31.4.3.2 Details of Registers

(1) APBFSGDPROT_PDMACM_A/PDMACH_A/INTC2_A/SPn_A — P-bus FS Guard Protection Setting Register (n = 1, 4)

These registers are for setting P-bus guard in read cycles.

Access: These registers can be read/written in 32/16/8-bit units.

Address: APBFSGDPROT_PDMACM_A: FFC4 C000$_H$
APBFSGDPROT_PDMACH_A: FFC4 C010$_H$
APBFSGDPROT_INTC2_A: FFC4 C020$_H$
APBFSGDPROT_SP1_A: FFC4 C050$_H$
APBFSGDPROT_SP4_A: FFC4 C070$_H$

Value after reset: 060D FE1B$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	—	PEID4	—	—	PEID1	—	—
Value after reset	0	0	0	0	0	1	1	0	0	0	0	0	1	1	0	1

Table 31.159 APBFSGDPROT_PDMACM_A/PDMACH_A/INTC2_A/SPn_A Register Contents

Bit Position	Bit Name	Function
31	LOCK	Lock bit 0: Registers can be-written 1: Any further writes to APBFSGDPROT_× and APBFSGDSPID_× are ignored. This bit can only be cleared by reset.
30 to 22	Reserved	When read, the value after reset is read. When writing, write the value after reset.
21	PEID4	Access with PEID4 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
20 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PEID1	Access with PEID1 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(2) APBFSGDPROT_PDMACM_B/PDMACH_B/INTC2_B/SPn_B — P-bus FS Guard Protection Setting Register (n = 1, 4)

These registers are for setting P-bus guard in write cycles.

Access: These registers can be read/written in 32/16/8-bit units.

Address: APBFSGDPROT_PDMACM_B: FFC4 $C008_H$
APBFSGDPROT_PDMACH_B: FFC4 $C018_H$
APBFSGDPROT_INTC2_B: FFC4 $C028_H$
APBFSGDPROT_SP1_B: FFC4 $C058_H$
APBFSGDPROT_SP4_B: FFC4 $C078_H$

Value after reset: 060D $FE17_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.160 APBFSGDPROT_PDMACM_B/PDMACH_B/INTC2_B/SPn_B Register Contents

Bit Position	Bit Name	Function
31	LOCK	Lock bit 0: Registers can be-written 1: Any further writes to APBFSGDPROT_× and APBFSGDSPID_× are ignored. This bit can only be cleared by reset
30 to 22	Reserved	When read, the value after reset is read. When writing, write the value after reset.
21	PEID4	Access with PEID4 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
20 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PEID1	Access with PEID1 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(3) APBFSGDPROT_PBG_A — P-bus FS Guard Protection Setting Register

This register is for setting P-bus guard in read cycles.

Access: This register can be read/written in 32/16/8-bit units.

Address: FFC4 $C040_H$

Value after reset: 064D $FE1B_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.161 APBFSGDPROT_PBG_A Register Contents

Bit Position	Bit Name	Function
31	LOCK	Lock bit 0: Registers can be-written 1: Any further writes to APBFSGDPROT_PBG_A and APBFSGDSPID_PBG_A are ignored. This bit can only be cleared by reset
30 to 22	Reserved	When read, the value after reset is read. When writing, write the value after reset.
21	PEID4	Access with PEID4 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
20 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PEID1	Access with PEID1 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(4) APBFSGDPROT_PBG_B — P-bus FS Guard Protection Setting Register

This register is for setting P-bus guard in write cycles.

Access: This register can be read/written in 32/16/8-bit units.

Address: FFC4 C048$_H$

Value after reset: 064D FE17$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	LOCK	—	—	—	—	—	—	—	—	—	PEID4	—	—	PEID1	—	—
Value after reset	0	0	0	0	0	1	1	0	0	1	0	0	1	1	0	1

Value after reset	1	1	1	1	1	1	1	0	0	0	0	1	0	1	1	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.162 APBFSGDPROT_PBG_B Register Contents

Bit Position	Bit Name	Function
31	LOCK	Lock bit 0: Registers can be-written 1: Any further writes to APBFSGDPROT_PBG_B and APBFSGDSPID_PBG_B are ignored. This bit can only be cleared by reset
30 to 22	Reserved	When read, the value after reset is read. When writing, write the value after reset.
21	PEID4	Access with PEID4 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
20 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PEID1	Access with PEID1 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEIDn is not allowed. 1: Access with PEIDn is allowed.
17 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset.

(5) APBFSGDSPID_PDMACM_x/PDMACH_x/INTC2_x/PBG_x/SPy_x — P-bus FS Guard SPID Setting Register (x = A or B, y = 1, 4)

"A" is for setting read cycles, "B" is for setting write cycles.

Access: These registers can be read/written in 32-bit units.

Address:
APBFSGDSPID_INTC2_A: FFC4 $C024_H$
APBFSGDSPID_INTC2_B: FFC4 $C02C_H$
APBFSGDSPID_PDMACM_A: FFC4 $C004_H$

Table 31.163 APBFSGDSPID_PDMACM_x/PDMACH_x/INTC2_x/PBG_x/SPy_x Register Contents

Bit Position	Bit Name	Function
31 to 0	SPID[31:0]	Access with SPID SPID is a bit list where each bit represents one SPID value. Setting more than one bit allows to enable more than one SPID value at a time. E.g. setting SPID to "00000110" allows access with SPID = 1 and SPID = 2. 0: Access with SPIDn is not allowed. 1: Access with SPIDn is allowed.

(6) ERRSLVCTL_PFSS0/1 — ERRSLV Control Register for PFSS P-bus FS Guard Slave0/1

These registers are for setting P-bus guard in read cycles.

Access: These registers can be written only in 32-bit units.

Address: ERRSLVCTL_PFSS0:FFC4 C800$_H$
ERRSLVCTL_PFSS1: FFC4 C810$_H$

Value after reset: 0000 0000$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.167 xxxPROTx Register Contents

Bit Position	Bit Name	Function
31	LOCK	Lock bit 0: Registers can be-written 1: Any further writes to xxxPROTx and xxxSPIDx are ignored. This bit can only be cleared by reset
30 to 22	Reserved	When read, the value after reset is read. When writing, write the value after reset.
21	PEID4	Access with PEID4 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
20 to 19	Reserved	When read, the value after reset is read. When writing, write the value after reset.
18	PEID1	Access with PEID1 PEID is a bit list where each bit represents one PEID value. Setting more than one bit allows to enable more than one virtual Processor ID value at a time. 0: Access with PEID n is not allowed. 1: Access with PEID n is allowed.
17 to 4	Reserved	When read, the value after reset is read. When writing, write the value after reset.
3 to 0	Reserved	When read, the value after reset is read. When writing, write the value after reset. Please refer to the **Table 31.158** for the read values of these bits.

(10) xxxSPIDx — P-bus Guard SPID Setting Register

Access: These registers can be read/written in 32-bit units.

Address: see **Table 31.158, List of Registers** (P-bus Guard)

Value after reset: FFFF FFFF$_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 31.171 ERRSLVxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 16	SPID[4:0]	P-bus guard SPID error has occurred
15 to 13	PEID[2:0]	P-bus guard PEID error has occurred
12 to 1	Reserved	These bits are undefined.
0	WRITE	Access type of P-bus Guard error 0: read access 1: write access

31.4.4 HBG

H-bus guard protects against read access and write access to the peripheral circuit on H-bus. If H-bus guard detects illegal access, guard error notification is sent to ECM.

Table 31.172 List of Registers

Address	Symbol	Register Name	R/W	Value after reset	Access Size	Refer to

Table 31.178 ERRSLVxxTYPE Register Contents

Bit Position	Bit Name	Function
31 to 21	Reserved	When read, the value after reset is read.
20 to 16	SPID[4:0]	H-bus guard SPID error has occurred
15 to 13	PEID[2:0]	H-bus guard PEID error has occurred
12 to 10	Reserved	These bits are undefined.
9, 8	Reserved	When read, the value after reset is read.
7, 6	Reserved	These bits are undefined.
5, 4	Reserved	When read, the value after reset is read.
3 to 1	Reserved	These bits are undefined.
0	WRITE	Access type of H-bus Guard error 0: read access 1: write access

(7) HSSPIDRG0

This register is setting SPID for H-Bus master IP (FlexRay). The H-Bus master IP can only use a value of SPID between 2 and 31.

Access: These registers can be read/written in 32-bit units.

Address: HSSPIDRG0: FFFA 1000_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Register Symbol	target IP
HSSPIDRG0	FlexRay0

31.5 Clock Monitor (CLMA)

This product implements multiple clock monitors that monitor internal clocks related to the safety of the device. Each clock monitor detects clock failure by using two kinds of clocks: the “monitored clock” and the “sampling clock”. The “monitored clock” is the target of monitoring and the “sampling clock” is used as a reference to check the frequency of the “monitored clock”.

31.5.1 Features

- Implements four clock monitor modules.
  The individual CLMA units are identified by the index “n”(n = 0 to 3).
- Monitors to see if the frequency of the clock to be monitored is within the specified range based on the sampling clock. Issues an error notice to the ECM upon detection of the abnormal state of the clock.
- Supports self-diagnosis function.

31.5.1.1 Clock Monitor Configurations

Table 31.181 Clock Monitor Configuration

Clock Monitor	Monitored Clock (CLMATMON)	Sampling Clock (CLMATSMP)	Status After Reset	Output to
CLMA0	Main OSC	CLK_IOSC / 2 (4 MHz)	Disabled	ECM upper-limit error : Error factor #8 lower-limit error : Error factor #9
CLMA1	CLK_LSB / 2 (20MHz)	Main OSC / 8	Disabled	ECM upper-limit error : Error factor #12 lower-limit error : Error factor #13
CLMA2	Window Watch Dog count clock*1	Main OSC / 256	Disabled	ECM upper-limit error : Error factor #10 lower-limit error : Error factor #11
CLMA3	Clock CPU (160 MHz)	Main OSC / 4	Disabled	ECM upper-limit error : Error factor #14 lower-limit error : Error factor #15

Note 1. The monitored clock of CLMA2 is selected by the setting of OPWDMDS.
• OPWDMDS
0: WDTACLKI = CLK_IOSC (8 MHz)
1: WDTACLKI = CLK_IOSC / 32 (250 kHz)

31.5.1.2 Block Diagram

Figure 31.7 shows block diagram of each clock monitor A.

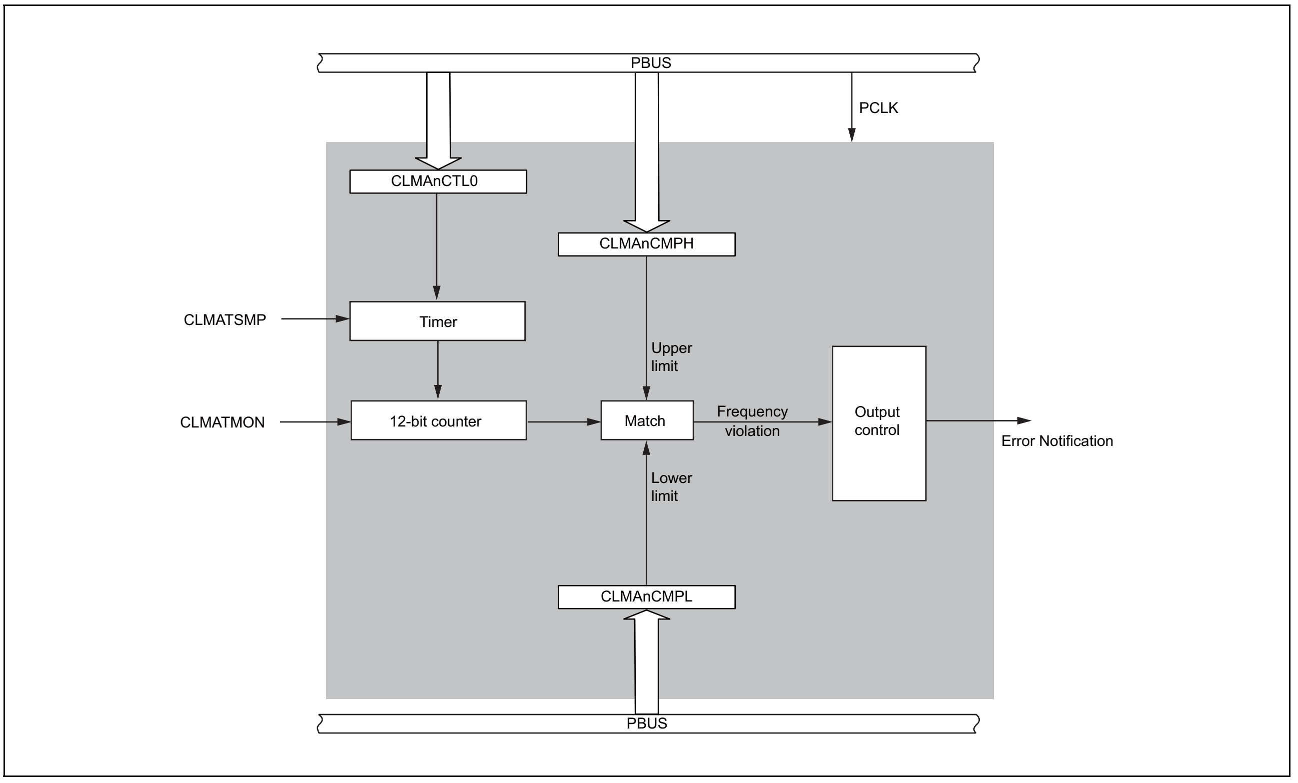

Figure 31.7 Block Diagram of Each Clock Monitor A

31.5.1.3 External Input/Output Pins

None.

31.5.2 Functional Description

The Clock Monitor CLMAn is used to verify whether the frequency of a clock (CLMATMON) is within the specified range.

31.5.2.1 Detection of Abnormal Clock Frequencies

1. CLMAn counts the number of rising edges of the monitored clock signal within 16 sampling clock cycles, and compares the count with the specified thresholds.
   - The lower threshold is specified using the CLMAnCMPL[11:0] bits in CLMAnCMPL register.
   - The upper threshold is specified using the CLMAnCMPH[11:0] bits in CLMAnCMPH register.
2. When the monitored clock frequency is so low*1 that the count falls below the value set in CLMAnCMPL[11:0] in the CLMAnCMPL register, CLMAn notifies the ECM of the abnormal clock. CLMAn also notifies the ECM of the abnormal clock when the clock frequency is so high that the count exceeds the value set in CLMAnCMPH[11:0] in the CLMAnCMPH register.

