shows the receive buffer reading procedure. This procedure ensures the consistency of messages read from registers RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q.



Note: y = 0, 1, q = 0 to 47, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 17.23 Receive Buffer Reading Procedure



Note: y = 0, 1, q = 0 to 47
RMNSq: Flag in the RSCFDn(CFD)RMNDy register

Figure 17.24 Receive Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing, the processing to store the message in the specified receive buffer starts.
When the message storage processing starts, the RMNSq flag in the corresponding RSCFDn(CFD)RMNDy register is set to 1 (the receive buffer contains a new message). If other channels are performing filter processing or transmit priority determination processing, the routing processing and the storage processing may be delayed.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(6) When the corresponding RMNSq flag is cleared to 0 (the receive buffer contains no new message), this flag is set to 1 again when the message storage processing starts. Even if the RMNSq flag remains 1, a new message is overwritten to the receive buffer. The RMNSq flag cannot be cleared to 0 during storage of messages.

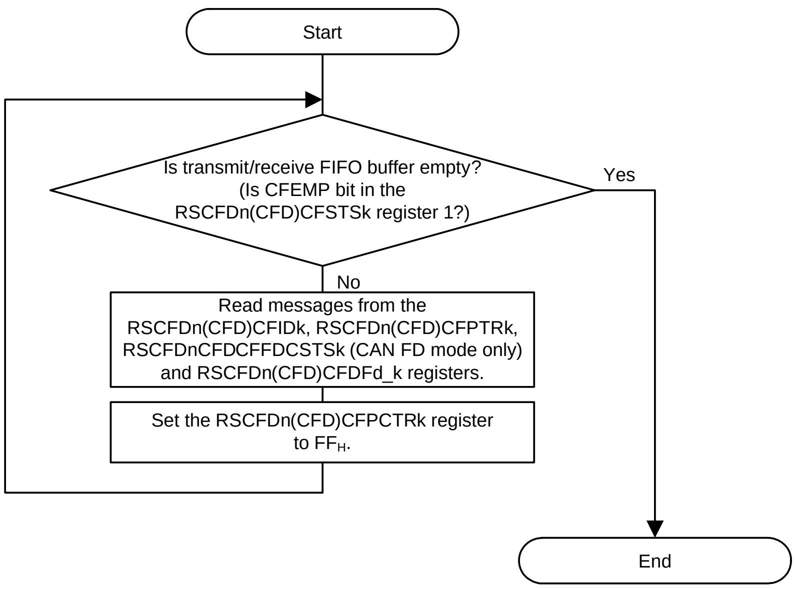
17.11.2.2 FIFO Buffer Reading Procedure

When received messages have been stored in one or more receive FIFO buffers or a transmit/receive FIFO buffer that is set to receive mode or gateway mode, the corresponding message counter (RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register (x = 0 to 7) or CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register (k = 0 to 8)) is incremented by 1. At this time, when the RFIE bit (receive FIFO interrupt is enabled) in the RSCFDn(CFD)RFCCx register or the CFRXIE bit (transmit/receive FIFO receive interrupt is enabled) in the RSCFDn(CFD)CFCCk register is set to 1, an interrupt request is generated. Received messages can be read from the RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx (only in CAN FD mode), and RSCFDn(CFD)RFDFd_x (d = 0 or 1 in classical CAN mode, d = 0 to 15 in CAN FD mode) registers for receive FIFO buffers, or from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk (only in CAN FD mode), and RSCFDn(CFD)CFDFd_k registers for transmit/receive FIFO buffers. Messages in FIFO buffers can be read sequentially on a first-in, first-out basis.

When the message counter value matches the FIFO buffer depth (a value set by the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register or the CFDC[2:0] bits in the RSCFDn(CFD)CFCCk register), the RFFLL or CFFLL flag is set to 1 (the receive FIFO buffer is full).

When all messages have been read out of the FIFO buffer, the RFEMP flag in the RSCFDn(CFD)RFSTSx register or the CFEMP flag in the RSCFDn(CFD)CFSTSk register is set to 1 (the receive FIFO buffer contains no unread message (buffer empty)).

If the RFE bit or the CFE bit is cleared to 0 (no receive FIFO buffer is used) with the interrupt request flag (RFIF flag in the RSCFDn(CFD)RFSTSx register or CFRXIF flag in the RSCFDn(CFD)CFSTSk register) set to 1 (a receive FIFO interrupt request is present), the interrupt request flag is not automatically cleared to 0. The program must clear the interrupt request flag to 0.



Note: k = 0 to 8, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 17.25 Transmit/Receive FIFO Buffer Reading Procedure

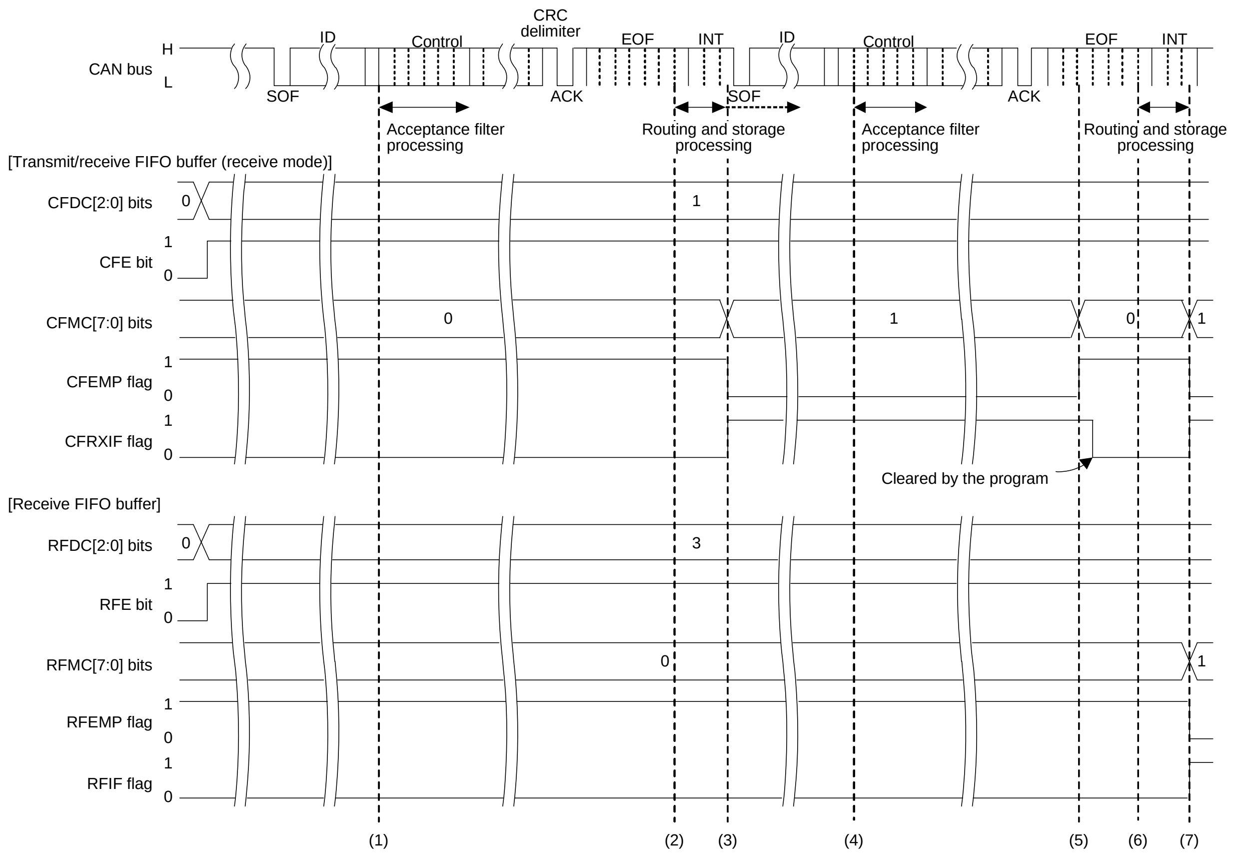
When reading a message in CAN FD mode, do not read the RSCFDnCFDRFDFd_x or RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 17.186 Payload Storage Area of Receive FIFO Buffer

Set RFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF1_x
001_B	12 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF2_x
010_B	16 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF3_x
011_B	20 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF4_x
100_B	24 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF5_x
101_B	32 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF7_x
110_B	48 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF11_x
111_B	64 bytes	RSCFDnCFDRFDF0_x to RSCFDnCFDRFDF15_x

Table 17.187 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFRXIF: Flags in the RSCFDn(CFD)CFSTSk register
RFDC[2:0], RFE: Bits in the RSCFDn(CFD)RFCCx register
RFMC[7:0], RFEMP, RFIF: Flags in the RSCFDn(CFD)RFSTSx register

Note: k = 0 to 8, x = 0 to 7

Figure 17.26 FIFO Buffer Reception Timing Chart

(1) When the ID field in a message has been received, the acceptance filter processing starts.

(2) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(3) When the message has passed through the DLC filter processing and the CFE bit in the RSCFDn(CFD)CFCCk register is 1 (transmit/receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCk register is 001_B or more, the message is stored in the transmit/receive FIFO buffer that is set to receive mode. The CFMC[7:0] value in the RSCFDn(CFD)CFSTSk register is incremented and becomes 01_H. When the CFIM bit in the RSCFDn(CFD)CFCCk register is set to 1 (a FIFO receive interrupt request is generated each time a message has been received), the CFRXIF flag in the RSCFDn(CFD)CFSTSk register is set to 1 (a transmit/receive FIFO receive interrupt request is present). The CFRXIF flag can be reset to 0 by the program.

(4) When the ID field of the next message has been received, the acceptance filter processing starts.

(5) Read received messages from the RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, and RSCFDn(CFD)CFDFd_k registers and write FF_H to the RSCFDn(CFD)CFPCTRk register. This causes the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSk register to be decremented. When CFMC[7:0] becomes 00_H, the CFEMP flag in the RSCFDn(CFD)CFSTSk register becomes 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

(6) When the message matches the receive rule of the corresponding channel and the message has been successfully received, the routing processing to transfer the message to the specified buffer starts. When the DCE bit in the RSCFDn(CFD)GCFG register is set to 1 (DLC check is enabled), the DLC filter processing starts at this time.

(7) The message is stored in the transmit/receive FIFO buffer set in receive mode when the message has passed through the DLC filter process if the CFE bit is set to 1 (transmit/receive FIFO buffers are used), and the CFDC[2:0] bits are set to 001_B or more. The CFMC[7:0] bit value is incremented by 1 to be 01_H. When the CFIM bit is set to 1 (an interrupt occurs each time a message has been received), the CFRXIF flag is set to 1 (a transmit/receive FIFO receive interrupt request is present).
The message is stored in the receive FIFO buffer if the RFE bit in the RSCFDn(CFD)RFCCx register is set to 1 (receive FIFO buffers are used), and the RFDC[2:0] bits in the RSCFDn(CFD)RFCCx register are set to 001_B or more. The RFMC[7:0] bits in the RSCFDn(CFD)RFSTSx register are set to 01_H by being incremented by 1. When the RFIM bit in the RSCFDn(CFD)RFCCx register is set to 1 (an interrupt request occurs each time a message has been received), the RFIF flag in the RSCFDn(CFD)RFSTSx register is set to 1 (a receive FIFO interrupt request is present).

17.11.2.3 FIFO Buffer Reading Procedure by DMA Transfer

In CAN FD mode, the following FIFO buffers can be read by DMA transfer.

- All receive FIFO buffers x (x = 0 to 7)
- The first transmit/receive FIFO buffer k allocated to channel m (k = 3 × m, m = 0 to 2)

The DMA enable bit (RFDMAEx or CFDMAEm bit in the RSCFDnCFDCDTCT register) can be set at any time. However, before setting the DMA enable bit to 1 (to enable DMA transfer requests), set the receive interrupt enable bit (RFIE bit in the RSCFDnCFDRFCCx register or CFRXIE bit in the RSCFDnCFDCFCCk register) of related FIFO buffers to 0 (to disable interrupts). When DMA transfer requests are enabled, do not write a value to the FIFO control register (RSCFDnCFDRFCCx register or RSCFDnCFDCFCCk register).

When an unread message is remaining in a DMA transfer-enabled FIFO buffer, a DMA transfer request trigger is generated. Specify the FIFO access register address(*****) for the transfer source address, and adjust the transfer size so that data can be read to the end of the payload storage area with a single trigger. The end of the payload storage area depends on the payload storage size specified by the RFPLS[2:0] bits in the RSCFDnCFDRFCCx register or the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

After the end of the payload stored in the FIFO buffer has been read, the RFMC[7:0] value in the RSCFDnCFDRFSTSx register or the CFMC[7:0] value in the RSCFDnCFDCFSTSk register is automatically decremented by 1. After that, if an unread message is remaining in the FIFO buffer, a trigger is generated again.

When the RFDMAEx or CFDMAEm bit is set to 0 (to disable DMA transfer requests) during DMA transfer, wait until the DMA transfer status (RFDMASTSx or CFDMASTSm bit in the RSCFDnCFDCDTSTS register) is cleared to 0 (DMA transfer disabled), and then start the next processing (enabling DMA transfer again etc.). When disabling DMA transfer, examine how to process a message remaining in the FIFO buffer and a newly arriving message. When the FIFO buffer is enabled, it continues to receive messages.

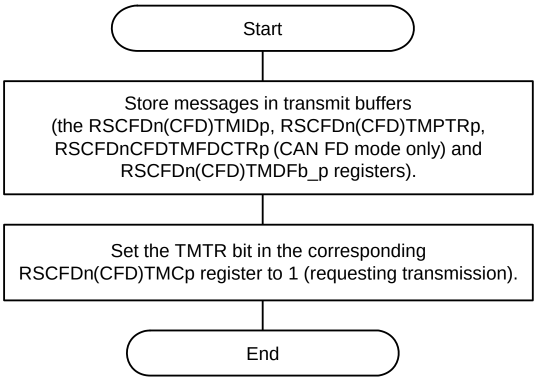
17.11.3 Transmission Procedure

17.11.3.1 Procedure for Transmission from Transmit Buffers

Figure 17.27 shows the procedure for transmission from transmit buffers.

Figure 17.28 shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmission has been successfully completed. **Figure 17.29** shows a timing chart where messages are transmitted from two transmit buffers in the same channel and transmit abort has been completed.



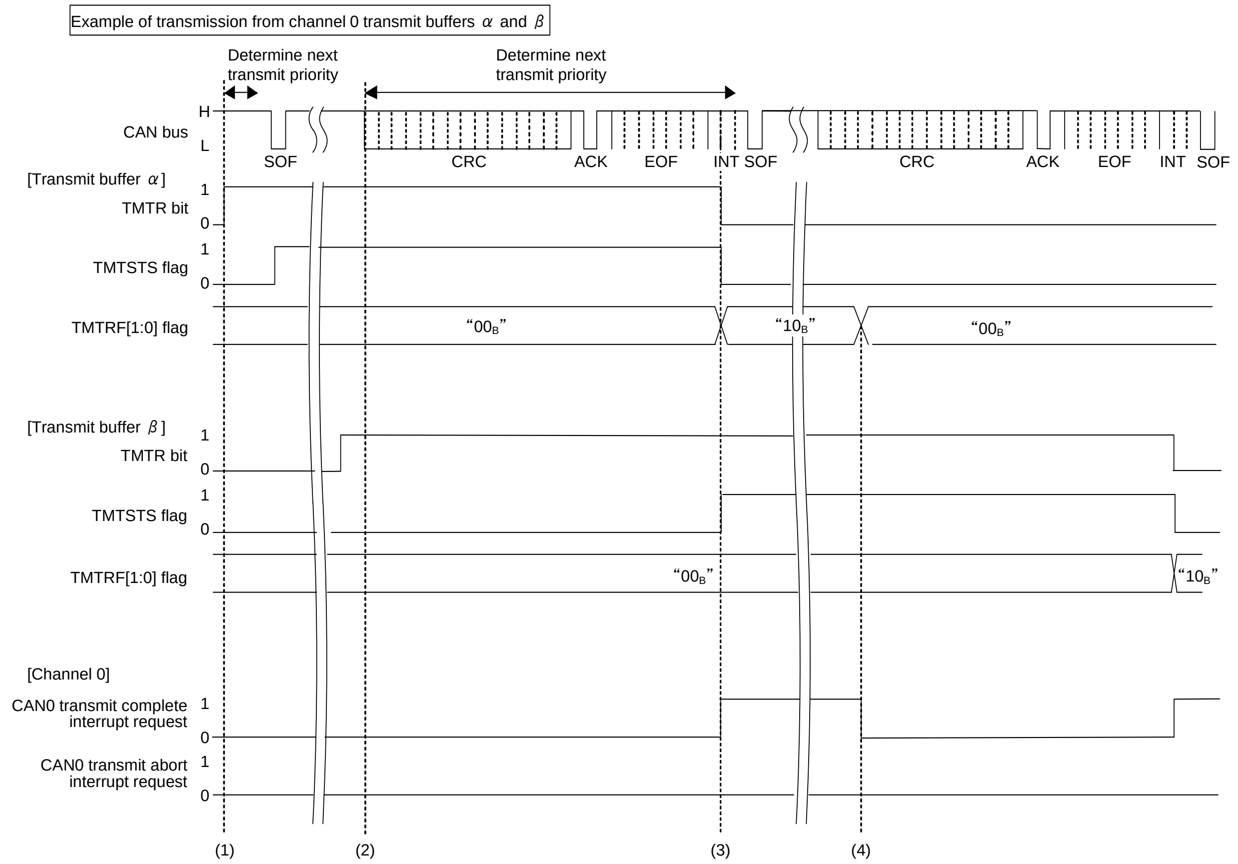
Note: p = 0 to 47, b = 0 or 1 (classical CAN mode), 0 to 4 (CAN FD mode)

Figure 17.27 Procedure for Transmission from Transmit Buffers

In CAN FD mode and transmit buffer merge mode, messages with a payload size of more than 20 bytes can be transmitted from transmit buffers (16 × m) + 0 and transmit buffers (16 × m) + 3. At this time, transmit buffers (16 × m) + 1 to (16 × m) + 2 and transmit buffers (16 × m) + 4 to (16 × m) + 5 are allocated as a payload storage area. Registers RSCFDnCFDTMIDp, RSCFDnCFDTMPTRp, and RSCFDnCFDTMFDCTRp corresponding to these buffers can be used as data field registers that can store 4-byte data bytes (payload) like the RSCFDnCFDTMDFb_p register. **Table 17.188** shows message storage registers when transmitting a message with a payload size of more than 20 bytes from transmit buffer 0.

Table 17.188 Message Storage Registers in Transmit Buffer Merge Mode (Example of Transmit Buffer 0)

Transmit Buffer	Offset from Base Address	Symbol	Register Function in Transmit Buffer Merge Mode
Transmit buffer 0	4000_H	RSCFDnCFDTMID0	Transmit buffer 0 ID data, transmit history data store enable bit, RTR bit,and IDE bit
	4004_H	RSCFDnCFDTMPTR0	Transmit buffer 0 label data and DLC data
	4008_H	RSCFDnCFDTMFDCTR0	Transmit buffer 0 ESI bit, BRS bit, and FDF bit
	$400C_H$ to $401C_H$	RSCFDnCFDTMDF0_0 to RSCFDnCFDTMDF4_0	Transmit buffer 0 data bytes 0, 1, 2, and 3 to transmit buffer 0 data bytes 16, 17, 18, and 19
Transmit buffer 1	4020_H	RSCFDnCFDTMID1	Transmit buffer 0 data bytes 20, 21, 22, and 23
	4024_H	RSCFDnCFDTMPTR1	Transmit buffer 0 data bytes 24, 25, 26, and 27
	4028_H	RSCFDnCFDTMFDCTR1	Transmit buffer 0 data bytes 28, 29, 30, and 31
	$402C_H$ to $403C_H$	RSCFDnCFDTMDF0_1 to RSCFDnCFDTMDF4_1	Transmit buffer 0 data bytes 32, 33, 34, and 35 to transmit buffer 0 data bytes 48, 49, 50, and 51
Transmit buffer 2	4040_H	RSCFDnCFDTMID2	Transmit buffer 0 data bytes 52, 53, 54, and 55
	4044_H	RSCFDnCFDTMPTR2	Transmit buffer 0 data bytes 56, 57, 58, and 59
	4048_H	RSCFDnCFDTMFDCTR2	Transmit buffer 0 data bytes 60, 61, 62, and 63
	$404C_H$ to $405C_H$	RSCFDnCFDTMDF0_2 to RSCFDnCFDTMDF4_2	Not used



Note: α = 0 to 15, β = 0 to 15
TMTR: Bit in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp registers

Figure 17.28 Transmit Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) When the TMTR bit in the RSCFDn(CFD)TMCα register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer α is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSα register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

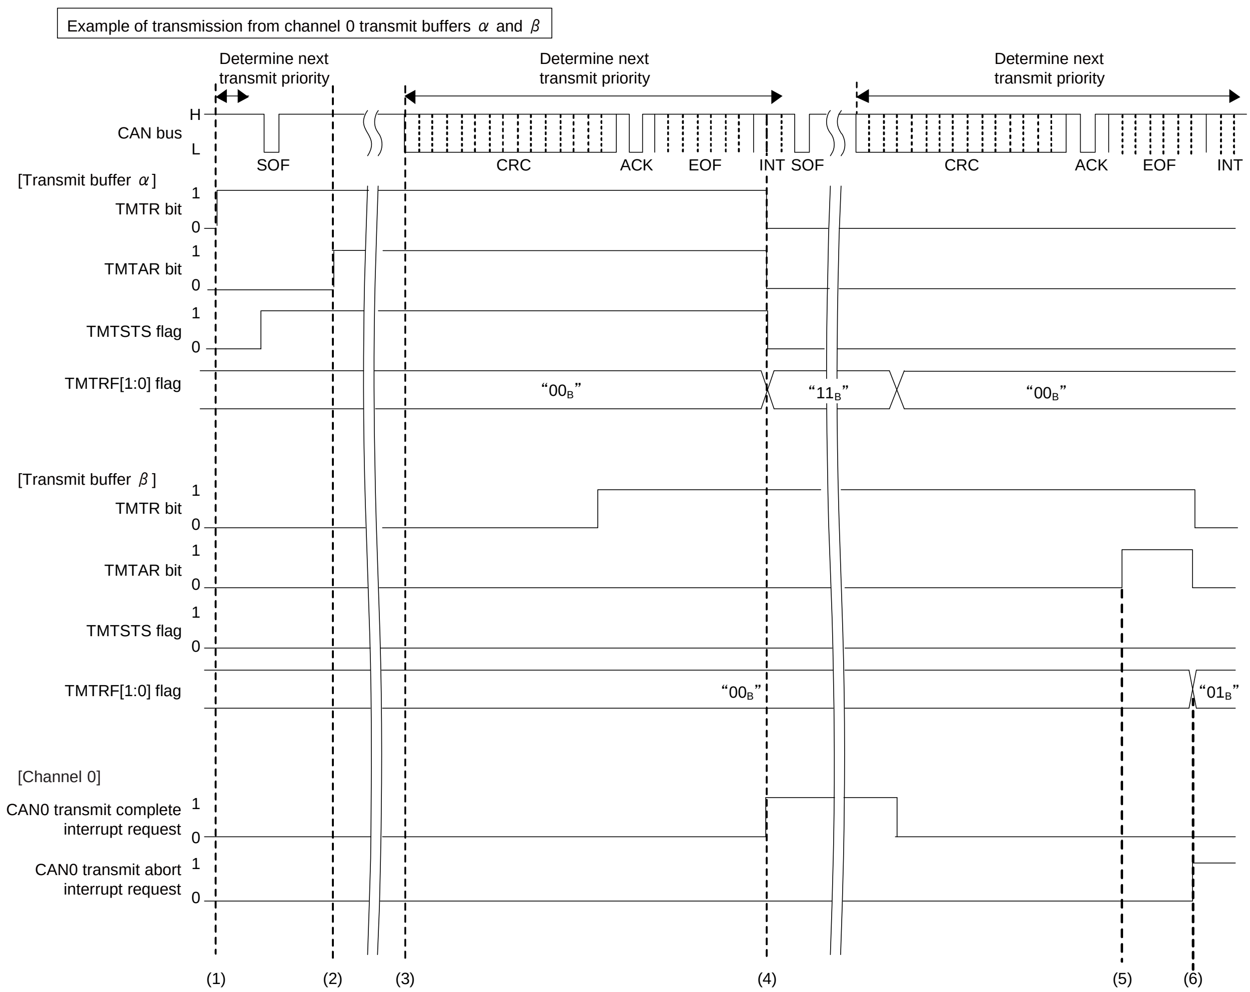
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur between transmissions because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSα register is set to 10_B (transmission has been completed (without transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCα register are cleared to 0. When the TMIEα bit in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(4) Before starting the next transmission, set the TMTRF[1:0] flag to 00_B. Write the next message to the transmit buffer, and then set the TMTR bit to 1 (transmission is requested). The TMTR bit can be set to 1 only when the TMTRF[1:0] flag value is 00_B.

If an arbitration-lost occurs after transmission is started, the TMTSTS flag is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).



Note: α = 0 to 15, β = 0 to 15
TMTR, TMTAR: Bits in the RSCFDn(CFD)TMCp register
TMTSTS, TMTRF[1:0]: Flags in the RSCFDn(CFD)TMSTSp register

Figure 17.29 Transmit Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) When the TMTR bit in the RSCFDn(CFD)TMCα register is set to 1 while the CAN bus is idle, the transmit priority determination processing starts to determine the highest-priority transmit buffer. If transmit buffer α is determined to be the highest-priority transmit buffer, the TMTSTS flag in the corresponding RSCFDn(CFD)TMSTSα register is set to 1 (transmission is in progress) and the CAN channel starts transmitting data.

(2) When it is determined that the transmit buffer is used for the next transmission or transmission is in progress, message transmission is not aborted unless an error or arbitration loss occurs even if the TMTAR bit is set to 1 (transmit abort is requested).

(3) The priority determination starts at the first bit of the CRC field for the next transmission. In this timing chart, buffer β is not selected as the next transmit buffer. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(4) When transmission completes successfully, the TMTRF[1:0] flag in the RSCFDn(CFD)TMSTSα register is set to 11_B (transmission has been completed (with transmit abort request)) and the TMTSTS flag and the TMTR bit in the RSCFDn(CFD)TMCα register are cleared to 0. When the TMIEα value in the RSCFDn(CFD)TMIEC0 register is 1 (transmit buffer interrupt is enabled), a CAN0 transmit complete interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B (transmission is in progress or no transmit request is present).

(5) While another CAN node is transmitting data on the CAN bus (TMTSTS flag = 0), if the TMTAR bit is set to 1 while the corresponding channel is determining transmit priority, the TMTR bit cannot be cleared to 0.

(6) After the internal processing time has passed, the transmission is terminated and the TMTRF[1:0] flag is set to 01_B. When the transmit buffer is not transmitting data and is not selected as the next transmit buffer and priority determination is not being made, an abort request is immediately accepted and the TMTRF[1:0] flag is set to 01_B. At this time, the TMTR and TMTAR bits are cleared to 0. When transmit abort is completed with the TAIE bit in the RSCFDn(CFD)CmCTR register set to 1 (transmit abort interrupt is enabled), an interrupt request is generated. To clear the interrupt request, set the TMTRF[1:0] flag to 00_B.

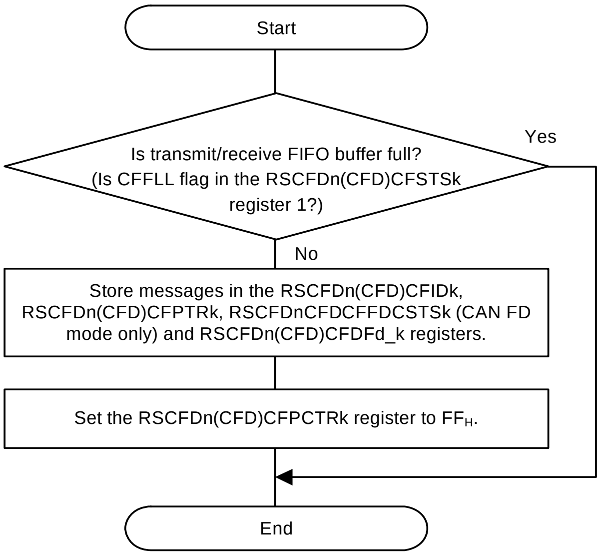
If an arbitration loss occurs after the CAN channel started transmission, the TMTSTS bit is cleared to 0. The transmit priority determination is reexecuted at the beginning of the CRC field to search the highest-priority transmit buffer. If an error has occurred during transmission or after arbitration loss, the priority determination processing is reexecuted during transmission of an error frame.

When a 2-bit ECC error is detected during the priority determination processing, no data is transmitted (in classical CAN mode, only when the EEFE bit in the RSCANnGCFG register is 1).

17.11.3.2 Procedure for Transmission from Transmit/Receive FIFO Buffers

Figure 17.30 shows the procedure for transmission from transmit/receive FIFO buffers.

Figure 17.31 shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmission has been successfully completed. **Figure 17.32** shows a timing chart where messages are transmitted from two transmit/receive FIFO buffers in the same channel and transmit abort has been completed.