Note 1. There is a case that the abnormal state is not detected when the monitor clock completely stops.

Note that even if the frequency of the monitored clock fluctuates during the sampling period, an error is not notified as long as the number of detected edges falls within the specified range.

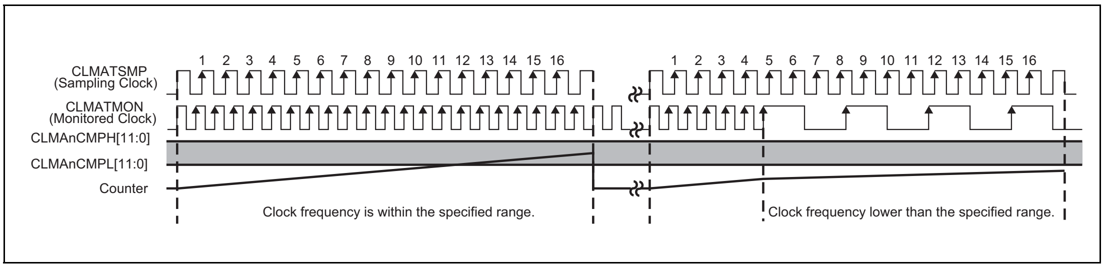

Figure 31.8 Operation when Monitored Clock Frequency is Lower than Lower Threshold

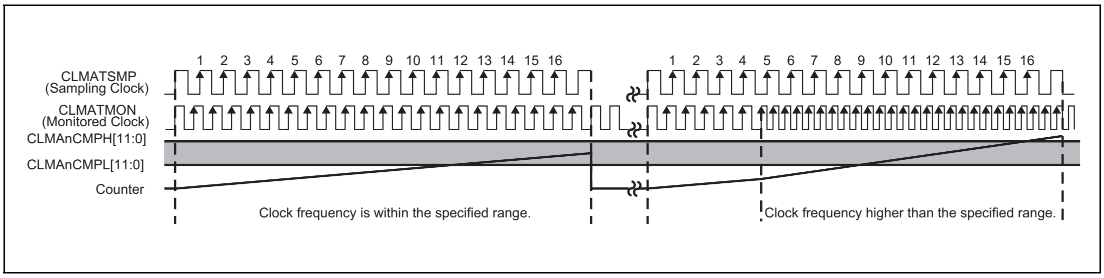

Figure 31.9 Operation when Monitored Clock Frequency is Higher than Higher Threshold

Calculation of thresholds

For the compare registers CLMAnCMPL and CLMAnCMPH, specify the minimum and maximum number of CLMATMON clock cycles to occur within 16 cycles of the sampling clock CLMATSMP that defines the normal range of CLMATMON.

The number of CLMATMON clock cycles to occur within 16 cycles of CLMATSMP is denoted by N.

$$\frac{16}{f_{CLMATSMP}} = \frac{N}{f_{CLMATMON}}$$

$$N = \frac{f_{CLMATMON}}{f_{CLMATSMP}} \times 16$$

Considering the allowed frequency deviations of CLMATMON and CLMATSMP, the threshold values can be calculated by the following formulas:

$$\text{Lower threshold} = N_{min} = \frac{f_{CLMATMON(min)}}{f_{CLMATSMP(max)}} \times 16 - 1$$

$$\text{Upper threshold} = N_{max} = \frac{f_{CLMATMON(max)}}{f_{CLMATSMP(min)}} \times 16 + 1$$

Minimum thresholds

The following restrictions must be taken into account:

- CLMAnCMPL $\geqq 0001_H$
- CLMAnCMPH $\geqq$ CLMAnCMPL + 0003_H

31.5.2.2 Resetting CLMAn

CLMAn is initialized by the Power On Reset, the System Resets 1 and 2, the Application Reset 1, and register. CLMATEST.RESCLM can reset each CLMAn by special procedure. See **Section 31.5.3.3, Resetting the Registers** and **Section 31.5.4.2, Reset Procedure Using CLMATEST.RESCLM** for details about CLMATEST.RESCLM.

Table 31.182 CLMAn Reset Conditions

CLMA	Reset Condition							
					CLMATEST.RESCLM			
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1	CLMA0TESEN = 1	CLMA1TESEN = 1	CLMA2TESEN = 1	CLMA3TESEN = 1
CLMA0	√	√	√	√	√			
CLMA1	√	√	√	√		√		
CLMA2	√	√	√	√			√	
CLMA3	√	√	√	√				√

31.5.2.3 Self-Diagnosis

Self-diagnosis of the clock monitor is available as described below.

(1) Configure thresholds (CLMAnCMPL/CLMAnCMPH) of target CLMA.Set thresholds into values to generate an error.

(2) Specify the clock monitor to be self-diagnosed.
Setting the CLMATEST.CLMAnTESEN bit to 1 enables specifying the corresponding clock monitor to be self-diagnosed.

(3) To prevent error notice to the ECM based on self-diagnosis, set CLMATEST.ERRMSK simultaneously with step (2).

(4) To enable the monitor operation, Set CLMAnCTL0.CLMAnCLME bit to1.

(5) Wait for the time long enough to allow error occurrence, read the CLMATESTS register to see if an error has been generated in the clock monitor to be self-diagnosed. The time from the start of self-diagnosis to the error occurrence depends on the sampling period. A maximum of two sampling cycles are required.

(6) Clear the error generated by self-diagnosis.
Setting CLMATEST.RESCLM to 1 enables initializing the clock monitor to be self-diagnosed.

(7) Terminate self-diagnosis.
Setting all the bits in CLMATEST to 0 enables terminating self-diagnosis.

Before restarting the clock monitor that has been self-diagnosed, set the registers again as required.

31.5.3 Register

31.5.3.1 Register Protection

Write protected registers are protected from unintended write access due to factors such as program errors. The following clock monitor register features this special write protection function:

- CLMAn control register 0 CLMAnCTL0

Other registers can be protected from unintended write access due to factors such as program errors by configuration of the P-Bus Guards. For details, see **31.4.3, PBG**.

31.5.3.2 List of Registers

Table 31.183 Register Base Addresses

Component	Symbol	Base Address
CLMA0	<CLMA0_base>	FFF8 3100$_{H}$
CLMA1	<CLMA1_base>	FFF8 3200$_{H}$
CLMA2	<CLMA2_base>	FFF8 3300$_{H}$
CLMA3	<CLMA3_base>	FFF8 3400$_{H}$
Clock Monitor Test	<CLMAT_base>	FFF8 3000$_{H}$

Each Clock Monitor is controlled and operated by the following registers.

Table 31.184 List of Registers

						Protection Register	
Module Name	Address	Register Name	Description	Access Width	Value After Reset	Command Register	Status Register
CLMAn	<CLMAn_base> + 00$_{H}$	CLMAnCTL0	CLMAn control register 0	8	00$_{H}$	CLMAnPCMD	CLMAnPS

Table 31.185 Register Reset Conditions

Register Name	Reset Condition			
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1
All registers	√	√	√	√

Each clock monitor (CLMA0/1/2/3) can also be reset by CLMATEST.RESCLM. In this case, it is necessary to perform a special procedure and reconfigure the CLMAn parameters before the clock frequency is changed by the register for the operating clock.

For details about this special procedure, see **Section 31.5.4.2**, **Reset Procedure Using CLMATEST.RESCLM**.

Table 31.186 Individual Reset Conditions

31.5.3.4 CLMAnCTL0 — CLMAn Control Register 0

This register enables the clock monitor CLMAn.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Protection

This register is write-protected; it can only be written by performing a special instruction sequence using the protection command register CLMAnPCMD. See **31.5.4.1, Write-Protected Registers** for details.

Access: These registers can be read/written in 8-bit units.

Address: <CLMAn_base> + 00_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAn CLME
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 31.187 CLMAnCTL0 Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	CLMAnCLME	Enables or disables the clock monitor: 0: Disables CLMAn. 1: Enables CLMAn. This bit can only be cleared by a reset

31.5.3.5 CLMAnCMPL — CLMAn Compare Register L

This register specifies the lower limit of monitored clock frequency.

Write access is permitted only when the CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: These registers can be read/written in 16-bit units.

Address: <CLMAn_base> + 08_H

Value after reset: 0001_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	CLMAnCMPL[11:0]

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11 to 0	CLMAnCMPL [11:0]	Specifies the lower threshold The recommended value is (fCLMATMON(min) × 16) / fCLMATSMP(max) –1 The minimum value is 0001_H

31.5.3.6 CLMAnCMPH — CLMAn Compare Register H

This register specifies the upper limit of monitored clock frequency.

Write access is permitted only when the CLMAn is disabled (CLMAnCTL0.CLMAnCLME = 0).

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: These registers can be read/written in 16-bit units.

Address: <CLMAn_base> + $0C_H$

Value after reset: $03FF_H$

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 31.189 CLMAnCMPH Register Contents

Bit Position	Bit Name	Function
15 to 12	Reserved	When read, the value after reset is read. When writing, write the value after reset.
11 to 0	CLMAnCMPH [11:0]	Specifies the upper threshold The recommended value is (fCLMATMON(max) × 16) / fCLMATSMP(min) +1 The minimum value is CLMAnCMPL + 0003_H.

31.5.3.7 CLMAnPCMD — CLMAn Protection Command Register

This register is a command register to protect the CLMAnCTL0 register from unintended write access. This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

NOTE

See **Section 31.5.4.1**, **Procedures to enable CLMAn** for the procedure.

Access: These registers can be written in 8-bit units.

Address: <CLMAn_base> + 10_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	CLMAnREG[7:0]							
Value after reset	0	0	0	0	0	0	0	0

Table 31.190 CLMAnPCMD Register Contents

Bit Position	Bit Name	Function
7 to 0	CLMAnREG [7:0]	Protection command that enables writing to write-protected register (CLMAnCTL0).

31.5.3.8 CLMAnPS — CLMAn Protection Status Register

This register is used to verify whether the write-protected register (CLMAnCTL0) has been successfully written or not.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: These registers can be read in 8-bit units.

Address: <CLMAn_base> + 14_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	CLMAn PRERR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 31.191 CLMAnPS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read.
0	CLMAnPRERR	Indicates whether the write-protected register (CLMAnCTL0) has been successfully written. 0: Write operation successful 1: Write operation failed

31.5.3.9 CLMATEST — CLMA Self-test Register

This register is used for the self-test of the clock monitors. Each Clock Monitor can be tested individually.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: These registers can be read/written in 32-bit units.

Address: <CLMAT_base> + 00_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.192 CLMATEST Register Contents

Bit Position	Bit Name	Function
31 to 7	Reserved	When read, the value after reset is read. When writing, write the value after reset.
6	CLMA3TESEN	CLMA3 self-test enable/disable 0: Test disabled. 1: Test enabled.
5	CLMA2TESEN	CLMA2 self-test enable/disable 0: Test disabled. 1: Test enabled.
4	CLMA1TESEN	CLMA1 self-test enable/disable 0: Test disabled. 1: Test enabled.
3	CLMA0TESEN	CLMA0 self-test enable/disable 0: Test disabled. 1: Test enabled.
2	ERRMSK*1	Masks an error notification to the ECM when CLMAn detects an error. When the ERRMSK is set for a certain CLMAn, the associated CLMAn does not issue an error notification to the ECM even if it detects an error. 0: Does not mask an error notification to the ECM. 1: Masks an error notification to the ECM.
1	MONCLKMSK*1	Fixes the level of the clock input to the CLMAn that should be monitored, to the low level. 0: Does not fix the clock input to the CLMAn that should be monitored to the low level. 1: Fixes the clock input to the CLMAn that should be monitored to the low level.
0	RESCLM*1	Initializes CLMAn forcibly. 0: Does not initialize CLMAn. 1: Initializes CLMAn.

Note 1. These bits are valid for CLMAn which is in self-diagnosis mode by setting “1” to CLMAnTESTEN.

NOTE

See **Section 31.5.4.2**, **Reset Procedure Using CLMATEST.RESCLM** for the individual reset procedure of each CLMAn.

31.5.3.10 CLMATESTS — CLMA Self-test Status Register

This register is used for the self-test of the clock monitors. It monitors the error detection flags which are otherwise forwarded to the ECM module. Once error is detected, this register keeps the status until CLMAn is reset.

This register is initialized by the Power On Reset, the System Resets 1 and 2, and the Application Reset 1.

Access: These registers can be read in 32-bit units.

Address: <CLMAT_base> + 04_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Table 31.193 CLMATESTS Register Contents

Bit Position	Bit Name	Function
31 to 4	Reserved	When read, the value after reset is read.
3	CLMA3ERRS	Indicate whether or not CLMAn have detected an error. These bits are not affected by CLMATEST.ERRMSK. 0: No error detected 1: Error detected
2	CLMA2ERRS	Indicate whether or not CLMAn have detected an error. These bits are not affected by CLMATEST.ERRMSK. 0: No error detected 1: Error detected
1	CLMA1ERRS	Indicate whether or not CLMAn have detected an error. These bits are not affected by CLMATEST.ERRMSK. 0: No error detected 1: Error detected
0	CLMA0ERRS	Indicate whether or not CLMAn have detected an error. These bits are not affected by CLMATEST.ERRMSK. 0: No error detected 1: Error detected

31.5.4 Operation

31.5.4.1 Write-Protected Registers

(1) Writing to Protected Registers

Writing to the CLMAnCTL0 register (n = 0 to 3) of each clock monitor is only possible with the protection unlock sequence described below.

Step 1. Write the fixed value (A5H) to the CLMAnPCMD register.

Step 2. Write the new setting to the CLMAnCTL0 register. Write the value after a reset to the reserved bits.

Step 3. Write the bitwise inverse of the setting value to the CLMAnCTL0 register. Write the inverse of the value after a reset to the reserved bits.

Step 4. Write the new setting to the CLMAnCTL0 register. Write the value after a reset to the reserved bits.

A value can only be written to a write-protected register by following the procedure above.