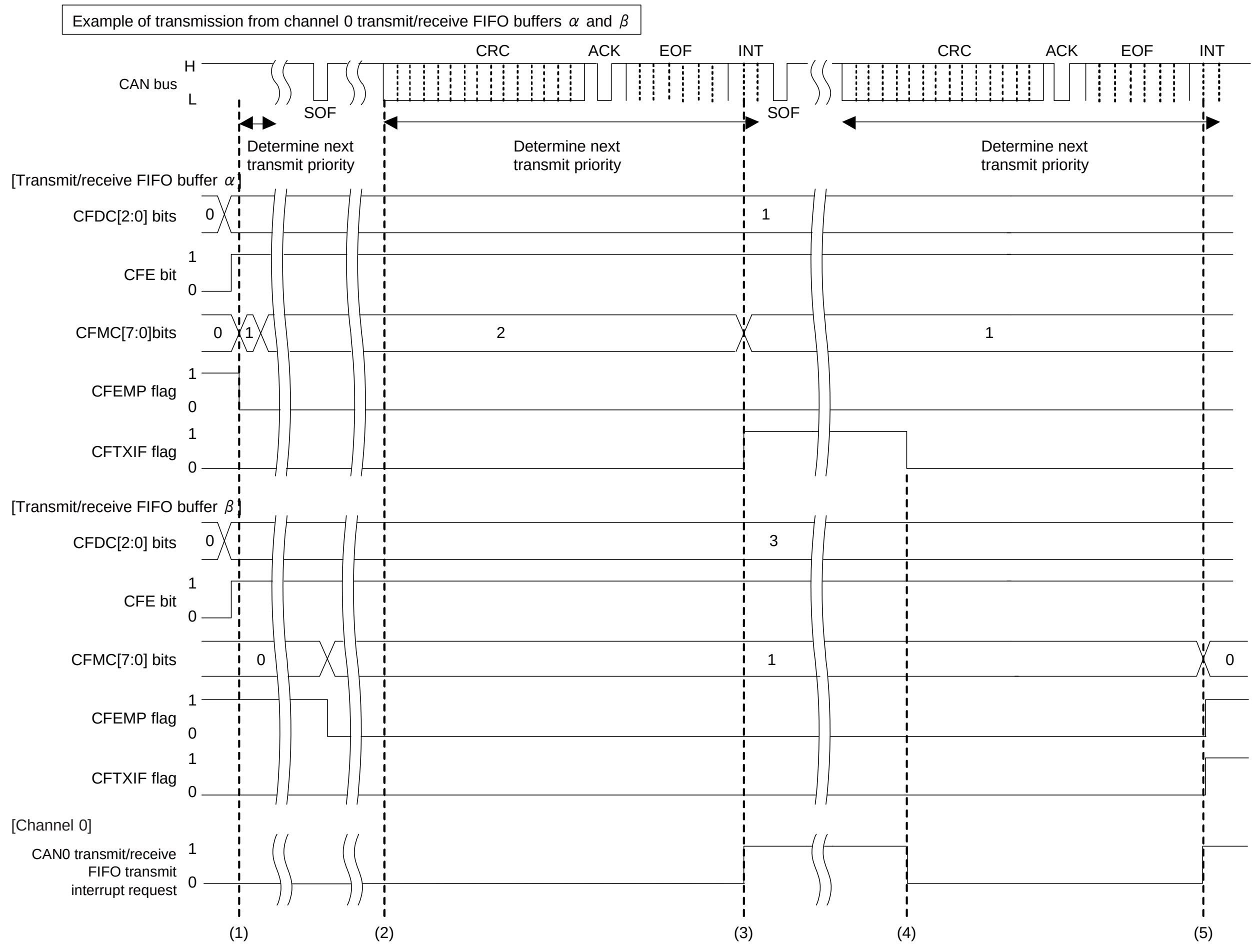
Note: k = 0 to 8, d = 0 or 1 (classical CAN mode), 0 to 15 (CAN FD mode)

Figure 17.30 Procedure for Transmission from Transmit/Receive FIFO Buffers

When storing a message, do not write a value to the RSCFDnCFDCFDFd_k register corresponding to the area exceeding the payload storage size specified by the CFPLS[2:0] bits in the RSCFDnCFDCFCCk register.

Table 17.189 Payload Storage Area of Transmit/Receive FIFO Buffer

Set CFPLS[2:0] Value	Payload Storage Size	Corresponding Data Field Registers
000_B	8 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF1_k
001_B	12 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF2_k
010_B	16 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF3_k
011_B	20 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF4_k
100_B	24 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF5_k
101_B	32 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF7_k
110_B	48 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF11_k
111_B	64 bytes	RSCFDnCFDCFDF0_k to RSCFDnCFDCFDF15_k



Note: α = 0 to 2, β = 0 to 2
CFDC[2:0],CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 17.31 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmission Completed Successfully)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCα register is 1 (transmit/ receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCα register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSα register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer α of channel 0.

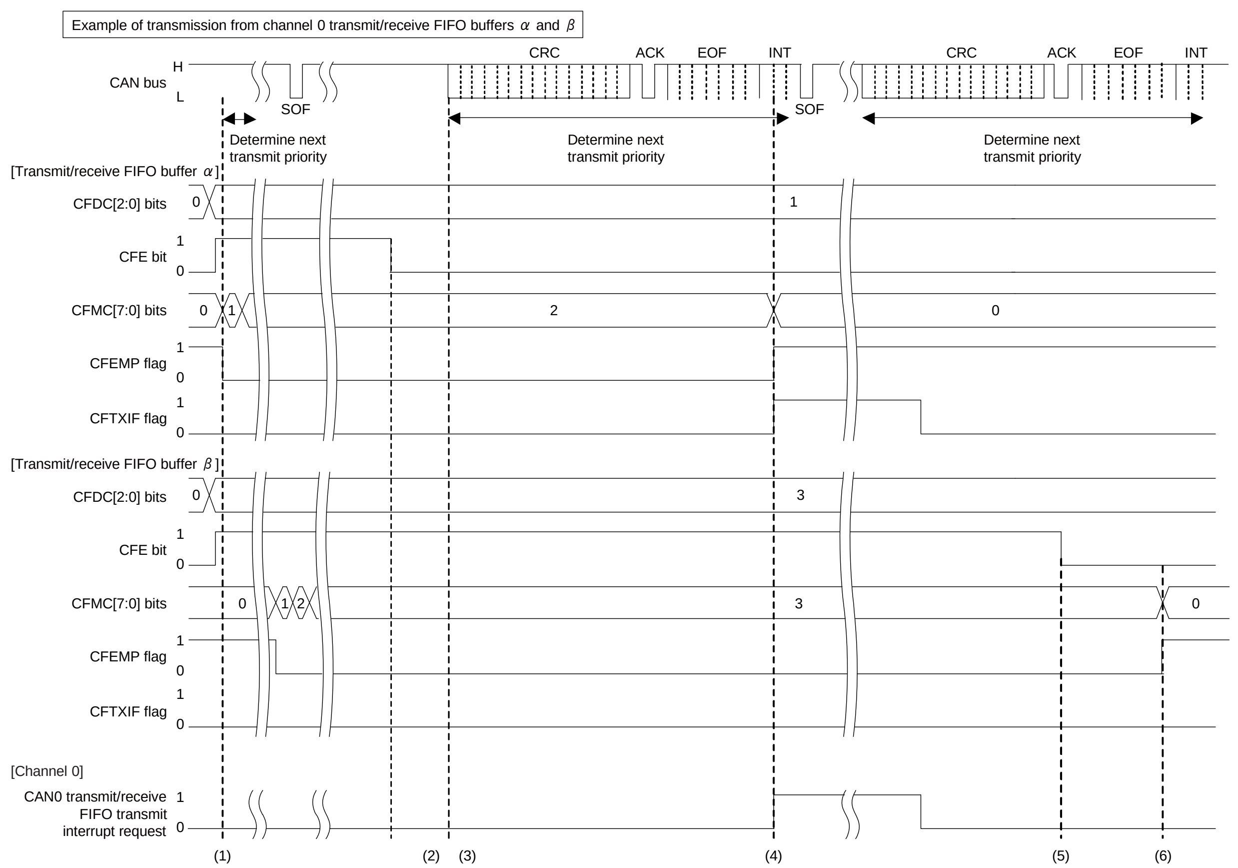
(2) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

(3) When transmission completes successfully, the CFMC[7:0] value in the RSCFDn(CFD)CFSTSα register is decremented by 1. Setting the CFIM bit in the RSCFDn(CFD)CFCCα register to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSα register to 1 (a transmit/receive FIFO transmit interrupt request is present).

(4) The program can clear the CFTXIF flag.

(5) Message transmission from transmit/receive FIFO buffer β of channel 0 completes and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSβ register is decremented by 1. The CFMC[7:0] bits are cleared to 00_H and therefore the CFEMP flag in the RSCFDn(CFD)CFSTSβ register is set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)).

Transmission is continued until the CFEMP flag is set to 1. It is possible to continuously store transmit messages in FIFO buffers until the CFFLL flag in the RSCFDn(CFD)CFSTSα and RSCFDn(CFD)CFSTSβ registers is set to 1 (the transmit/receive FIFO buffer is full).



Note: α = 0 to 2, β = 0 to 2
CFDC[2:0], CFE: Bits in the RSCFDn(CFD)CFCCk register
CFMC[7:0], CFEMP, CFTXIF: Flags in the RSCFDn(CFD)CFSTSk register

Figure 17.32 Transmit/Receive FIFO Buffer Transmission Timing Chart (Transmit Abort Completed)

(1) While the CAN bus is idle, when the CFE bit in the RSCFDn(CFD)CFCCα register is 1 (transmit/ receive FIFO buffers are used) and the CFDC[2:0] value in the RSCFDn(CFD)CFCCα register is 001_B (4 messages) or more and the CFMC[7:0] value in the RSCFDn(CFD)CFSTSα register is 01_H or more, the priority determination processing starts to determine the highest-priority transmit message. When the highest-priority transmit message has been determined, transmission of the message starts. In this figure, the message is transmitted from transmit/receive FIFO buffer α of channel 0.

(2) When transmission is in progress or it is determined that the transmit/receive FIFO buffer is used for the next transmission, message transmission is not aborted unless an error or arbitration loss occurs even if the CFE bit is set to 0 (no transmit/receive FIFO buffer is used).

(3) When a transmit request from a buffer is present, the priority determination starts at the first bit of the CRC field for the next transmission. In this figure, transmit/receive FIFO buffer β is not selected as a buffer for the next transmission. The determination time may delay if the transmit priority determination processing is performed on another channel. However, the delay does not occur during transmission because the determination processing is completed by the third bit of the intermission.

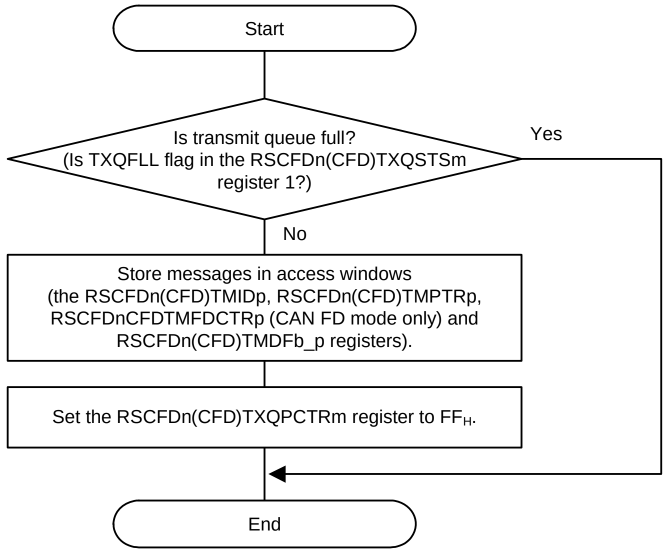
(4) When transmit completes successfully, the CFMC[7:0] value is cleared to 00_H. Setting the CFIM bit to 1 (a FIFO transmit interrupt request is generated each time a message has been transmitted) sets the CFTXIF flag in the RSCFDn(CFD)CFSTSα register to 1 (a transmit/receive FIFO transmit interrupt request is present). The program can clear the CFTXIF flag.

(5) If another CAN node on the CAN bus is transmitting data (not from transmit/receive FIFO buffer β), transmit/receive FIFO buffer β cannot be disabled immediately even if the CFE bit in the RSCFDn(CFD)CFCCβ register is cleared to 0 (no transmit/receive FIFO buffer is used) during transmit priority determination. (The CFEMP flag in the RSCFDn(CFD)CFSTSβ register is not set to 1 (the transmit/receive FIFO buffer contains no message (buffer empty)) immediately.)

(6) After the internal processing time has passed, transmit/receive FIFO buffer β are disabled and the CFMC[7:0] bits in the RSCFDn(CFD)CFSTSβ register are cleared to 00_H and the CFEMP flag is set to 1. When the transmit/receive FIFO buffer β is not transmitting data and is not selected as the next transmit buffer and priority determination is not in progress, the transmit/receive FIFO buffer β is immediately disabled. (The CFMC[7:0] bits are cleared to 00_H and the CFEMP flag is set to 1.)

17.11.3.3 Procedure for Transmission from the Transmit Queue

Figure 17.33 shows the procedure for transmission from the transmit queue.

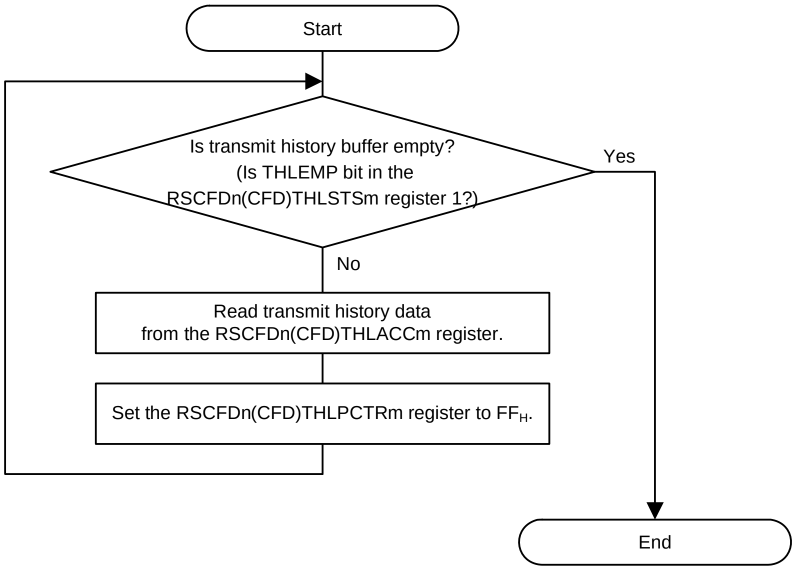


Note: $p = m \times 16 + 15$, $m = 0$ to 2

Figure 17.33 Procedure for Transmission from the Transmit Queue

17.11.3.4 Transmit History Buffer Reading Procedure

Transmit history data can be read from the RSCFDn(CFD)THLACCm register. The next data can be accessed by writing FF_H to the corresponding RSCFDn(CFD)THLPCTRm register (m = 0 to 2) after reading a set of data. **Figure 17.34** shows the transmit history buffer reading procedure.



Note: m = 0 to 2

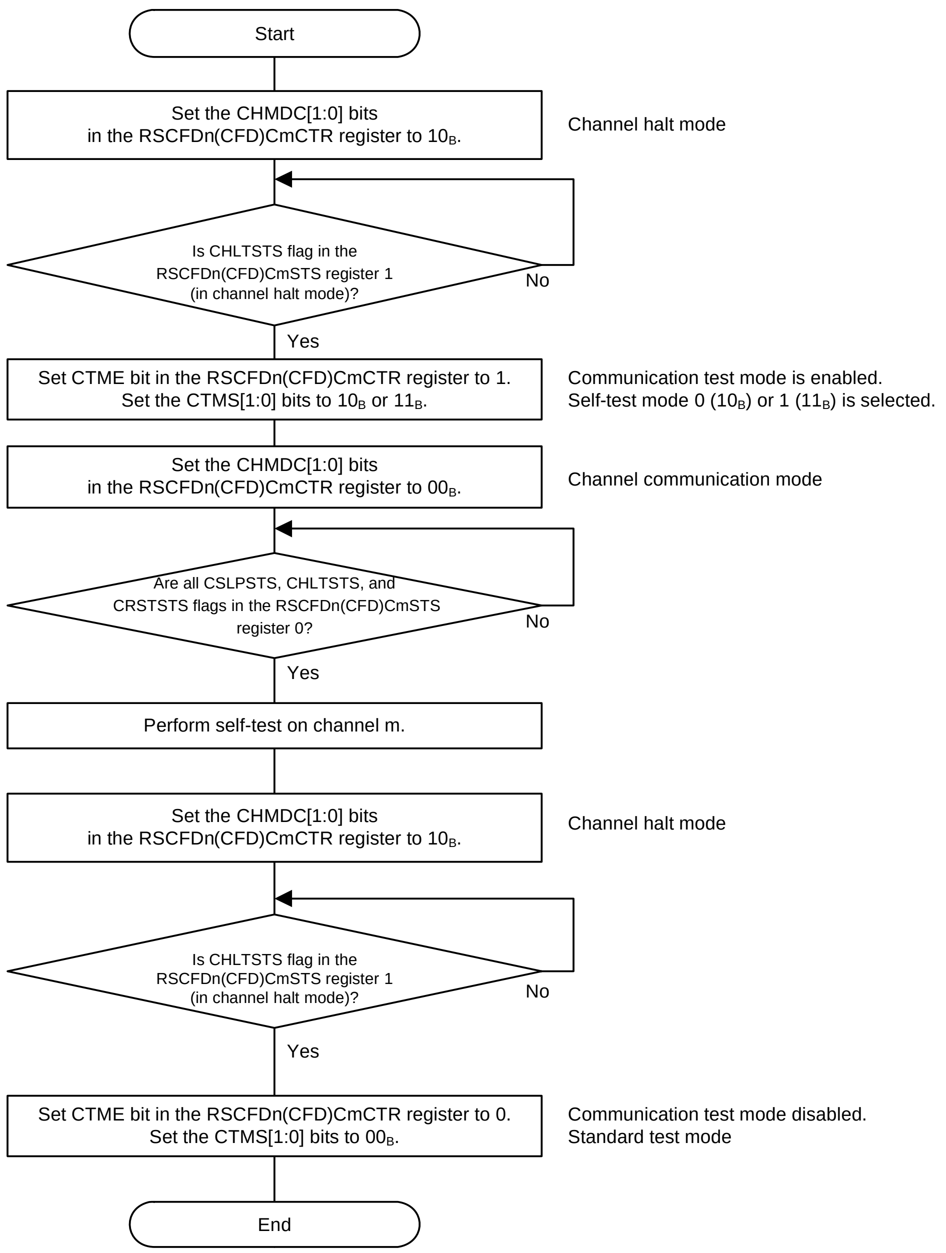
Figure 17.34 Transmit History Buffer Reading Procedure

17.11.4 Test Settings

17.11.4.1 Self-Test Mode Setting Procedure

Self-test mode allows communication test on a channel basis by enabling a CAN node to receive its own transmitted messages.

Figure 17.35 shows the self-test mode setting procedure.



Note: m = 0 to 2

Figure 17.35 Self-Test Mode Setting Procedure

17.11.4.2 Procedure for Releasing the Protection

Since the global test function in **Table 17.190** is protected, write the protection release data 1 and release data 2 in succession to the LOCK[15:0] bits in the RSCFDn(CFD)GLOCKK register, then set the target test bit to 1.

Table 17.190 Protection Release Data for Test Function

Test Function	Protection Release Data 1	Protection Release Data 2	Target Bit
RAM test	7575_H	$8A8A_H$	RTME bit in the RSCFDn(CFD)GTSTCTR register

If an incorrect value is written to the LOCK[15:0] bits, restart from writing the protection release data 1. **Figure 17.36** shows the procedure for releasing the protection.

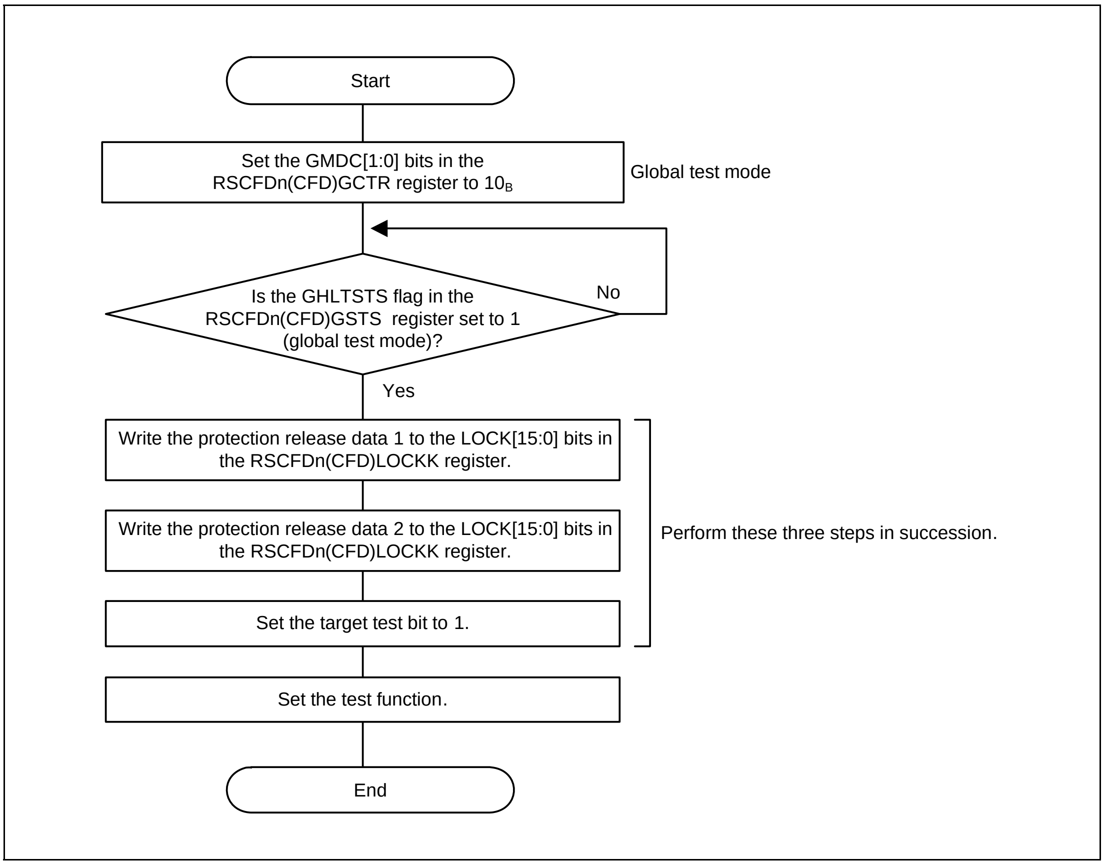


Figure 17.36 Protection Release Procedure

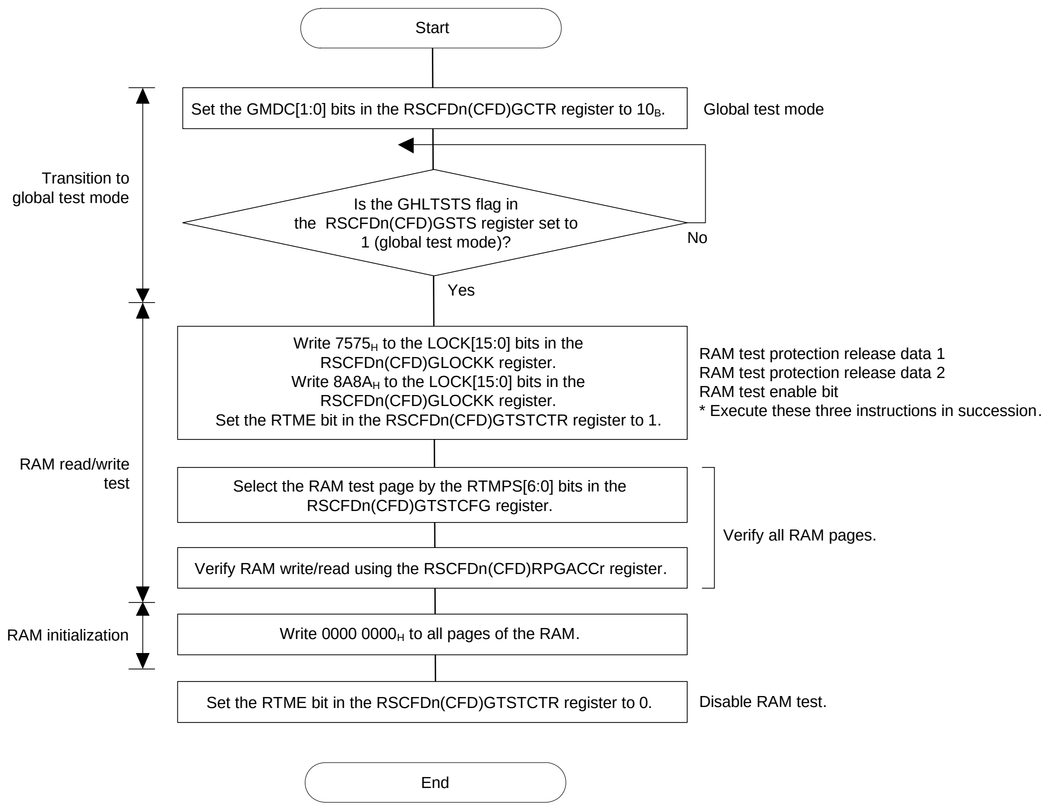
17.11.4.3 RAM Test Setting Procedure

RAM tests include CAN RAM read/write test. The read/write test verifies that data written to the RAM is read correctly. Before ending the RAM test, write 0000 0000_H to all pages of the CAN RAM.

Figure 17.37 shows the RAM test setting procedure.



Note 1. Before changing to the RAMTEST mode, make sure to:
- Cancel transmission request(s), if any,
- Disable all the FIFO and Transmit Queues, and,
- Clear the receiving flags of receiving buffers.

Note 2. r = 0 to 63

Figure 17.37 RAM Test Setting Procedure

17.11.4.4 Inter-Channel Communication Test Setting Procedure

Communication testing can be performed by transmitting and receiving data between different channels.

Figure 17.38 shows the inter-channel communication test setting procedure.

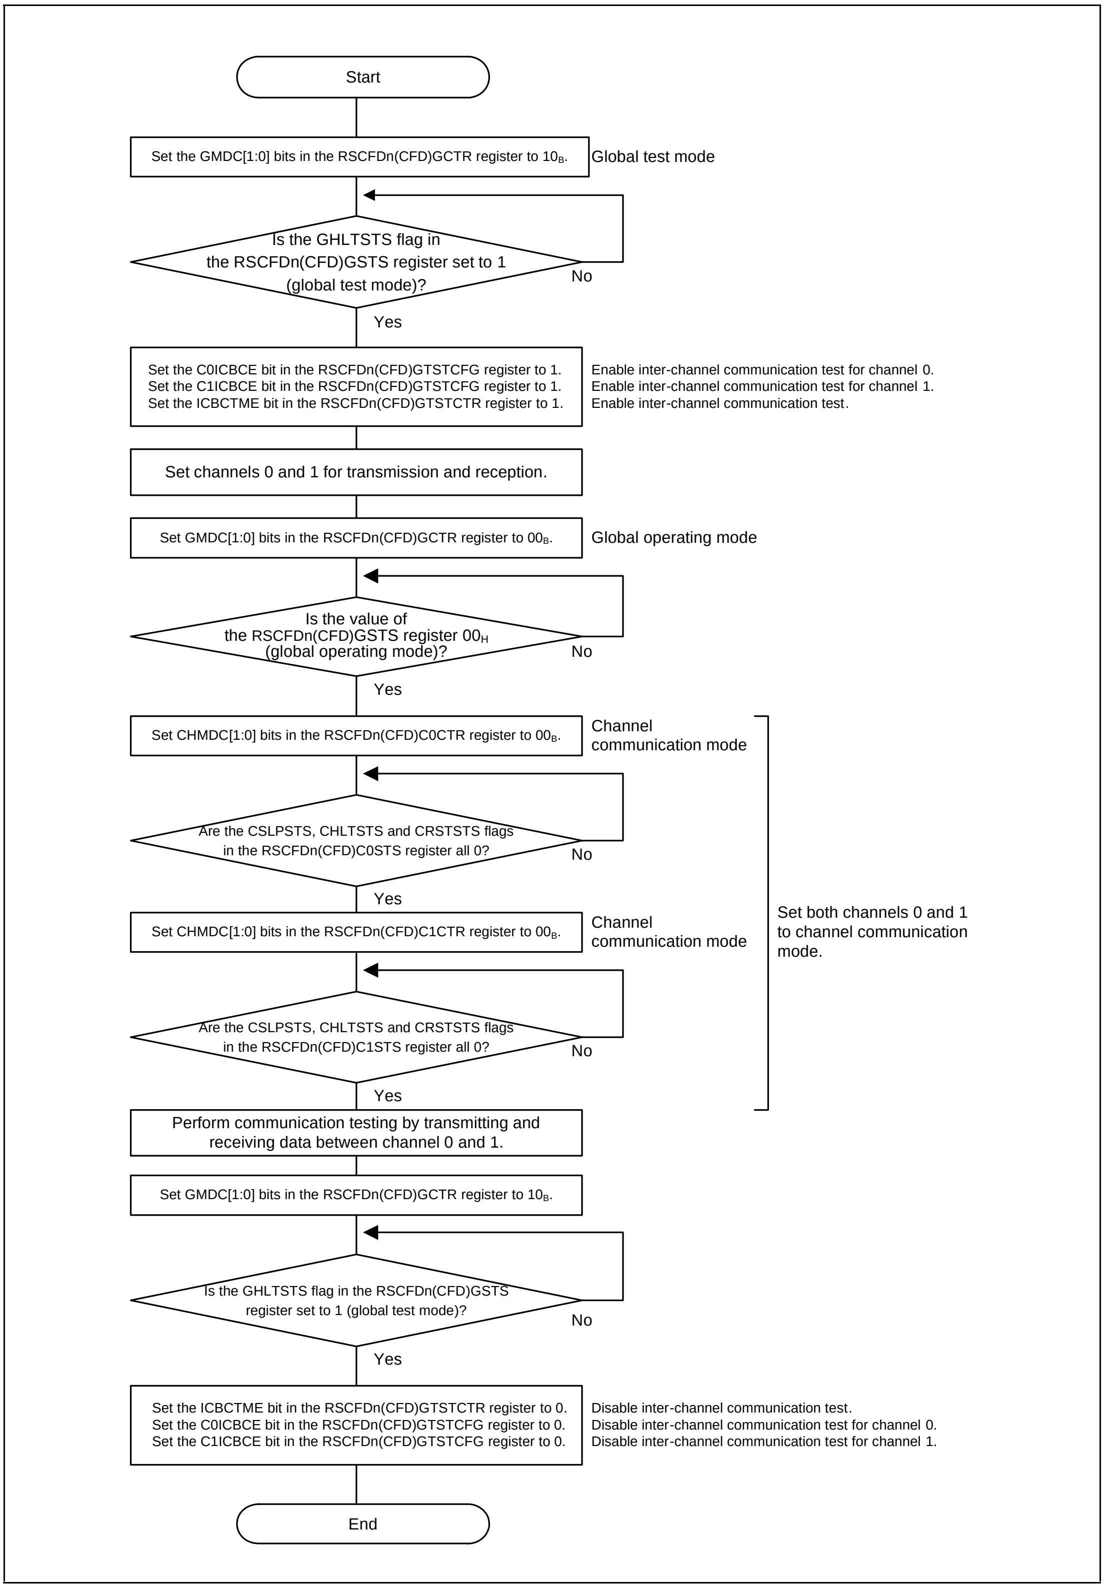


Figure 17.38 Inter-Channel Communication Test Setting Procedure (Example of Communication Test between Channel 0 and Channel 1)

17.12 Notes on the RS-CANFD Module

- When changing interface mode without resetting the RS-CANFD, write the value after reset to all registers and bits that are not allocated to the register map after change and then modify the RSCFDn(CFD)GRMCFG register.
- When changing a global mode, check the GSLPSTS, GHLTSTS, and GRSTSTS flags in the RSCFDn(CFD)GSTS register for transitions. When changing a channel mode, check the CSLPSTS, CHLTSTS, and CRSTSTS flags in the RSCFDn(CFD)CmSTS register (m = 0 to 2) for transitions.
- When only classical CAN frames are used in CAN FD mode, set the RSCFDnCFDCmDCFG register to the value equal to the set RSCFDnCFDCmNCFG register value.
- The acceptance filter processing checks receive rules sequentially in ascending order from the smallest rule number. If the same ID, IDE bit, or RTR bit value is set for multiple receive rules, the smallest number of receive rule is used for the acceptance filter processing. If the message does not pass through the subsequent DLC filter processing, the data processing is terminated without returning to the acceptance filter processing and the message is not stored in the buffer.
- When linking transmit buffers to transmit/receive FIFO buffers or allocating transmit buffers to transmit queues, set the control register (RSCFDn(CFD)TMCp) of the corresponding transmit buffer to 00_H. The status register (RSCFDn(CFD)TMSTSp) of the corresponding transmit buffer should not be used. Flags in other status registers (registers RSCFDn(CFD)TMTRSTSy, RSCFDn(CFD)TMTARSTSy, RSCFDn(CFD)TMTCSTSy, and RSCFDn(CFD)TMTASTSy), which correspond to transmit buffers linked to transmit/receive FIFO buffers or allocated to transmit queues remain unchanged. Set the enable bit in the corresponding interrupt enable register (registers RSCFDn(CFD)TMIECy) to 0 (transmit buffer interrupt is disabled).
- When using transmit buffer merge mode (in CAN FD mode), write 00_H to the control register (RSCFDn(CFD)TMCp) of the transmit buffer corresponding to the transmit buffer allocated as a payload storage area. Set the enable bit of corresponding interrupt enable registers (RSCFDn(CFD)TMIECy) to 0 (to disable interrupts).
- Transmit buffers that are linked to transmit/receive FIFO buffers must not be allocated to transmit queues. Do not allocate a transmit buffer allocated as a payload storage area in transmit buffer merge mode (in CAN FD mode) to the transmit queue either.
- Only a single transmit/receive FIFO buffer can be linked to a transmit buffer. Do not link two or more transmit/receive FIFO buffers to transmit buffers of the same number.
- When the CANm bit time clock is selected as a timestamp counter clock source, the timestamp counter stops when the corresponding channel has transitioned to channel reset mode or channel halt mode.
- In case of an attempt to store a newly received message when the receive FIFO buffer and the transmit/receive FIFO buffer are full, the new message is discarded. If you wish to store a new transmit message in the transmit/receive FIFO buffer or the transmit queue, check that the transmit/receive FIFO buffer or the transmit queue is not full.

- In the case of registers that access the RAM, the value after reset shown in **Section 17.3, Registers (Classical CAN Mode)** and **Section 17.4, Registers (CAN FD Mode)** indicate the values cleared by initialization of the CAN RAM. Values before clear are undefined. The following registers apply.
  - Receive rule (RSCFDn(CFD)GAFLIDj, RSCFDn(CFD)GAFLMj, RSCFDn(CFD)GAFLP0_j, RSCFDn(CFD)GAFLP1_j registers)
  - Receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, RSCFDn(CFD)RMDFb_q registers)
  - Receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers)
  - Transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers)
  - Transmit buffers (RSCFDn(CFD)TMIDp, RSCFDn(CFD)TMPTRp, RSCFDnCFDTMFDCTRp, and RSCFDn(CFD)TMDFb_p registers)
  - Transmit history access register (RSCFDn(CFD)THLACCm register)
  - RAM test page access register (RSCFDn(CFD)RPGACCr register)
- The values of unused receive buffers (RSCFDn(CFD)RMIDq, RSCFDn(CFD)RMPTRq, RSCFDnCFDRMFDSTSq, and RSCFDn(CFD)RMDFb_q registers), receive FIFO buffer access registers (RSCFDn(CFD)RFIDx, RSCFDn(CFD)RFPTRx, RSCFDnCFDRFFDSTSx, and RSCFDn(CFD)RFDFd_x registers) and transmit/receive FIFO buffer access registers (RSCFDn(CFD)CFIDk, RSCFDn(CFD)CFPTRk, RSCFDnCFDCFFDCSTSk, and RSCFDn(CFD)CFDFd_k registers) are undefined when the RS-CANFD module transitions to global operation mode or global test mode after exiting from global reset mode.

Section 18 FlexRay (FLXA)

The FlexRay IP-module performs communication according to the FlexRay protocol specification v2.1. With maximum specified sample clock the bitrate is 10 MBit/s. Additional bus driver (BD) hardware is required for connection to the physical layer.

18.1 Features of RH850/P1M-E FLXA

18.1.1 Number of Units and Channels

This microcontroller has the following number units of FlexRay.

Table 18.1 Number of Units

FlexRay	RH850/P1M-E
Number of Units	1 (A ch, B ch)
Name	FLXAn

Table 18.2 Index

Index	Meaning
n	The number of the FlexRay indicated by the letter “n” (n = 0).
m	The register number is identified by the index “m”, for example, FLXAnFRESIDm for the even Sync ID register.
p	The flag number is indicated by the letter “p” (p = (m – 1) × 32 to (m × 32 – 1)).

18.1.2 Register Base Address

All FlexRay register addresses are given as address offsets to the individual base address <FLXAn_base>.

The base address <FLXAn_base> of each FlexRay is listed in the following table:

Table 18.3 Register Base Address <FLXAn_base>

Base Address Name	Base Address
<FLXA0_base>	$1002\ 0000_H$

18.1.3 Clock Supply

FlexRay provide one clock input.

Table 18.4 Clock Supply

Unit Name	Clock for the Unit	Supply Clock Name
FLXAn	Sample clock	High-speed peripheral clock CLK_HSB
	Peripheral bus clock	

18.1.4 Interrupt Requests

FlexRay can generate the following interrupt requests:

Table 18.5 Interrupt Requests

Unit Interrupt Name	Outline	Interrupt	DMA/DTS Trigger
INTFLXA0LINE0	FLXA0 FlexRay0 interrupt	194	—
INTFLXA0LINE1	FLXA0 FlexRay1 interrupt	195	—
INTFLXA0TIM0	FLXA0 Timer 0 interrupt	196	—
INTFLXA0TIM1	FLXA0 Timer 1 interrupt	197	—
INTFLXA0TIM2	FLXA0 Timer 2 interrupt	198	—
INTFLXA0FDA	FLXA0 FIFO transfer interrupt	199	—
INTFLXA0FW	FLXA0 FIFO transfer warning interrupt	200	—
INTFLXA0OW	FLXA0 Output transfer warning interrupt	201	—
INTFLXA0OT	FLXA0 Output transfer end interrupt	202	—
INTFLXA0IQF	FLXA0 Input queue full interrupt	203	—
INTFLXA0IQE	FLXA0 Input queue empty interrupt	204	—

18.1.5 Reset Source

Please refer to **Section 8, Reset Controller**.

18.1.6 External Input/Output Pins

Table 18.6 shows the pin information.

Table 18.6 External Input/Output Signals

Unit Signal Name	I/O	Description	Alternative Port Pin Signals
rxda_extfxr	I	Receive Data(ch:A)	FLXA0RXDA
rxdb_extfxr	I	Receive Data(ch:B)	FLXA0RXDB
fxr_txda	O	Transmit Data(ch:A)	FLXA0TXDA
fxr_txdb	O	Transmit Data(ch:B)	FLXA0TXDB
fxr_txena_n	O	Transmit Enable(ch:A)	FLXA0TXENA
fxr_txenb_n	O	Transmit Enable(ch:B)	FLXA0TXENB
stpwt_extfxr	I	Stop watch trigger input	FLXA0STPWT

18.1.7 Combinations of Pins and Ports

Combinations of FlexRay pins and ports are listed in the following table.

Table 18.7 Combinations of Pins and Ports

Function	Pin Name	Port Name	
		Group 1	Group 2
FLXA0	FLXA0RXDA	P4_2	P4_8*1
	FLXA0RXDB	P4_3	P4_11*1
	FLXA0STPWT	P4_4	P4_14*1
	FLXA0TXDA	P4_0	P4_9*1
	FLXA0TXDB	P4_5	P4_12*1
	FLXA0TXENA	P4_1	P4_10*1
	FLXA0TXENB	P4_6	P4_13*1

Note 1. Available in devices with 144-pin.

18.1.8 Functions

For communication on a FlexRay network, individual message buffers with up to 254 data bytes are configurable. The message buffer is a Message RAM that is configurable up to 128 message buffers. All functions concerning the handling of messages are implemented in the Message Handler. Those functions are the acceptance filtering, the transfer of messages between the two FlexRay Channel Protocol Controllers and the Message RAM, maintaining the transmission schedule as well as providing message status information.

The register set of the FlexRay IP-module can be accessed directly by an external Host via the module's Host interface. These registers are used to control/configure/monitor the FlexRay Channel Protocol Controllers, Message Handler, Global Time Unit, System Universal Control, Frame and Symbol Processing, Network Management, Interrupt Control, to access the Message RAM via Input / Output Buffer; and to control the data transfer between the Message RAM and the Local RAM/Global RAM.

The FlexRay IP-module supports the following features:

Item	Specification
Communication	Conformance with FlexRay protocol specification v2.1
Data transfer rate	Up to 10 M bit/s on each channel
Data link layer clock frequency	80 MHz
Input/Output pins per channel	TxD, RxD, TxEN
FlexRay channels	2 (channels A and B)
Message buffer	Up to 128 message buffers are configurable. Message buffers are configurable with different payload length Each message buffer can be configured as a part of receive buffer, transfer buffer or receive FIFO. Filtering for slot counter, cycle counter or channel.
Message RAM	8-Kbyte message RAM can be configured as below. • 128 message buffers with up to 48-byte data section • 30 message buffers with 254-byte data section
FIFO	One configurable receive FIFO
Message Buffer Access	Access by the host CPU through input/output buffer Input buffer: a message transferred to the message RAM is retained. Output buffer: a message read from the message RAM is retained.
	Access by data transfer function Input transfer: the contents of the message buffer is transferred from the Local RAM/Global RAM to the message RAM by a request of the CPU Input transfer: the contents of the message buffer is transferred automatically to the Local RAM/Global RAM from the message RAM
Network management	Supported
Interrupts	Maskable module interrupts
Timer	Two absolute timers One relative timer One stop watch timer

18.1.9 Block Diagram

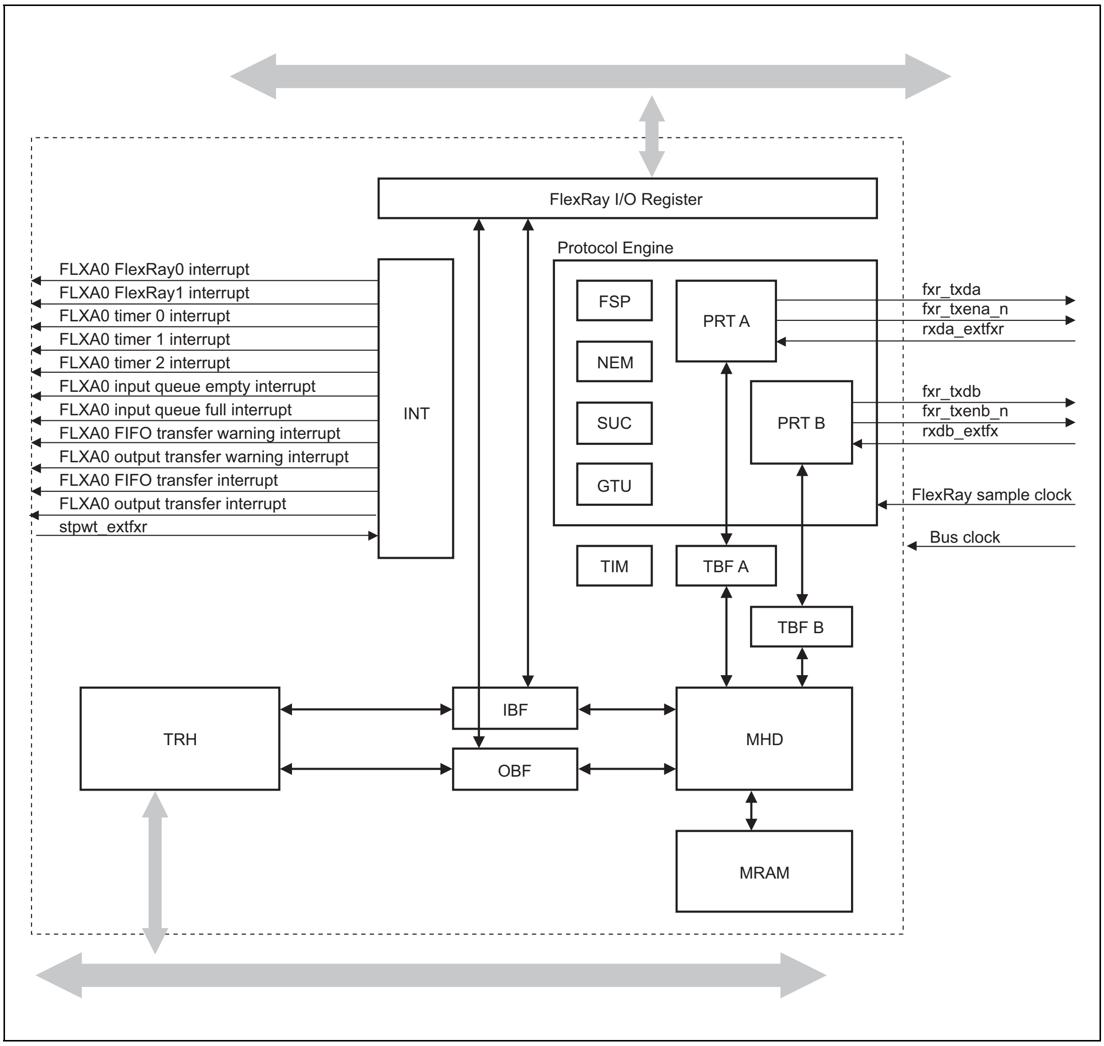

Figure 18.1 FlexRay IP Block Diagram

Input Buffer (IBF)

For write access to the message buffers configured in the Message RAM, the Host can write the header and data section for a specific message buffer to the Input Buffer. The Message Handler then transfers the data from the Input Buffer to the selected message buffer in the Message RAM.

Output Buffer (OBF)

For read access to a message buffer configured in the Message RAM the Message Handler transfers the selected message buffer to the Output Buffer. After the transfer has completed, the Host can read the header and data section of the transferred message buffer from the Output Buffer.

Message Handler (MHD)

The FlexRay Message Handler controls data transfers between the following components:

- Input / Output Buffer and Message RAM
- TBFRAMs of the two FlexRay Protocol Controllers and Message RAM

Message RAM (MRAM)

The Message RAM consists of a single-ported RAM that stores up to 128 FlexRay message buffers together with the related configuration data (header and data partition).

TBFRAM (TBF A/B)

Stores the data section of two complete messages.

FlexRay Channel Protocol Controller (PRT A/B)

The FlexRay Channel Protocol Controllers consist of shift register and FlexRay protocol FSM. They are connected to the TBFRAMs for intermediate message storage and to the physical layer via bus driver (BD).

They perform the following functionality:

- Control and check of bit timing
- Reception / transmission of FlexRay frames and symbols
- Check of header CRC
- Generation / check of frame CRC
- Interfacing to bus driver

Global Time Unit (GTU)

The Global Time Unit performs the following functions:

- Generation of microtick (µT)
- Generation of macrotick (MT)
- Fault tolerant clock synchronization by FTM algorithm
  - rate correction
  - offset correction
- Cycle counter
- Timing control of static segment
- Timing control of dynamic segment (minislotting)
- Support of external clock correction

System Universal Control (SUC)

The System Universal Control controls the following functions:

- Configuration
- Wakeup
- Startup
- Normal Operation
- Passive Operation

Frame and Symbol Processing (FSP)

The Frame and Symbol Processing controls the following functions:

- Checks the correct timing of frames and symbols
- Tests the syntactical and semantical correctness of received frames
- Sets the slot status flags

Network Management (NEM)

Handles the network management vector.

Interrupt Control (INT)

The Interrupt Controller performs the following functions:

- Provides error and status interrupt flags
- Enable / disable interrupt sources
- Assignment of interrupt sources to one of the two general module interrupt lines
- Enable / disable module interrupt lines

Timer (TIM)

The Timer module includes the following macrotick timer:

- two absolute timers
- one relative timer
- one stop watch timer

Transfer Handler (TRH)

Handles the data transfer between Local RAM/Global RAM and FlexRay module.

The Transfer Handler supports the following transfer types:

- Transfer of buffer configuration data from the Local RAM/Global RAM to the Message RAM
- Transfer of payload data for transmission buffers from the Local RAM/Global RAM to the Message RAM
- Transfer of buffer configuration data and payload data for transmission buffer from the Local RAM/Global RAM to the Message RAM
- Automatic transfer of payload data from receive buffer to the Local RAM/Global RAM upon frame reception
- Automatic transfer of payload data, buffer configuration data and message buffer status data from receive buffer to the Local RAM/Global RAM upon frame reception
- Automatic transfer of buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Global RAM in response to slot status update
- Manual transfer of payload data, buffer configuration data and message buffer status data from the dedicated transmit/receive buffer to the Local RAM/Global RAM.

18.2 Register

18.2.1 Register Map

The FlexRay module allocates an address space as shown in **Table 18.8**.

Within this specification the “Values after reset” refers to the reset of the microcontroller. For registers in the address range <FLXAn_base> + 0010_H to <FLXAn_base> + $0FFF_H$ the “Value after reset” are also applicable when the software reset of the FlexRay module (using bit FLXAnFROC.OE) is applied.

The addresses in this specification are listed as offsets from a base address. The base address <FLXAn_base> must thus be added to the addresses.

For <FLXAn_base>, refer to **Section 18.1.2, Register Base Address**.

Table 18.8 FlexRay Register Map (1/3)

Register Name	Symbol	Value after Reset	Address	Access Size
FlexRay Operation Control Register	FLXAnFROC	$0000\ 0000_H$	<FLXAn_base> + 0004_H	8, 16, 32
FlexRay Operation Status Register	FLXAnFROS	$0000\ 0000_H$	<FLXAn_base> + $000C_H$	8, 16, 32
FlexRay Lock Register	FLXAnFRLCK	$0000\ 0000_H$	<FLXAn_base> + $001C_H$	8, 16, 32
FlexRay Error Interrupt Register	FLXAnFREIR	$0000\ 0000_H$	<FLXAn_base> + 0020_H	8, 16, 32
FlexRay Status Interrupt Register	FLXAnFRSIR	$0000\ 0000_H$	<FLXAn_base> + 0024_H	8, 16, 32
FlexRay Error Interrupt Line Select	FLXAnFREILS	$0000\ 0000_H$	<FLXAn_base> + 0028_H	8, 16, 32
FlexRay Status Interrupt Line Select	FLXAnFRSILS	$0303\ FFFF_H$	<FLXAn_base> + $002C_H$	8, 16, 32
FlexRay Error Interrupt Enable Set Register	FLXAnFREIES	$0000\ 0000_H$	<FLXAn_base> + 0030_H	8, 16, 32
FlexRay Error Interrupt Enable Reset Register	FLXAnFREIER	$0000\ 0000_H$	<FLXAn_base> + 0034_H	8, 16, 32
FlexRay Status Interrupt Enable Set Register	FLXAnFRSIES	$0000\ 0000_H$	<FLXAn_base> + 0038_H	8, 16, 32
FlexRay Status Interrupt Enable Reset Register	FLXAnFRSIER	$0000\ 0000_H$	<FLXAn_base> + $003C_H$	8, 16, 32
FlexRay Interrupt Line Enable Register	FLXAnFRILE	$0000\ 0000_H$	<FLXAn_base> + 0040_H	8, 16, 32
FlexRay Timer 0 Configuration Register	FLXAnFRT0C	$0000\ 0000_H$	<FLXAn_base> + 0044_H	8, 16, 32
FlexRay Timer 1 Configuration Register	FLXAnFRT1C	$0002\ 0000_H$	<FLXAn_base> + 0048_H	8, 16, 32
FlexRay Stop Watch Register 1	FLXAnFRSTPW1	$0000\ 0000_H$	<FLXAn_base> + $004C_H$	8, 16, 32
FlexRay Stop Watch Register 2	FLXAnFRSTPW2	$0000\ 0000_H$	<FLXAn_base> + 0050_H	8, 16, 32
FlexRay SUC Configuration Register 1	FLXAnFRSUCC1	$0C40\ 1080_H$	<FLXAn_base> + 0080_H	8, 16, 32
FlexRay SUC Configuration Register 2	FLXAnFRSUCC2	$0100\ 0504_H$	<FLXAn_base> + 0084_H	8, 16, 32
FlexRay SUC Configuration Register 3	FLXAnFRSUCC3	$0000\ 0011_H$	<FLXAn_base> + 0088_H	8, 16, 32
FlexRay NEM Configuration Register	FLXAnFRNEMC	$0000\ 0000_H$	<FLXAn_base> + $008C_H$	8, 16, 32
FlexRay PRT Configuration Register 1	FLXAnFRPRTC1	$084C\ 0633_H$	<FLXAn_base> + 0090_H	8, 16, 32
FlexRay PRT Configuration Register 2	FLXAnFRPRTC2	$0F2D\ 0A0E_H$	<FLXAn_base> + 0094_H	8, 16, 32
FlexRay MHD Configuration Register	FLXAnFRMHDC	$0000\ 0000_H$	<FLXAn_base> + 0098_H	8, 16, 32
FlexRay GTU Configuration Register 1	FLXAnFRGTUC1	$0000\ 0280_H$	<FLXAn_base> + $00A0_H$	8, 16, 32
FlexRay GTU Configuration Register 2	FLXAnFRGTUC2	$0002\ 000A_H$	<FLXAn_base> + $00A4_H$	8, 16, 32
FlexRay GTU Configuration Register 3	FLXAnFRGTUC3	$0202\ 0000_H$	<FLXAn_base> + $00A8_H$	8, 16, 32
FlexRay GTU Configuration Register 4	FLXAnFRGTUC4	$0008\ 0007_H$	<FLXAn_base> + $00AC_H$	8, 16, 32

18.2.2 FlexRay Operation register

18.2.2.1 FLXAnFROC — FlexRay Operation Control Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0004_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	T2IE	T1IE	T0IE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Table 18.9 FLXAnFROC Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	T2IE	Timer 2 interrupt enable Bit 0: Disabled 1: Enabled
17	T1IE	Timer 1 interrupt enable Bit 0: Disabled 1: Enabled
16	T0IE	Timer 0 interrupt enable Bit 0: Disabled 1: Enabled
15 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7	OEP	Operation Enable bit Protection Bit 0: OE is unprotected 1: OE is protected
6 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	OE	Operation Enable Bit 0: Operation disabled, software reset of the FlexRay module 1: Operation enabled

(1) FLXAnFROC.T2IE

Timer 2 interrupt enable bit

This bit controls the timer 2 interrupt.

0: Disabled

No interrupt will be requested and the timer 2 interrupt line will be released if pending.

1: Enabled

Timer 2 interrupt will be asserted when FLXAnFROTS.T2IS is 1.

(2) FLXAnFROC.T1IE

Timer 1 interrupt enable bit

The user should only set this bit to 1 when timer 1 interrupt is not enabled in the FlexRay Status interrupt enable register (bit FLXAnFRSIES.TI1E should be 0).

This bit controls the timer 1 interrupt.

0: Disabled

No interrupt will be requested and the timer 1 interrupt line will be released if pending.

1: Enabled

Timer 1 interrupt will be asserted when bit FLXAnFROTS.T1IS is 1.

(3) FLXAnFROC.T0IE

Timer 0 interrupt enable bit

The user should only set this bit to 1 when timer 0 interrupt is not enabled in the FlexRay Status interrupt enable register (bit FLXAnFRSIES.TI0E should be 0).

This bit controls the timer 0 interrupt.

0: Disabled

No interrupt will be requested and the timer 0 interrupt line will be released if pending.

1: Enabled

Timer 0 interrupt will be asserted when bit FLXAnFROTS.T0IS is 1.

(4) FLXAnFROC.OEP

Operation enable bit protection bit

This bit protects against unintended write access to the OE bit.

0: OE bit is unprotected

Write access to the OE bit is enabled

1: OE bit is protected

Write access to the OE bit is disabled

(5) FLXAnFROC.OE

Operation enable bit

The user can only write to this bit when bit FLXAnFROC.OEP is 0.

The user should only write this bit with 0 when bit FLXAnFROS.OS is 1.

The user should only write this bit with 1 when bit FLXAnFROS.OS is 0 and the FlexRay sample clock is enabled.

This bit controls the operation state and serves the software reset of the FlexRay module. The operation status bit (FLXAnFROS.OS) indicates whether the FlexRay module is in reset state or not.

0: Operation disabled, software reset of the FlexRay module

Forcibly moves the FlexRay module to its reset state, whatever the state of the FlexRay module is.

1: Operation enabled

Reset state of the FlexRay module is released.

18.2.2.2 FLXAnFROS — FlexRay Operation Status Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $000C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	T2IS	T1IS	T0IS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	OS
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.10 FLXAnFROS Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	T2IS	Timer 2 Interrupt Status Bit 0: Timer 2 has not matched the conditions configured in the FLXAnFRT2C register 1: Timer 2 matched the conditions configured in the FLXAnFRT2C register
17	T1IS	Timer 1 Interrupt Status Bit 0: Timer 1 has not matched the conditions configured in the FLXAnFRT1C register 1: Timer 1 matched the conditions configured in the FLXAnFRT1C register
16	T0IS	Timer 0 Interrupt Status Bit 0: Timer 0 has not matched the conditions configured in the FLXAnFRT0C register 1: Timer 0 matched the conditions configured in the FLXAnFRT0C register
15 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	OS	Operation Status Bit 0: Operation disabled, reset state 1: Operation enabled

(1) FLXAnFROS.T2IS

Timer 2 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit indicates that the timer 2 has matched the state configured in the FLXAnFRT2C register.

When the FLXAnFROC.T2IE bit is enabled and the FLXAnFROS.T2IS bit is set to 1, the timer 2 interrupt is generated.

[Clearing condition]

- This bit is cleared by writing 1 to the FLXAnFROS.T2IS bit.
- This bit is cleared when the FLXAnFROS.OS bit changes from 1 to 0.

[Setting condition]

- This bit is set when the state matches the state configured in the FLXAnFRT2C register.

(2) FLXAnFROS.T1IS

Timer 1 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit indicates that the timer 1 has matched the state configured in the FLXAnFRT1C register.

When the FLXAnFROC.T1IE bit is enabled and the FLXAnFROS.T1IS bit is set to 1, the timer 1 interrupt is generated.

[Clearing condition]

- This bit is cleared by writing 1 to the FLXAnFROS.T1IS bit.
  This bit is cleared when the FLXAnFROS.OS bit changes from 1 to 0.

[Setting condition]

- This bit is set when the state becomes the state configured in the FLXAnFRT1C register.

(3) FLXAnFROS.T0IS

Timer 0 Interrupt Status Bit

Writing 0 has no effect on the bit value.

This bit indicates that the timer 0 has matched the state configured in the FLXAnFRT0C register.

When the FLXAnFROC.T0IE bit is enabled and the FLXAnFROS.T0IS bit is set to 1, the timer 0 interrupt is generated.

[Clearing condition]

- This bit is cleared by writing 1 to the FLXAnFROS.T0IS bit.
- This bit is cleared when the FLXAnFROS.OS bit changes from 1 to 0.

[Setting condition]

- This bit is set when the state becomes the state configured in the FLXAnFRT0C register.

(4) FLXAnFROS.OS

Operation Status Bit

This bit represents if the FlexRay module is in the reset or the operation state.

When bit FLXAnFROS.OS is 0 the FlexRay module gets initialized and registers mapped to the address area <FLXAn_base>+ 0010_H to <FLXAn_base> + $0FFF_H$ cannot be accessed; read access from these registers will return undefined data.