Protection is not unlocked if the procedure is not followed correctly, the setting is not written to the write-protected register, and the CLMAnPS.CLMAnPRERR bit is set to 1. (Although this is not a requirement, you can confirm if the values set in the targeted register was correctly written by checking that the setting of the CLMAnPS.CLMAnPRERR bit is 0 after step 4.)

In case of failure to follow the sequence, repeat the procedure from the beginning.

In case of writing to another register during steps 1 to 4 of the sequence, the protection function operates as follows. Operation is also as described when any interrupt is accepted during the sequence and the interrupt handling includes access to another register.

- When the writing is to another register in the same module, writing to the protected register fails and the CLMAnPS.CLMAnPRERR bit is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly

Reading of another register while the sequence is in progress does not lead to failure.

(2) Interrupt during Write Sequence

(1) If an interrupt request is accepted during the write sequence and write access to a register of the same module is made:

The write to the write protection target register fails and the error monitor bit is set to 1. **Figure 31.10** shows an execution example.

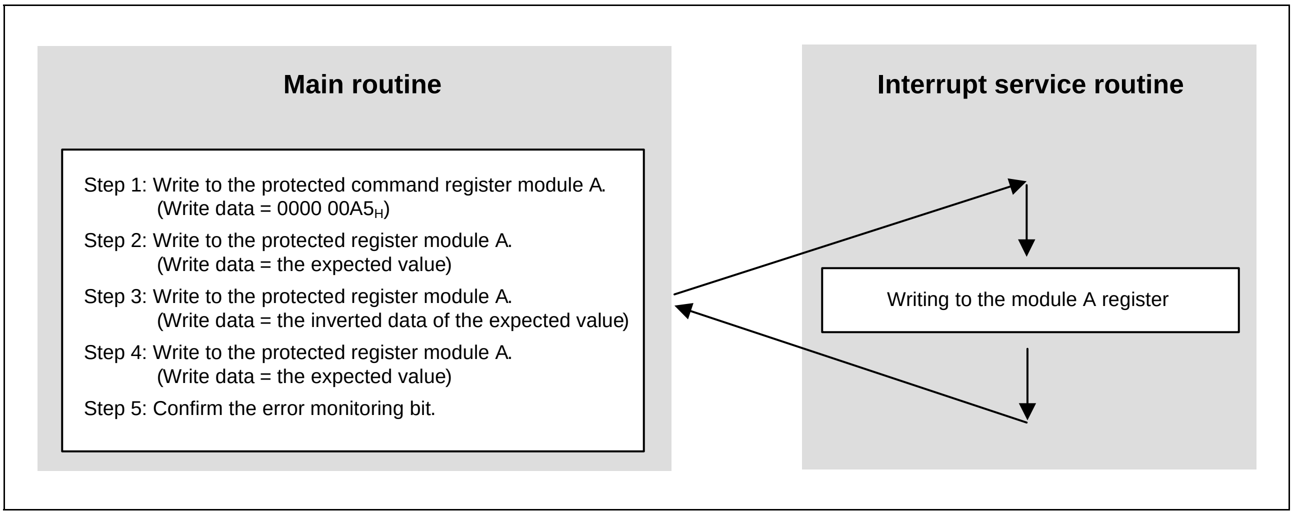

Figure 31.10 Example of Failed Write Sequence

(2) If an interrupt request is accepted during the write sequence and write access to a register of a different module is made.

The write to the write protection register can be completed successfully. **Figure 31.11** shows an execution example.

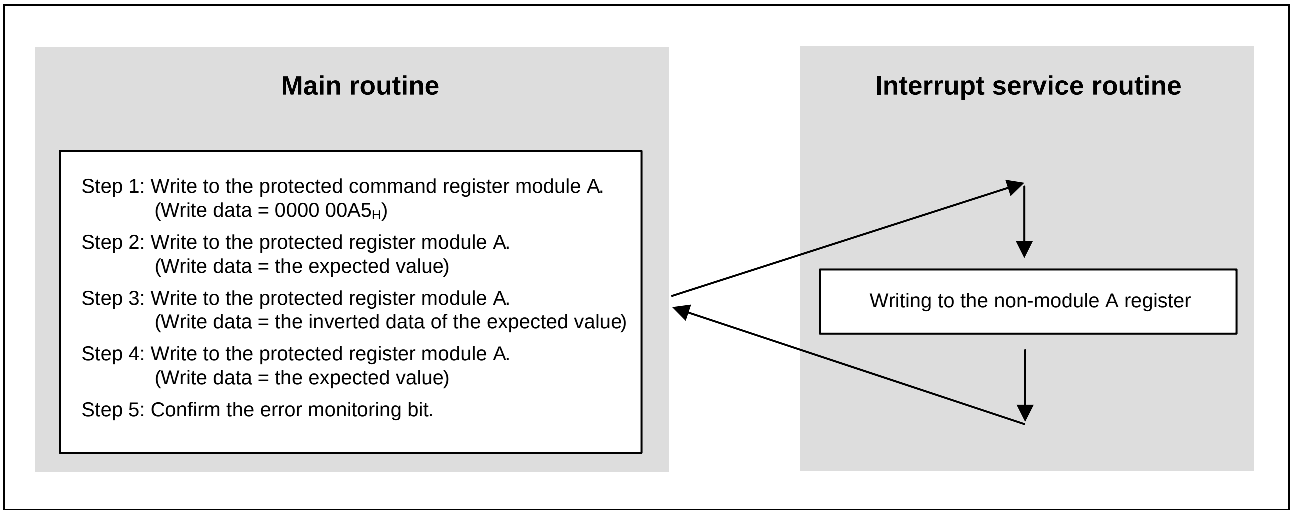

Figure 31.11 Example of Successful Write Sequence

(3) Emulation Break during Write Sequence

If an emulation break occurs during the above write sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed. Even if any register of the same module is accessed during the break, the write sequence is not suspended and the error monitor bit is not set to 1.

31.5.4.2 Reset Procedure Using CLMATEST.RESCLM

Each clock monitor (CLMA0/1/2/3) can also be reset by CLMATEST.RESCLM. In this case, it is necessary to perform the following procedure and reconfigure the CLMAn parameters before the clock frequency is changed by the register for the operating clock.

[Procedure]

Example: resetting CLMA0

1. CLMATEST.CLMA0TESEN = 1 (write data : 0000_0008$_H$)
2. CLMATEST.ERRMSK = 1 (write data : 0000_000C$_H$)
3. CLMATEST.MONCLKMSK = 1 (write data : 0000_000E$_H$)
4. CLMATEST.RESCLM = 1 (write data : 0000_000F$_H$)
5. CLMATEST.RESCLM = 0 (write data : 0000_000E$_H$)
6. CLMATEST.MONCLKMSK = 0 (write data : 0000_000C$_H$)
7. CLMATEST.ERRMSK = 0 (write data : 0000_0008$_H$)
8. CLMATEST.CLMA0TESEN = 0 (write data : 0000_0000$_H$)

31.6 BIST

This product incorporates the function to detect failures of the failure detection function itself, which is referred to as BIST. BIST execution results can be identified by the field BIST result register (BSEQ0ST).

31.6.1 List of Registers

Table 31.194 List of Registers

Address	Symbol	Register Name	R/W	Value after reset	Access Size
FFCD $A000_H$	LBISTREF1	Logic BIST reference value register 1	R	000A $5A5A_H$*1	32
FFCD $A004_H$	LBISTREF2	Logic BIST reference value register 2	R	0005 $A5A5_H$*1	32
FFCD $A008_H$	MBISTREF	Memory BIST reference value register	R	000A $A55A_H$*1	32
FFCD $A010_H$	LBISTSIG1	Logic BIST signature value register 1	R	0005 $A5A5_H$*1	32
FFCD $A014_H$	LBISTSIG2	Logic BIST signature value register 2	R	000A $5A5A_H$*1	32
FFCD $A018_H$	MBISTSIG	Memory BIST signature value register	R	0005 $5AA5_H$*1	32
FFCD $A020_H$	MBISTFTAGL	Memory BIST FTAG signature value register L	R	FFFF $FFFF_H$*1	32
FFCD $A024_H$	MBISTFTAGH	Memory BIST FTAG signature value register H	R	FFFF $FFFF_H$*1	32
FFCD $A030_H$	BSEQ0ST	BIST sequencer status register	R	0000 0001_H*1	32
FFCD $A034_H$	BSEQ0STB	BIST sequencer inverted status register	R	0000 0002_H*1	32
FFCD $A038_H$	BISTST	Field BIST Result register	R	0000 0007_H*1	32
FFF8 0200_H	BSEQ0CTL	Field BIST control register	R/W	0000 0001_H	32

Note 1. This register doesn't show the fixed value.

31.6.2 Details of Registers

(1) LBISTREF1 — Logic BIST Reference Value Register 1

This register indicates the reference value of the Logic BIST.

Access: LBISTREF1 can be read only in 32-bit units.

Address: FFCD $A000_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTREF1[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LBISTREF1[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.195 LBISTREF1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	LBISTREF1 [19:0]	Reference signature (expected signature)

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
It does not match the value of corresponding signature register.
[Application Reset 1]
The previous value is kept.

(2) LBISTREF2 — Logic BIST Reference Value Register 2

This register indicates the reference value of the Logic BIST.

Access: LBISTREF2 can be read only in 32-bit units.

Address: FFCD A004$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTREF2[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LBISTREF2[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.196 LBISTREF2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	LBISTREF2 [19:0]	Reference signature (expected signature)

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
It does not match the value of corresponding signature register.
[Application Reset 1]
The previous value is kept.

(3) MBISTREF — Memory BIST Reference Value Register

This register indicates the reference value of the Memory BIST.

Access: MBISTREF can be read only in 32-bit units.

Address: FFCD A008$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	MBISTREF[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MBISTREF[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.197 MBISTREF Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	MBISTREF [19:0]	Reference signature (expected signature)

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
It does not match the value of corresponding signature register.
[Application Reset 1]
The previous value is kept.

(4) LBISTSIG1 — Logic BIST Signature Value Register 1

This register indicates the signature value of the Logic BIST. Compare the reference signature of LBISTREF1 against the resulting signature of LBISTSIG1. The LBIST is passed if these are equal.

Access: LBISTSIG1 can be read only in 32-bit units.

Address: FFCD A010H

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTSIG1[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LBISTSIG1[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.198 LBISTSIG1 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	LBISTSIG1 [19:0]	LBIST1 signature result

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
It does not match the value of corresponding reference register.
[Application Reset 1]
The previous value is kept.

(5) LBISTSIG2 — Logic BIST Signature Value Register 2

This register indicates the signature value of the Logic BIST. Compare the reference signature of LBISTREF2 against the resulting signature of LBISTSIG2. The LBIST is passed if these are equal.

Access: LBISTSIG2 can be read only in 32-bit units.

Address: FFCD $A014_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	LBISTSIG2[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	LBISTSIG2[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.199 LBISTSIG2 Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	LBISTSIG2 [19:0]	LBIST2 signature result

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
It does not match the value of corresponding reference register.
[Application Reset 1]
The previous value is kept.

(6) MBISTSIG — Memory BIST Signature Value Register

This register indicates the signature value of the Memory BIST. Compare the reference signature of MBISTREF against the resulting signature of MBISTSIG. The MBIST is passed if these are equal.

Access: MBISTSIG can be read only in 32-bit units.

Address: FFCD $A018_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	MBISTSIG[19:16]			
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MBISTSIG[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.200 MBISTSIG Register Contents

Bit Position	Bit Name	Function
31 to 20	Reserved	When read, the value after reset is read.
19 to 0	MBISTSIG [19:0]	MBIST1 signature result

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
It does not match the value of corresponding reference register.
[Application Reset 1]
The previous value is kept.

(7) MBISTFTAGL — Memory BIST FTAG Signature Value Register L

This register indicates the Memory BIST status of each RAM group (bridge).

Access: MBISTFTAGL can be read only in 32-bit units.

Address: FFCD $A020_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MBISTFTAGL[31:16]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1

Table 31.201 MBISTFTAGL Register Contents

Bit Position	Bit Name	Function
31 to 0	MBISTFTAGL [31:0]	The state of self-diagnostic MBIST of Bridge No.n 0: MBIST status is PASS. 1: MBIST status is FAIL. Refer to **Table 31.202** for mapping of each RAM.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
This register shows $FFFFFFFF_H$.
[Application Reset 1]
The previous value is kept.

Table 31.202 Mapping of MBISTFTAGL Register (1/2)

Bit Position	Bit Name	Function
31 to 29	MBISTFTAGL [31:29]	Reserved bit
28	MBISTFTAGL [28]	The state of self-diagnostic MBIST of Trace RAM0 0: MBIST status is PASS 1: MBIST status is FAIL
27, 26	MBISTFTAGL [27:26]	Reserved bit
25	MBISTFTAGL [25]	The state of self-diagnostic MBIST of CAN RAM (AFL). 0: MBIST status is PASS. 1: MBIST status is FAIL.
24	MBISTFTAGL [24]	The state of self-diagnostic MBIST of CAN RAM (MB). 0: MBIST status is PASS. 1: MBIST status is FAIL.
23 to 21	MBISTFTAGL [23:21]	Reserved bit
20	MBISTFTAGL [20]	The state of self-diagnostic MBIST of CSIH RAM. 0: MBIST status is PASS. 1: MBIST status is FAIL.

Table 31.202 Mapping of MBISTFTAGL Register (2/2)

Bit Position	Bit Name	Function
19	MBISTFTAGL [19]	The state of self-diagnostic MBIST of FlexRay RAM (Temporary buffer RAM for FLX0). 0: MBIST status is PASS. 1: MBIST status is FAIL.
18	MBISTFTAGL [18]	The state of self-diagnostic MBIST of FlexRay RAM (Message RAM for FLX0). 0: MBIST status is PASS. 1: MBIST status is FAIL.
17	MBISTFTAGL [17]	Reserved bit
16	MBISTFTAGL [16]	The state of self-diagnostic MBIST of DTS RAM. 0: MBIST status is PASS. 1: MBIST status is FAIL.
15 to 9	MBISTFTAGL [15:9]	Reserved bit
8	MBISTFTAGL [8]	The state of self-diagnostic MBIST of Instruction cache RAM (data) (PE1). 0: MBIST status is PASS. 1: MBIST status is FAIL.
7	MBISTFTAGL [7]	The state of self-diagnostic MBIST of Instruction cache RAM (data) (PE1). 0: MBIST status is PASS. 1: MBIST status is FAIL.
6 to 3	MBISTFTAGL [6:3]	Reserved bit
2	MBISTFTAGL [2]	The state of self-diagnostic MBIST of Instruction cache RAM (tag) (PE1). 0: MBIST status is PASS. 1: MBIST status is FAIL.
1, 0	MBISTFTAGL [1:0]	Reserved bit

(8) MBISTFTAGH — Memory BIST FTAG Signature Value Register H

This register indicates the Memory BIST status of each RAM group (bridge).

Access: MBISTFTAGH can be read only in 32-bit units.

Address: FFCD $A024_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	MBISTFTAGH[31:16]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1

	MBISTFTAGH[15:0]															
Value after reset	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.203 MBISTFTAGH Register Contents

Bit Position	Bit Name	Function
31 to 0	MBISTFTAGH [31:0]	The state of self-diagnostic MBIST of Bridge No.n 0: MBIST status is PASS. 1: MBIST status is FAIL. Refer to **Table 31.204** for mapping of each RAM.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode (DCUTRST = 1)]
This register shows $FFFFFFFF_H$.
[Application Reset 1]
The previous value is kept.

Table 31.204 Mapping of MBISTFTAGH Register (1/3)

Bit Position	Bit Name	Function
31	MBISTFTAGH [31]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBF_0000_H to FEBF_$FFFC_H$ and the 4 bits of address LSB are 8_H or C_H. 0: MBIST status is PASS. 1: MBIST status is FAIL.
30	MBISTFTAGH [30]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBF_0000_H to FEBF_$FFFC_H$ and the 4 bits of address LSB are 0_H or 4_H. 0: MBIST status is PASS. 1: MBIST status is FAIL.
29	MBISTFTAGH [29]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBF_0000_H to FEBF_$FFFC_H$ and the 4 bits of address LSB are 8_H or C_H. 0: MBIST status is PASS. 1: MBIST status is FAIL.
28	MBISTFTAGH [28]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBF_0000_H to FEBF_$FFFC_H$ and the 4 bits of address LSB are 0_H or 4_H. 0: MBIST status is PASS. 1: MBIST status is FAIL.

Table 31.204 Mapping of MBISTFTAGH Register (2/3)

Bit Position	Bit Name	Function
27	MBISTFTAGH [27]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBE_0000$_H$ to FEBE_FFFC$_H$ and the 4 bits of address LSB are 8$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.
26	MBISTFTAGH [26]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBE_0000$_H$ to FEBE_FFFC$_H$ and the 4 bits of address LSB are 0$_H$ or 4$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.
25	MBISTFTAGH [25]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBE_0000$_H$ to FEBE_FFFC$_H$ and the 4 bits of address LSB are 8$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.
24	MBISTFTAGH [24]	The state of self-diagnostic MBIST of Local RAM(PE1) for which the address is in the range of FEBE_0000$_H$ to FEBE_FFFC$_H$ and the 4 bits of address LSB are 0$_H$ or 4$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL.
23 to 20	MBISTFTAGH [23:20]	Reserved bit
19	MBISTFTAGH [19]	The state of self-diagnostic MBIST of ERAM for which the address is in the range of F982_0000$_H$ to F982_1FFC$_H$ and the 4 bits of address LSB are 8$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
18	MBISTFTAGH [18]	The state of self-diagnostic MBIST of ERAM for which the address is in the range of F982_0000$_H$ to F982_1FFC$_H$ and the 4 bits of address LSB are 0$_H$ or 4$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
17	MBISTFTAGH [17]	The state of self-diagnostic MBIST of ERAM for which the address is in the range of F980_0000$_H$ to F980_1FFC$_H$ and the 4 bits of address LSB are 8$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
16	MBISTFTAGH [16]	The state of self-diagnostic MBIST of ERAM for which the address is in the range of F980_0000$_H$ to F980_1FFC$_H$ and the 4 bits of address LSB are 0$_H$ or 4$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
15 to 10	MBISTFTAGH [15:10]	Reserved bit
9	MBISTFTAGH [9]	The state of self-diagnostic MBIST of Global RAM for which the address is in the range of FEF0_0000$_H$ to FEF0_7FFC$_H$ and the 4 bits of address LSB are 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
8	MBISTFTAGH [8]	The state of self-diagnostic MBIST of Global RAM for which the address is in the range of FEF0_0000$_H$ to FEF0_7FFC$_H$ and the 4 bits of address LSB are 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
7	MBISTFTAGH [7]	The state of self-diagnostic MBIST of Global RAM for which the address is in the range of FEEF_8000$_H$ to FEEF_FFFC$_H$ and the 4 bits of address LSB are 4$_H$ or C$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL

Table 31.204 Mapping of MBISTFTAGH Register (3/3)

Bit Position	Bit Name	Function
6	MBISTFTAGH [6]	The state of self-diagnostic MBIST of Global RAM for which the address is in the range of FEEF_8000$_H$ to FEF0_FFFC$_H$ and the 4 bits of address LSB are 0$_H$ or 8$_H$. 0: MBIST status is PASS. 1: MBIST status is FAIL
5 to 0	MBISTFTAGH [5:0]	Reserved bit

(9) BSEQ0ST — BIST Sequencer Status Register

This register indicates the state of the BIST sequencer.

Access: BSEQ0ST can be read only in 32-bit units.

Address: FFCD A030$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BIST_RESULT [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.205 BSEQ0ST Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1, 0	BIST_RESULT [1:0]	10: The self-diagnostic BIST is normally ended. Other than above: The self-diagnostic BIST is abnormally ended, not completed, nor not started.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2]
This register shows 00000001$_H$.
[Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
This register shows 00000002$_H$.
[Application Reset 1]
The previous value is kept.

(10) BSEQ0STB— BIST Sequencer Inverted Status Register

This register indicates the inverted state of the BIST sequencer

Access: BSEQ0STB can be read only in 32-bit units.

Address: FFCD A034$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	BIST_RESULTB [1:0]	
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.206 BSEQ0STB Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When read, the value after reset is read.
1, 0	BIST_RESULTB [1:0]	Indicates the inverse of the BIST_RESULT[1:0] bits in the BSEQ0ST register.

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2]
This register shows 00000002$_H$.
[Debug mode ($\overline{\text{DCUTRST}}$ = 1)]
This register shows 00000001$_H$.
[Application Reset 1]
The previous value is kept.

(11) BISTST— Field BIST Result Register

This register indicates the result of the field BIST.

Access: BISTST can be read only in 32-bit units.

Address: FFCD A038$_H$

Value after reset: *1

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	MBISTST	LBIST2ST	LBIST1ST
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	*1	*1	*1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 31.207 BISTST Register Contents

Bit Position	Bit Name	Function
31 to 3	Reserved	When read, the value after reset is read.
2	MBISTST	0: MBIST passed successfully 1: MBIST has detected an error
1	LBIST2ST	0: LBIST2 passed successfully 1: LBIST2 has detected an error
0	LBIST1ST	0: LBIST1 passed successfully 1: LBIST1 has detected an error

Note 1. When the Field BIST is skipped, the value is shown as below.
[BSEQ0CTL.HWBISTEXE = 0 and System reset1 (Pin reset only)] or
[BSEQ0CTL.HWBISTEXE = 0 and System Reset 2] or [Debug mode (DCUTRST = 1)]
This register shows 00000007$_H$.
[Application Reset 1]
The previous value is kept.

(12) BSEQ0CTL — Field BIST Control Register

This register is used to control the field BIST.

Access: BSEQ0CTL can be read/written in 32-bit units.

Address: FFF8 0200_H

Value after reset: 0000 0001_H This register is reset by a Power On Reset or a System Reset 1 (CVM reset only)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	HWBISTEXE
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 31.208 BSEQ0CTL Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	HWBISTEXE	This bit controls whether to execute the Field BIST or not after System Reset 1 (except CVM reset) and System Reset 2. 0: Skip BIST 1: Execute BIST

31.6.3 Confirming Completion of BIST with no Abnormalities Detected

The registers listed below can be used to confirm the result of field BIST.

- Confirming matching of field BIST signatures
  The expected value stored in logic BIST signature register 1 or 2 or in the memory BIST signature register matching the value of the result stored in the logic BIST signature result register 1 or 2 or in the memory BIST signature result register indicates that no abnormalities were detected by field BIST.

  LBISTREF1 = LBISTSIG1
  LBISTREF2 = LBISTSIG2
  MBISTREF = MBISTSIG

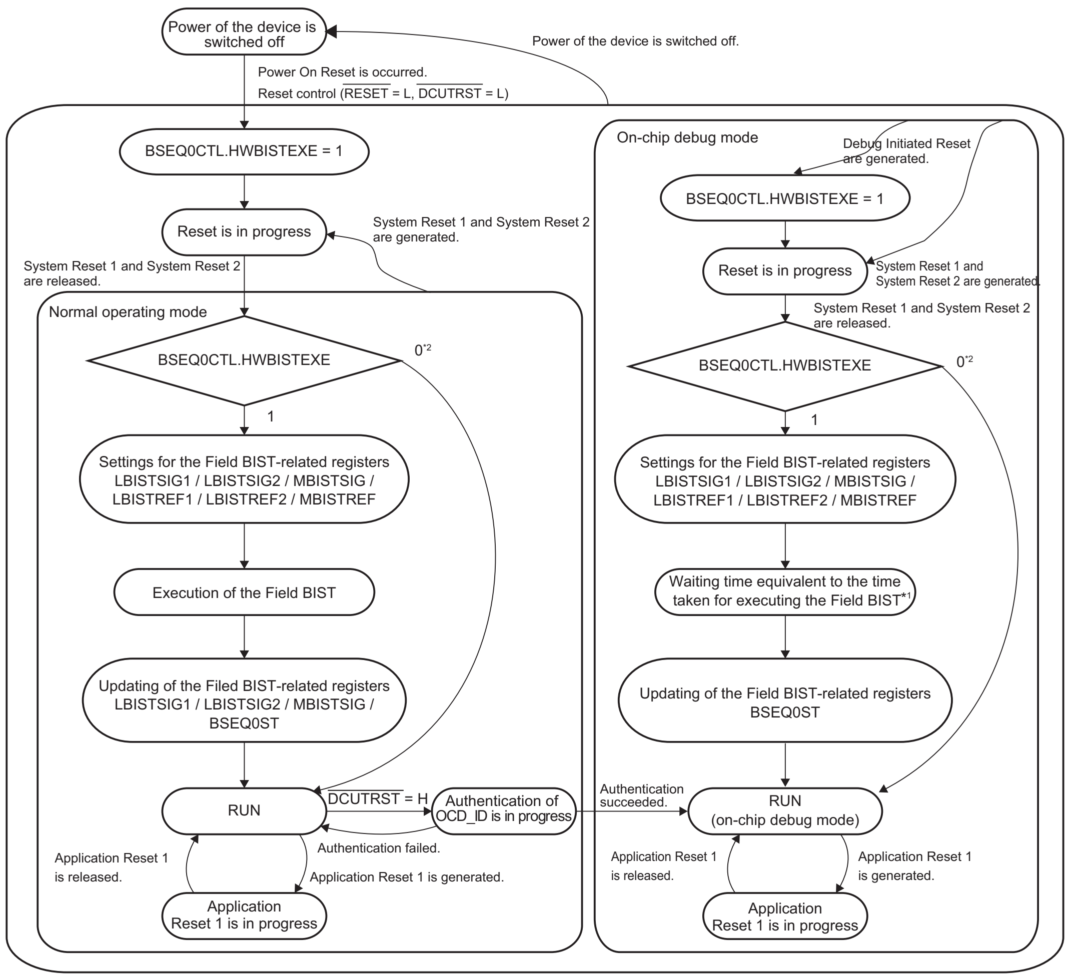
- Confirming the error status
  Use the BIST error status register to confirm that the BIST sequence has been completed without detecting abnormalities. The BSEQ0STB register value indicates the inverse of the BSEQ0ST register value.

  BSEQ0ST = 0000 0002_H

- Debug mode:
  In debug mode ($\overline{\text{DCUTRST}}$ = H), expected values are not stored in the LBISTREF1, LBISTREF2 and MBISTREF registers, and results are not stored in the LBISTSIG1, LBISTSIG2, and MBISTSIG registers. Design the program to judge the result of field BIST from the value of $\overline{\text{DCUTRST}}$ (JP0_4) pin.

31.6.4 State Transition of Field BIST

The following chart shows the state transition of the Field BIST.



Note 1. A waiting time equivalent to the time taken for executing the Field BIST is inserted.

Note 2. When System Reset 1 occurred by CVM reset, Field BIST is executed regardless of the HWBISTEXE setting.

Figure 31.12 State Transition of Field BIST

31.6.5 Note

In this device, when executing the Field BIST, test code is read at the beginning of the program. If ECC 1-bit error or ECC 2-bit error is detected during reading of the test code, the error is notified to ECM. For details, see **Table 32.9, List of Error Inputs**. Field BIST is executed at the time of ECC error occurrence, but MCU does not move to normal operation. When ECC 1-bit error detected, the MCU does not correct ECC error.

31.7 ECM

The ECM monitors various failure detection states in the LSI chip, and defines the operation to be carried out upon failure detection. For the details of the ECM, refer to **Section 32, Error Control Module (ECM)**.

31.8 CVM

The core voltage monitor (CVM) detects over and under voltage of the core voltage. For the details of the CVM, refer to **Section 10, Core Voltage Monitor**.

31.9 WDTA

The window watchdog timer (WDTA) detects deadlock of CPU operation. For the details of the WDTA, refer to **Section 21, Window Watchdog Timer A (WDTA)**.

31.10 DCRA

The Data CRC Function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths. For the details of the DCRA, refer to **Section 33, Data CRC Function A (DCRA)**.

Section 32 Error Control Module (ECM)

32.1 Features of RH850/P1M-E ECM

32.1.1 Units

This microcontroller has the following number of ECM units.

Each ECM unit has one channel interface.