When bit FLXAnFROS.OS is 1 it is possible to access to the address area <FLXAn_base> + 0010_H to <FLXAn_base> + $0FFF_H$ and to perform FlexRay communication.

When bit FLXAnFROS.OS changes from 0 to 1 all registers in the address range <FLXAn_base> + 0010_H to <FLXAn_base> + $0FFF_H$ are set to the “Values after reset”.

[Clearing condition]

- When bit FLXAnFROC.OE is set to 0. It takes up to two peripheral bus clock cycles until bit FLXAnFROS.OS is set to 0.

[Setting condition]

- When bit FLXAnFROC.OE is set to 1 it takes up to four peripheral clock cycles of the clock with the lower frequency out of the FlexRay sample clock and peripheral bus clock until bit FLXAnFROS.OS is set to 1.

18.2.3 Special Registers

18.2.3.1 FLXAnFRLCK — FlexRay Lock Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 001C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	CLK[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.11 FLXAnFRLCK Register Contents

Bit	Symbol	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7 to 0	CLK[7:0]	Configuration Lock Key Bit

(1) FLXAnFRLCK.CLK

Configuration Lock Key Bit

The Lock Register is write-only. Reading the register will return 0000 0000$_H$.

To leave CONFIG state by writing bits FLXAnFRSUCC1.CMD[3:0] (command READY), the write operation has to be directly preceded by two write accesses to the Configuration Lock Key (unlock sequence). If the write sequence below is interrupted by other write accesses between the second write to the Configuration Lock Key and the write access to the FLXAnFRSUCC1 register, the CC remains in CONFIG state and the sequence has to be repeated.

First write: Bits FLXAnFRLCK.CLK[7:0] = “1100 1110$_B$” (CE$_H$)

Second write: Bits FLXAnFRLCK.CLK[7:0] = “0011 0001$_B$” (31$_H$)

Third write: Bits FLXAnFRSUCC1.CMD[3:0]

CAUTION

In case that the Host uses 8/16-bit accesses to write the listed bit fields, the user has to ensure that no “dummy accesses” e.g. to the remaining register bytes / words are inserted by the compiler.

18.2.4 Interrupt Registers

18.2.4.1 FLXAnFREIR — FlexRay Error Interrupt Register

The flags are set when the CC detects one of the listed error conditions. The flags remain set until the Host clears them.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0020_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	TABB	LTVB	EDB	—	—	—	—	—	TABA	LTVA	EDA

	—	—	—	—	MHF	IOBA	IIBA	EFA	RFO	AERR	CCL	CCF	SFO	SFBM	CNA	PEMC
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.12 FLXAnFREIR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read. When writing, write the value after reset.
26	TABB	Transmission Across Boundary Channel B Flag 0: No transmission across slot boundary detected on channel B 1: Transmission across slot boundary detected on channel B
25	LTVB	Latest Transmit Violation Channel B Flag 0: No latest transmit violation detected on channel B 1: Latest transmit violation detected on channel B
24	EDB	Error Detected on Channel B Flag 0: No error detected on channel B 1: Error detected on channel B
23 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	TABA	Transmission Across Boundary Channel A Flag 0: No transmission across slot boundary detected on channel A 1: Transmission across slot boundary detected on channel A
17	LTVA	Latest Transmit Violation Channel A Flag 0: No latest transmit violation detected on channel A 1: Latest transmit violation detected on channel A
16	EDA	Error Detected on Channel A Flag 0: No error detected on channel A 1: Error detected on channel A
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11	MHF	Message Handler Constraints Flag 0: No Message Handler failure detected 1: Message Handler failure detected
10	IOBA	Illegal Output buffer Access Flag 0: No illegal Host access to Output Buffer occurred 1: Illegal Host access to Output Buffer occurred

Table 18.12 FLXAnFREIR Register Contents (2/2)

Bit Position	Bit Name	Function
9	IIBA	Illegal Input Buffer Access Flag 0: No illegal Host access to Input Buffer occurred 1: Illegal Host access to Input Buffer occurred
8	EFA	Empty FIFO Access Flag 0: No Host access to empty FIFO occurred 1: Host access to empty FIFO occurred
7	RFO	Receive FIFO Overrun Flag 0: No receive FIFO overrun detected 1: A receive FIFO overrun has occurred
6	AERR	Access error flag Flag 0: Access error is not detected. 1: Access error is detected.
5	CCL	CHI Command Locked Flag 0: CHI command accepted 1: CHI command not accepted
4	CCF	Clock Correction Failure Flag 0: No clock correction error 1: Clock correction failed
3	SFO	Sync Frame Overflow Flag 0: Number of received sync frames ≤ the FLXAnFRGTUC2.SNM bit 1: More sync frames received than configured by the FLXAnFRGTUC2.SNM bit
2	SFBM	Sync Frames Below Minimum Flag 0: Sync node: 1 or more sync frames received Non-sync node: 2 or more sync frames received 1: Less than the required minimum of sync frames received
1	CNA	Command Not Accepted Flag 0: CHI command accepted 1: CHI command not accepted
0	PEMC	POC Error Mode Changed Flag 0: Error mode has not changed 1: Error mode has changed

(1) FLXAnFREIR.TABB

Transmission Across Boundary Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when 1 is written.

The flag signals to the Host that a transmission across a slot boundary occurred for channel B.

(2) FLXAnFREIR.LTVB

Latest Transmit Violation Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals a latest transmit violation on channel B to the Host.

(3) FLXAnFREIR.EDB

Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This bit is set whenever one of bits FLXAnFRACS.SEDB, FLXAnFRACS.CEDB, FLXAnFRACS.CIB, and FLXAnFRACS.SBVB changes from 0 to 1.

(4) FLXAnFREIR.TABA

Transmission Across Boundary Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals to the Host that a transmission across a slot boundary occurred for channel A.

(5) FLXAnFREIR.LTVA

Latest Transmit Violation Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals a latest transmit violation on channel A to the Host.

(6) FLXAnFREIR.EDA

Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This bit is set whenever one of bits FLXAnFRACS.SEDA, FLXAnFRACS.CEDA, FLXAnFRACS.CIA, and FLXAnFRACS.SBVA changes from 0 to 1.

(7) FLXAnFREIR.MHF

Message Handler Constraints Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals a Message Handler constraints violation condition. It is set whenever one of the bits FLXAnFRMHDF.SNUA, FLXAnFRMHDF.SNUB, FLXAnFRMHDF.FNFA, FLXAnFRMHDF.FNFB, FLXAnFRMHDF.TBFA, FLXAnFRMHDF.TBFB, and FLXAnFRMHDF.WAHP changes from 0 to 1.

(8) FLXAnFREIR.IOBA

Illegal Output buffer Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Host requests the transfer of a message buffer from the Message RAM to the Output Buffer while bit FLXAnFROBCR.OBSYS is set to 1.

(9) FLXAnFREIR.IIBA

Illegal Input Buffer Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Host wants to modify a message buffer via Input Buffer and one of the following conditions applies:

1. The CC is not in CONFIG or DEFAULT_CONFIG state and the Host writes to the Input Buffer Command Request register to modify the
   - Header section of message buffer 0, 1 if configured for transmission in key slot
   - Header section of static message buffers with buffer number < FLXAnFRMRC.FDB[7:0] while bits FLXAnFRMRC.SEC[1:0] = “01”
   - Header section of any static or dynamic message buffer while bits FLXAnFRMRC.SEC[1:0] = “1x”
   - Header and / or data section of any message buffer belonging to the receive FIFO
2. The Host writes to any register of the Input Buffer while bit FLXAnFRIBCR.IBSYH is set to 1.

(10) FLXAnFREIR.EFA

Empty FIFO Access Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Host requests the transfer of a message from the receive FIFO via Output Buffer while the receive FIFO is empty.

(11) FLXAnFREIR.RFO

Receive FIFO Overrun Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag is set by the CC when a receive FIFO overrun is detected. When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. The actual state of the FIFO is monitored in register FLXAnFRFSR.

(12) FLXAnFREIR.AERR

Access error flag Flag

Writing 0 in this bit has no effect.

This bit is cleared when writing 1 to it.

Notifies of an access error.

When bit FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, or FLXAnFRMHDS.ATBF2 changes from 0 to 1, this bit is set to 1.

(13) FLXAnFREIR.CCL

CHI Command Locked Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals that the write access to the CHI command vector FLXAnFRSUCC1.CMD[3:0] bits was not successful because the execution of the previous CHI command has not yet completed. In this case bit FLXAnFREIR.CNA is also set to 1.

(14) FLXAnFREIR.CCF

Clock Correction Failure Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set at the end of the communication cycle whenever one of the following errors occurred:

- Missing offset and / or rate correction
- Clock correction limit reached

The clock correction status is monitored in registers FLXAnFRCCEV and FLXAnFRSFS. A failure may occur during startup, therefore bit FLXAnFREIR.CCF should be set to 0 after the CC entered NORMAL_ACTIVE state.

(15) FLXAnFREIR.SFO

Sync Frame Overflow Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

It is set to 1 when either the number of sync frames received during the last communication cycle or the total number of different sync frame IDs received during the last double cycle exceeds the maximum number of sync frames as defined by the FLXAnFRGTUC2.SNM[3:0] bits.

(16) FLXAnFREIR.SFBM

Sync Frames Below Minimum Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 at the end of a cycle if the number of sync frames received during the last communication cycle was below the limit required for rate or offset correction term calculation (i.e. missing offset and / or missing rate correction). The clock correction status is monitored in FLXAnFRCCEV and FLXAnFRSFS.

This flag may be set to 1 during startup. Therefore this flag should be set to 0 by the Host after the CC entered NORMAL_ACTIVE state.

(17) FLXAnFREIR.CNA

Command Not Accepted Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

The flag signals that the write access to the CHI command vector FLXAnFRSUCC1.CMD[3:0] bits was not successful because the requested command was not valid in the actual POC state, or because the CHI command was locked (FLXAnFREIR.CCL = 1).

(18) FLXAnFREIR.PEMC

POC Error Mode Changed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 whenever the error mode signaled by the FLXAnFRCCEV.ERRM[1:0] bits has changed.

18.2.4.2 FLXAnFRSIR — FlexRay Status Interrupt Register

The flags are set when the CC detects one of the listed events. The flags remain set until the Host clears them.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0024_H

Value after reset: $0000\ 0000_H$

Table 18.13 FLXAnFRSIR Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25	MTSB	MTS Received on Channel B Flag (vSS!ValidMTSB) 0: No MTS symbol received on channel B 1: MTS symbol received on channel B
24	WUPB	Wakeup Pattern Channel B Flag 0: No wakeup pattern received on channel B 1: Wakeup pattern received on channel B
23 to 18	Reserved	When read, the value after reset is read. When writing, write the value after reset.
17	MTSA	MTS Received on Channel A Flag (vSS!ValidMTSA) 0: No MTS symbol received on channel A 1: MTS symbol received on channel A
16	WUPA	Wakeup Pattern Channel A Flag 0: No wakeup pattern received on channel A 1: Wakeup pattern received on channel A
15	SDS	Start of Dynamic Segment Flag 0: Dynamic segment not yet started 1: Dynamic segment started
14	MBSI	Message Buffer Status Interrupt Flag 0: No message buffer status change of message buffer with MBI = 1 1: Message buffer status of at least one message buffer with MBI = 1 has changed
13	SUCS	Startup Completed Successfully Flag 0: No startup completed successfully 1: Startup completed successfully
12	SWE	Stop Watch Event Flag 0: No Stop Watch Event 1: Stop Watch Event occurred
11	TOBC	Transfer Output Buffer Completed Flag 0: No transfer completed 1: Transfer between Message RAM and Output Buffer completed

Table 18.13 FLXAnFRSIR Register Contents (2/2)

Bit Position	Bit Name	Function
10	TIBC	Transfer Input Buffer Completed Flag 0: No transfer completed 1: Transfer between Input Buffer and Message RAM completed
9	TI1	Timer Interrupt 1 Flag 0: No timer interrupt 1 1: Timer interrupt 1 occurred
8	TI0	Timer Interrupt 0 Flag 0: No timer interrupt 0 1: Timer interrupt 0 occurred
7	NMVC	Network Management Vector Changed Flag 0: No change in the network management vector 1: Network management vector changed
6	RFCL	Receive FIFO Critical Level Flag 0: Receive FIFO below critical level 1: Receive FIFO critical level reached
5	RFNE	Receive FIFO Not Empty Flag 0: Receive FIFO is empty 1: Receive FIFO is not empty
4	RXI	Receive Interrupt Flag 0: No ND flag of a receive buffer with MBI = 1 has been set to 1 1: At least one ND flag of a receive buffer with MBI = 1 has been set to 1
3	TXI	Transmit Interrupt Flag 0: No frame transmitted from a transmit buffer with MBI = 1 1: At least one frame was transmitted from a transmit buffer with MBI = 1
2	CYCS	Cycle Start Interrupt Flag 0: No communication cycle started 1: Communication cycle started
1	CAS	Collision Avoidance Symbol Flag 0: No bit pattern matching the CAS symbol received 1: Bit pattern matching the CAS symbol received
0	WST	Wakeup Status Flag 0: Wakeup status unchanged 1: Wakeup status changed

(1) FLXAnFRSIR.MTSB

MTS Received on Channel B Flag (vSS!ValidMTSB)

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Media Access Test symbol received on channel B during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

(2) FLXAnFRSIR.WUPB

Wakeup Pattern Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 when a wakeup pattern was received on channel B in either of the following states:

- WAKEUP
- READY
- STARTUP

(3) FLXAnFRSIR.MTSA

MTS Received on Channel A Flag (vSS!ValidMTSA)

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Media Access Test symbol received on channel A during the preceding symbol window.

Updated by the CC for each channel at the end of the symbol window.

(4) FLXAnFRSIR.WUPA

Wakeup Pattern Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 when a wakeup pattern was received on channel A in either of the following states:

- WAKEUP
- READY
- STARTUP

(5) FLXAnFRSIR.SDS

Start of Dynamic Segment Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the dynamic segment starts.

(6) FLXAnFRSIR.MBSI

Message Buffer Status Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the message buffer status FLXAnFRMBS register has changed and if bit MBI of that message buffer is 1 (see **Table 18.106**).

(7) FLXAnFRSIR.SUCS

Startup Completed Successfully Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever a startup completed successfully and the CC entered NORMAL_ACTIVE state.

(8) FLXAnFRSIR.SWE

Stop Watch Event Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set after a stop watch activation when the actual cycle counter and macrotick value are stored in the Stop Watch register (see **Section 18.2.5.4, FLXAnFRSTPW1 — FlexRay Stop Watch Register 1**).

(9) FLXAnFRSIR.TOBC

Transfer Output Buffer Completed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever a transfer from the Message RAM to the Output Buffer has completed and bit FLXAnFROBCR.OBSYS has been reset by the Message Handler.

(10) FLXAnFRSIR.TIBC

Transfer Input Buffer Completed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever a transfer from Input Buffer to the Message RAM has completed and bit FLXAnFRIBCR.IBSYS has been reset by the Message Handler.

(11) FLXAnFRSIR.TI1

Timer 1 Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever timer 1 matches the conditions configured in register FLXAnFRT1C.

FlexRay timer 1 interrupt is generated when bit FLXAnFROC.T1IE is effective.

(12) FLXAnFRSIR.TI0

Timer 0 Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set whenever timer 0 matches the conditions configured in register FLXAnFRT0C.

FlexRay timer 0 interrupt is generated when bit FLXAnFROC.T0IE is effective.

(13) FLXAnFRSIR.NMVC

Network Management Vector Changed Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This is set when a change in the Network Management Vector occurs.

(14) FLXAnFRSIR.RFCL

Receive FIFO Critical Level Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set when the receive FIFO fill level indicated by bits FLXAnFRFSR.RFFL[7:0] is equal or greater than the critical level as configured by bit FLXAnFRFCL.CL.

(15) FLXAnFRSIR.RFNE

Receive FIFO Not Empty Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when a received valid frame was stored into the empty receive FIFO. The actual state of the receive FIFO is monitored in register FLXAnFRFSR.

(16) FLXAnFRSIR.RXI

Receive Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC whenever the set condition of a message buffers ND flag is fulfilled (see **Section 18.2.9.6, FLXAnFRNDATm — FlexRay New Data Register m (m = 1 to 4)**, and if bit MBI of that message buffer is set to 1 (see **Table 18.106**)

(17) FLXAnFRSIR.TXI

Transmit Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC at the end of frame transmission if bit MBI in the respective message buffer is set to 1 (see **Table 18.106**).

(18) FLXAnFRSIR.CYCS

Cycle Start Interrupt Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when a communication cycle starts.

(19) FLXAnFRSIR.CAS

Collision Avoidance Symbol Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC during STARTUP state when a CAS or a potential CAS was received.

(20) FLXAnFRSIR.WST

Wakeup Status Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set when flags FLXAnFRCCSV.WSV[2:0] change to a value other than UNDEFINED.

18.2.4.3 FLXAnFREILS — FlexRay Error Interrupt Line Select Register

This register assigns an interrupt generated by a specific error interrupt flag from register FLXAnFREIR to one of the two modules interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt).

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0028_H

Value after reset: $0000\ 0000_H$

18.2.4.5 FLXAnFREIES — FlexRay Error Interrupt Enable Set Register

The settings in the FlexRay Error Interrupt Enable Set (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 sets the interrupt enable bit.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0030_H

Value after reset: $0000\ 0000_H$

18.2.4.6 FLXAnFREIER — FlexRay Error Interrupt Enable Reset Register

The settings in the FlexRay Error Interrupt Enable Set (FLXAnFREIES) and FlexRay Error Interrupt Enable Reset (FLXAnFREIER) register determine which status changes in the FlexRay Error Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFREIES and reset by writing to FLXAnFREIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 clears the interrupt enable bit.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0034_H

Value after reset: $0000\ 0000_H$

18.2.4.7 FLXAnFRSIES — FlexRay Status Interrupt Enable Set Register

The settings in the FlexRay Status Interrupt Enable Set (FLXAnFRSIES) and FlexRay Status Interrupt Enable Reset (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 sets the interrupt enable bit.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0038_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

18.2.4.8 FLXAnFRSIER — FlexRay Status Interrupt Enable Reset Register

The settings in the FlexRay Status Interrupt Enable Set (FLXAnFRSIES) and FlexRay Status Interrupt Enable Reset (FLXAnFRSIER) register determine which status changes in the FlexRay Status Interrupt Register will result in an interrupt.

The enable bits are set by writing to FLXAnFRSIES and reset by writing to FLXAnFRSIER. Reading from both addresses will result in the same value.

Writing 0 has no effect on the bit value.

Writing a 1 clears the interrupt enable bit.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $003C_H$

Value after reset: $0000\ 0000_H$

18.2.4.9 FLXAnFRILE — FlexRay Interrupt Line Enable Register

Each of the two module interrupt lines (FlexRay 0 interrupt, FlexRay 1 interrupt) can be enabled / disabled separately by programming bit FLXAnFRILE.EINT0 and FLXAnFRILE.EINT1.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0040_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

18.2.5 FlexRay Timer Registers

18.2.5.1 FLXAnFRT0C — FlexRay Timer 0 Configuration Register

This register is an absolute timer. It specifies the point in time when a FlexRay timer 0 interrupt occurs as the values of cycle count and macrotick (MT). When the FlexRay timer 0 passes, bits FLXAnFRSIR.TI0 and FLXAnFROS.T0IS are set to 1. A timer 0 interrupt then occurs while bit FLXAnFROC.T0IE is effective.

CAUTION

The configuration of timer 0 is compared against the macrotick counter value, there is no separate counter for timer 0.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0044_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.21 FLXAnFRT0C Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29 to 16	T0MO[13:0]	Timer 0 Macrotick Offset Bit Timer 0 Macrotick Offset
15	Reserved	When read, the value after reset is read. When writing, write the value after reset.
14 to 8	T0CC[6:0]	Timer 0 Cycle Code Bit Timer 0 Cycle Code
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	T0MS	Timer 0 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T0RC	Timer 0 Run Control Bit 0: Timer 0 halted 1: Timer 0 running

(1) FLXAnFRT0C.T0MO

Timer 0 Macrotick Offset Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT0C.T0RC to 0.

Configures the macrotick offset from the beginning of the communication cycle where the interrupt is to occur. The FlexRay timer 0 interrupt occurs at this offset for each cycle of the cycle set.

(2) FLXAnFRT0C.T0CC

Timer 0 Cycle Code Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT0C.T0RC to 0.

The 7-bit timer 0 cycle code determines the cycle set used for generation of the FlexRay timer 0 interrupt. For details about the configuration of the cycle code see **Section 18.3.8.2, Cycle Counter Filtering**.

(3) FLXAnFRT0C.T0MS

Timer 0 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT0C.T0RC to 0.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

(4) FLXAnFRT0C.T0RC

Timer 0 Run Control Bit

Timer 0 can be activated (set bit FLXAnFRT0C.T0RC to 1) when the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.

Timer 0 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

18.2.5.2 FLXAnFRT1C — FlexRay Timer 1 Configuration Register

This register is a relative timer. After the specified number of macroticks (MT) has expired, a FlexRay timer 1 interrupt is asserted. When the FlexRay timer 1 passes, bits FLXAnFRSIR.TI1 and FLXAnFROS.T1IS are set to 1. A timer 1 interrupt then occurs while bit FLXAnFROC.T1IE is effective.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0048_H

Value after reset: $0002\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.22 FLXAnFRT1C Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29 to 16	T1MC[13:0]	Specify timer 1 macrotick count value.
15 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	T1MS	Timer 1 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T1RC	Timer 1 Run Control Bit 0: Timer 1 halted 1: Timer 1 running

(1) FLXAnFRT1C.T1MC

Timer 1 Macrotick Count Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT1C.T1RC to 0.

Valid values are 2 to 16383 MT in continuous mode

Valid values are 1 to 16383 MT in single-shot mode

When the configured macrotick count is reached the FlexRay timer 1 interrupt is generated.

(2) FLXAnFRT1C.T1MS

Timer 1 Mode Select Bit

Before reconfiguration of the timer, the timer has to be halted first by writing bit FLXAnFRT1C.T1RC to 0.

Configures the timer run mode. In Single-shot mode the timer is deactivated when the timer configuration matches the configured cycle counter and macrotick value.

(3) FLXAnFRT1C.T1RC

Timer 1 Run Control Bit

Timer 1 can be activated (set bit FLXAnFRT1C.T1RC to 1) as long as the POC is either in NORMAL_ACTIVE state or in NORMAL_PASSIVE state.

Timer 1 is deactivated when leaving NORMAL_ACTIVE state or NORMAL_PASSIVE state except for transitions between the two states.

18.2.5.3 FLXAnFRT2C — FlexRay Timer 2 Configuration Register

This register is an absolute timer. Timer 2 has the same absolute timer features as timer 0.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0844_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.23 FLXAnFRT2C Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29 to 16	T2MO[13:0]	Timer 2 Macrotick Offset Bit Timer 2 Macrotick Offset
15	Reserved	When read, the value after reset is read. When writing, write the value after reset.
14 to 8	T2CC[6:0]	Timer 2 Cycle Code Bit Timer 2 Cycle Code
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1	T2MS	Timer 2 Mode Select Bit 0: Single-shot mode 1: Continuous mode
0	T2RC	Timer 2 Run Control Bit 0: Timer halted 1: Timer running

(1) FLXAnFRT2C.T2MO

Timer 2 Macrotick Offset Bit

Stop the timer by writing 0 to the FLXAnFRT2C.T2RC bit before changing the setting of the timer.

The T2MO bits are used to set the timing for generation of the timer 2 interrupt as an offset value in MT units from the position where the transfer cycle starts. That is, the timer 2 interrupt is generated at the offset position specified by the setting for the number of MT cycles.

(2) FLXAnFRT2C.T2CC

Timer 2 Cycle Code Bit

Stop the timer by writing 0 to bit FLXAnFRT2C.T2RC before changing the setting of the timer.

The T2CC bits are used to make the cycle setting for generation of the timer 2 interrupt as a 7-bit timer 2 cycle code. For details, see **Section 18.3.8.2, Cycle Counter Filtering**.

(3) FLXAnFRT2C.T2MS

Timer 2 Mode Select Bit

Stop the timer by writing 0 to bit FLXAnFRT2C.T2RC before changing the setting of the timer.

Set the execution mode of the timer. In single shot mode, the timer stops when the timer setting matched with the MT value of the cycle counter.

(4) FLXAnFRT2C.T2RC

Timer 2 Run Control Bit

The timer 2 can operate only when POC is in NORMAL_ACTIVE state or NORMAL_PASSIVE state (bit FLXAnFRT2C.T2RC is set to 1).

The timer 2 stops when it transits to other state except transition between NORMAL_ACTIVE state and NORMAL_PASSIVE state.

18.2.5.4 FLXAnFRSTPW1 — FlexRay Stop Watch Register 1

The stop watch is activated by the following trigger events.

- Input of a rising edge or falling edge to the FLXA0STPWT pin
- FlexRay 0 interrupt or FlexRay 1 interrupt
- Writing bit FLXAnFRSTPW1.SSWT to 1

With the macrotick counter increment following next to the stop watch activation the actual cycle counter and macrotick values are captured in register FLXAnFRSTPW1 while the slot counter values for channel A and B are captured in register FLXAnFRSTPW2.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $004C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.24 FLXAnFRSTPW1 Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29 to 16	SMTV[13:0]	Stop Watch Event Occurrence Macrotick Value
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13 to 8	SCCV[5:0]	Stop Watch Event Occurrence Cycle Counter Value
7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	EINT1	FlexRay Interrupt 1 Trigger Enable 0: Stop watch trigger by FlexRay 1 interrupt disabled 1: FlexRay 1 interrupt event triggers stop watch
5	EINT0	FlexRay 0 Interrupt Trigger Enable 0: Stop watch trigger by FlexRay 0 interrupt disabled 1: FlexRay interrupt 0 event triggers stop watch
4	EETP	External Trigger Pin Enable 0: Trigger by the FLXA0STPWT pin is disabled. 1: Trigger by the FLXA0STPWT pin is enabled.
3	SSWT	Software Stop Watch Trigger 0: Software trigger reset 1: Stop watch activated by software trigger
2	EDGE	Stop Watch Trigger Edge Select 0: Falling edge 1: Rising edge

Table 18.24 FLXAnFRSTPW1 Register Contents (2/2)

Bit Position	Bit Name	Function
1	SWMS	Stop Watch Mode Select 0: Single-shot mode 1: Continuous mode
0	ESWT	Hardware Stop Watch Trigger Enable 0: Stop watch trigger disabled 1: Stop watch trigger enabled

(1) FLXAnFRSTPW1.SMTV

Stop Watch Captured Macrotick Value

State of the macrotick counter when the stop watch event occurred.

(2) FLXAnFRSTPW1.SCCV

Stop Watch Captured Cycle Counter Value

State of the cycle counter when the stop watch event occurred.

(3) FLXAnFRSTPW1.EINT1

Enable FlexRay 1 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 1 interrupt when bit FLXAnFRSTPW1.ESWT is 1.

(4) FLXAnFRSTPW1.EINT0

Enable FlexRay 0 Interrupt Trigger Bit

Enables stop watch trigger by FlexRay 0 interrupt when bit FLXAnFRSTPW1.ESWT = 1.

(5) FLXAnFRSTPW1.EETP

External Trigger Pin Enable Bit

When bit FLXAnFRSTPW1.ESWT is set to 1, the FLXA0STPWT pin event is treated as a stop watch trigger.

(6) FLXAnFRSTPW1.SSWT

Software Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

Writing 1 in this bit activates the stop watch. This bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

(7) FLXAnFRSTPW1.EDGE

Stop Watch Trigger Edge Select Bit

(8) FLXAnFRSTPW1.SWMS

Stop Watch Mode Select Bit

(9) FLXAnFRSTPW1.ESWT

Enable Stop Watch Trigger Bit

Bits FLXAnFRSTPW1.ESWT and FLXAnFRSTPW1.SSWT cannot be set to 1 simultaneously. In this case the write access to the register is ignored, and both bits keep their previous values. Either the external stop watch trigger or the software stop watch trigger may be used.

If enabled, any of an external trigger pin input event, a FlexRay 0 interrupt event, or a FlexRay 1 interrupt event activates the stop watch.

In single-shot mode, this bit is reset to 0 after the cycle count and slot count, and macrotick (MT) value are stored in the FlexRay stop watch register.

18.2.5.5 FLXAnFRSTPW2 — FlexRay Stop Watch Register 2

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0050_H

Value after reset: $0000\ 0000_H$

15 to 11	Reserved	When read, the value after reset is read.
10 to 0	SSCVA[10:0]	Stop Watch Captured Slot Counter Value Channel A

(1) FLXAnFRSTPW2.SSCVB

Stop Watch Captured Slot Counter Value Channel B

State of the slot counter for channel B when the stop watch event occurred.

(2) FLXAnFRSTPW2.SSCVA

Stop Watch Captured Slot Counter Value Channel A

State of the slot counter for channel A when the stop watch event occurred.

18.2.6 CC Control Registers

This section describes the registers provided by the CC (Communication Controller) to allow the Host to control the operation of the CC. The FlexRay protocol specification requires the Host to write application configuration data in CONFIG state only. Please consider that the configuration registers are not locked for writing in DEFAULT_CONFIG state.

The configuration data is reset when DEFAULT_CONFIG state is entered from reset. To change POC state from DEFAULT_CONFIG to CONFIG state the Host has to apply CHI command CONFIG. If the Host wants the CC to leave CONFIG state, the Host has to execute the lock release sequence as described in **Section 18.2.3.1, FLXAnFRLCK — FlexRay Lock Register**.