Table 32.1 Unit Configurations and Channels

Unit Name (Channel Name) ECM	Channels per Unit
ECM	1

Table 32.2 Index

Index	Meaning
m	Throughout this section, the individual ECM Master and ECM Checker are identified by the index “m” (m = M, C): for example, ECMmEST bit is the ECM m Error set trigger bit.

32.1.2 Register Base Address

ECM base addresses are listed in the following table.

ECM register addresses are given as offsets from the base addresses in general.

Table 32.3 Register Base Address

Base Address	Name Base Address
<ECMM_base>	FFD6 0000_H
<ECMC_base>	FFD6 1000_H
<ECM_base>	FFD6 2000_H

32.1.3 Clock Supply

Clock supply by and to ECM is listed in the following table.

Table 32.4 Clock Supply

Unit Name	Clock port	Explanation	Specification	
			Clock name	Symbol
ECM	PCLK	Peripheral Bus clock.	High speed peripheral clock	CLK_HSB
	cntclk	Delay timer/Error clear mask timer clock 4 MHz,1/2 the frequency of CLK_IOSC.	Delay Timer Clock	CLK_IOSC2

32.1.4 Interrupt Requests

ECM interrupt requests are listed in the following table. The interrupt request signal is driven to the high level with a pulse width of one PCLK cycle when error source status whose interrupt generation is enabled is set.

Table 32.5 Interrupt Requests

Unit Interrupt Name	Description	Interrupt Number
INTECM	ECM maskable interrupt (EI level)	8
INTECMNMI	ECM non-maskable interrupt	FENMI

32.1.5 External Output Signals

External output signals of ECM are listed below.

Table 32.6 External Output Signals

Unit Signal Name	Description	Alternative port pin signal
$\overline{\text{ERROROUT}}$	$\overline{\text{ERROROUT}}$ mode can be selected out of two modes: 1. ERROROUT from ECM master is singly output to the ERROROUT pin 2. Logical AND of ERROROUT from ECM master and ERROROUT_C from ECM checker is output to the ERROROUT pin.	$\overline{\text{ERROROUT}}$
$\overline{\text{ERROROUT\_C}}$	Error output signal from ECM checker	$\overline{\text{ERROROUT\_C}}$

32.2 Overview

32.2.1 Specification Overview

ECM (Error Control Module) collects error signals coming from various error sources and monitoring circuits. It also outputs error signals from the error pins ($\overline{\text{ERROROUT}}$ and $\overline{\text{ERROROUT\_C}}$) and generates interrupts and Error Control Module Reset signals. **Table 32.7** shows the specification overview of ECM.

Table 32.7 Specification Overview

Item	Description
Safety processing	ECM can handle the following processing in response to error signal inputs from individual modules. • Error flag set • EI level interrupt generation EI level interrupt generation can be controlled (enabled/disabled) for individual errors. • Non-maskable interrupt generation Non-maskable interrupt generation can be controlled (enabled/disabled) for individual errors. • Internal reset generation Error Control Module Reset signals can be controlled (enabled/disabled) for individual errors. • Error pin outputs Pin output masks can be controlled (enabled/disabled) for individual errors. Outputs can be toggled in response to a timer input or made at a fixed level.
Error status	ECM incorporates error source status registers, which can be used to confirm the error status from the error flag. The error flags are only cleared by software or a power on reset. In case of resets other than power on reset, the error flags are kept and the reset generation source can be confirmed by reading the status register after reset.
Debug, self-diagnosis	• Pseudo errors can be generated for debug and self-diagnosis. The operation in response to the injection of pseudo errors is identical to that for the occurrence of real errors. All configurations for the masking of error pin output, interrupt, or Error Control Module Reset apply in the same way. • ECM incorporates a loop-back function of the error pin outputs that are used to diagnose the paths to the error output pins. The status of the error output pins is reflected to internal registers and can be confirmed by reading the registers.
Timeout function	ECM incorporates a function that generates error signals output(s) or Error Control Module Reset when the count value of the delay timer matches with the delay timer compare register because the delay timer was not stopped during the interrupt processing after being started simultaneously with the occurrence of an interrupt request. If another error by which the delay timer is to be started occurs while the delay timer is running, the current value counted by the delay timer is not reset but the timer continues to run. An ECM reset is generated if the counter overflows before counting by the delay timer is stopped.
Register protection	A write-protection with Protection Unlock Sequence is incorporated to protect registers from illegal write access.
$\overline{\text{ERROROUT}}$ and $\overline{\text{ERROROUT\_C}}$ clear masking	ECM incorporates a function that can mask software clearance of $\overline{\text{ERROROUT}}$ and $\overline{\text{ERROROUT\_C}}$ until the counter which is started from error occurrence reaches the value specified in the Error Output Clear Invalidation Configuration register. If another error occurs during time counting, then the time count is reset and restarted from 0.
Others	ECM is duplexed. ECM incorporates the error output pins. The ERROROUT outputs from the ECM master and ECM checker are constantly compared. If they do not match, an ECM compare error (error source 92) occurs.

32.2.2 Flash Option

Table 32.8 Flash Option

Flash Option	Function	Description	Option Byte
ERROUTSEL	ERROROUT Mode setting	Specifies the ERROROUT mode settings: 0: ERROROUT from ECM master is singly output to ERROROUT pin. 1: Logical AND of ERROROUT from ECM master and ERROROUT_C from ECM checker is output to ERROROUT pin.	OPBT0.OPBT0[1]

32.3 Block Diagram

ECM is redundantly implemented using ECM Master and ECM Checker. The ERROROUT signal to PIC1 is not toggled, even if the ECM is set for dynamic mode. See **Figure 32.1, Connection between ECM Master, ECM Checker and Peripherals**.

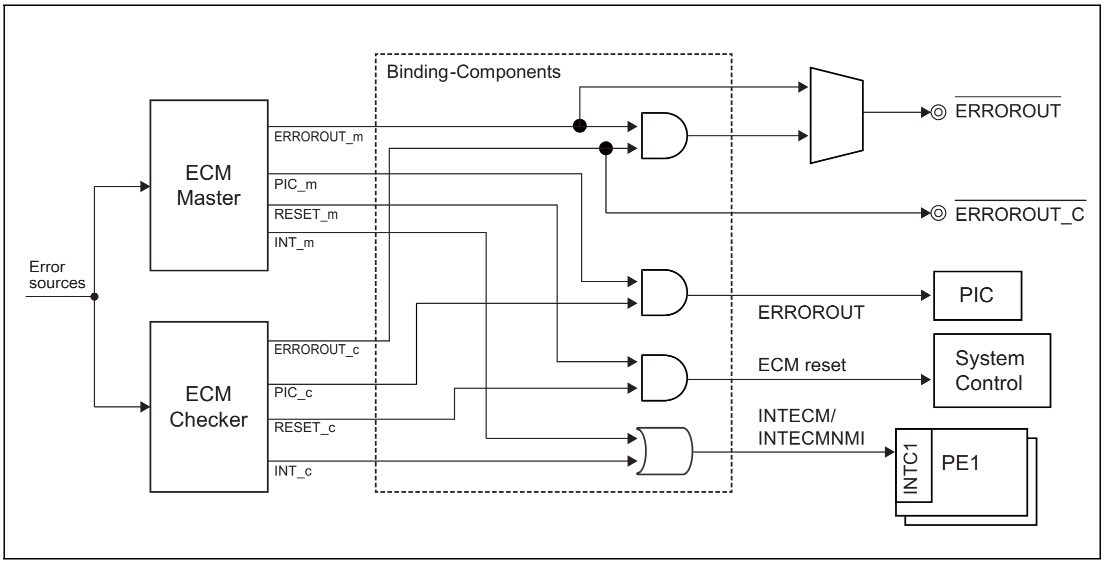


Figure 32.1 Connection between ECM Master, ECM Checker and Peripherals

32.3.1 Error Input

Table 32.9 shows the error inputs to ECM of RH850/P1M-E.

Table 32.9 List of Error Inputs (1/4)

No.	Error sources	Module	Comment
0	Window watchdog timer error	WDTA	Occurs when WDTA detects an error. (For details, see **Section 21.5.3, WDTA Error Detection**.)
1	DCLS compare error	CPU	Occurs when outputs of the CPU master core and checker core mismatch (Lock Step).
2	PFSS compare error • DMA • GRAM Controller	DMA/GRAM controller	• Occurs when outputs of the redundant DMA mismatch (Lock Step). • Occurs when outputs of the redundant function blocks in GRAM controller mismatch.
3	Bus bridge error	System Interconnect / Code Flash Interface / GRAM Interface / P-Bus	Occurs when abnormal arbitration detected in bus arbiter.
4	Compare error of functional block with redundancy	System Interconnect / Code Flash Interface / GRAM Interface / P-Bus	• Occurs when the ECC decoder for internal bus detected ECC error output mismatch. • Occurs when the address parity checker detected parity error output mismatch. • Occurs when the comparator for lock step function detected compare error output mismatch.
5	Reserved	—	—
6	Temperature sensor error (over/under temp. detection)	TSN0	Occurs when the temperature sensor detects an abnormal temperature error. (For details, see **Section 11, Temperature Sensor**.)
7	Reserved	—	—

Table 32.9 List of Error Inputs (2/4)

No.	Error sources	Module	Comment
8	Clock monitor upper-limit error for Main OSC	CLMA	Occurs when the clock monitor detects abnormal frequency of the targeted clock. (For details, see **Section 31.5, Clock Monitor (CLMA)**.)
9	Clock monitor lower-limit error for Main OSC		
10	Clock monitor upper-limit error for WDTA count clock		
11	Clock monitor lower-limit error for WDTA count clock		
12	Clock monitor upper-limit error for Peripheral clock		
13	Clock monitor lower-limit error for peripheral clock		
14	Clock monitor upper-limit error for PE1 checker core clock		
15	Clock monitor lower-limit error for PE1 checker core clock		
16	Local RAM ECC • uncorrectable error	Local RAM	Occurs when local RAM ECC decoder detects a data ECC 2-bit error.
17	Global RAM ECC • uncorrectable error	Global RAM	Occurs when global RAM ECC decoder detects a data ECC 2-bit error or an address ECC 2-bit error.
18	Instruction Cache RAM EDC • uncorrectable error	Instruction Cache RAM	Occurs when instruction cashe RAM EDC decoder detects a data 1-bit EDC error or a data EDC 2-bit error.
19	Code Flash ECC/address parity error • uncorrectable error and address parity error	Code Flash	Occurs when code flash ECC decoder detects a data ECC 2-bit or address parity error.
20	Data Flash ECC • uncorrectable error	Data Flash	Occurs when data flash ECC decoder detects a data ECC 2-bit error.
21	Peripheral (CSIH:SPI) RAM ECC • uncorrectable error	CSIH	Occurs when data is read from CSIH RAM and if a data ECC 2-bit error is detected.
22	Peripheral (RS-CANFD) RAM ECC • uncorrectable error	RS-CANFD	Occurs when data is read from RS-CANFD RAM and if a data ECC 2-bit error is detected.
23	Reserved	—	—
24	Peripheral (FlexRay) RAM ECC • uncorrectable error	FLXA	Occurs when data is read from FlexRay RAM and if a data ECC 2-bit error is detected.
25	Reserved	—	—
26	Reserved	—	—
27	Reserved	—	—
28	Bus ECC error: DED	System Interconnect / P-Bus	Occurs when a data ECC 2-bit error or an address ECC 2-bit error is detected in ECC decoder for the data transfer path.
29	Bus ECC error: SED	System Interconnect / P-Bus	Occurs when a data ECC 1-bit error or an address ECC 1-bit error is detected in ECC decoder for the data transfer path.
30	Reserved	—	—
31	Reserved	—	—
32	Local RAM error address overflow	Local RAM	Occurs when a address overflow error for the local RAM data ECC 1-bit error is detected.
33	Global RAM error address overflow	Global RAM	Occurs when a address overflow error for the global RAM data ECC 1-bit error is detected.
34	Reserved	—	—
35	Code Flash ECC error address overflow	Code Flash	Occurs when a address overflow error for the code flash data ECC 1-bit error is detected.

Table 32.9 List of Error Inputs (3/4)

No.	Error sources	Module	Comment
36	Data Flash ECC error address overflow	Data Flash	Occurs when a address overflow error for the code flash data ECC error is detected.
37	Peripheral RAM ECC error address overflow	CSIH/RS-CANFD/ FLXA	Occurs when a address overflow error for the CSIH/RS-CANFD/FLXA RAM data ECC error is detected.
38	Reserved	—	—
39	Reserved	—	—
40	DTSRAM ECC • uncorrectable error	DTS	Occurs when data is read from DTS RAM and if a data ECC 2-bit error is detected.
41	DTSRAM ECC • correctable error*1	DTS	Occurs when data is read from DTS RAM and if a data ECC 1-bit error is detected.
42	Reserved	—	—
43	Reserved	—	—
44	Reserved	—	—
45	Reserved	—	—
46	Reserved	—	—
47	Reserved	—	—

76	Reserved	—	—
77	Reserved	—	—
78	Reserved	—	—
79	Reserved	—	—
80	DMA transfer error	DMA	Occurs when a DMA transfer error is detected. (For details, see **Section 7.5.2, DMA Transfer Error**.)
81	DMA illegal access error	DMA	Occurs when register access protection function in DMA detects an illegal access. (For details, see **Section 7.6, Reliability Function**.)
82	Flash • Flash sequencer error	Flash	Occurs when code flash or data flash illegal access detected. (For details, *Flash Memory Users Manual Section 4.2 Flash Access Status Register (FASTAT)*, *4.3Flash Access Error Interrupt Enable Register (FAEINT)*.)
83	Flash • ECC correctable/uncorrectable errors during FACI reset • ECC correctable/uncorrectable errors of the BIST code	Flash	Occurs when a FACI reset transfer error or ECC error of BIST code is detected. (About a FACI reset transfer error, *Flash Memory Users Manual Section 4.12 FACI Reset Transfer Status Register (FRTSTAT)*, *4.13 FACI Reset Transfer Error Interrupt Enable Register (FRTEINT)*.)
84	A/D Converter parity error	ADCG	Occurs when ADCA detects a parity error. (For details, **Section 30.4.5.2, A/D Error Interrupt Request and A/D Parity Error Interrupt Request**.)
85	Reserved	—	—
86	Reserved	—	—
87	Reserved	—	—
88	Mode error • Unintended deactivation of user mode	Operating Mode	Occurs at an unintentional disabling of normal operating mode while normal operating mode is set (FLMD0 = 0).
89	Mode error • Unintended activation of Code Flash Programming mode	Operating Mode	Occurs at an unintentional transition to serial programming mode while normal operating mode is set (FLMD0 = 0).
90	Mode error • Unintended Debug Enable detection	Operating Mode	Occurs at an unintentional transition to debug mode while normal operating mode is set (FLMD0 = 0).
91	FieldBIST executed*2 or following mode error • Unintended activation of Test Mode	Operating Mode	• Occurs at an unintentional transition to production test mode while normal operating mode is set (FLMD0 = 0). • Occurs when Field BIST operation is ended.
92	ECM compare error	ECM	Occurs when $\overline{\text{ERROROUT}}$ output of the ECM master and ECM checker mismatched.