18.2.6.1 FLXAnFRSUCC1 — FlexRay SUC Configuration Register 1

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0080_H

Value after reset: 0C40 1080_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	CCHB	CCHA	MTSB	MTSA	HCSE	TSM	WUCS	PTA[4:0]

Table 18.26 FLXAnFRSUCC1 Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the value after reset.
27	CCHB	Connected to Channel B Bit Configures pChannels 0: Not connected to channel B 1: Node connected to channel B (value after reset)
26	CCHA	Connected to Channel A Bit Configures pChannels 0: Not connected to channel A 1: Node connected to channel A (value after reset)
25	MTSB	Select Channel B for MTS Transmission Bit 0: Channel B disabled for MTS transmission 1: Channel B selected for MTS transmission
24	MTSA	Select Channel A for MTS Transmission Bit 0: Channel A disabled for MTS transmission 1: Channel A selected for MTS transmission
23	HCSE	Halt due to Clock Sync Error Bit Configures pAllowHaltDueToClock 0: CC will enter / remain in NORMAL_PASSIVE 1: CC will enter HALT state
22	TSM	Transmission Slot Mode Bit Configures pSingleSlotEnabled 0: ALL Slot Mode 1: SINGLE Slot Mode (value after reset)

Table 18.26 FLXAnFRSUCC1 Register Contents (2/2)

Bit Position	Bit Name	Function
21	WUCS	Wakeup Channel Select Bit Configures pWakeupChannel 0: Send wakeup pattern on channel A 1: Send wakeup pattern on channel B
20 to 16	PTA[4:0]	Passive to Active Bit Configures pAllowPassiveToActive
15 to 11	CSA[4:0]	Cold Start Attempts Bit Configures gColdStartAttempts
10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9	TXSY	Transmit Sync Frame in Key Slot Bit Configures pKeySlotUsedForSync 0: No sync frame transmission in key slot, node is neither sync nor coldstart node 1: Key slot used to transmit sync frame, node is sync node
8	TXST	Transmit Startup Frame in Key Slot Bit Configures pKeySlotUsedForStartup 0: No startup frame transmission in key slot, node is non-coldstarter 1: Key slot used to transmit startup frame, node is leading or following coldstarter
7	PBSY	POC Busy Flag 0: POC not busy, bit FLXAnFRSUCC1.CMD writeable 1: POC is busy, bit FLXAnFRSUCC1.CMD locked
6 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	CMD[3:0]	CHI Command Vector Bit 0000: command_not_accepted 0001: CONFIG 0010: READY 0011: WAKEUP 0100: RUN 0101: ALL_SLOTS 0110: HALT 0111: FREEZE 1000: SEND_MTS 1001: ALLOW_COLDSTART 1010: RESET_STATUS_INDICATORS 1011: MONITOR_MODE 1100: CLEAR_RAMS others: reserved

(1) FLXAnFRSUCC1.CCHB

Connected to Channel B Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Configures whether the node is connected to channel B (pChannels).

(2) FLXAnFRSUCC1.CCHA

Connected to Channel A Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Configures whether the node is connected to channel A (pChannels).

(3) FLXAnFRSUCC1.MTSB

Select Channel B for MTS Transmission Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

The FLXAnFRSUCC1.MTSB bit may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 18.2.3.1, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1 an MTS symbol will be transmitted on both channels when requested by writing 1000_B to the FLXAnFRSUCC1.CMD[3:0] bits.

The bit selects channel B for MTS symbol transmission.

(4) FLXAnFRSUCC1.MTSA

Select Channel A for MTS Transmission Bit

The user can only write to these bits when FLXAnFRCCSV.POCS[5:0] bits are DEFAULT_CONFIG or CONFIG.

Bit FLXAnFRSUCC1.MTSA may also be changed outside DEFAULT_CONFIG or CONFIG state when the write to FLXAnFRSUCC1 register is directly preceded by the unlock sequence for the Configuration Lock Key as described in **Section 18.2.3.1, FLXAnFRLCK — FlexRay Lock Register**. This may be combined with CHI command SEND_MTS. If both bits FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB are set to 1 an MTS symbol will be transmitted on both channels when requested by writing 1000_B to the FLXAnFRSUCC1.CMD[3:0] bits.

The bit selects channel A for MTS symbol transmission.

(5) FLXAnFRSUCC1.HCSE

Halt due to Clock Sync Error Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Controls the transition to HALT state due to a clock synchronization error (pAllowHaltDueToClock).

(6) FLXAnFRSUCC1.TSM

Transmission Slot Mode Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] is DEFAULT_CONFIG or CONFIG.

Selects the value after transmission slot mode reset (pSingleSlotEnabled).

In SINGLE slot mode the CC may only transmit in the preconfigured key slot. The key slot ID is configured in the header section of message buffer 0 respectively message buffers 0 and 1 depending on bit FLXAnFRMRC.SPLM.

In case FLXAnFRSUCC1.TSM = 1, message buffer 0 respectively message buffers 0,1 can be (re)configured in DEFAULT_CONFIG or CONFIG state only. In ALL slot mode the CC may transmit in all slots.

FLXAnFRSUCC1.TSM is a configuration bit which can only be set / reset by the Host.

The CC changes to ALL slot mode when the Host successfully applied the ALL_SLOTS command by writing 0101_B to bits FLXAnFRSUCC1.CMD[3:0] in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. The actual slot mode is monitored by bits FLXAnFRCCSV.SLM[1:0].

(7) FLXAnFRSUCC1.WUCS

Wakeup Channel Select Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

With this bit the Host selects the channel on which the CC sends the Wakeup pattern (pWakeupChannel).

(8) FLXAnFRSUCC1.PTA

Passive to Active Bit

The user can only write to these bits when the FLXAnFRCCSV.POCS[5:0] bits is DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 31 even / odd cycle pairs.

Defines the number of consecutive even / odd cycle pairs that must have valid clock correction terms before the CC is allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state (pAllowPassiveToActive).

If set to “00000_B” the CC is not allowed to transit from NORMAL_PASSIVE to NORMAL_ACTIVE state.

(9) FLXAnFRSUCC1.CSA

Cold Start Attempts Bit

The user can only write to these bits when the FLXAnFRCCSV.POCS[5:0] bits is DEFAULT_CONFIG or CONFIG.

Must be identical in all nodes of a cluster.

Valid values are 2 to 31.

Configures the maximum number of attempts that a cold starting node is permitted to try to start up the network without receiving any valid response from another node (gColdStartAttempts).

(10) FLXAnFRSUCC1.TXSY

Transmit Sync Frame in Key Slot Bit

The user can only write to these bits when the FLXAnFRCCSV.POCS[5:0] bits is DEFAULT_CONFIG or CONFIG.

Defines whether the key slot is used to transmit sync frames (pKeySlotUsedForSync).

CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

(11) FLXAnFRSUCC1.TXST

Transmit Startup Frame in Key Slot Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Defines whether the key slot is used to transmit startup frames (pKeySlotUsedForStartup).

CAUTION

The protocol requires that both bits FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY are set for coldstart nodes.

(12) FLXAnFRSUCC1.PBSY

POC Busy Flag

Signals that the POC is busy and cannot accept a command from the Host. Bits FLXAnFRSUCC1.CMD[5:0] are locked against write accesses.

Set to 1 after reset during initialization of internal RAM blocks.

(13) FLXAnFRSUCC1.CMD

CHI Command Vector Bit

The Host may write any CHI command at any time, but certain commands are enabled only in certain POC states. If a command is not enabled, it will not be executed, the CHI command vector FLXAnFRSUCC1.CMD[3:0] bits will be reset to 0000_B = command_not_accepted, and flag FLXAnFREIR.CNA will be set to 1.

In general the Host must check FLXAnFRSUCC1.PBSY before writing a new CHI command.

In case the previous CHI command has not yet completed, flag FLXAnFREIR.CCL is set to 1 together with FLXAnFREIR.CNA; the CHI command needs to be repeated.

Except for HALT state, a POC state change command applied while the CC is already in the requested POC state neither causes a state change nor will flag FLXAnFREIR.CNA be set.

Reading bits FLXAnFRSUCC1.CMD[3:0] show whether the last CHI command was accepted. The actual POC state is monitored by bits FLXAnFRCCSV.POCS[5:0].

- command_not_accepted

  Bits FLXAnFRSUCC1.CMD[3:0] are reset to 0000_B due to one of the following conditions:

  - Illegal command applied by the Host
  - Host applied command to leave CONFIG state without preceding config lock key
  - Host applied new command while execution of the previous Host command has not completed
  - Host writes command_not_accepted

When bits FLXAnFRSUCC1.CMD[3:0] are reset to 0000_B, FLXAnFREIR.CNA is set to 1, and if enabled an interrupt is generated. Commands which are not accepted are not executed.

CONFIG command

Go to POC state CONFIG when called in POC states DEFAULT_CONFIG, or READY. When called in HALT state the CC transits to POC state DEFAULT_CONFIG. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to 0000_B = command_not_accepted.

READY command

Go to POC state READY when called in POC states CONFIG, NORMAL_ACTIVE, NORMAL_PASSIVE, STARTUP, or WAKEUP. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

WAKEUP command

Go to POC state WAKEUP when called in POC state READY. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

RUN command

Go to POC state STARTUP when called in POC state READY. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

ALL_SLOTS command

Leave SINGLE slot mode and go to ALL-SLOTS mode after successful startup / integration at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

HALT command

Set halt request FLXAnFRCCSV.HRQ to 1 and go to POC state HALT at the next end of cycle when called in POC states NORMAL_ACTIVE or NORMAL_PASSIVE. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

FREEZE command

Set the freeze status indicator FLXAnFRCCSV.FSI flag to 1 and go to POC state HALT immediately. Can be called from any state.

SEND_MTS command

Send single MTS symbol during the next following symbol window on the channel configured by the FLXAnFRSUCC1.MTSA and FLXAnFRSUCC1.MTSB bits, when called in POC state NORMAL_ACTIVE after CC entered ALL slot mode (the FLXAnFRCCSV.SLM[1:0] bits = “11”). When called in any other state, or when called while a previously requested MTS has not yet been transmitted, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

ALLOW_COLDSTART command

The command resets the FLXAnFRCCSV.CSI flag to enable the node to become leading coldstarter. When called in states DEFAULT_CONFIG, CONFIG, or HALT, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted. To become leading coldstarter it is also required that both FLXAnFRSUCC1.TXST and FLXAnFRSUCC1.TXSY bits are set.

RESET_STATUS_INDICATORS command

Resets status flags FLXAnFRCCSV.FSI, FLXAnFRCCSV.HRQ, FLXAnFRCCSV.CSNI, and FLXAnFRCCSV.CSAI to their values after reset. May be called in POC states READY and STARTUP. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

CLEAR_RAMS command

Sets bit FLXAnFRMHDS.CRAM to 1 when called in DEFAULT_CONFIG or CONFIG state. When called in any other state, bits FLXAnFRSUCC1.CMD[3:0] will be reset to “0000_B” = command_not_accepted.

Bit FLXAnFRMHDS.CRAM is also set to 1 when the CC leaves reset. By setting bit FLXAnFRMHDS.CRAM all internal RAM blocks are initialized to zero. During the initialization of the RAMs, bit RSUCC1.PBSY will show POC busy. Access to the configuration and status registers is possible during execution of CHI command CLEAR_RAMS.

The initialization of the internal message RAM requires 2048 bus clock cycles. There should be no Host access to IBF or OBF during initialization of the internal RAM blocks after reset or after assertion of CHI command CLEAR_RAMS.

Before asserting CHI command CLEAR_RAMS, the Host should make sure that no transfer between Message RAM and IBF / OBF or the TBFRAMs is ongoing and that the data transfer handler has no effect (bits FLXAnFRITS.ITS and FLXAnFROTS.OTS are 0). This command also resets the Message Buffer Status registers FLXAnFRMHDS, FLXAnFRLDTS, FLXAnFRFSR, FLXAnFRMHDF, FLXAnFRTXRQ1 to FLXAnFRTXRQ4, FLXAnFRNDAT1 to FLXAnFRNDAT14, and FLXAnFRMBSC1 to FLXAnFRMBSC4.

CAUTIONS

1. **All accepted commands with exception of CLEAR_RAMS and SEND_MTS will cause a change of the POC state in the FlexRay domain after at most 8 cycles of the slower of the two clocks “bus clock” and “FlexRay sample clock”, assumed that POC was not busy when the command was applied and that no POC state change was forced by bus activity in that time frame. Reading register FLXAnFRCCSV will show data that is additionally delayed by synchronization from the FlexRay domain to the bus clock domain. The maximum additional delay is 12 cycles of the slower of the two clocks 'bus clock' and “FlexRay sample clock”.**
2. **When transfer is stopped by a FREEZE or READY command and then restarted as a leading ColdStart node, the startup frame may not be transmitted in cycle 0. This depends on the internal state of the FlexRay module. Such cases arise when the startup frame is set in a slot 1 to slot 7. This does not occur in a ColdStart after the reset of the microcontroller. Even if the above situation arises, the ColdStart will succeed on the second trial. Repetition prolongs the overall ColdStart process, but the ColdStart will not be obstructed by the earlier situation. To avoid this effect, allocate startup and sync frames to static slot 8 or a slot with a higher number.**

Table 18.27 below references the CHI commands from the *FlexRay Protocol Specification* (*Section 2.1.1.1, Table 2.2*) to the FlexRay CHI command vector FLXAnFRSUCC1.CMD[3:0] bits.

Table 18.27 Reference to CHI Host Command Summary from FlexRay Protocol Specification

CHI command	Where processed (POC States)	CHI Command Vector CMD
ALL_SLOTS	POC: normal active, POC: normal passive	ALL_SLOTS
ALLOW_COLDSTART	All except POC: default config, POC: config, POC: halt	ALLOW_COLDSTART
CONFIG	POC: default config, POC: ready	CONFIG
CONFIG_COMPLETE	POC: config	Unlock sequence & READY
DEFAULT_CONFIG	POC: halt	CONFIG
FREEZE	All	FREEZE
HALT	POC: normal active, POC: normal passive	HALT
READY	All except POC: default config, POC: config, POC: ready, POC: halt	READY
RUN	POC: ready	RUN
WAKEUP	POC: ready	WAKEUP

18.2.6.2 FLXAnFRSUCC2 — FlexRay SUC Configuration Register 2

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0084_H

Value after reset: $0100\ 0504_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	LTN[3:0]				—	—	—	LT[20:16]				
Value after reset	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LT[15:0]															
Value after reset	0	0	0	0	0	1	0	1	0	0	0	0	0	1	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.28 FLXAnFRSUCC2 Register Contents

Bit Position	Bit Name	Function
31 to 28	Reserved	When read, the value after reset is read. When writing, write the value after reset.
27 to 24	LTN[3:0]	Listen Timeout Noise Bit Configures (gListenNoise - 1)
23 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20 to 0	LT[20:0]	Listen Timeout Bit Configures pdListenTimeout

(1) FLXAnFRSUCC2.LTN

Listen Timeout Noise Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

The range for gListenNoise is 2 to 16.

FLXAnFRSUCC2.LTN must be configured identical in all nodes of a cluster.

Configures the upper limit for startup and wakeup listen timeout in the presence of noise expressed as a multiple of pdListenTimeout.

CAUTION

The wakeup / startup noise timeout is calculated as follows:
pdListenTimeout × gListenNoise = FLXAnFRSUCC2.LT × (FLXAnFRSUCC2.LTN + 1)

(2) FLXAnFRSUCC2.LT

Listen Timeout Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

The range for pdListenTimeout is 1284 to 1283846 µT.

Configures wakeup / startup listen time out in µT.

18.2.6.3 FLXAnFRSUCC3 — FlexRay SUC Configuration Register 3

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0088_H

Value after reset: $0000\ 0011_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 18.29 FLXAnFRSUCC3 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7 to 4	WCF[3:0]	Maximum Without Clock Correction Fatal Bit (transition to HALT state) Configures gMaxWithoutClockCorrectionFatal
3 to 0	WCP[3:0]	Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state) Configures gMaxWithoutClockCorrectionPassive

(1) FLXAnFRSUCC3.WCF

Maximum Without Clock Correction Fatal Bit (transition to HALT state)

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 15 cycle pairs.

Must be identical in all nodes of a cluster.

Defines the number of consecutive even / odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE or NORMAL_PASSIVE to HALT state.

CAUTION

The transition to HALT state is prevented if the FLXAnFRSUCC1.HCSE bit is not set.

(2) FLXAnFRSUCC3.WCP

Maximum Without Clock Correction Passive Bit (transition to NORMAL_PASSIVE state)

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 15 cycle pairs.

Must be identical in all nodes of a cluster.

Defines the number of consecutive even / odd cycle pairs with missing clock correction terms that will cause a transition from NORMAL_ACTIVE to NORMAL_PASSIVE state.

18.2.6.4 FLXAnFRNEMC — FlexRay NEM Configuration Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $008C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 18.30 FLXAnFRNEMC Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	NML[3:0]	Network Management Vector Length Bit Configures gNetworkManagementVectorLength

(1) FLXAnFRNEMC.NML

Network Management Vector Length Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 12 bytes.

The configured length must be identical in all nodes of a cluster.

These bits configure the length of the NM vector.

18.2.6.5 FLXAnFRPRTC1 — FlexRay PRT Configuration Register 1

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0090_H

Value after reset: $084C\ 0633_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.31 FLXAnFRPRTC1 Register Contents

Bit Position	Bit Name	Function
31 to 26	RWP[5:0]	Repetitions of Tx Wakeup Pattern Bit Configures pWakeupPattern
25	Reserved	When read, the value after reset is read. When writing, write the value after reset.
24 to 16	RXW[8:0]	Wakeup Symbol Receive Window Length Bit Configures gdWakeupSymbolRxWindow
15, 14	BRP[1:0]	Baud Rate Prescaler Bit Configures gdSampleClockPeriod and pSamplesPerMicrotick 00 = 10 Mbps 01 = 5 Mbps 10 = 2.5 Mbps 11 = 2.5 Mbps
13, 12	SPP[1:0]	Strobe Point Position Bit Configures Strobe point position 00 = Sample 5 01 = Sample 4 10 = Sample 6 11 = Sample 5
11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
10 to 4	CASM[6:0]	Collision Avoidance Symbol Max Bit Configures gdCASRxLowMax
3 to 0	TSST[3:0]	Transmission Start Sequence Transmitter Bit Configures gdTSSTransmitter

(1) FLXAnFRPRTC1.RWP

Repetitions of Tx Wakeup Pattern Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 63.

Configures the number of repetitions (sequences) of the Tx wakeup symbol.

(2) FLXAnFRPRTC1.RXW

Wakeup Symbol Receive Window Length Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] DEFAULT_CONFIG or CONFIG.

Valid values are 76 to 301 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the received wakeup pattern.

(3) FLXAnFRPRTC1.BRP

Baud Rate Prescaler Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

The Baud Rate Prescaler configures the baud rate on the FlexRay bus. The baud rates listed below are valid with a sample clock set to 80 MHz. One bit time always consists of 8 samples independent of the configured baud rate.

00 = 10 MBit/s

gdSampleClockPeriod = 12.5 ns = 1 × “sample clock”

pSamplesPerMicrotick = 2 (1 µT = 25 ns)

01 = 5 MBit/s

gdSampleClockPeriod = 25 ns = 2 × “sample clock”

pSamplesPerMicrotick = 1 (1 µT = 25 ns)

10, 11 = 2.5 MBit/s

gdSampleClockPeriod = 50 ns = 4 × “sample clock”

pSamplesPerMicrotick = 1 (1 µT = 50 ns)

(4) FLXAnFRPRTC1.SPP

Strobe Point Position Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

These bits specify the sample-counter position at which the Checker Core strobes in response to received bits.

The strobed bit value is determined by sampling at the timing specified by bits FLXAnFRPRTC1.SPP[1:0].

CAUTION

The current revision 2.1 of the FlexRay protocol requires that the FLXAnFRPRTC1.SPP[1:0] bits are 00. The alternate strobe point positions could be used to compensate for asymmetries in the physical layer.

(5) FLXAnFRPRTC1.CASM

Collision Avoidance Symbol Max Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

CASM6 is fixed to 1.

Valid values are 67 to 99 bit times.

Configures the upper limit of the acceptance window for a collision avoidance symbol (CAS).

(6) FLXAnFRPRTC1.TSST

Transmission Start Sequence Transmitter Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are is DEFAULT_CONFIG or CONFIG.

Valid values are 3 to 15 bit times.

Must be identical in all nodes of a cluster.

Configures the duration of the Transmission Start Sequence (TSS) in terms of bit times (1 bit time = 4 µT = 100ns @ 10Mbps).

18.2.6.6 FLXAnFRPRTC2 — FlexRay PRT Configuration Register 2

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0094_H

Value after reset: $0F2D\ 0A0E_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.32 FLXAnFRPRTC2 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29 to 24	TXL[5:0]	Wakeup Symbol Transmit Low Bit Configures gdWakeupSymbolTxLow
23 to 16	TXI[7:0]	Wakeup Symbol Transmit Idle Bit Configures gdWakeupSymbolTxIdle
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13 to 8	RXL[5:0]	Wakeup Symbol Receive Low Bit Configures gdWakeupSymbolRxLow
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5 to 0	RXI[5:0]	Wakeup Symbol Rx Idle Bit Configures gdWakeupSymbolRxIdle

(1) FLXAnFRPRTC2.TXL

Wakeup Symbol Transmit Low Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 15 to 60 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the low phase of the wakeup symbol.

(2) FLXAnFRPRTC2.TXI

Wakeup Symbol Transmit Idle Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 45 to 180 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to transmit the idle phase of the wakeup symbol.

(3) FLXAnFRPRTC2.RXL

Wakeup Symbol Receive Low Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 10 to 55 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the low phase of the received wakeup symbol.

(4) FLXAnFRPRTC2.RXI

Wakeup Symbol Rx Idle Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 14 to 59 bit times.

Must be identical in all nodes of a cluster.

Configures the number of bit times used by the node to test the duration of the idle phase of the received wakeup symbol.

18.2.6.7 FLXAnFRMHDC — FlexRay MHD Configuration Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0098_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	SLT[12:0]

Table 18.33 FLXAnFRMHDC Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is read. When writing, write the value after reset.
28 to 16	SLT[12:0]	Start of Latest Transmit Bit Configures pLatestTx
15 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	SFDL[6:0]	Static Frame Data Length Bit Configures gPayloadLengthStatic

(1) FLXAnFRMHDC.SLT

Start of Latest Transmit Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7981 minislots.

Configures the maximum minislot value allowed before inhibiting frame transmission in the dynamic segment of the cycle. There is no transmission in dynamic segment if FLXAnFRMHDC.SLT is set to zero.

(2) FLXAnFRMHDC.SFDL

Static Frame Data Length Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 127.

The payload length must be identical in all nodes of a cluster.

Configures the cluster-wide payload length for all frames sent in the static segment in double bytes.

18.2.6.8 FLXAnFRGTUC1 — FlexRay GTU Configuration Register 1

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00A0_H$

Value after reset: $0000\ 0280_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.34 FLXAnFRGTUC1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19 to 0	UT[19:0]	Setting of Communication Cycle in Microticks Bit Configures pMicroPerCycle

(1) FLXAnFRGTUC1.UT

Setting of Communication Cycle in Microticks Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 640 to 640000 µT.

Configures the duration of the communication cycle in microticks.

18.2.6.9 FLXAnFRGTUC2 — FlexRay GTU Configuration Register 2

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00A4_H$

Value after reset: $0002\ 000A_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	SNM[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.35 FLXAnFRGTUC2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read. When writing, write the value after reset.
19 to 16	SNM[3:0]	Sync Node Max Bit
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13 to 0	MPC[13:0]	Setting of Communication Cycle in Macrotick Bit Configures gMacroPerCycle

(1) FLXAnFRGTUC2.SNM

Sync Node Max Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCSDEFAULT_CONFIG or CONFIG.

Valid values are 2 to 15.

Must be identical in all nodes of a cluster.

Maximum number of frames within a cluster with sync frame indicator bit SYN set to 1.

(2) FLXAnFRGTUC2.MPC

Setting of Communication Cycle in Macrotick Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS [5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 10 to 16000 MT.

The cycle length must be identical in all nodes of a cluster.

Configures the duration of one communication cycle in macroticks.

18.2.6.10 FLXAnFRGTUC3 — FlexRay GTU Configuration Register 3

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00A8_H$

Value after reset: $0202\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	MIOB[6:0]							—	MIOA[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UIOB[7:0]								UIOA[7:0]							
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.36 FLXAnFRGTUC3 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is read. When writing, write the value after reset.
30 to 24	MIOB[6:0]	Macrotick Initial Offset Channel B Bit Configures pMacroInitialOffset[B]
23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	MIOA[6:0]	Macrotick Initial Offset Channel A Bit Configures pMacroInitialOffset[A]
15 to 8	UIOB[7:0]	Microtick Initial Offset Channel B Bit Configures pMicroInitialOffset[B]
7 to 0	UIOA[7:0]	Microtick Initial Offset Channel A Bit Configures pMicroInitialOffset[A]

(1) FLXAnFRGTUC3.MIOB

Macrotick Initial Offset Channel B Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

Must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

(2) FLXAnFRGTUC3.MIOA

Macrotick Initial Offset Channel A Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 72 MT.

Must be identical in all nodes of a cluster.

Configures the number of macroticks between the static slot boundary and the subsequent macrotick boundary of the secondary time reference point based on the nominal macrotick duration.

(3) FLXAnFRGTUC3.UIOB

Microtick Initial Offset Channel B Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCSDEFAULT_CONFIG or CONFIG.

Valid values are 0 to 240 µT.

Configures the number of microticks between the actual time reference point on channel B and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [B] and therefore has to be set for each channel independently.

(4) FLXAnFRGTUC3.UIOA

Microtick Initial Offset Channel A Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS [5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 240 µT.

Configures the number of microticks between the actual time reference point on channel A and the subsequent macrotick boundary of the secondary time reference point. The parameter depends on pDelayCompensation [A] and therefore has to be set for each channel independently.

18.2.6.11 FLXAnFRGTUC4 — FlexRay GTU Configuration Register 4

For details about configuration of FLXAnFRGTUC4.NIT and FLXAnFRGTUC4.OCS see **Section 18.3.2.5, Configuration of NIT Start and Offset Correction Start**.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00AC_H$

Value after reset: $0008\ 0007_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	OCS[13:0]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.37 FLXAnFRGTUC4 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29 to 16	OCS[13:0]	Offset Correction Start Bit Configures (gOffsetCorrectionStart - 1)
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13 to 0	NIT[13:0]	Network Idle Time Start Bit Configures (gMacroPerCycle -gdNIT - 1)

(1) FLXAnFRGTUC4.OCS

Offset Correction Start Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 8 to 15998 MT.

For cluster consisting of E-Ray implementations only, it is sufficient to program FLXAnFRGTUC4.OCS = FLXAnFRGTUC4.NIT + 1.

Must be identical in all nodes of a cluster.

Determines the start of the offset correction within the NIT phase, calculated from start of cycle.

(2) FLXAnFRGTUC4.NIT

Network Idle Time Start Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 7 to 15997 MT.

Must be identical in all nodes of a cluster.

Configures the starting point of the Network Idle Time NIT at the end of the communication cycle expressed in terms of macroticks from the beginning of the cycle. The start of NIT is recognized if Macrotick = gMacroPerCycle -gdNIT -1 and the increment pulse of Macrotick is set.

18.2.6.12 FLXAnFRGTUC5 — FlexRay GTU Configuration Register 5

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00B0_H$

Value after reset: $0E00\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.38 FLXAnFRGTUC5 Register Contents

Bit Position	Bit Name	Function
31 to 24	DEC[7:0]	Decoding Correction Bit Configures pDecodingCorrection
23 to 21	Reserved	When read, the value after reset is read. When writing, write the value after reset.
20 to 16	CDD[4:0]	Cluster Drift Damping Bit Configures pClusterDriftDamping
15 to 8	DCB[7:0]	Delay Compensation Channel B Bit Configures pDelayCompensation[B]
7 to 0	DCA[7:0]	Delay Compensation Channel A Bit Configures pDelayCompensation[A]

(1) FLXAnFRGTUC5.DEC

Decoding Correction Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 14 to 143 µT.

Configures the decoding correction value in microticks used to determine the primary time reference point.

(2) FLXAnFRGTUC5.CDD

Cluster Drift Damping Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 20 µT.

Configures the cluster drift damping value in microticks used in clock synchronization to minimize accumulation of rounding errors.

(3) FLXAnFRGTUC5.DCB

Delay Compensation Channel B Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 200 µT.

Used to compensate for reception delays on channel B. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

(4) FLXAnFRGTUC5.DCA

Delay Compensation Channel A Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 200 µT.

Used to compensate for reception delays on channel A. This covers assumed propagation delay up to cPropagationDelayMax for microticks in the range of 0.0125 to 0.05µs. In practice, the minimum of the propagation delays of all sync nodes should be applied.

18.2.6.13 FLXAnFRGTUC6 — FlexRay GTU Configuration Register 6

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00B4_H$

Value after reset: $0002\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	MOD[10:0]

	—	—	—	—	—	ASR[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.39 FLXAnFRGTUC6 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read. When writing, write the value after reset.
26 to 16	MOD[10:0]	Maximum Oscillator Drift Bit Configures pdMaxDrift
15 to 11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
10 to 0	ASR[10:0]	Accepted Startup Range Bit Configures pdAcceptedStartupRange

(1) FLXAnFRGTUC6.MOD

Maximum Oscillator Drift Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1923 µT.

Maximum drift offset between two nodes that operate with unsynchronized clocks over one communication cycle in µT.

(2) FLXAnFRGTUC6.ASR

Accepted Startup Range Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 1875 µT.

Number of microticks constituting the expanded range of measured deviation for startup frames during integration.

18.2.6.14 FLXAnFRGTUC7 — FlexRay GTU Configuration Register 7

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 00B8$_H$

Value after reset: 0002 0004$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	NSS[9:0]

Table 18.40 FLXAnFRGTUC7 Register Contents

Bit Position	Bit Name	Function
31 to 26	Reserved	When read, the value after reset is read. When writing, write the value after reset.
25 to 16	NSS[9:0]	Number of Static Slots Bit Configures gNumberOfStaticSlots
15 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9 to 0	SSL[9:0]	Static Slot Length Bit Configures gdStaticSlot

(1) FLXAnFRGTUC7.NSS

Number of Static Slots Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1023.