Note 1. Even if correction is disabled, single bit errors are still reported as correctable errors to the ECM.
Note 2. Even when Field BIST operation has normally ended, an error is notified error to ECM.

32.3.2 Operations for Error Output

After reset release, the ERROROUT pin and ERROROUT_C pin output the low (error) level. Follow the procedure described in **Section 32.4.3, ECMmECLR — ECM Master/Checker Error Clear Trigger Register (m = M/C)** , to clear the error before using ECM.

The error output can be configured for two different modes of operation, non-dynamic or dynamic.

Table 32.10 ERROROUT Output Operation

Error Status ECMmSSE031 to ECMmSSE000 ECMmSSE131 to ECMmSSE100 ECMmSSE230 to ECMmSSE200	Operating Mode ECMSL0 Bit	Error Output Operating Mode	Error Output Level	Error Status
0	0	Non-dynamic	H	No error
	1	Dynamic	Toggles (according to timer input)	No error
1	0	Non-dynamic	L	Error
	1	Dynamic	L	Error

32.3.3 ERROROUT behavior at reset

The following table explains the behavior of the error output logic, the ERROROUT pin and the ERROROUT_C pin at reset. Also the level of the ERROROUT signal and the ERROROUT_C signal during and after reset are explained.

Table 32.11 ERROROUT and ERROROUT_C behavior at reset

Category	Reset signal for initialize			
	Power On Reset	System Reset 1	System Reset 2	Application Reset 1
ERROROUT pin level during reset	Hi-Z	Hi-Z*1	Low level	No effect
ERROROUT pin level after reset	Low level	Low level	Low level	Level according to error status before reset
ERROROUT_C pin level during reset	Hi-Z (GPIO)	Hi-Z (GPIO)	Hi-Z (GPIO)	Hi-Z (GPIO)
ERROROUT_C pin level after reset	Hi-Z (GPIO)	Hi-Z (GPIO)	Hi-Z (GPIO)	Hi-Z (GPIO)

Note 1. In case of the debugger disconnect reset, the ERROROUT pin outputs a low level signal during reset.

32.3.3.1 Enabling Dynamic Mode

1. Select the timer output by the ECMEPCTL register (see **Section 32.4.40, ECMEPCTL — ECM Error Pulse Control Register**).
2. Initialize channel 15 in TAUD1 or OSTM1.
3. Set the ERROROUT output, and ERROROUT_C if used, to normal outputs by setting the ECMmECT (m = M/C) bit in the ECM master/checker error clear trigger register to 1.

4. Set the ECMSL0 bit in the ECM error pulse configuration register to 1 for dynamic mode.
5. Start up channel 15 in TAUD1 or OSTM1.

32.3.3.2 Disabling Dynamic Mode

1. Set the ERROROUT output, and ERROROUT_C output if used, to low level by setting the ECMmEST bit (m = M/C) in the ECM master/checker error set trigger register to 1.
2. Stop channel 15 in TAUD1 or OSTM1.
3. Clear the ECMSL0 bit in the ECM error pulse configuration register to 0 to specify non-dynamic mode.

32.3.4 Error Status

The error status is indicated by ECM master/checker error source status register 0 and ECM master/checker error source status register 1 and ECM master/checker error source status register 2. The error status is only cleared by ECM Error Source Status Clear Trigger Registers or a power on reset. In case of resets other than power on reset, the error status is kept and the error that triggered the reset can be confirmed by reading the ECM master/checker error source status register 0 and ECM master/checker error source status register 1 and ECM master/checker error source status register 2 after reset release.

32.3.5 Writing to Protected Registers

Write protected registers are protected from inadvertent write access due to erroneous program execution, etc. An overview of the related registers is shown in **Section 32.4, Register Specification**, Overview of ECM Registers.

32.3.5.1 Protection Unlock Sequence

Write access to a write protected register is only possible within a special Protection Unlock Sequence.

1. Write the fixed value 0000 $00A5_H$ to the protection command registers ECMPCMD1 or ECMmPCMD0.
2. Write the desired value to the registers protected by ECMPCMD1 or ECMmPCMD0.
3. Write the bit-wise inversion of desired value to the registers protected by ECMPCMD1 or ECMmPCMD0.
4. Write the desired value to the registers protected by ECMPCMD1 or ECMmPCMD0.

NOTE

Confirm successful write of the desired value to the protected register by checking that ECMPS.ECMPRERR = 0.

If an access is made to another register between step 1 to step 4 of the above sequence, the protection mechanism behaves as follows:

- When the writing is to another register in the same module, writing to the protected register fails and the EMCPS.ECMPRERR bit is set to 1.
- When writing is to a register in another module, writing to the protected register will successfully proceed to completion, if the remainder of the procedure is followed correctly.

Reading of another register while the sequence is in progress does not lead to failure.

NOTE

For sequences of ECMPCMD1 and ECMmPCMD0 registers, the status of the Protection Unlock Sequence is commonly indicated by the ECMPS.ECMPRERR flag. Therefore, it is recommended not to interleave multiple Protection Unlock Sequences of ECMPCMD1 and ECMmPCMD0.

32.3.5.2 Interrupt during Write Sequence

If an interrupt is generated during the write sequence, the protection mechanism operates as follows:

(1) If an interrupt request is accepted during the write sequence and write access to a register of the same module is made:

The write to the write protection target register fails, and the error monitor bit is set to 1. **Figure 32.2** shows an execution example.

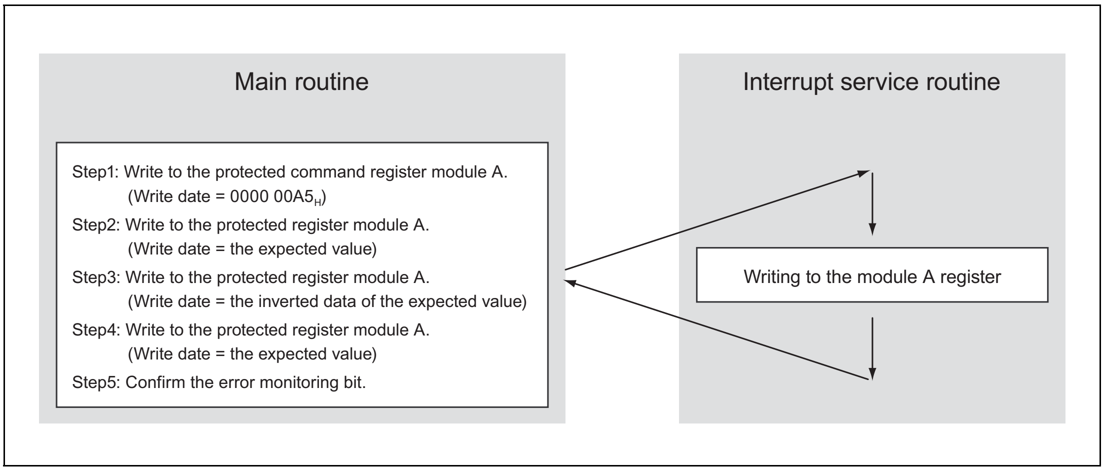

Figure 32.2 Example of Failed Write Sequence

(2) If an interrupt request is accepted during the write sequence and write access to a register of a different module is made.

The write to the write protection register can be completed successfully. **Figure 32.3** shows an execution example.

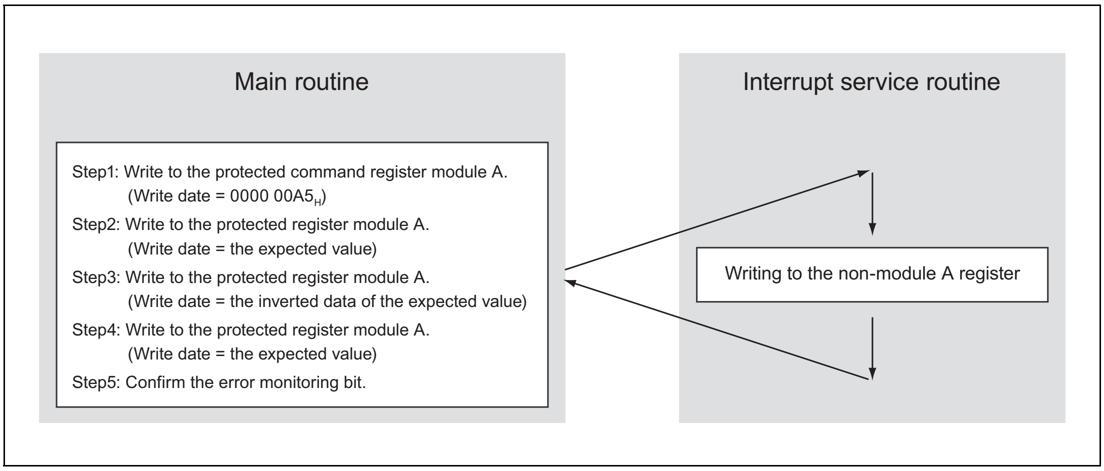

Figure 32.3 Example of Successful Write Sequence

32.3.5.3 Emulation Break during Write Sequence

If an emulation break occurs during the above write sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed. Even if any register of the same module is accessed during the break, the write sequence is not suspended and the error monitor bit is not set to 1.

32.3.6 Timeout Function for Interrupt Processing

The delay timer incorporated in ECM can be started simultaneously with the occurrence of an interrupt request. ECM incorporates a function that generates an error signal output or Error Control Module Reset when the count value of the delay timer matches with the value of the delay timer compare register because the delay timer was not stopped during the interrupt processing. The timer counting is not stopped when a break occurs.

The counting of the delay timer always starts from 0. Configure the duration until an Error Control Module Reset or error output is generated with the settings of the delay timer compare register.

Do not set the delay timer for clock monitor upper limit/lower limit errors (Error No.8 to 15).

32.3.7 Configuration lock

The following configuration registers in ECM are protected by Protection Unlock Sequence and slave guard.

- Error Set Trigger Register (**Section 32.4.2**)
- Error Clear Trigger Register (**Section 32.4.3**)
- Error Pulse Configuration Register (**Section 32.4.8**)
- Interrupt configuration Register (**Section 32.4.9**, **Section 32.4.10**, **Section 32.4.11**, **Section 32.4.12**, **Section 32.4.13**, **Section 32.4.14**)
- Internal Reset configuration Register (**Section 32.4.15**, **Section 32.4.15**, **Section 32.4.17**)
- Error Mask Register (**Section 32.4.18**, **Section 32.4.19**, **Section 32.4.20**)
- Error Source Status Clear Trigger Register (**Section 32.4.21**, **Section 32.4.22**, **Section 32.4.23**)
- Pseudo Error Trigger Register (**Section 32.4.26**, **Section 32.4.27**, **Section 32.4.28**)
- Delay Timer Control Register (**Section 32.4.29**)
- Delay Timer Compare Register (**Section 32.4.31**)
- Delay Timer Configuration Register (**Section 32.4.32**, **Section 32.4.33**, **Section 32.4.34**, **Section 32.4.35**, **Section 32.4.36**, **Section 32.4.37**)
- Error Output Clear Invalidation Configuration Register (**Section 32.4.38**)

The detail of Protection Unlock Sequence is described in **Section 32.3.5, Writing to Protected Registers**.

Slave guard is described in **Section 31, Functional Safety**.

32.3.8 Masking of error clear trigger registers

The active error output status must be cleared by software via the Error clear trigger registers (ECMMECLR/ECMCECLR). A minimum activation time of the error output is achieved by the Error output clear invalidation counter. This counter is (re)started each time a new error event is triggered at the ECM. It counts up from 0000_H to $FFFF_H$. Error output clear by software is not possible unless this counter reaches the compare value configured in the ECMEOCCFG register. If Error output clear invalidation counter is still running, Error output clear is masked and Error output clear request by software is ignored.

32.4 Register Specification

32.4.1 List of Registers

ECM consists of three address areas: common part, ECM master, and ECM checker.

The following shows the register map of the ECM master and checker registers.

Table 32.12 Address List of ECM Master and Checker Registers

Address	Register Symbol	Register Name	R/W	Access Width	Value after reset	Protection Registers	
						Command Register	Status Register
ECM Master Registers						**<ECMM_base: FFD6 0000_H>**	
<ECMM_base>	ECMMESET	ECM master error set trigger register	W	8	00_H	ECMMPCMD0	ECMPS
<ECMM_base> + 04_H	ECMMECLR	ECM master error clear trigger register	W	8	00_H	ECMMPCMD0	ECMPS
<ECMM_base> + 08_H	ECMMESSTR0	ECM master error source status register 0	R	32	0000 0000_H	—	—
<ECMM_base> + $0C_H$	ECMMESSTR1	ECM master error source status register 1	R	32	0000 0000_H	—	—
<ECMM_base> + 10_H	ECMMESSTR2	ECM master error source status register 2	R	32	0000 0000_H	—	—
<ECMM_base> + 14_H	ECMMPCMD0	ECM master protection command register	W	32	Undefined	—	—
ECM Checker Registers						**<ECMC_base: FFD6 1000_H>**	
<ECMC_base>	ECMCESET	ECM checker error set trigger register	W	8	00_H	ECMCPCMD0	ECMPS
<ECMC_base> + 04_H	ECMCECLR	ECM checker error clear trigger register	W	8	00_H	ECMCPCMD0	ECMPS
<ECMC_base> + 08_H	ECMCESSTR0	ECM checker error source status register 0	R	32	0000 0000_H	—	—
<ECMC_base> + $0C_H$	ECMCESSTR1	ECM checker error source status register 1	R	32	0000 0000_H	—	—
<ECMC_base> + 10_H	ECMCESSTR2	ECM checker error source status register 2	R	32	0000 0000_H	—	—
<ECMC_base> + 14_H	ECMCPCMD0	ECM checker protection command register	W	32	Undefined	—	—

The following shows the register map of the ECM common part.

Table 32.13 Address List of ECM Common Registers (1/2)

<ECM_base: FFD6 2000$_H$>

Address	Register Symbol	Register Name	R/W	Access Width	Value after reset	Protection Registers	
						Command Register	Status Register
<ECM_base>	ECMEPCFG	ECM error pulse configuration register	R/W	8	00$_H$	ECMPCMD1	ECMPS

<ECM_base> + 48$_H$	ECMPE0	ECM pseudo error trigger register 0	W	32	0000 0000$_H$	ECMPCMD1	ECMPS
<ECM_base> + 4C$_H$	ECMPE1	ECM pseudo error trigger register 1	W	32	0000 0000$_H$	ECMPCMD1	ECMPS
<ECM_base> + 50$_H$	ECMPE2	ECM pseudo error trigger register 2	W	32	0000 0000$_H$	ECMPCMD1	ECMPS
<ECM_base> + 54$_H$	ECMDTMCTL	ECM delay timer control register	R/W	8	00$_H$	ECMPCMD1	ECMPS
<ECM_base> + 58$_H$	ECMDTMR	ECM delay timer register	R	16	0000$_H$	—	—
<ECM_base> + 5C$_H$	ECMDTMCMP	ECM delay timer compare register	R/W	32	0000 0000$_H$	ECMPCMD1	ECMPS

Table 32.13 Address List of ECM Common Registers (2/2)

<ECM_base: FFD6 2000_H>

Address	Register Symbol	Register Name	R/W	Access Width	Value after reset	Protection Registers	
						Command Register	Status Register
<ECM_base> + 60_H	ECMDTMCFG0	ECM delay timer configuration register 0	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + 64_H	ECMDTMCFG1	ECM delay timer configuration register 1	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + 68_H	ECMDTMCFG2	ECM delay timer configuration register 2	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + $6C_H$	ECMDTMCFG3	ECM delay timer configuration register 3	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + 70_H	ECMDTMCFG4	ECM delay timer configuration register 4	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + 74_H	ECMDTMCFG5	ECM delay timer configuration register 5	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + 78_H	ECMEOCCFG	ECM error output clear invalidation configuration register	R/W	32	$0000\ 0000_H$	ECMPS	ECMPS
<ECM_base> + $7C_H$	ECMPEM	ECM pseudo error mask register	R/W	32	$0000\ 0000_H$	—	—
FFD6 3000_H	ECMEPCTL	ECM error pulse control register	R/W	8	00_H	—	—

The ECM registers are assigned to three address areas: the address area for ECM common registers, the address area for ECM master registers, and the address area for ECM checker registers. The address area for ECM common registers is used for both master and checker registers. Writing to this common area is performed by master and checker registers simultaneously. Reading from the common area reads the master register's value. The ECM master and checker registers can be written separately.

ECM Register reset conditions are shown in **Table 32.14** and **Table 32.15**.

Table 32.14 Reset Condition of ECM Master and Checker Registers (1/2)

Register Symbol	Register Name	Reset condition			
		Power On Reset	System Reset1	System Reset2	Application Reset1

32.4.2 ECMmESET — ECM Master/Checker Error Set Trigger Register (m = M/C)

The ECM master/checker error set trigger register is for setting the error signal from the error pin to the low level. When the ECMmEST bit is set to 1, the error pin outputs the low level. The output cannot be masked.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base>
<ECMC_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmEST
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 32.16 ECMmESET Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ECMmEST	Error set trigger bit 0: Writing 0 is invalid 1: Sets the output level from the error pin to the active (low) level.

CAUTIONS

Setting or clearing the error output from the $\overline{\text{ERROROUT}}$ pin via the ECMmESET or ECMmECLR register will set the ECMmSSE228 bit of the ECMmESSTR2 register (ECM compare error). Therefore, the ECMmESET register has to be set in the following sequence.

1. Set the MSKM bit and MSKC bit of the ECMPEM register to “masked”.
2. Set the ECMmEST bit in the ECMmESET register.
3. Wait until $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ becomes low by checking that the ECMmSSE231 bit of the ECMmESSTR2 register is “0”.
4. Set the MSKM bit and MSKC bit of the ECMPEM register to “not masked”.

32.4.3 ECMmECLR — ECM Master/Checker Error Clear Trigger Register (m = M/C)

The ECM master/checker error clear trigger registers are for setting the error signal from the error pin(s) to the high level (toggle). When the ECMmECT bit is set to 1, the error pin outputs the high level (toggle) as long as there are no other sources that set the error pin to the low level.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence. This register is always read as 00_H.

Access: This register can be written in 8-bit units.

Address: <ECMM_base> + 04_H
<ECMC_base> + 04_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMmECT
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	W

Table 32.17 ECMmECLR Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ECMmECT	Error clear trigger bit 0: Writing 0 is invalid 1: Sets the output level from the error pin to the inactive (high) level.

CAUTIONS

Clearing of the error pin is only possible if all errors, not masked by ECMEMK0/1/2, are cleared beforehand.

Setting or clearing the error output via the ECMmECLR register will generate an error. Therefore, the following has to be set in advance.

1. Set the MSKM bit and MSKC bit of the ECMPEM register to “masked”.
2. Set the ECMmECT bit in the ECMmECLR register.
3. Wait until $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ becomes high by reading ECMmSSE231 bit of ECMmESSTR2 register 30 times. After that, check that the ECMmSSE231 bit of the ECMmESSTR2 register is “1”. If the ECMmSSE231 bit of the ECMmESSTR2 register is not “1”, a new error may have occurred.
4. Set the MSKM bit and MSKC bit of the ECMPEM register to “not masked”.

Note: This procedure is applicable when the ECMEOCCFG register is not set.

NOTE

If the “output clear invalidation counter”, which is configured by ECMEOCCFG, the Error Output clear function is masked and Error Output clear requests are ignored. Error Output clear function is executed, after the Error Pin Low Time Counter has expired and the Error Output clear register is written.

32.4.4 ECMmESSTR0 — ECM Master/Checker Error Source Status Register 0 (m = M/C)

The ECM master/checker error source status register 0 is a read-only register. This register represents the status of individual internal error sources which are independent from the settings of the error masks. The status can be cleared only by software and power on reset (except debug initiated reset). Other resets than power on reset will not affect the status.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + 08_H
<ECMC_base> + 08_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 32.18 ECMmESSTR0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMmSSE031 to ECMmSSE000	Error source status bit ECMmSSE031 to ECMmSSE000 correspond to error sources 31 to 0. 0: Error not occurred 1: Error occurred

32.4.5 ECMmESSTR1 — ECM Master/Checker Error Source Status Register 1 (m = M/C)

The ECM master/checker error source status register 1 is a read-only register. This register represents the status of individual internal error sources which are independent from the settings of the error masks. The status can be cleared only by software and power on reset (except debug initiated reset). Other resets than power on reset will not affect the status.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + $0C_H$
<ECMC_base> + $0C_H$

Value after reset: $0000\ 0000_H$

Table 32.19 ECMmESSTR1 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMmSSE131 to ECMmSSE100	Error source status bit ECMmSSE131 to ECMmSSE100 correspond to error sources 63 to 32. 0: Error not occurred 1: Error occurred

32.4.6 ECMmESSTR2 — ECM Master/Checker Error Source Status Register 2 (m = M/C)

The ECM master/checker error source status register 2 is a read-only register.

This register represents the status of individual internal error sources which are independent from the settings of the error masks. The status can be cleared only by software and power on reset (except debug initiated reset). Other resets than power on reset will not affect the status. As for bit 31, it does not have a reset and it reflects the level of $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ pin.

Access: This register can be read in 32-bit units.

Address: <ECMM_base> + 10_H
<ECMC_base> + 10_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ECMmSSE231	ECMmSSE230	ECMmSSE229	ECMmSSE228	ECMmSSE227	ECMmSSE226	ECMmSSE225	ECMmSSE224	ECMmSSE223	ECMmSSE222	ECMmSSE221	ECMmSSE220	ECMmSSE219	ECMmSSE218	ECMmSSE217	ECMmSSE216
Value after reset	—*1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMmSSE215	ECMmSSE214	ECMmSSE213	ECMmSSE212	ECMmSSE211	ECMmSSE210	ECMmSSE209	ECMmSSE208	ECMmSSE207	ECMmSSE206	ECMmSSE205	ECMmSSE204	ECMmSSE203	ECMmSSE202	ECMmSSE201	ECMmSSE200
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note 1. Depends on $\overline{\text{ERROROUT}}$ pin state (m=M) or $\overline{\text{ERROROUT\_C}}$ pin state (m=C). When using $\overline{\text{ERROROUT\_C}}$ pin, set the alternative output level loopback function.

Table 32.20 ECMmESSTR2 Register Contents

Bit Position	Bit Name	Function
31	ECMmSSE231	The status of the $\overline{\text{ERROROUT}}$ pin 0: $\overline{\text{ERROROUT}}$ is low level 1: $\overline{\text{ERROROUT}}$ is high level
30	ECMmSSE230	The status of the ECMmESET writing 0: No Error 1: Error is set by ECMmESET
29	ECMmSSE229	The status of the delay timer overflow 0: No overflow 1: Overflow
28 to 0	ECMmSSE228 to ECMmSSE200	Error source status bit ECMmSSE228 to ECMmSSE200 correspond to error sources 92 to 64. 0: Error not occurred 1: Error occurred

NOTE

After Field-BIST executes, regardless of whether it is an intended execution or not, ECMmESSTR2.ECMmSSE227 will be always “1”. In the startup (after reset release), Field-BIST will be always executed and “1” will be captured in ECMmESSTR2.bit 27.

Therefore, confirm that ECMmESSTR2.ECMmSSE227 is 1 and then clear this bit by software before user operation starts.

32.4.7 ECMmPCMD0 — ECM Master/Checker Protection Command Register (m = M/C)

The ECM master/checker protection command register is a write-only register and can be written in 32-bit units. Refer to **Section 32.4.1, List of Registers**, for the protected registers.

Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence. The value after reset is undefined.

Access: This register can be written 32-bit units.

Address: <ECMM_base> + 14_H
<ECMC_base> + 14_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.21 ECMmPCMD0 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write 0.
7 to 0	ECMmREG0 [7:0]	Protection command that enables writing to write protected ECMm registers.

32.4.8 ECMEPCFG — ECM Error Pulse Configuration Register

The ECM error pulse configuration register sets the error output operation for the $\overline{\text{ERROROUT}}$ pin. The ECM error pulse configuration register is a read/write register. You have to follow Protection Unlock Sequence for writing data to this register.

Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 8-bit units.

Address: <ECM_base>

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMSL0
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.22 ECMEPCFG Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	ECMSL0	Error pin output operation configuration bit Error output operation setting for the error pin 0: Non-dynamic mode 1: Dynamic mode

In Dynamic mode the timer output channel 15 in TAUD1 or OSTM1 determines the output wave of the $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ pins in case of no error.

32.4.9 ECMMICFG0 — ECM Maskable Interrupt Configuration Register 0

The ECM maskable interrupt configuration register 0 is used to set the generation of the INTECM interrupts (EI level interrupts). The generation of EI level interrupts in response to errors can be enabled.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 04_H

Value after reset: 0000 0000_H

Table 32.29 ECMIRCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMIRE031 to ECMIRE000	ECM internal reset generation control bit ECMIRE031 to ECMIRE000 correspond to error sources 31 to 0. 0: Error Control Module Reset generation disabled 1: Error Control Module Reset generation enabled

NOTE

Only the watchdog timer error is enabled by the default setting of Error Control Module Reset. Please refer to **Table 32.9, List of Error Inputs**. The default setting is useful to support the default start mode of WDTA. The start mode is selectable by flash option setting. The WDTA provides two modes for the counter start after reset release:

- Software trigger start mode: The counter value remains 0000_H after reset release. The counter is started with the first WDTA trigger. The first trigger can occur any time after reset release.
- Default start mode: The counter starts automatically after reset release. The first trigger must occur before the counter overflows.

32.4.16 ECMIRCFG1 — ECM Internal Reset Configuration Register 1

The ECM internal reset configuration register 1 is used to set the generation of Error Control Module Reset in response to internal errors.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 20_H

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 0	ECMIRE131 to ECMIRE100	ECM Internal reset generation control bit ECMIRE131 to ECMIRE100 correspond to error sources 63 to 32. 0: Error Control Module Reset generation disabled 1: Error Control Module Reset generation enabled

32.4.17 ECMIRCFG2 — ECM Internal Reset Configuration Register 2

The ECM internal reset configuration register 2 is used to set the generation of Error Control Module Reset in response to internal errors. You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 24_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.31 ECMIRCFG2 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When writing, write the value after reset.
29	ECMIRE229	ECM internal reset control bit. Corresponds to delay timer overflow. 0: Error Control Module Reset generation disabled. 1: Error Control Module Reset generation enabled.
28 to 0	ECMIRE228 to ECMIRE200	ECM internal reset generation control bit ECMIRE228 to ECMIRE200 correspond to error sources 92 to 64. 0: Error Control Module Reset generation disabled 1: Error Control Module Reset generation enabled

32.4.18 ECMEMK0 — ECM Error Mask Register 0

The ECM error mask register 0 is used to mask the individual error sources of the error pin output(s).

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 28_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.32 ECMEMK0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMEMK031 to ECMEMK000	ECM error output signal mask control bit ECMEMK031 to ECMEMK000 correspond to error sources 31 to 0. 0: Error signal output not masked 1: Error signal output masked

NOTE

If an error flag is set but masked, clearing the mask will set the $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ to low level.

This happens independently from the time of the error occurrence. In other words, the flag is evaluated statically.