The number of static slots must be identical in all nodes of a cluster.

Configures the number of static slots in a cycle.

(2) FLXAnFRGTUC7.SSL

Static Slot Length Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 4 to 659 MT.

The static slot length must be identical in all nodes of a cluster.

Configures the length of a static slot in macroticks.

18.2.6.15 FLXAnFRGTUC8 — FlexRay GTU Configuration Register 8

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00BC_H$

Value after reset: $0000\ 0002_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	NMS[12:0]

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.41 FLXAnFRGTUC8 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When read, the value after reset is read. When writing, write the value after reset.
28 to 16	NMS[12:0]	Number of Minislots Bit Configures gNumberOfMinislots
15 to 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5 to 0	MSL[5:0]	Minislot Length Bit Configures gdMinislot

(1) FLXAnFRGTUC8.NMS

Number of Minislots Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7986.

The number of minislots must be identical in all nodes of a cluster.

Configures the number of minislots within the dynamic segment of a cycle.

(2) FLXAnFRGTUC8.MSL

Minislot Length Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 63 MT.

The minislot length must be identical in all nodes of a cluster.

Configures the length of a minislot in macroticks.

18.2.6.16 FLXAnFRGTUC9 — FlexRay GTU Configuration Register 9

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 00C0$_H$

Value after reset: 0000 0101$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	DSI[1:0]

Table 18.42 FLXAnFRGTUC9 Register Contents

Bit Position	Bit Name	Function
31 to 18	Reserved	When read, the value after reset is read. When writing, write the value after reset.
17, 16	DSI[1:0]	Dynamic Slot Idle Phase Bit Configures gdDynamicSlotIdlePhase
15 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12 to 8	MAPO[4:0]	Minislot Action Point Offset Bit Configures gdMinislotActionPointOffset
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5 to 0	APO[5:0]	Action Point Offset Bit Configures gdActionPointOffset

(1) FLXAnFRGTUC9.DSI

Dynamic Slot Idle Phase Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 2 Minislot.

Must be identical in all nodes of a cluster.

Configures the duration of the dynamic slot idle phase in the number of minislots. The duration has to be greater or equal than the idle detection time.

(2) FLXAnFRGTUC9.MAPO

Minislot Action Point Offset Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 31 MT.

Must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within the minislots of the dynamic segment.

(3) FLXAnFRGTUC9.APO

Action Point Offset Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 1 to 63 MT.

Must be identical in all nodes of a cluster.

Configures the action point offset in macroticks within static slots and symbol window.

18.2.6.17 FLXAnFRGTUC10 — FlexRay GTU Configuration Register 10

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00C4_H$

Value after reset: $0002\ 0005_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	MRC[10:0]

	—	—	MOC[13:0]													
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1
R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.43 FLXAnFRGTUC10 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read. When writing, write the value after reset.
26 to 16	MRC[10:0]	Maximum Rate Correction Bit Configures pRateCorrectionOut
15, 14	Reserved	When read, the value after reset is read. When writing, write the value after reset.
13 to 0	MOC[13:0]	Maximum Offset Correction Bit Configures pOffsetCorrectionOut

(1) FLXAnFRGTUC10.MRC

Maximum Rate Correction Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 2 to 1923 µT.

Holds the maximum permitted rate correction value to be applied by the internal clock synchronization algorithm. The CC checks only the internal rate correction value against the maximum rate correction value (absolute value).

(2) FLXAnFRGTUC10.MOC

Maximum Offset Correction Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 5 to 15266 µT.

Holds the maximum permitted offset correction value (absolute value) to be applied by the internal clock synchronization algorithm (absolute value). The CC checks only the internal offset correction value against the maximum offset correction value.

18.2.6.18 FLXAnFRGTUC11 — FlexRay GTU Configuration Register 11

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $00C8_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	ERC[2:0]			—	—	—	—	—	EOC[2:0]

	—	—	—	—	—	—	ERCC[1:0]		—	—	—	—	—	—	EOCC[1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Table 18.44 FLXAnFRGTUC11 Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read. When writing, write the value after reset.
26 to 24	ERC[2:0]	External Rate Correction Bit Configures pExternRateCorrection
23 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18 to 16	EOC[2:0]	External Offset Correction Bit Configures pExternOffsetCorrection
15 to 10	Reserved	When read, the value after reset is read. When writing, write the value after reset.
9, 8	ERCC[1:0]	External Rate Correction Control Bit Configures vExternRateControl 00: External rate correction is prohibited. 01: External rate correction is prohibited. 10: Subtract 11: Add
7 to 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	EOCC[1:0]	External Offset Correction Control Bit Configures vExternOffsetControl 00: External offset correction is prohibited. 01: External offset correction is prohibited. 10: Subtract 11: Add

(1) FLXAnFRGTUC11.ERC

External Rate Correction Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7 µT.

Holds the external rate correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted / added from / to the calculated rate correction value. The value is applied during NIT.

(2) FLXAnFRGTUC11.EOC

External Offset Correction Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Valid values are 0 to 7 µT.

Holds the external offset correction value in microticks to be applied by the internal clock synchronization algorithm. The value is subtracted / added from / to the calculated offset correction value. The value is applied during NIT.

(3) FLXAnFRGTUC11.ERCC

External Rate Correction Control Bit

Should be modified only outside NIT (Network Idle Time).

Writing the following values enables the external rate correction.

00 = External rate correction is prohibited.

01 = External rate correction is prohibited.

10 = Subtract

External rate correction value subtracted from calculated rate correction value

11 = Add

External rate correction value added to calculated rate correction value

(4) FLXAnFRGTUC11.EOCC

External Offset Correction Control Bit

Should be modified only outside NIT (Network Idle Time).

Writing the following values enables the external offset correction.

00 = External offset correction is prohibited.

01 = External offset correction is prohibited.

10 = Subtract

External offset correction value subtracted from calculated offset correction value

11 = Add

External offset correction value added to calculated offset correction value

18.2.7 CC Status Registers

During 8/16-bit accesses to status variables coded with more than 8/16-bit, the variable might be updated by the CC between two accesses (non-atomic read accesses).

18.2.7.1 FLXAnFRCCSV — FlexRay CC Status Vector Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0100_H

Value after reset: $0010\ 4000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	PSL[5:0]						RCA[4:0]					WSV[2:0]		
Value after reset	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	CSI	CSAI	CSNI	—	—	SLM[1:0]		HRQ	FSI	POCS[5:0]					
Value after reset	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.45 FLXAnFRCCSV Register Contents (1/2)

Bit	Symbol	Function
31, 30	Reserved	When read, the value after reset is read.
29 to 24	PSL[5:0]	POC Status Log Flag Status of FLXAnFRCCSV.POCS immediately before entering HALT state.
23 to 19	RCA[4:0]	Remaining Coldstart Attempts Flag Indicates vRemainingColdstartAttempts
18 to 16	WSV[2:0]	Wakeup Status Flag Indicates vPOC!WakeupStatus 000: UNDEFINED 001: RECEIVED_HEADER 010: RECEIVED_WUP 011: COLLISION_HEADER 100: COLLISION_WUP 101: COLLISION_UNKNOWN 110: TRANSMITTED 111: Reserved
15	Reserved	When read, the value after reset is read.
14	CSI	Cold Start Inhibit Flag Indicates vColdStartInhibit 0: Cold starting of node enabled 1: Cold starting of node disabled
13	CSAI	Coldstart Abort Indicator Flag
12	CSNI	Coldstart Noise Indicator Flag Indicates vPOC!ColdstartNoise
11, 10	Reserved	When read, the value after reset is read.
9, 8	SLM[1:0]	Slot Mode Flag Indicates vPOC!SlotMode 00: SINGLE 01: reserved 10: ALL_PENDING 11: ALL

Table 18.45 FLXAnFRCCSV Register Contents (2/2)

Bit	Symbol	Function
7	HRQ	Halt Request Flag Indicates vPOC!CHIHaltRequest
6	FSI	Freeze Status Indicator Flag Indicates vPOC!Freeze
5 to 0	POCS[5:0]	Protocol Operation Control Status Flag

(1) FLXAnFRCCSV.PSL

POC Status Log Flag

Set the value of bits FLXAnFRCCSV.POCS[5:0] immediately before entering HALT state.

Set to HALT when FREEZE command is applied during HALT state and FLXAnFRCCSV.FSI is not already set i.e. the HALT state was not reached by FREEZE command.

Reset to “000000_B” when leaving HALT state.

(2) FLXAnFRCCSV.RCA

Remaining Coldstart Attempts Flag

Indicates the number of remaining coldstart attempts (vRemainingColdstartAttempts).

The value after a reset during CONFIG and DEFAULT_CONFIG state is also bits FLXAnFRSUCC1.CSA[4:0].

The RUN command resets this counter to the maximum number of coldstart attempts as configured by the FLXAnFRSUCC1.CSA [4:0] bits.

(3) FLXAnFRCCSV.WSV

Wakeup Status Flag

Indicates the status of the current wakeup attempt (vPOC!WakeupStatus).

Reset to 0 when entering Wakeup state, by CHI command RESET_STATUS_INDICATORS, or by transition from DEFAULT_CONFIG to CONFIG state

000_B = UNDEFINED

Wakeup not yet executed by the CC.

001_B = RECEIVED_HEADER

Set when the CC finishes wakeup due to the reception of a frame header without coding violation on either channel in WAKEUP_LISTEN state.

010_B = RECEIVED_WUP

Set when the CC finishes wakeup due to the reception of a valid wakeup pattern on the configured wakeup channel in WAKEUP_LISTEN state.

011_B = COLLISION_HEADER

Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid header on either channel.

100_B = COLLISION_WUP

Set when the CC stops wakeup due to a detected collision during wakeup pattern transmission by receiving a valid wakeup pattern on the configured wakeup channel.

101_B = COLLISION_UNKNOWN

Set when the CC stops wakeup by leaving WAKEUP_DETECT state after expiration of the wakeup timer without receiving a valid wakeup pattern or a valid frame header.

110_B = TRANSMITTED

Set when the CC has successfully completed the transmission of the wakeup pattern.

111_B = reserved

(4) FLXAnFRCCSV.CSI

Cold Start Inhibit Flag

Indicates that the node is disabled from cold starting (vColdStartInhibit).

The flag is set to 1 whenever the POC enters READY state due to CHI command READY.

The flag has to be reset under control of the Host by CHI command ALLOW_COLDSTART (bits FLXAnFRSUCC1.CMD[3:0] are 1001_B).

(5) FLXAnFRCCSV.CSAI

Coldstart Abort Indicator Flag

Indicates that a coldstart attempt was aborted.

Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

(6) FLXAnFRCCSV.CSNI

Coldstart Noise Indicator Flag

Indicates that the cold start procedure occurred under noisy conditions (vPOC!ColdstartNoise).

Reset by CHI command RESET_STATUS_INDICATORS or by transition from HALT to DEFAULT_CONFIG state or from READY to STARTUP state.

(7) FLXAnFRCCSV.SLM

Slot Mode Flag

Indicates the actual slot mode of the POC (vPOC!SlotMode) in states READY, WAKEUP, STARTUP, NORMAL_ACTIVE, and NORMAL_PASSIVE.

Default value is SINGLE. Changes to ALL, depending on FLXAnFRSUCC1.TSM.

In NORMAL_ACTIVE or NORMAL_PASSIVE state the CHI command ALL_SLOTS will change the slot mode from SINGLE over ALL_PENDING to ALL.

Set FLXAnFRSUCC1.TSM to SINGLE except for NORMAL_ACTIVE or NORMAL_PASSIVE.

(8) FLXAnFRCCSV.HRQ

Halt Request Flag

Indicates that a request from the Host has been received to halt the POC at the end of the communication cycle (vPOC!CHIHaltRequest).

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(9) FLXAnFRCCSV.FSI

Freeze Status Indicator Flag

Indicates that the POC has entered the HALT state due to CHI command, FREEZE (bits FLXAnFRSUCC1.CMD[3:0] are 0111_B) or due to an error condition requiring an immediate POC halt (vPOC!Freeze).

Reset by transition from HALT to DEFAULT_CONFIG state.

(10) FLXAnFRCCSV.POCS

Protocol Operation Control Status Flag

Indicates the actual state of operation of the CC Protocol Operation Control

00 0000_B = DEFAULT_CONFIG state

00 0001_B = READY state

00 0010_B = NORMAL_ACTIVE state

00 0011_B = NORMAL_PASSIVE state

00 0100_B = HALT state

00 1111_B = CONFIG state

Indicates the actual state of operation of the POC in the wakeup path

01 0000_B = WAKEUP_STANDBY state

01 0001_B = WAKEUP_LISTEN state

01 0010_B = WAKEUP_SEND state

01 0011_B = WAKEUP_DETECT state

Indicates the actual state of operation of the POC in the startup path

10 0000_B = STARTUP_PREPARE state

10 0001_B = COLDSTART_LISTEN state

10 0010_B = COLDSTART_COLLISION_RESOLUTION state

10 0011_B = COLDSTART_CONSISTENCY_CHECK state

10 0100_B = COLDSTART_GAP state

10 0101_B = COLDSTART_JOIN State

10 0110_B = INTEGRATION_COLDSTART_CHECK state

10 0111_B = INTEGRATION_LISTEN state

10 1000_B = INTEGRATION_CONSISTENCY_CHECK state

10 1001_B = INITIALIZE_SCHEDULE state

10 1010_B = ABORT_STARTUP state

10 1011_B = STARTUP_SUCCESS state

others = reserved

18.2.7.2 FLXAnFRCCEV — FlexRay CC Error Vector Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0104_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	PTAC[4:0]					ERRM[1:0]		—	—	CCFC[3:0]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.46 FLXAnFRCCEV Register Contents

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read.
12 to 8	PTAC[4:0]	Passive to Active Count Flag Indicates vAllowPassiveToActive
7, 6	ERRM[1:0]	Error Mode Flag Indicates vPOC!ErrorMode 00: ACTIVE 01: PASSIVE 10: COMM_HALT 11: reserved
5, 4	Reserved	When read, the value after reset is read.
3 to 0	CCFC[3:0]	Clock Correction Failed Counter Indicates vClockCorrectionFailed

(1) FLXAnFRCCEV.PTAC

Passive to Active Count Flag

Indicates the number of consecutive even / odd cycle pairs that have passed with valid rate and offset correction terms, while the node is waiting to transit from NORMAL_PASSIVE state to NORMAL_ACTIVE state. The transition takes place when this bit equals to the value of bits FLXAnFRSUCC1.PTA[4:0] –1.

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(2) FLXAnFRCCEV.ERRM

Error Mode Flag

Indicates the actual error mode of the POC (vPOC!ErrorMode).

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

(3) FLXAnFRCCEV.CCFC

Clock Correction Failed Counter

Indicates the clock correction failed counter of the POC (vClockCorrectionFailed).

The Clock Correction Failed Counter is incremented by one at the end of any odd communication cycle where either the missing offset correction error or missing rate correction error are active.

The Clock Correction Failed Counter is reset to 0 at the end of an odd communication cycle if neither the offset correction failed nor the rate correction failed errors are active.

The Clock Correction Failed Counter stops at 15.

Reset by transition from HALT to DEFAULT_CONFIG state or when entering READY state.

18.2.7.3 FLXAnFRSCV — FlexRay Slot Counter Value Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0110_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.47 FLXAnFRSCV Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read.
26 to 16	SCCB[10:0]	Slot Counter Channel B Indicates vSlotCounter[B]
15 to 11	Reserved	When read, the value after reset is read.
10 to 0	SCCA[10:0]	Slot Counter Channel A Indicates vSlotCounter[A]

(1) FLXAnFRSCV.SCCB

Slot Counter Channel B

Current slot counter value on channel B (vSlotCounter[B]). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRSCV.SCCA

Slot Counter Channel A

Current slot counter value on channel A (vSlotCounter[A]). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

18.2.7.4 FLXAnFRMTCCV — FlexRay Macrotick and Cycle Counter Value Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0114_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	CCV[5:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.48 FLXAnFRMTCCV Register Contents

Bit Position	Bit Name	Function
31 to 22	Reserved	When read, the value after reset is read.
21 to 16	CCV[5:0]	Cycle Counter Value Indicates vCycleCounter
15, 14	Reserved	When read, the value after reset is read.
13 to 0	MTV[13:0]	Macrotick Value Indicates vMacrotick

(1) FLXAnFRMTCCV.CCV

Cycle Counter Value

Current cycle counter value (vCycleCounter). The value is incremented by the CC at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRMTCCV.MTV

Macrotick Value

Current macrotick value (vMacrotick). The value is incremented by the CC and reset at the start of a communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

18.2.7.5 FLXAnFRRCV — FlexRay Rate Correction Value Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0118_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 18.49 FLXAnFRRCV Register Contents

Bit Position	Bit Name	Function
31 to 12	Reserved	When read, the value after reset is read.
11 to 0	RCV[11:0]	Rate Correction Value Flag Indicates vRateCorrection

(1) FLXAnFRRCV.RCV

Rate Correction Value Flag

Indicates internal rate correction value (vRateCorrection/ two's complement) before limitation. If the value of this bit exceeds the limits defined by bits FLXAnFRGTUC10.MRC[10:0], flag FLXAnFRSFS.RCLR is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

CAUTION

The external rate correction value is added to the limited rate correction value.

18.2.7.6 FLXAnFROCV — FlexRay Offset Correction Value Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $011C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	OCV[18:16]

Table 18.50 FLXAnFROCV Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read.
18 to 0	OCV[18:0]	Offset Correction Value Flag Indicates vOffsetCorrection

(1) FLXAnFROCV.OCV

Offset Correction Value Flag

Indicates offset correction value (vOffsetCorrection/ two’s complement) before limitation. If the value of this bit exceeds the limits defined by bits FLXAnFRGTUC10.MOC[10:0], flag FLXAnFRSFS.OCLR is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

CAUTION

The external offset correction value is added to the limited offset correction value.

18.2.7.7 FLXAnFRSFS — FlexRay Sync Frame Status Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0120_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.51 FLXAnFRSFS Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19	RCLR	Rate Correction Limit Reached Flag 0: Rate correction below limit 1: Rate correction limit reached
18	MRCS	Missing Rate Correction Signal Flag 0: Rate correction signal valid 1: Missing rate correction signal
17	OCLR	Offset Correction Limit Reached Flag 0: Offset correction below limit 1: Offset correction limit reached
16	MOCS	Missing Offset Correction Signal Flag 0: Offset correction signal valid 1: Missing offset correction signal
15 to 12	VSBO[3:0]	Valid Sync Frames Channel B, odd communication cycle
11 to 8	VSBE[3:0]	Valid Sync Frames Channel B, even communication cycle
7 to 4	VSAO[3:0]	Valid Sync Frames Channel A, odd communication cycle
3 to 0	VSAE[3:0]	Valid Sync Frames Channel A, even communication cycle

(1) FLXAnFRSFS.RCLR

Rate Correction Limit Reached Flag

The Rate Correction Limit Reached flag signals to the Host, that the rate correction value has exceeded its limit as defined by bits FLXAnFRGTUC10.MRC[10:0]. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(2) FLXAnFRSFS.MRCS

Missing Rate Correction Signal Flag

The Missing Rate Correction flag signals to the Host, that no rate correction calculation can be performed because no pairs of even / odd sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(3) FLXAnFRSFS.OCLR

Offset Correction Limit Reached Flag

The Offset Correction Limit Reached flag signals to the Host, that the offset correction value has exceeded its limit as defined by bits FLXAnFRGTUC10.MOC[10:0]. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(4) FLXAnFRSFS.MOCS

Missing Offset Correction Signal Flag

The Missing Offset Correction flag signals to the Host, that no offset correction calculation can be performed because no sync frames were received. The flag is updated by the CC at start of offset correction phase.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(5) FLXAnFRSFS.VSBO

Valid Sync Frames Channel B, odd communication cycle

These bits are only valid when bit FLXAnFRSUCC1.CCHB is 1.

Holds the number of valid sync frames received on channel B in the odd communication cycle. If transmission of sync frames is enabled by bit FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(6) FLXAnFRSFS.VSBE

Valid Sync Frames Channel B, even communication cycle

These bits are only valid when bit FLXAnFRSUCC1.CCHB is 1.

Holds the number of valid sync frames received on channel B in the even communication cycle. If transmission of sync frames is enabled by bit FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(7) FLXAnFRSFS.VSAO

Valid Sync Frames Channel A, odd communication cycle

These bits are only valid when bit FLXAnFRSUCC1.CCHA is 1.

Holds the number of valid sync frames received on channel A in the odd communication cycle. If transmission of sync frames is enabled by bit FLXAnFRSUCC1.TXSY the value is incremented by one. The value is updated during the NIT of each odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

(8) FLXAnFRSFS.VSAE

Valid Sync Frames Channel A, even communication cycle

These bits are only valid when bit FLXAnFRSUCC1.CCHA is 1.

Holds the number of valid sync frames received on channel A in the even communication cycle. If transmission of sync frames is enabled by bit FLXAnFRSUCC1.TXSY, the value is incremented by one. The value is updated during the NIT of each even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state, INTEGRATION_COLDSTART_CHECK state or INTEGRATION_CONSISTENCY_CHECK state.

18.2.7.8 FLXAnFRSWNIT — FlexRay Symbol Window and NIT Status Register

Symbol window related status information is updated by the CC at the end of the symbol window for each channel. NIT related status information is updated by the CC at the end of the NIT for each channel.

During startup the status data is not updated.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0124_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.52 FLXAnFRSWNIT Register Contents (1/2)

Bit	Symbol	Function
31 to 12	Reserved	When read, the value after reset is read.
11	SBNB	Slot Boundary Violation during NIT Channel B Flag 0: No slot boundary violation detected 1: Slot boundary violation during NIT detected on channel B
10	SENB	Syntax Error during NIT Channel B Flag 0: No syntax error detected 1: Syntax error during NIT detected on channel B
9	SBNA	Slot Boundary Violation during NIT Channel A Flag 0: No slot boundary violation detected 1: Slot boundary violation during NIT detected on channel A
8	SENA	Syntax Error during NIT Channel A Flag 0: No syntax error detected 1: Syntax error during NIT detected on channel A
7	MTSB	MTS Received on Channel B Flag 0: No MTS symbol received on channel B 1: MTS symbol received on channel B
6	MTSA	MTS Received on Channel A Flag 0: No MTS symbol received on channel A 1: MTS symbol received on channel A
5	TCSB	Transmission Conflict in Symbol Window Channel B Flag 0: No transmission conflict detected 1: Transmission conflict in symbol window detected on channel B
4	SBSB	Slot Boundary Violation in Symbol Window Channel B Flag 0: No slot boundary violation detected 1: Slot boundary violation during symbol window detected on channel B
3	SESB	Syntax Error in Symbol Window Channel B Flag 0: No syntax error detected 1: Syntax error during symbol window detected on channel B

Table 18.52 FLXAnFRSWNIT Register Contents (2/2)

Bit	Symbol	Function
2	TCSA	Transmission Conflict in Symbol Window Channel A Flag 0: No transmission conflict detected 1: Transmission conflict in symbol window detected on channel A
1	SBSA	Slot Boundary Violation in Symbol Window Channel A Flag 0: No slot boundary violation detected 1: Slot boundary violation during symbol window detected on channel A
0	SESA	Syntax Error in Symbol Window Channel A Flag 0: No syntax error detected 1: Syntax error during symbol window detected on channel A

(1) FLXAnFRSWNIT.SBNB

Indicates a Slot Boundary Violation during NIT Channel B Flag (vSS!BViolationB).

Reset when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRSWNIT.SENB

Indicates a Syntax Error during NIT Channel B Flag (vSS!SyntaxErrorB).

Reset when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFRSWNIT.SBNA

Indicates a Slot Boundary Violation during NIT Channel A Flag (vSS!BViolationA).

Reset when leaving CONFIG state or when entering STARTUP state.

(4) FLXAnFRSWNIT.SENA

Indicates a Syntax Error during NIT Channel A Flag (vSS!SyntaxErrorA).

Reset when leaving CONFIG state or when entering STARTUP state.

(5) FLXAnFRSWNIT.MTSB

Indicates a MTS Received on Channel B Flag (vSS!ValidMTSB).

Media Access Test symbol received on channel B during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to 1, also bit FLXAnFRSIR.MTSB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(6) FLXAnFRSWNIT.MTSA

Indicates a MTS Received on Channel A Flag (vSS!ValidMTSA).

Media Access Test symbol received on channel A during the preceding symbol window. Updated by the CC for each channel at the end of the symbol window.

When this bit is set to 1, also bit FLXAnFRSIR.MTSA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(7) FLXAnFRSWNIT.TCSB

Indicates a Transmission Conflict in Symbol Window Channel B Flag (vSS!TxConflictB).

Reset when leaving CONFIG state or when entering STARTUP state.

(8) FLXAnFRSWNIT.SBSB

Indicates a Slot Boundary Violation in Symbol Window Channel B Flag (vSS!BViolationB).

Reset when leaving CONFIG state or when entering STARTUP state.

(9) FLXAnFRSWNIT.SESB

Indicates a Syntax Error in Symbol Window Channel B Flag (vSS!SyntaxErrorB).

Reset when leaving CONFIG state or when entering STARTUP state.

(10) FLXAnFRSWNIT.TCSA

Indicates a Transmission Conflict in Symbol Window Channel A Flag (vSS!TxConflictA).

Reset when leaving CONFIG state or when entering STARTUP state.

(11) FLXAnFRSWNIT.SBSA

Indicates a Slot Boundary Violation in Symbol Window Channel A Flag (vSS!BViolationA).

Reset when leaving CONFIG state or when entering STARTUP state.

(12) FLXAnFRSWNIT.SESA

Indicates a Syntax Error in Symbol Window Channel A Flag (vSS!SyntaxErrorA).

Reset when leaving CONFIG state or when entering STARTUP state.

18.2.7.9 FLXAnFRACS — FlexRay Aggregated Channel Status Register

The aggregated channel status provides the Host with an accrued status of channel activity for all communication slots regardless of whether they are assigned for transmission or subscribed for reception.

The aggregated channel status also includes status data from the symbol window and the network idle time.

The status data is updated (set) after each slot and aggregated until it is reset by the Host.

During startup the status data is not updated.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0128_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.53 FLXAnFRACS Register Contents (1/2)

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12	SBVB	Slot Boundary Violation on Channel B Flag 0: No slot boundary violation observed 1: Slot boundary violation(s) observed on channel B
11	CIB	Communication Indicator Channel B Flag 0: No valid frame(s) received in slots containing any additional communication 1: Valid frame(s) received on channel B in slots containing any additional communication
10	CEDB	Content Error Detected on Channel B Flag 0: No frame with content error received 1: Frame(s) with content error received on channel B
9	SEDB	Syntax Error Detected on Channel B Flag 0: No syntax error observed 1: Syntax error(s) observed on channel B
8	VFRB	Valid Frame Received on Channel B Flag 0: No valid frame received 1: Valid frame(s) received on channel B
7 to 5	Reserved	When read, the value after reset is read. When writing, write the value after reset.
4	SBVA	Slot Boundary Violation on Channel A Flag 0: No slot boundary violation observed 1: Slot boundary violation(s) observed on channel A

Table 18.53 FLXAnFRACS Register Contents (2/2)

Bit Position	Bit Name	Function
3	CIA	Communication Indicator Channel A Flag 0: No valid frame(s) received in slots containing any additional communication 1: Valid frame(s) received on channel A in slots containing any additional communication
2	CEDA	Content Error Detected on Channel A Flag 0: No frame with content error received 1: Frame(s) with content error received on channel A
1	SEDA	Syntax Error Detected on Channel A Flag 0: No syntax error observed 1: Syntax error(s) observed on channel A
0	VFRA	Valid Frame Received on Channel A Flag 0: No valid frame received 1: Valid frame(s) received on channel A

(1) FLXAnFRACS.SBVB

Slot Boundary Violation on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more slot boundary violations were observed on channel B at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from 0 to 1, bit FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRACS.CIB

Communication Indicator Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel B in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had When any combination of either syntax error OR content error OR slot boundary violation.

When this flag changes from 0 to 1, bit FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

The FLXAnFRACS.CIB flag is also set when the slot boundary at the end of the slot is reached during the channel idle recognition phase while there is only a single frame in the slot.

(3) FLXAnFRACS.CEDB

Content Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more frames with a content error were received on channel B in any static or dynamic slot during the observation period.

When this flag changes from 0 to 1, bit FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(4) FLXAnFRACS.SEDB

Syntax Error Detected on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel B.

When this flag changes from 0 to 1, bit FLXAnFREIR.EDB is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(5) FLXAnFRACS.VFRB

Valid Frame Received on Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel B in any static or dynamic slot during the observation period.

Reset when leaving CONFIG state or when entering STARTUP state.

(6) FLXAnFRACS.SBVA

Slot Boundary Violation on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Slot boundary violations were observed on channel A at any time during the observation period (static or dynamic slots, symbol window, and NIT).

When this flag changes from 0 to 1, bit FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(7) FLXAnFRACS.CIA

Communication Indicator Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel A in slots that also contained any additional communication during the observation period, i.e. one or more slots received a valid frame AND had any combination of either syntax error OR content error OR slot boundary violation.

When this flag changes from 0 to 1, the FLXAnFREIR.EDA bit is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

The FLXAnFRACS.CIB flag is also set when the slot boundary at the end of the slot is reached during the channel idle recognition phase while there is only a single frame in the slot.

(8) FLXAnFRACS.CEDA

Content Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more frames with a content error were received on channel A in any static or dynamic slot during the observation period.

When this flag changes from 0 to 1, bit FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(9) FLXAnFRACS.SEDA

Syntax Error Detected on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more syntax errors in static or dynamic slots, symbol window, and NIT were observed on channel A.

When this flag changes from 0 to 1, bit FLXAnFREIR.EDA is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

(10) FLXAnFRACS.VFRA

Valid Frame Received on Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

One or more valid frames were received on channel A in any static or dynamic slot during the observation period.

Reset when leaving CONFIG state or when entering STARTUP state.

18.2.7.10 FLXAnFRESIDm — FlexRay Even Sync ID Register m (m = 1 to 15)

Registers FLXAnFRESID1 to FLXAnFRESID15 hold the frame IDs of the sync frames received in even communication cycles used for clock synchronisation up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFRESID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an even communication cycle, register FLXAnFRESID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFRESID1.RXEA, FLXAnFRESID1.RXEB are set. The value is updated during the NIT of each even communication cycle.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0130_H to <FLXAn_base> + 0168_H (<FLXAn_base> + 0130_H+(n-1) × 4)

Value after reset: $0000\ 0000_H$

Table 18.54 FLXAnFRESIDn (n=1 to 15) Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read.
15	RXEB	Received / Configured Even Sync ID on Channel B Flag 0: No sync frame received on channel B / node not configured to transmit sync frames 1: Sync frame received on channel B / node configured to transmit sync frames
14	RXEA	Received / Configured Even Sync ID on Channel A Flag 0: No sync frame received on channel A / node not configured to transmit sync frames 1: Sync frame received on channel A / node configured to transmit sync frames
13 to 10	Reserved	When read, the value after reset is read.
9 to 0	EID[9:0]	Even Sync ID Flag (vsSyncIDListA,B even)

(1) FLXAnFRESIDn.RXEB

Received / Configured Even Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel B or that the node is configured to be a sync node with key slot = bits FLXAnFRESID1.EID[9:0].

Reset when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFRESIDn.RXEA

Received / Configured Even Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored even sync ID was received on channel A or that the node is configured to be a sync node with key slot = bits FLXAnFRESID1.EID[9:0].

Reset when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFRESIDn.EID

Even Sync ID Flag (vsSyncIDListA,B even)

Sync frame ID even communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

18.2.7.11 FLXAnFROSIDm — FlexRay Odd Sync ID Register m (m = 1 to 15)

Registers FLXAnFROSID1 to FLXAnFROSID15 hold the frame IDs of the sync frames received in odd communication cycles used for clock synchronisation up to the limit of gSyncNodeMax. The values are sorted in ascending order, with register FLXAnFROSID1 holding the lowest received sync frame ID. If the node itself transmits a sync frame in an odd communication cycle, register FLXAnFROSID1 holds the respective sync frame ID as configured in message buffer 0 and flags FLXAnFROSID1.RXOA, FLXAnFROSID1.RXOB are set. The value is updated during the NIT of each odd communication cycle.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0170_H to <FLXAn_base> + $01A8_H$ (<FLXAn_base> + 0170_H+ (n-1) × 4)

Value after reset: $0000\ 0000_H$

Table 18.55 FLXAnFROSIDn Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read.
15	RXOB	Received / Configured Odd Sync ID on Channel B Flag 0: No sync frame received on channel B / node not configured to transmit sync frames 1: Sync frame received on channel B / node configured to transmit sync frames
14	RXOA	Received / Configured Odd Sync ID on Channel A Flag 0: No sync frame received on channel A / node not configured to transmit sync frames 1: Sync frame received on channel A / node configured to transmit sync frames
13 to 10	Reserved	When read, the value after reset is read.
9 to 0	OID[9:0]	Odd Sync ID Flag (vsSyncIDListA,B odd)

(1) FLXAnFROSIDn.RXOB

Received / Configured Odd Sync ID on Channel B Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel B or that the node is configured to be a sync node with key slot = bits FLXAnFROSID1.OID[9:0].

Reset when leaving CONFIG state or when entering STARTUP state.

(2) FLXAnFROSIDn.RXOA

Received / Configured Odd Sync ID on Channel A Flag

Signals that a sync frame corresponding to the stored odd sync ID was received on channel A or that the node is configured to be a sync node with key slot = bits FLXAnFROSID1.OID[9:0].

Reset when leaving CONFIG state or when entering STARTUP state.

(3) FLXAnFROSIDn.OID

Odd Sync ID Flag (vsSyncIDListA,B odd)

Sync frame ID odd communication cycle.

Reset when leaving CONFIG state or when entering STARTUP state.

18.2.7.12 FLXAnFRNMVm — FlexRay Network Management Vector Register m (m = 1 to 3)

The three network management registers hold the accrued NM vector (see **Section 18.3.7, Network Management**).

The CC updates the NM vector at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.

FLXAnFRNMVm-bytes exceeding the configured NM vector length are not valid.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $01B0_H$ to <FLXAn_base> + $01B8_H$ (<FLXAn_base> + $01B0_H$ + (m-1) × 4)

Value after reset: $0000\ 0000_H$

Table 18.56 FLXAnFRNMVn Register Contents

Bit Position	Bit Name	Function
31 to 0	NM[31:0]	NM Vector

(1) FLXAnFRNMVm.NM

NM Vector

The three network management vector registers hold the accrued NM vector (configurable 0 to 12 bytes). The NM vector to be held is generated by bit-wise logic OR for each NM vector received on each channel (valid static frames with PPI = 1) (see **Section 18.3.7, Network Management**).

FLXAnFRNMVm-bytes exceeding the configured NM vector length are not valid.

The Register Contents are updated at the end of each communication cycle as long as the CC is either in NORMAL_ACTIVE or NORMAL_PASSIVE state.

These bits are cleared when leaving CONFIG state or when entering STARTUP state.

18.2.8 Message Buffer Control Registers

18.2.8.1 FLXAnFRMRC — FlexRay Message RAM Configuration Register

The Message RAM Configuration register defines the number of message buffers assigned to the static segment, dynamic segment, and FIFO.

The Message RAM can be divided into up three different areas; Static Buffer area, Static and Dynamic Buffer area, FIFO area. If present, the Static Buffer area is starting at Message Buffer 0.

The start of the Static and Dynamic Buffer area is configured by bits FLXAnFRMRC.FDB[7:0]. Bits FLXAnFRMRC.FDB[7:0] define the end of the Static Buffer area. If no Static Buffer area is present, the Static and Dynamic Buffer area starts at Message Buffer 0.

The start of the FIFO area is configured by bits FLXAnFRMRC.FFB[7:0]. Bits FLXAnFRMRC.FFB[7:0] define the end of the previous area, which can be either the Static Buffer area or the Static and Dynamic Buffer area. If no Static Buffer area and no Static and Dynamic Buffer area is present, the FIFO area starts at Message Buffer 0.

With bits FLXAnFRMRC.LCB[7:0], the end of the last configured area is configured which can be the Static Buffer area, the Static and Dynamic Buffer area or the FIFO area.

Figure 18.2 shows an example configuration of the Message RAM where all there area are configured.

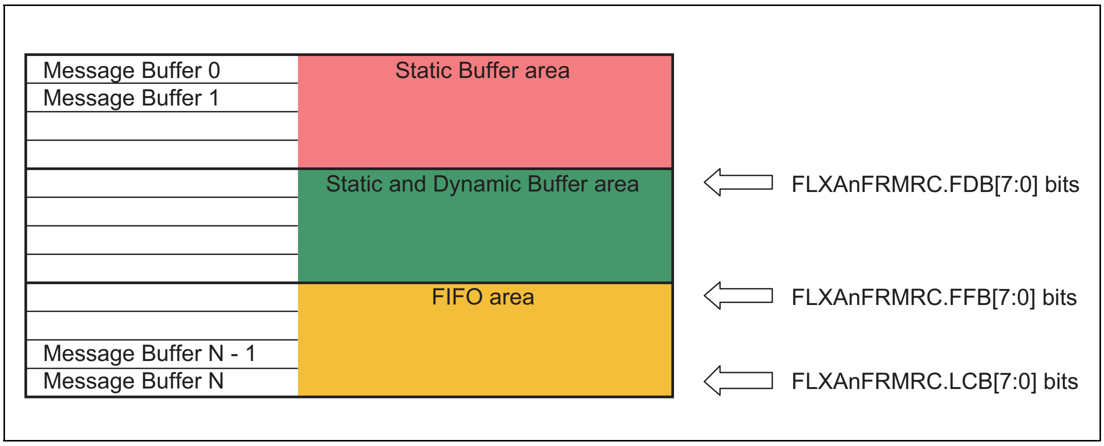

Figure 18.2 Message RAM Organization

CAUTIONS

1. **In case the node is configured as sync node (bit FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (bit FLXAnFRSUCC1.TSM = 1), message buffer 0 resp. 1 is reserved for sync frames or single slot frames and have to be configured with the node-specific key slot ID. In case the node is neither configured as sync node nor for single slot operation message buffer 0 resp. 1 is treated like all other message buffers.**
2. **The maximum number of header sections is 128. This means a maximum of 128 message buffers can be configured. The maximum length of a data section is 254 bytes. The length of the data section may be configured differently for each message buffer. For details see Section 18.3.13, Message RAM.**
3. **In case two or more message buffers are assigned to slot 1 by use of cycle filtering, all of them must be located either in the "Static Buffers" or at the beginning of the "Static + Dynamic Buffers" section.**

4. **The FlexRay protocol specification requires that each node has to send a frame in its key slot. Therefore at least message buffer 0 is reserved for transmission in the key slot. Due to this requirement a maximum number of 127 message buffers can be assigned to the FIFO. Nevertheless, a non protocol conform configuration without a transmission slot in the static segment would still be operational.**
5. **The payload length configured and the length of the data section need to be configured identical for all message buffers belonging to the FIFO via the FLXAnFRWRHS2.PLC[6:0] and FLXAnFRWRHS3.DP[6:0] bits. When the CC is not in DEFAULT_CONFIG or CONFIG state reconfiguration of message buffers belonging to the FIFO is locked.**

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0300$_H$

Value after reset: 0180 0000$_H$

Table 18.57 FLXAnFRMRC Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read. When writing, write the value after reset.
26	SPLM	Sync Frame Payload Multiplex Bit 0: Only message buffer 0 locked against reconfiguration 1: Both message buffers 0 and 1 are locked against reconfiguration
25, 24	SEC[1:0]	Secure Buffers Bit 00: all buffers unlocked 01: static buffers locked, FIFO locked, limited transmission 10: all buffers locked 11: all buffers locked, limited transmission
23 to 16	LCB[7:0]	Last Configured Buffer Bit 0 to 127: Number of message buffers is FLXAnFRMRF.LCB + 1 128: No message buffer assigned to the FIFO
15 to 8	FFB[7:0]	First Buffer of FIFO Bit 0: All message buffers assigned to the FIFO 1 to 127: Message buffers from FLXAnFRMRC.FFB to FLXAnFRMRC.LCB assigned to the FIFO 128: No message buffer configured
7 to 0	FDB[7:0]	First Dynamic Buffer Bit 0: No group of message buffers exclusively for the static segment configured 1 to 127: Message buffers 0 to FLXAnFRMRC.FDB - 1 reserved for static segment 128: No dynamic message buffers configured

(1) FLXAnFRMRC.SPLM

Sync Frame Payload Multiplex Bit

The user can only write to these bits when FLXAnFRCCSV.POCS is DEFAULT_CONFIG or CONFIG.

This bit is only evaluated if the node is configured as sync node (bit FLXAnFRSUCC1.TXSY = 1) or for single slot mode operation (bit FLXAnFRSUCC1.TSM = 1).

When this bit is set to 1 message buffers 0 and 1 are dedicated for sync frame transmission with different payload data on channel A and B.

When this bit is set to 0, sync frames are transmitted from message buffer 0 with the same payload data on all channels configured. Note that the channel filter configuration for message buffer 0 resp. message buffer 1 has to be chosen according to this bit setting.

(2) FLXAnFRMRC.SEC

Secure Buffers Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Not evaluated when the CC is in DEFAULT_CONFIG or CONFIG state.

For temporary unlocking, see **Section 18.3.13.4, Host Handling of Access Errors**.

00_B = all buffers unlocked

Reconfiguration of message buffers enabled with numbers < FLXAnFRMRC.FFB enabled

Exception: In nodes configured for sync frame transmission or for single slot mode operation message buffer 0 (and if bit FLXAnFRMRC.SPLM = 1, also message buffer 1) is always locked

01_B = static buffers locked, FIFO locked, limited transmission

Reconfiguration of message buffers with numbers < FLXAnFRMRC.FDB and with numbers ≥ FLXAnFRMRC.FFB locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled

10_B = all buffers locked

Reconfiguration of all message buffers locked

11_B = all buffers locked, limited transmission

Reconfiguration of all message buffers locked and transmission of message buffers for static segment with numbers ≥ FLXAnFRMRC.FDB disabled

(3) FLXAnFRMRC.LCB

Last Configured Buffer Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (bits FLXAnFRMRC.FDB[7:0] < 128), the user should configure FLXAnFRMRC.LCB ≥ FLXAnFRMRC.FDB.

When a FIFO area is configured (bits FLXAnFRMRC.FFB[7:0] < 128), the user should configure bits FLXAnFRMRC.LCB[7:0] ≥ bits FLXAnFRMRC.FFB[7:0].

(4) FLXAnFRMRC.FFB

First Buffer of FIFO Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

When a Static and Dynamic Buffer area is configured (bits FLXAnFRMRC.FDB[7:0] < 128), the user should configure bits FLXAnFRMRC.FFB[7:0] > bits FLXAnFRMRC.FDB[7:0].

(5) FLXAnFRMRC.FDB

First Dynamic Buffer Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

18.2.8.2 FLXAnFRFRF — FlexRay FIFO Rejection Filter Register

The FIFO Rejection Filter defines a user specified sequence of bits to which channel, frame ID, and cycle count of the incoming frames are compared. Together with the FIFO Rejection Filter Mask this register determines whether a message is rejected by the FIFO.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0304$_H$

Value after reset: 0180 0000$_H$

Table 18.58 FLXAnFRFRF Register Contents

Bit Position	Bit Name	Function
31 to 25	Reserved	When read, the value after reset is read. When writing, write the value after reset.
24	RNF	Reject Null Frames Bit 0: Null frames are stored in the FIFO 1: Reject all null frames
23	RSS	Reject in Static Segment Bit 0: FIFO also used for static segment 1: Reject messages in static segment
22 to 16	CYF[6:0]	Cycle Counter Filter Bit
15 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12 to 2	FID[10:0]	Frame ID Filter Bit 0 to 2047: Frame ID filter values
1, 0	CH[1:0]	Channel Filter Bit 00: receive on both channels 01: receive only on channel B 10: receive only on channel A 11: no reception

(1) FLXAnFRFRF.RNF

Reject Null Frames Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

If this bit is set to 1, received null frames are not stored in the FIFO.

(2) FLXAnFRFRF.RSS

Reject in Static Segment Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

If this bit is set to 1, the FIFO is used only for the dynamic segment.

(3) FLXAnFRFRF.CYF

Cycle Counter Filter Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

The 7-bit cycle counter filter determines the cycle set to which frame ID and channel rejection filter are applied. In cycles not belonging to the cycle set specified by FLXAnFRFRF.CYF, all frames are rejected. For details about the configuration of the cycle counter filter see **Section 18.3.8.2, Cycle Counter Filtering**.

(4) FLXAnFRFRF.FID

Frame ID Filter Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

Determines the frame ID to be rejected by the FIFO. With the additional configuration of register FLXAnFRFRFM, the corresponding frame ID filter bits are ignored, which results in further rejected frame IDs. When bits FLXAnFRFRFM.MFID[10:0] are zero, a frame ID filter value of zero means that no frame ID is rejected.

(5) FLXAnFRFRF.CH

Channel Filter Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

If reception on both channels is configured, also in static segment always both frames (from channel A and B) are stored in the FIFO, even if they are identical.

18.2.8.3 FLXAnFRFRFM — FlexRay FIFO Rejection Filter Mask Register

The FlexRay FIFO Rejection Filter Mask specifies which of the corresponding frame ID filter bits are relevant for rejection filtering. If a bit is set to 1, it indicates that the corresponding bit in the FLXAnFRFRF register will not be considered for rejection filtering.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0308_H

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 13	Reserved	When read, the value after reset is read. When writing, write the value after reset.
12 to 2	MFID[10:0]	Mask Frame ID Filter Bit 0: Corresponding frame ID filter bit is used for rejection filtering 1: Ignore corresponding frame ID filter bit.
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(1) FLXAnFRFRFM.MFID

Mask Frame ID Filter Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

18.2.8.4 FLXAnFRFCL — FlexRay FIFO Critical Level Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $030C_H$

Value after reset: $0000\ 0080_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit Position	Bit Name	Function
31 to 8	Reserved	When read, the value after reset is read. When writing, write the value after reset.
7 to 0	CL[7:0]	Critical Level Bit Critical Level

(1) FLXAnFRFCL.CL

Critical Level Bit

The user can only write to these bits when bits FLXAnFRCCSV.POCS[5:0] are DEFAULT_CONFIG or CONFIG.

When the receive FIFO fill level (bits FLXAnFRCCSV.POCS[5:0]) FLXAnFRFSR.RFFL is equal or greater than the critical level configured by bits FLXAnFRFCL.CL[7:0], the receive FIFO critical level flag FLXAnFRFSR.RFCL is set to 1.

If FLXAnFRFCL.CL is programmed to values > 128, bit FLXAnFRFSR.RFCL is never set to 1.

18.2.9 Message Buffer Status Registers

18.2.9.1 FLXAnFRMHDS — FlexRay Message Handler Status Register

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0310_H

Value after reset: $0000\ 0080_H$

15	Reserved	When read, the value after reset is read. When writing, write the value after reset.
14 to 8	FMB[6:0]	Faulty Message Buffer Number Flag
7	CRAM	Clear all internal RAM's Flag 0: No execution of the CHI command CLEAR_RAMS 1: Execution of the CHI command CLEAR_RAMS ongoing
6	MFMB	Multiple Faulty Message Buffer Detection Flag 0 = No additional faulty message buffer. 1 = Additional faulty message buffer was detected while the FMBD flag is set to 1.
5	FMBD	Faulty Message Buffer Detection Flag 0 = No faulty message buffer. 1 = Message buffer referenced by bit FLXAnFRMHDS.FMB holds faulty data with a parity error.
4	ATBF2	TBFRAM B Access Error Flag 0 = No access error 1 = Access error occurred when reading the RAM B.
3	ATBF1	TBFRAM A Access Error Flag 0 = No access error. 1 = Access error occurred when reading the RAM A.
2	AMR	Message RAM Access Error Flag 0 = No access error 1 = Access error occurred when reading the Message RAM.
1, 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(1) FLXAnFRMHDS.MBU

Message Buffer Updated Flag

Number of message buffer that was updated last by the CC. For this message buffer the respective ND and / or MBC flag in the FLXAnFRNDAT1 to FLXAnFRNDAT4 registers and the FLXAnFRMBSC1 to FLXAnFRMBSC4 registers are also set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) FLXAnFRMHDS.MBT

Message Buffer Transmitted Flag

Number of last successfully transmitted message buffer.

If the message buffer is configured for single-shot mode, the respective TXR flag in the FLXAnFRTXRQ1 to FLXAnFRTXRQ4 registers was reset to 0.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(3) FLXAnFRMHDS.FMB

Faulty Message Buffer Number Flag

This flag indicates that an access error occurred when reading from the message buffer referenced by FLXAnFRMHDS.FMB.

The value of this flag is only valid when one of flags FLXAnFRMHDS.AMR, FLXAnFRMHDS.ATBF1, FLXAnFRMHDS.ATBF2, and FLXAnFRMHDS.FMBD is set to 1.

This flag is not updated while the FLXAnFRMHDS.FMBD flag is 1.

This flag is cleared by the CHI command CLEAR_RAMS.

(4) FLXAnFRMHDS.CRAM

Internal RAM Clear Flag

This flag indicates that the CHI command CLEAR_RAMS is ongoing (all bits of the message RAM, input buffer, output buffer and TBF are written to 0).

This flag is set by the CHI command CLEAR_RAMS.

(5) FLXAnFRMHDS.MFMB

Multiple Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This bit indicates that an additional faulty message buffer was detected while the FLXAnFRMHDS.FMBD flag is set.

This bit is cleared by the CHI command CLEAR_RAMS.

(6) FLXAnFRMHDS.FMBD

Faulty Message Buffer Detection Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This bit indicates that the message buffer referenced by FLXAnFRMHDS.FMB holds faulty data due to an access error.

This bit is cleared by the CHI command CLEAR_RAMS.

(7) FLXAnFRMHD.ATBF2

TBFRAM B Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the TBFRAM B.

CAUTION

When this flag changes from 0 to 1, the FLXAnFREIR.AERR bit is set to 1. This flag can be reset by the CHI command CLEAR_RAMS.

(8) FLXAnFRMHD.ATBF1

TBFRAM A Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the TBFRAM A.

CAUTION

When this flag changes from 0 to 1, the FLXAnFREIR.AERR bit is set to 1. This flag can be reset by the CHI command CLEAR_RAMS.

(9) FLXAnFRMHDS.AMR

Message RAM Access Error Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing 1 to it.

This flag indicates that an access error occurred when reading the Message RAM.

CAUTION

When this flag changes from 0 to 1, the FLXAnFREIR.AERR bit is set to 1. This flag can be reset by the CHI command CLEAR_RAMS.

18.2.9.2 FLXAnFRLDTS — FlexRay Last Dynamic Transmit Slot Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0314_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	LDTB[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	LDTA[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.62 FLXAnFRLDTS Register Contents

Bit Position	Bit Name	Function
31 to 27	Reserved	When read, the value after reset is read.
26 to 16	LDTB[10:0]	Last Dynamic Transmission Channel B Flag
15 to 11	Reserved	When read, the value after reset is read.
10 to 0	LDTA[10:0]	Last Dynamic Transmission Channel A Flag

(1) FLXAnFRLDTS.LDTB

Last Dynamic Transmission Channel B Flag

Stores the value of vSlotCounter[B] at the time of the last frame transmission on channel B in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS of channel B.

(2) FLXAnFRLDTS.LDTA

Last Dynamic Transmission Channel A Flag

Stores the value of vSlotCounter[A] at the time of the last frame transmission on channel A in the dynamic segment of this node.

It is updated at the end of the dynamic segment and is reset to zero if no frame was transmitted during the dynamic segment.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS of channel A.

18.2.9.3 FLXAnFRFSR — FlexRay FIFO Status Register

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0318_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFFL[7:0]								—	—	—	—	—	RFO	RFCL	RFNE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.63 FLXAnFRFSR Register Contents

Bit Position	Bit Name	Function
31 to 16	Reserved	When read, the value after reset is read.
15 to 8	RFFL[7:0]	Receive FIFO Fill Level Flag
7 to 3	Reserved	When read, the value after reset is read.
2	RFO	Receive FIFO Overrun Flag 0: No receive FIFO overrun detected 1: A receive FIFO overrun has been detected
1	RFCL	Receive FIFO Critical Level Flag 0: Receive FIFO below critical level 1: Receive FIFO critical level reached
0	RFNE	Receive FIFO Not Empty Flag 0: Receive FIFO is empty 1: Receive FIFO is not empty

(1) FLXAnFRFSR.RFFL

Receive FIFO Fill Level Flag

Indicates the number of FIFO buffers filled with new data not yet read by the Host. Maximum value is 128.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) FLXAnFRFSR.RFO

Receive FIFO Overrun Flag

The flag is set to 1 by the CC when a receive FIFO overrun is detected.

When a receive FIFO overrun occurs, the oldest message is overwritten with the actual received message. In addition, the FLXAnFREIR.RFO flag is set to 1.

The flag is cleared by the next FIFO read access issued by the Host.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(3) FLXAnFRFSR.RFCL

Receive FIFO Critical Level Flag

This flag is set to 1 when the value of the receive FIFO fill level FLXAnFRFSR.RFFL[7:0] is equal or greater than the critical level as configured by FLXAnFRFCL.CL.

When this bit changes from 0 to 1 bit FLXAnFRSIR.RFCL is set to 1, and if enabled, an interrupt is generated.

The flag is cleared by the CC as soon as the value of the FLXAnFRFSR.RFFL[7:0] bits drops below the value set in the FLXAnFRFCL.CL bit.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(4) FLXAnFRFSR.RFNE

Receive FIFO Not Empty Flag

This flag is set to 1 by the CC when a received valid frame (data or null frame depending on rejection mask) was stored in the FIFO. In addition, the FLXAnFRSIR.RFNE bit is set to 1.

The bit is reset to 0 after the Host has read all messages from the FIFO.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

18.2.9.4 FLXAnFRMHDF — FlexRay Message Handler Constraints Flags Register

Some constraints exist for the Message Handler regarding bus clock frequency, Message RAM configuration, and FlexRay bus traffic. To simplify software development, constraints violations are reported by setting flags in the FLXAnFRMHDF.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 031C$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WAHP	TNSB	TNSA	TBFB	TBFA	FNFB	FNFA	SNUB	SNUA
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 18.64 FLXAnFRMHDF Register Contents

Bit Position	Bit Name	Function
31 to 9	Reserved	When read, the value after reset is read. When writing, write the value after reset.
8	WAHP	Write Attempt to Header Partition Flag 0: No write attempt to header partition 1: Write attempt to header partition
7	TNSB	Transmission Not Started Channel B Flag 0: No transmission not started on channel B 1: Transmission not started on channel B
6	TNSA	Transmission Not Started Channel A Flag 0: No transmission not started on channel A 1: Transmission not started on channel A
5	TBFB	TBFB Access Failure B Flag 0: No TBFB access failure 1: TBFB access failure
4	TBFA	Temporary buffer Access Failure A Flag 0: No TBFA access failure 1: TBFA access failure
3	FNFB	Find Sequence Not Finished Channel B Flag 0: No find sequence not finished for channel B 1: Find sequence not finished for channel B
2	FNFA	Find Sequence Not Finished Channel A Flag 0: No find sequence not finished for channel A 1: Find sequence not finished for channel A
1	SNUB	Status Not Updated Channel B Flag 0: No overload condition occurred when updating MBS (FLXAnFRMBS) for channel B 1: Message buffer status (FLXAnFRMBS) for channel B not updated
0	SNUA	Status Not Updated Channel A Flag 0: No overload condition occurred when updating MBS (FLXAnFRMBS) for channel A 1: Message buffer status (FLXAnFRMBS) for channel A not updated

(1) FLXAnFRMHDF.WAHP

Write Attempt to Header Partition Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

Outside DEFAULT_CONFIG and CONFIG state this flag is set to 1 by the CC when the message handler tries to write message data into the header partition of the Message RAM due to faulty configuration of a message buffer. The write attempt is not executed, to protect the header partition from unintended write accesses.

When this flag changes from 0 to 1, the FLXAnFREIR.MHF flag is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(2) FLXAnFRMHDF.TNSB

Transmission Not Started Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler was not ready to start a scheduled transmission on channel B at the action point of the configured slot.

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(3) FLXAnFRMHDF.TNSA

Transmission Not Started Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set by the CC when the Message Handler was not ready to start a scheduled transmission on channel A at the action point of the configured slot.

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(4) FLXAnFRMHDF.TBFB

TBFB Access Failure Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when a read or write access to TBFB requested by PRT (Protocol controller) B could not complete within the available time.

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(5) FLXAnFRMHDF.TBFA

TBFA Access Failure Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when a read or write access to TBFA requested by PRT A could not complete within the available time.

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(6) FLXAnFRMHDF.FNFB

Find sequence Not Finished flag, channel B

Writing 0 has no effect on the bit’s value.

Writing a 1 to the bit clears it.

This flag is set to 1 by the CC when the message handler, due to being overloaded, was not able to finish a find sequence (scan of message RAM for a matching message buffer).

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is also set to 1.

The value is reset on leaving the CONFIG state or entering the STARTUP state.

The value is also reset by the CLEAR_RAMS CHI command.

(7) FLXAnFRMHDF.FNFA

Find sequence Not Finished flag, channel A

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to finish a find sequence (scan of Message RAM for matching message buffer).

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(8) FLXAnFRMHDF.SNUB

Status Not Updated Channel B Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer's status (FLXAnFRMBS).

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

(9) FLXAnFRMHDF.SNUA

Status Not Updated Channel A Flag

Writing 0 has no effect on the bit value.

This bit is cleared when writing a 1 to it.

This flag is set to 1 by the CC when the Message Handler, due to overload condition, was not able to update a message buffer’s status (FLXAnFRMBS).

When this flag changes from 0 to 1, flag FLXAnFREIR.MHF is set to 1.

Reset when leaving CONFIG state or when entering STARTUP state.

Reset by the CHI command CLEAR_RAMS.

18.2.9.5 FLXAnFRTXRQm — FlexRay Transmission Request m (m = 1 to 4)

The four registers reflect the state of the TXR flags of all configured message buffers. The flags are evaluated for transmit buffers only. If the number of configured message buffers is less than 128, the remaining TXR flags have no meaning.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0320_H to <FLXAn_base> + $032C_H$ (<FLXAn_base> + 0320_H + (m–1) × 4)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	TXRp[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TXRp[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.65 FLXAnFRTXRQm Register Contents

Bit Position	Bit Name	Function
31 to 0	TXRp[31:0]	Transmission Request Flag p

(1) FLXAnFRTXRQm.TXRp (p = (m – 1) × 32 to (m × 32 – 1))

Transmission Request Flag p

If the flag is set to 1, the respective message buffer is ready for transmission respectively transmission of this message buffer is in progress.

In single-shot mode the flags are reset to 0 after transmission has completed.

This bit is cleared by the CHI command CLEAR_RAMS.

18.2.9.6 FLXAnFRNDATm — FlexRay New Data Register m (m = 1 to 4)

The four registers reflect the state of the ND flags of all configured message buffers. ND flags belonging to transmit buffers have no meaning. If the number of configured message buffers is less than 128, the remaining ND flags have no meaning.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0330_H to <FLXAn_base> + $033C_H$ (<FLXAn_base> + 0330_H + (m-1) × 4)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	NDp[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NDp[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.66 FLXAnFRNDATm Register Contents

Bit Position	Bit Name	Function
31 to 0	NDp[31:0]	New Data Flag p

(1) FLXAnFRNDATm.NDp (p = (m – 1) × 32 to (m × 32 – 1))

New Data Flag p

The flags are set to 1 when a valid received data frame matches the message buffer's filter configuration, independent of the payload length received or the payload length configured for that message buffer.

The flags are not set to 1 after reception of null frames except for message buffers belonging to the receive FIFO.

An ND flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when the data section has been transferred to the Output Buffer.

Reset when leaving CONFIG state or when entering STARTUP state.

This bit is cleared by the CHI command CLEAR_RAMS.

18.2.9.7 FLXAnFRMBSCm — FlexRay Message Buffer Status Changed Register m (m = 1 to 4)

The four registers reflect the state of the MBC flags of all configured message buffers. If the number of configured message buffers is less than 128, the remaining MBC flags have no meaning.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0340_H to <FLXAn_base> + $034C_H$ (<FLXAn_base> + 0340_H + (m–1) × 4)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MBCp[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MBCp[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.67 FLXAnFRMBSCm Register Contents

Bit Position	Bit Name	Function
31 to 0	MBCp[31:0]	Message Buffer Status Changed Flag p

(1) FLXAnFRMBSCm.MBCp (p = (m – 1) × 32 to (m × 32 – 1))

Message Buffer Status Changed Flag p

Indicates whether the Message Handler has changed one of the status flags VFRA, VFRB, SEOA, SEOB, CEOA, CEOB, SVOA, SVOB, TCIA, TCIB, ESA, ESB, MLST, FTA, FTB in the header section (see **Section 18.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** and **Section 18.3.13.1, Header Partition**) of the respective message buffer.

An MBC flag is reset to 0 when the header section of the corresponding message buffer is reconfigured or when it has been transferred to the Output Buffer.

Reset when leaving CONFIG state or when entering STARTUP state.

This bit is cleared by the CHI command CLEAR_RAMS.

18.2.10 Input Buffer

Double buffer structure consisting of Input Buffer Host and Input Buffer Shadow. While the Host can write to Input Buffer Host, the transfer to the Message RAM is done from Input Buffer Shadow. The Input Buffer holds the header and data sections to be transferred to the selected message buffer in the Message RAM. It is used to configure the message buffers in the Message RAM and to update the data sections of transmit buffers.

When updating the header section of a message buffer in the Message RAM from the Input Buffer, the Message Buffer Status as described in **Section 18.2.11.5, FLXAnFRMBS — FlexRay Message Buffer Status Register** is automatically reset to zero.

The header sections of message buffers belonging to the receive FIFO can only be (re)configured when the CC is in DEFAULT_CONFIG or CONFIG state. For those message buffers only the payload length configured and the data pointer need to be configured via bits FLXAnFRWRHS2.PLC[6:0] and bits FLXAnFRWRHS3.DP[10:0]. All information required for acceptance filtering is taken from the FIFO rejection filter and the FIFO rejection filter mask.

The data transfer between Input Buffer (IBF) and Message RAM is described in detail in **Section 18.3.12.2, Host access to Message RAM**.

These registers cannot be written when the input data transfer function shown in **Section 18.3.16.1, Input Data Transfer** is used and the FLXAnFRITS.ITS bit is 1.

18.2.10.1 FLXAnFRWRDSm — FlexRay Write Data Section Register m (m = 1 to 64)

This register holds the data wards to be transferred to the data section of the specified message buffer. The number of data words written to the Message RAM is defined by the payload length configured in bits FLXAnFRWRHS2.PLC[6:0].

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0400_H to <FLXAn_base> + $04FC_H$(<FLXAn_base> + 0400_H+(m–1) × 4)

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.68 FLXAnFRWRDSm Register Contents

Bit Position	Bit Name	Function
31 to 0	MD[31:0]	Message Data Bit

(1) FLXAnFRWRDSm.MD

Message Data Bit

Reset by the CHI command CLEAR_RAMS.

CAUTIONS

1. In case the FLXAnFRWRHS2.PLC[6:0] bits specifies an odd payload length, the remaining message data bytes are unused.
2. When writing to the FLXAnFRWRDSm register, all bytes have to be written by one 32-bit access, two consecutive 16-bit accesses, or four consecutive 8- bit accesses before the transfer from the Input Buffer to the Message RAM is started. If not all bytes of a 32- bit word have been written by the Host (8/16-bit access only), the FLXAnFRWRDSm register holds partly undefined data.

18.2.10.2 FLXAnFRWRHS1 — FlexRay Write Header Section Register 1

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0500_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.69 FLXAnFRWRHS1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read. When writing, write the value after reset.
29	MBI	Message Buffer Interrupt Bit 0: The corresponding message buffer interrupt is disabled 1: The corresponding message buffer interrupt is enabled
28	TXM	Transmission Mode Setting Bit 0: Continuous mode 1: Single-shot mode
27	PPIT	Payload Preamble Indicator Transmit Bit 0: Payload Preamble Indicator is set to 0 1: Payload Preamble Indicator is set to 1
26	CFG	Message Buffer Direction Configuration Bit 0: The corresponding buffer is configured as Receive Buffer 1: The corresponding buffer is configured as Transmit Buffer
25,24	CH[1:0]	Channel Filter Control Bit
23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	CYC[6:0]	Cycle Code Bit
15 to 11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
10 to 0	FID[10:0]	Frame ID Bit

(1) FLXAnFRWRHS1.MBI

Message Buffer Interrupt Enable Bit

This bit enables the message buffer interrupt.

After a dedicated receive buffer has been updated by the Message Handler, bit FLXAnFRSIR.RXI and /or bit FLXAnFRSIR.MBSI are set to 1. After a transmission has completed bit FLXAnFRSIR.TXI is set to 1.

(2) FLXAnFRWRHS1.TXM

Transmission Mode Setting Bit

This bit selects transmit mode of the corresponding message buffer. For transmit mode, see **Section 18.3.9.3, Transmit Buffers**.

(3) FLXAnFRWRHS1.PPIT

Payload Preamble Indicator Transmit Bit

This bit is used to control the state of the Payload Preamble Indicator in transmit frames in transmit frames of the corresponding message buffer.

If the bit is set to 1 in a static message buffer, the respective message buffer holds network management information.

If the bit is set to 1 in a dynamic message buffer the first two bytes of the payload segment may be used for message ID filtering by the receiver. Message ID filtering of received FlexRay frames is not supported by the FlexRay module, but can be done by the Host.

(4) FLXAnFRWRHS1.CFG

Message Buffer Direction Configuration Bit

This bit is used to configure the corresponding buffer as transmit buffer or as receive buffer. For message buffers belonging to the receive FIFO the bit is not evaluated.

When an unused 32-bit or larger area is not allocated to the head of the data partition, set the data section of the message buffer that is allocated immediately after the header partition (of the last buffer) as a transmit buffer by setting this bit to 1.

(5) FLXAnFRWRHS1.CH

Channel Filter Control Bit

The 2-bit channel filtering field associated with each buffer serves as a filter for receive buffers, and as a control field for transmit buffers.

CH[1:0]	Transmit Buffer transmit frame on	Receive Buffer store frame received from
00	No transmission	Ignore frame
01	Channel A	Channel A
10	Channel B	Channel B
11	Both channels (static segment only)	Channel A or B (store first semantically valid frame; static segment only)

CAUTION

If a message buffer is configured for the dynamic segment and both bits of the channel filtering field are set to 1, no frames are transmitted resp. received frames are ignored (same function as CH = “00_B”)

(6) FLXAnFRWRHS1.CYC

Cycle Code Bit

The 7-bit cycle code determines the cycle set used for cycle counter filtering.

For details about the configuration of the cycle code **Section 18.3.8.2, Cycle Counter Filtering**.

(7) FLXAnFRWRHS1.FID

Frame ID Bit

Frame ID of the selected message buffer. The frame ID defines the slot number for transmission / reception of the respective message.

Message buffers with frame ID = 0 are considered as not valid.

18.2.10.3 FLXAnFRWRHS2 — FlexRay Write Header Section Register 2

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0504_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	PLC[6:0]						
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CRC[10:0]

Table 18.70 FLXAnFRWRHS2 Register Contents

Bit Position	Bit Name	Function
31 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	PLC[6:0]	Payload Length Configured Bit
15 to 11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
10 to 0	CRC[10:0]	Header CRC Bit (vRF!Header!HeaderCRC) Receive Buffer: Configuration not required Transmit Buffer: Header CRC is configured

(1) FLXAnFRWRHS2.PLC

Payload Length Configured Bit

Length of data section (number of 2-byte words) as configured by the Host.

During static segment the static frame payload length as configured by bits FLXAnFRMHDC.SFDL[6:0] defines the payload length for all static frames. If the payload length configured by bits FLXAnFRWRHS2.PLC[6:0] is shorter than this value padding bytes are inserted to ensure that frames have proper physical length. The padding pattern is “0000_H” (see **Section 18.3.9.3, Transmit Buffers**).

(2) FLXAnFRWRHS2.CRC

Header CRC Bit (vRF!Header!HeaderCRC)

Setting of the receive buffer is not required.

Transmitting of the message buffer needs the header CRC calculation and setting.

For calculation of the header CRC the payload length of the frame send on the bus has to be considered. In static segment the payload length of all frames is configured by bits FLXAnFRMHDC.SFDL[6:0].

18.2.10.4 FLXAnFRWRHS3 — FlexRay Write Header Section Register 3

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0508_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit Position	Bit Name	Function
31 to 11	Reserved	When read, the value after reset is read. When writing, write the value after reset.
10 to 0	DP[10:0]	Data Pointer Bit

(1) FLXAnFRWRHS3.DP

Data Pointer Bit

Configures the pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

18.2.10.5 FLXAnFRIBCM — FlexRay Input Buffer Command Mask Register

Configures how the message buffer in the Message RAM selected by register FLXAnFRIBCR is updated. When IBF Host and IBF Shadow are swapped, also mask bits FLXAnFRIBCM.LHSH, FLXAnFRIBCM.LDSH, and FLXAnFRIBCM.STXRH are swapped with bits FLXAnFRIBCM.LHSS, FLXAnFRIBCM.LDSS, and FLXAnFRIBCM.STXRS.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0510_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	STXRS	LDSS	LHSS

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Table 18.72 FLXAnFRIBCM Register Contents

Bit Position	Bit Name	Function
31 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	STXRS	Set Transmission Request Shadow Flag 0: Reset TXR flag 1: Set TXR flag, transmit buffer released for transmission (operation ongoing or finished)
17	LDSS	Load Data Section Shadow Flag 0: Data section is not updated 1: Data section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
16	LHSS	Load Header Section Shadow Flag 0: Header section is not updated 1: Header section selected for transfer from Input Buffer to the Message RAM (transfer ongoing or finished)
15 to 3	Reserved	When read, the value after reset is read. When writing, write the value after reset.
2	STXRH	Set Transmission Request Host Bit 0: Reset TXR flag 1: Set TXR flag, transmit buffer released for transmission
1	LDSH	Load Data Section Host Bit 0: Data section is not updated 1: Data section selected for transfer from Input Buffer to the Message RAM
0	LHSH	Load Header Section Host Bit 0: Header section is not updated 1: Header section selected for transfer from Input Buffer to the Message RAM

(1) FLXAnFRIBCM.STXRS

Set Transmission Request Shadow Flag

(2) FLXAnFRIBCM.LDSS

Load Data Section Shadow Flag

(3) FLXAnFRIBCM.LHSS

Load Header Section Shadow Flag

(4) FLXAnFRIBCM.STXRH

Set Transmission Request Host Bit

If this bit is set to 1, the TXR flag for the selected message buffer is set in the FLXAnFRTXRQ1 to FLXAnFRTXRQ4 registers to release the message buffer for transmission. In single-shot mode the flag is cleared by the CC after transmission has completed.

TXR is evaluated for transmit buffers only.

(5) FLXAnFRIBCM.LDSH

Set Load Data Section Host Bit

(6) FLXAnFRIBCM.LHSH

Set Load Header Section Host Bit

18.2.10.6 FLXAnFRIBCR — FlexRay Input Buffer Command Request Register

When the Host writes the number of the target message buffer in the Message RAM to bits FLXAnFRIBCR.IBRH[6:0], IBF Host and IBF Shadow are swapped. In addition the message buffer numbers stored under bits FLXAnFRIBCR.IBRH[6:0] and bits FLXAnFRIBCR.IBRS[6:0] are also swapped (see **Section 18.3.12.2 (1), Data Transfer from Input Buffer to Message RAM**).

With this write operation bit FLXAnFRIBCR.IBSYS is set to 1. The Message Handler then starts to transfer the contents of IBF Shadow to the message buffer in the Message RAM selected by bits FLXAnFRIBCR.IBRS[6:0].

While the Message Handler transfers the data from IBF Shadow to the target message buffer in the Message RAM, the Host may write the next message into the IBF Host. After the transfer between IBF Shadow and the Message RAM has completed, bit FLXAnFRIBCR.IBSYS is set back to 0 and the next transfer to the Message RAM may be started by the Host by writing the respective target message buffer number to bits FLXAnFRIBCR.IBRH[6:0].

If a write access to bits FLXAnFRIBCR.IBRH[6:0] occurs while bit FLXAnFRIBCR.IBSYS is 1, bit FLXAnFRIBCR.IBSYH is set to 1. After completion of the ongoing data transfer from IBF Shadow to the Message RAM, IBF Host and IBF Shadow are swapped, bit FLXAnFRIBCR.IBSYH is reset to 0. Bit FLXAnFRIBCR.IBSYS remains set to 1, and the next transfer to the Message RAM is started. In addition the message buffer numbers stored under bits FLXAnFRIBCR.IBRH[6:0] and bits FLXAnFRIBCR.IBRS[6:0] are also swapped.

Any write access to an Input Buffer register while both bit FLXAnFRIBCR.IBSYS and bit FLXAnFRIBCR.IBSYH are set to 1 will cause the error flag FLXAnFREIR.IIBA to be set to 1.

Access: This register can be read/written in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0514_H

Value after reset: 00000000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 18.73 FLXAnFRIBCR Register Contents (1/2)

Bit Position	Bit Name	Function
31	IBSYS	Input Buffer Busy Shadow Flag 0: Transfer between IBF Shadow and Message RAM completed 1: Transfer between IBF Shadow and Message RAM in progress
30 to 23	Reserved	When read, the value after reset is read. When writing, write the value after reset.
22 to 16	IBRS[6:0]	Input Buffer Request Shadow Flag
15	IBSYH	Input Buffer Busy Host Flag 0: No request pending 1: Request while transfer between IBF Shadow and Message RAM in progress

Table 18.73 FLXAnFRIBCR Register Contents (2/2)

Bit Position	Bit Name	Function
14 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6 to 0	IBRH[6:0]	Input Buffer Request Host Bit

(1) FLXAnFRIBCR.IBSYS

Input Buffer Busy Shadow Flag

Set to 1 after writing bits FLXAnFRIBCR.IBRH[6:0].

This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.

When the transfer between IBF Shadow and the Message RAM has completed, FLXAnFRIBCR.IBSYS is set back to 0.

(2) FLXAnFRIBCR.IBRS

Input Buffer Request Shadow Flag

Number of the target message buffer actually updated / lately updated.

(3) FLXAnFRIBCR.IBSYH

Input Buffer Busy Host Flag

Set to 1 by writing bits FLXAnFRIBCR.IBRH[6:0] while bit FLXAnFRIBCR.IBSYS is still 1.

This bit indicates transmitting between the IBF Shadow and the Message RAM is ongoing.

After the ongoing transfer between IBF Shadow and the Message RAM has completed, the FLXAnFRIBCR.IBSYH is set back to 0.

(4) FLXAnFRIBCR.IBRH

Input Buffer Request Host Bit

Selects the target message buffer in the Message RAM for data transfer from Input Buffer.

18.2.11 Output Buffer

Double buffer structure consisting of Output Buffer Host and Output Buffer Shadow. Used to read out message buffers from the Message RAM. While the Host can read from Output Buffer Host, the Message Handler transfers the selected message buffer from Message RAM to Output Buffer Shadow. The data transfer between Message RAM and Output Buffer (OBF) is described in **Section 18.3.12.2 (2), Data Transfer from Message RAM to Output Buffer**.

These registers cannot be written when the output data transfer function shown in **Section 18.3.16.2, Output Data Transfer**, in Output Data Transfer is used and the FLXAnFROTS.OTS bit is 1.

18.2.11.1 FLXAnFRRDDSm — FlexRay Read Data Section Register m (m = 1 to 64)

Holds the data words read from the data section of the addressed message buffer. This register holds the data wards to be transferred to the data section of the specified message buffer. The number of data words (DWn) read from the Message RAM is defined by the payload length configured in bits FLXAnFRRDHS2.PLC[6:0].

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0600_H to <FLXAn_base> + $06FC_H$ (<FLXAn_base> + 0600_H + (m–1) × 4)

Value after reset: $0000\ 0000_H$

Table 18.75 FLXAnFRRDHS1 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read.
29	MBI	Message Buffer Interrupt Flag
28	TXM	Transmission Mode Flag
27	PPIT	Payload Preamble Indicator Transmit Flag
26	CFG	Message Buffer Direction Configuration Flag
25, 24	CH[1:0]	Channel Filter Control Flag
23	Reserved	When read, the value after reset is read.
22 to 16	CYC[6:0]	Cycle Code
15 to 11	Reserved	When read, the value after reset is read.
10 to 0	FID[10:0]	Frame ID

(1) FLXAnFRRDHS1.MBI

Message Buffer Interrupt Flag

Values as configured by the Host via bit FLXAnFRWRHS1.MBI.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(2) FLXAnFRRDHS1.TXM

Transmission Mode Flag

Values as configured by the Host via bit FLXAnFRWRHS1.TXM.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(3) FLXAnFRRDHS1.PPIT

Payload Preamble Indicator Transmit Flag

Values as configured by the Host via bit FLXAnFRWRHS1.PPIT.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(4) FLXAnFRRDHS1.CFG

Message Buffer Direction Configuration Flag

Values as configured by the Host via bit FLXAnFRWRHS1.CFG.

In case that the message buffer read from the Message RAM belongs to the receive FIFO this bit is set to 0.

(5) FLXAnFRRDHS1.CH

Channel Filter Control Flag

Values as configured by the Host via bit FLXAnFRWRHS1.CH.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

(6) FLXAnFRRDHS1.CYC

Cycle Code

Values as configured by the Host via bit FLXAnFRWRHS1.CYC.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are set to 0.

(7) FLXAnFRRDHS1.FID

Frame ID

Values as configured by the Host via bit FLXAnFRWRHS1.FID.

In case that the message buffer read from the Message RAM belongs to the receive FIFO these bits are holding the received frame ID.

18.2.11.3 FLXAnFRRDHS2 — FlexRay Read Header Section Register 2

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0704_H

Value after reset: $0000\ 0000_H$

CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area, the FLXAnFRWRHS2 register is updated from data frames only.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	CRC[10:0]										
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 18.76 FLXAnFRRDHS2 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When read, the value after reset is read.
30 to 24	PLR[6:0]	Payload Length Received Flag (vRF!Header!Length)
23	Reserved	When read, the value after reset is read.
22 to 16	PLC[6:0]	Payload Length Configuration Flag
15 to 11	Reserved	When read, the value after reset is read.
10 to 0	CRC[10:0]	Header CRC Flag (vRF!Header!HeaderCRC)

(1) FLXAnFRRDHS2.PLR

Payload Length Received Flag (vRF!Header!Length)

Payload length (vRF!Header!Length) value updated from received data frames (exception: if message buffer belongs to the receive FIFO FLXAnFRRDSH2.PLR is also updated from received null frames).

(2) FLXAnFRRDHS2.PLC

Payload Length Configuration Flag

Length of data section (number of 2-byte words) as configured by the Host.

(3) FLXAnFRRDHS2.CRC

Header CRC Flag (vRF!Header!HeaderCRC)

Receive Buffer: Header CRC (vRF!Header!HeaderCRC) updated from received data frames

Transmit Buffer: Header CRC configured by the Host

(4) Data storage

When a message is stored into a message buffer the following behavior with respect to payload length received and payload length configured is implemented:

Bits FLXAnFRRDHS2.PLR[6:0] > Bits FLXAnFRRDHS2.PLC[6:0]:

The payload data stored in the message buffer is truncated to the payload length configured if bits FLXAnFRRDHS2.PLC[6:0] even or else truncated to bits FLXAnFRRDHS2.PLC[6:0] + 1.

Bits FLXAnFRRDHS2.PLR[6:0] <= Bits FLXAnFRRDHS2.PLC[6:0]:

The received payload data is stored into the message buffers data section. The remaining data bytes of the data section as configured by bits FLXAnFRRDHS2.PLC[6:0] are filled with undefined data.

Bits FLXAnFRRDHS2.PLR[6:0] = zero:

The message buffer’s data section is filled with undefined data

Bits FLXAnFRRDHS2.PLC[6:0] = zero:

Message buffer has no data section configured. No data is stored into the message buffer's data section.

CAUTIONS

1. The Message RAM is organized in 4-byte words. When received data is stored into a message buffer's data section, the number of 2-byte data words written into the message buffer is the FLXAnFRRDHS2.PLC[6:0] bits rounded to the next even value.
2. The FLXAnFRRDHS2.PLC[6:0] bits should be configured identical for all message buffers belonging to the receive FIFO. Header 2 is updated from data frames only.
   For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area, the FLXAnFRWRHS2 register is updated from data frames only.

18.2.11.4 FLXAnFRRDHS3 — FlexRay Read Header Section Register 3

CAUTION

For message buffers belonging to the Static Buffer area or Static and Dynamic Buffer area, the FLXAnFRWRHS3 register is updated from data frames only.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + 0708_H

Value after reset: $0000\ 0000_H$

Table 18.77 FLXAnFRRDHS3 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read.
29	RES	Reserved Bit Indicator Flag (vRF!Header!Reserved)
28	PPI	Payload Preamble Indicator (vRF!Header!PPIndicator)
27	NFI	Null Frame Indicator Flag (vRF!Header!NFIndicator) 0: Up to now no data frame has been stored into the respective message buffer 1: At least one data frame has been stored into the respective message buffer
26	SYN	Sync Frame Indicator Flag (vRF!Header!SyFIndicator) 0: The received frame is not a sync frame 1: The received frame is a sync frame
25	SFI	Startup Frame Indicator Flag (vRF!Header!SuFIndicator) 0: The received frame is not a startup frame 1: The received frame is a startup frame
24	RCI	Received on Channel Indicator Flag (vSS!Channel) 0: Frame received on channel B 1: Frame received on channel A
23, 22	Reserved	When read, the value after reset is read.
21 to 16	RCC[5:0]	Receive Cycle Counter (vRF!Header!CycleCount)
15 to 11	Reserved	When read, the value after reset is read.
10 to 0	DP[10:0]	Data Pointer Flag

(1) FLXAnFRRDHS3.RES

Reserved Bit Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as 0.

(2) FLXAnFRRDHS3.PPI

Payload Preamble Indicator Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

0 = The payload segment of the received frame does not contain a network management vector nor a message ID

1 = Static segment: Network management vector in the first part of the payload
Dynamic segment: Message ID in the first part of the payload

(3) FLXAnFRRDHS3.NFI

Null Frame Indicator Flag (vRF!Header!NFIndicator)

Is set to 1 after storage of the first received data frame.

(4) FLXAnFRRDHS3.SYN

Sync Frame Indicator Flag (vRF!Header!SyFIndicator)

A sync frame is marked by the sync frame indicator.

(5) FLXAnFRRDHS3.SFI

Startup Frame Indicator Flag (vRF!Header!SuFIndicator)

A startup frame is marked by the startup frame indicator.

(6) FLXAnFRRDHS3.RCI

Received on Channel Indicator Flag (vSS!Channel)

Indicates the channel from which the received data frame was taken to update the respective receive buffer.

(7) FLXAnFRRDHS3.RCC

Receive Cycle Counter (vRF!Header!CycleCount)

Cycle counter value updated from received data frame.

(8) FLXAnFRRDHS3.DP

Data Pointer Flag

Pointer to the first 32-bit word of the data section of the addressed message buffer in the Message RAM.

The bit value is the same as that set in bit FLXAnFRWRHS3.DP

18.2.11.5 FLXAnFRMBS — FlexRay Message Buffer Status Register

The message buffer status is updated by the CC with respect to the assigned channel(s) latest at the end of the slot following the slot assigned to the message buffer.

The flags are updated only when the CC is in NORMAL_ACTIVE or NORMAL_PASSIVE state.

If only one channel (A or B) is assigned to a message buffer, the channel-specific status flags of the other channel are written to zero. If both channels are assigned to a message buffer, the channel-specific status flags of both channels are updated.

The message buffer status is updated only when the slot counter reached the configured frame ID and when the cycle counter filter matched. When the Host updates a message buffer via Input Buffer, all FLXAnFRMBS flags are reset to zero independent of which FLXAnFRIBCM bits are set or not.

For details about receive / transmit filtering see **Section 18.3.8, Filtering and Masking**, **Section 18.3.9, Transmit Process** and **Section 18.3.10, Receive Process**.

Whenever the Message Handler changes one of the flags FLXAnFRMBS.VFRA, FLXAnFRMBS.VFRB, FLXAnFRMBS.SEOA, FLXAnFRMBS.SEOB, FLXAnFRMBS.CEOA, FLXAnFRMBS.CEOB, FLXAnFRMBS.SVOA, FLXAnFRMBS.SVOB, FLXAnFRMBS.TCIA, FLXAnFRMBS.TCIB, FLXAnFRMBS.ESA, FLXAnFRMBS.ESB, FLXAnFRMBS.MLST, FLXAnFRMBS.FTA, FLXAnFRMBS.FTB the respective message buffer's MBC flag in registers FLXAnFRMBSC1 to FLXAnFRMBSC4 is set.

Access: This register can only be read in 8-, 16-, or 32-bit units.

Address: <FLXAn_base> + $070C_H$

Value after reset: $0000\ 0000_H$

Table 18.78 FLXAnFRMBS Register Contents (1/2)

Bit Position	Bit Name	Function
31, 30	Reserved	When read, the value after reset is read.
29	RESS	Reserved Bit Status Flag (vRF!Header!Reserved)
28	PPIS	Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator) 0: PPI indicator set to 0 1: PPI indicator set to 1
27	NFIS	Null Frame Indicator Status Flag (vRF!Header!NFIndicator) 0: Received frame is a null frame 1: Received frame is not a null frame
26	SYNS	Sync Frame Indicator Status Flag (vRF!Header!SyFIndicator) 0: No sync frame received 1: The received frame is a sync frame

Table 18.78 FLXAnFRMBS Register Contents (2/2)

Bit Position	Bit Name	Function
25	SFIS	Startup Frame Indicator Status Flag (vRF!Header!SuFIndicator) 0: No startup frame received 1: The received frame is a startup frame
24	RCIS	Received on Channel Indicator Status Flag (vSS!Channel) 0: Frame received on channel B 1: Frame received on channel A
23, 22	Reserved	When read, the value after reset is read.
21 to 16	CCS[5:0]	Cycle Count Status Flag
15	FTB	Frame Transmitted on Channel B Flag 0: No data frame transmitted on channel B 1: Data frame transmitted on channel B
14	FTA	Frame Transmitted on Channel A Flag 0: No data frame transmitted on channel A 1: Data frame transmitted on channel A
13	Reserved	When read, the value after reset is read.
12	MLST	Message Lost Flag 0: No message lost 1: Unprocessed message was overwritten
11	ESB	Empty Slot Channel B Flag 0: Bus activity detected in the assigned slot on channel B 1: No bus activity detected in the assigned slot on channel B
10	ESA	Empty Slot Channel A Flag 0: Bus activity detected in the assigned slot on channel A 1: No bus activity detected in the assigned slot on channel A
9	TCIB	Transmission Conflict Indication Channel B Flag (vSS!TxConflictB) 0: No transmission conflict occurred on channel B 1: Transmission conflict occurred on channel B
8	TCIA	Transmission Conflict Indication Channel A Flag (vSS!TxConflictA) 0: No transmission conflict occurred on channel A 1: Transmission conflict occurred on channel A
7	SVOB	Slot Boundary Violation Observed on Channel B Flag (vSS!BViolationB) 0: No slot boundary violation observed on channel B 1: Slot boundary violation observed on channel B
6	SVOA	Slot Boundary Violation Observed on Channel A Flag (vSS!BViolationA) 0: No slot boundary violation observed on channel A 1: Slot boundary violation observed on channel A
5	CEOB	Content Error Observed on Channel B Flag (vSS!ContentErrorB) 0: No content error observed on channel B 1: Content error observed on channel B
4	CEOA	Content Error Observed on Channel A Flag (vSS!ContentErrorA) 0: No content error observed on channel A 1: Content error observed on channel A
3	SEOB	Syntax Error Observed on Channel B Flag (vSS!SyntaxErrorB) 0: No syntax error observed on channel B 1: Syntax error observed on channel B
2	SEOA	Syntax Error Observed on Channel A Flag (vSS!SyntaxErrorA) 0: No syntax error observed on channel A 1: Syntax error observed on channel A
1	VFRB	Valid Frame Received on Channel B (vSS!ValidFrameB) 0: No valid frame received on channel B 1: Valid frame received on channel B
0	VFRA	Valid Frame Received on Channel A Flag (vSS!ValidFrameA) 0: No valid frame received on channel A 1: Valid frame received on channel A

(1) FLXAnFRMBS.RESS

Reserved Bit Status Flag (vRF!Header!Reserved)

Reflects the state of the received reserved bit. The reserved bit is transmitted as 0.

For receive buffers (bit FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

(2) FLXAnFRMBS.PPIS

Payload Preamble Indicator Status Flag (vRF!Header!PPIndicator)

The payload preamble indicator defines whether a network management vector or message ID is contained within the payload segment of the received frame.

For receive buffers (bit FLXAnFRWRHS1.CFG = 0) this bit is updated from both valid data and null frames. If no valid frame was received, the previous value is maintained. For transmit buffers the flag has no meaning and should be ignored.

0 = PPI indicator set to 0