32.4.19 ECMEMK1 — ECM Error Mask Register 1

The ECM error mask register 1 is used to mask the individual error sources of the error pin output(s).

You have to follow Protection Unlock Sequence for writing data to this register.

Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $2C_H$

Value after reset: $0000\ 0000_H$

Table 32.34 ECMEMK2 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When writing, write the value after reset.
29	ECMEMK229	Corresponds to delay timer overflow. 0: Error signal output is not masked. 1: Error signal output is masked.
28 to 0	ECMEMK228 to ECMEMK200	ECM error output signal mask control bit ECMEMK228 to ECMEMK200 correspond to error sources 92 to 64. 0: Error signal output not masked 1: Error signal output masked

NOTE

If an error flag is set but masked, clearing the mask will set the $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ to low level. This happens independently from the time of the error occurrence. In other words, the flag is evaluated statically.

32.4.21 ECMESSTC0 — ECM Error Source Status Clear Trigger Register 0

The ECM error source status clear trigger register 0 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 0. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 34_H

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 0	ECMCLSSE031 to ECMCLSSE000	ECM error status clear bit ECMCLSSE031 to ECMCLSSE000 correspond to ECMmSSE031 to ECMmSSE000. 0: Corresponding error status unchanged 1: Corresponding error status cleared

32.4.22 ECMESSTC1 — ECM Error Source Status Clear Trigger Register 1

The ECM error source status clear trigger register 1 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 1. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 38_H

Value after reset: $0000\ 0000_H$

Bit Position	Bit Name	Function
31 to 0	ECMCLSSE131 to ECMCLSSE100	ECM error status clear bit ECMCLSSE131 to ECMCLSSE100 correspond to ECMmSSE131 to ECMmSSE100. 0: Corresponding error status unchanged 1: Corresponding error status cleared

32.4.23 ECMESSTC2 — ECM Error Source Status Clear Trigger Register 2

The ECM error source status clear trigger register 2 is a write-only register and can be written in 32-bit units. This register is used to clear the individual error source status of the ECM master/checker error source status register 2. Both the error status of the ECM master and the ECM checker are cleared simultaneously.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + $3C_H$

Value after reset: $0000\ 0000_H$

Table 32.37 ECMESSTC2 Register Contents

Bit Position	Bit Name	Function
31	Reserved	When writing, write the value after reset.
30	ECMCLSSE230	ECM error status clear bit ECMCLSSE230 corresponds to ECMmSSE230. 0: Error status unchanged 1: Error status cleared
29	ECMCLSSE229	ECM error status clear bit ECMCLSSE229 corresponds to ECMmSSE229. 0: Error status unchanged 1: Error status cleared
28 to 0	ECMCLSSE228 to ECMCLSSE200	ECM error status clear bit ECMCLSSE228 to ECMCLSSE200 correspond to ECMmSSE228 to ECMmSSE200. 0: Corresponding error status unchanged 1: Corresponding error status cleared

32.4.24 ECMPCMD1 — ECM Protection Command Register

The ECM protection command register is a write-only register and can be written in 32-bit units. Refer to **Section 32.4.1, List of Registers**, for the protected registers. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence. The value after reset is undefined.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 40_H

Value after reset: Undefined

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 32.38 ECMPCMD1 Register Contents

Bit Position	Bit Name	Function
31 to 8	Reserved	When writing, write 0.
7 to 0	ECMREG1[7:0]	Protection command that enables writing to write protected ECM registers.

32.4.25 ECMPS — ECM Protection Status Register

The ECM protection status register is a read-only register. This register is used to verify whether the write protected register has been written successfully or not. Refer to **Section 32.3.5, Writing to Protected Registers**.

Access: This register can be read in 8-bit units.

Address: <ECM_base> + 44_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMPRERR
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R

Table 32.39 ECMPS Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When read, the value after reset is returned.
0	ECMPRERR	ECM protection status bit Indicates whether writing to a write protected register failed or succeeded. 0: Writing was successfully completed. 1: Writing failed

32.4.26 ECMPE0 — ECM Pseudo Error Trigger Register 0

The ECM pseudo error trigger register 0 is a write-only register. This register is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that of a real error source.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + 48_H

Value after reset: $0000\ 0000_H$

Table 32.40 ECMPE0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMPE031 to ECMPE000	ECM pseudo error trigger bit ECMPE031 to ECMPE000 correspond to error sources 31 to 0. 0: Pseudo error is not generated. 1: Pseudo error is generated.

32.4.27 ECMPE1 — ECM Pseudo Error Trigger Register 1

The ECM pseudo error trigger register 1 is a write-only register. This register is used to generate a pseudo error for test purposes. The ECM operation in response to the generation of a pseudo error is identical to that of a real error source.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be written in 32-bit units.

Address: <ECM_base> + $4C_H$

Value after reset: $0000\ 0000_H$

Table 32.42 ECMPE2 Register Contents

Bit Position	Bit Name	Function
31, 30	Reserved	When writing, write the value after reset.
29	ECMPE229	ECM pseudo error trigger bit. Corresponds to delay timer overflow. 0: Pseudo error is not generated. 1: Pseudo error is generated.
28	ECMPE228	ECM pseudo error trigger bit. Corresponds to ECM compare error. 0: Pseudo error is not generated. 1: Pseudo error is generated.
27	Reserved	When writing, write the value after reset.
26 to 0	ECMPE226 to ECMPE200	ECM pseudo error trigger bit ECMPE226 to ECMPE200 correspond to error sources 90 to 64. 0: Pseudo error is not generated. 1: Pseudo error is generated.

NOTE

After Field-BIST executes, regardless of whether it is an intended execution or not, ECMmESSTR2.ECMmSSE227 will be always “1”.
In the startup (after reset release), Field-BIST will be always executed and “1” will be captured in ECMmESSTR2.ECMmSSE227. If ECMmESSTR2.ECMmSSE227 is not set to 1 after Field-BIST is run, then ECMmESSTR2.ECMmSSE227 has a failure. That is, it is possible to detect the failure of bit 27 of ECMmESSTR2 without conducting self-diagnosis using ECMPE2. For this reason, bit 27 of ECMPE2 is reserved.

32.4.29 ECMDTMCTL — ECM Delay Timer Control Register

The ECM delay timer control register is a read/write register. This register is used to control the delay timer.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 8-bit units.

Address: <ECM_base> + 54_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	DTMSTACNTCLK	—	—	ECMSTP	ECMSTA
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	W	R/W

Table 32.43 ECMDTMCTL Register Contents

Bit Position	Bit Name	Function
7 to 5	Reserved	When writing, write the value after reset.
4	DTMSTACNTCLK	Delay timer start confirmation status. 0: Delay timer does not start. 1: Delay timer starts.
1	ECMSTP	Delay timer stop bit By writing “1” to this bit, the delay timer is initialized and stopped (writing 0 is ignored). Simultaneously, ECMSTA bit will be 0. 0: Delay timer is completed or stop request is not in progress. 1: Stop request for delay timer is in progress.
0	ECMSTA	Delay timer start bit Specifies the operation of the delay timer at the occurrence of an error event. 0: Delay timer does not start 1: Delay timer starts (Writing 0 to this bit stops the delay timer)

NOTE

1. ECMDTMCTL register can be accessed via P-Bus but delay timer runs. ECMDTMCTL register is set via PBUS, however actual delay timer exists in a different clock domain. Therefore, time lag exists between writing of ECMDTMCTL and actual starting/stopping of delay timer.
   DTMSTACNTCLK can be used to confirm whether delay timer is enabled or not. Reconfirm that ECMSTA has been updated by checking DTMSTACNTCLK after writing to ECMSTA.
2. ECMDTMCTL register can be written only when (ECMSTA, DTMSTACNTCLK) = (0,0) or (1,1) Confirm the values of ECMSTA and DTMSTACNTCLK before writing to ECMDTMCTL.

32.4.30 ECMDTMR — ECM Delay Timer Register

The ECM delay timer register indicates the value of the delay timer counter. The ECM delay timer register is initialized by setting the ECMSTA bit of the ECM delay timer control register from 1 (timer in operation) to 0 (timer stopped). The ECM delay timer uses the internal oscillator clock divided by 2 for counting.

Access: This register can be read in 16-bit units.

Address: <ECM_base> + 58_H

Value after reset: 0000_H

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMR[15:0]

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

32.4.31 ECMDTMCMP — ECM Delay Timer Compare Register

The ECM delay timer compare register is a read/write register. The ECMmSSE229 bit is set when the value in ECMDTMCMP register matches with the value of the ECM delay timer register. Writing data to this register has to be conducted while the delay timer is stopped.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $5C_H$

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPW
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ECMDTMCMP[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 32.44 ECMDTMCMP Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When writing, write the value after reset.
16	CMPW	Indicates whether reflecting the new ECMDTMCMP value across clock domains is in progress. 0: Not in progress 1: In progress. While the bit is set, further setting to the ECMDTMCMP is prohibited. When writing, write the value after reset.
15 to 0	ECMDTMCMP [15:0]	Delay timer compare value

NOTE

1. ECMDTMCMP register is set via PBUS, however actual delay timer exists in a different clock domain. When ECMDTMCMP is configured, the value is copied across clock domains to reflect to the delay timer, which takes a certain time. CMPW indicates whether reflecting the new ECMDTMCMP value across clock domains is in progress.
2. While CMPW is 1, further setting to ECMDTMCMP is ignored.
   Please confirm CMPW = 0, before writing to ECMDTMCMP.

32.4.32 ECMDTMCFG0 — ECM Delay Timer Configuration Register 0

The ECM delay timer configuration register 0 is used to enable/disable the delay timer start caused by EI level interrupts in response to errors.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 60_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 32.45 ECMDTMCFG0 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMTE031 to ECMTE000	ECM delay timer start control bit ECMTE031 to ECMTE000 correspond to EI level interrupts generated by error sources 31 to 0. 0: Delay timer start disabled 1: Delay timer start enabled

NOTE

Do not enable delay timer start for clock monitor error events (ECMTE015 to ECMTE008).

32.4.33 ECMDTMCFG1 — ECM Delay Timer Configuration Register 1

The ECM delay timer configuration register 1 is used to enable/disable the delay timer start caused by EI level interrupts in response to errors.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 64_H

Value after reset: $0000\ 0000_H$

Table 32.47 ECMDTMCFG2 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When writing, write the value after reset.
28 to 0	ECMTE228 to ECMTE200	ECM delay timer start control bit ECMTE228 to ECMTE200 correspond to EI level interrupts generated by error sources 92 to 64. 0: Delay timer start disabled 1: Delay timer start enabled

32.4.35 ECMDTMCFG3 — ECM Delay Timer Configuration Register 3

The ECM delay timer configuration register 3 is a read/write register and can be written in 32-bit units. This register is used to enable/disable the delay timer start caused by Non-maskable interrupt in response to errors.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $6C_H$

Value after reset: $0000\ 0000_H$

Table 32.48 ECMDTMCFG3 Register Contents

Bit Position	Bit Name	Function
31 to 0	ECMTE331 to ECMTE300	ECM delay timer start control bit ECMTE331 to ECMTE300 correspond to FE level interrupts generated by error sources 31 to 0. 0: Delay timer start disabled 1: Delay timer start enabled

NOTE

Do not enable delay timer start for clock monitor error events (ECMTE315 to ECMTE308).

32.4.36 ECMDTMCFG4 — ECM Delay Timer Configuration Register 4

The ECM delay timer configuration register 4 is a read/write register and can be written in 32-bit units. This register is used to enable/disable the delay timer start caused by Non-maskable interrupt in response to errors.

You have to follow Protection Unlock Sequence for writing data to this register. Refer to **Section 32.3.5, Writing to Protected Registers** for details of the Protection Unlock Sequence.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 70_H

Value after reset: $0000\ 0000_H$

Table 32.50 ECMDTMCFG5 Register Contents

Bit Position	Bit Name	Function
31 to 29	Reserved	When writing, write the value after reset.
28 to 0	ECMTE528 to ECMTE500	ECM delay timer start control bit ECMTE528 to ECMTE500 correspond to non-maskable interrupts generated by error sources 92 to 64. 0: Delay timer start disabled 1: Delay timer start enabled

32.4.38 ECMEOCCFG — ECM Error Output Clear Invalidation Configuration Register

This register is a read/write register and can be written in 32-bit units.
The register can determine the period to suppress clearing $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUR\_C}}$ state after an error occurs.
When the value of the error output clear invalidation counter exceeds the value configured in this register, the error status of the $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUR\_C}}$ pin can be cleared by software.
Configure this register only when $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUR\_C}}$ pin status is not in error status.

This register is initialized by Power on Reset or System Reset 1 or System Reset 2.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + 78_H

Value after reset: 0000 0000_H This register is initialized by Power on Reset or System Reset 1 or System Reset 2.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CMPW

Table 32.51 ECMEOCCFG Register Contents

Bit Position	Bit Name	Function
31 to 17	Reserved	When writing, write the value after reset.
16	CMPW	Indicates whether reflecting the new ECMEOUTCLRT across clock domains is in progress 0: Not in progress 1: In progress. While the bit is set, further setting to the ECMEOUTCLRT is prohibited. When writing, write the value after reset.
15 to 0	ECMEOUTCLRT[15:0]	The number of clock cycles after which it is possible to clear error output by software.

NOTES

1. ECMEOUTCLRT register is set via PBUS, however actual “output clear invalidation counter” exists in a different clock domain. When ECMEOUTCLRT is configured, the value is copied across clock domains to reflect to the counter, which takes a certain time. CMPW indicates whether the reflection across clock domains is in progress.
2. While CMPW is 1, further setting to ECMEOUTCLR is ignored. Please confirm CMPW = 0, before writing to ECMEOUTCLR.

32.4.39 ECMPEM — ECM Pseudo Error Mask Register

This register can mask the pseudo error of “ECM compare error” to support self-diagnosis of the binding components for $\overline{\text{ERROROUT}}$ and $\overline{\text{ERROROUR\_C}}$ pins.

Access: This register can be read/written in 32-bit units.

Address: <ECM_base> + $7C_H$

Value after reset: $0000\ 0000_H$

Table 32.52 ECMPEM Register Contents

Bit Position	Bit Name	Function
31 to 2	Reserved	When writing, write the value after reset.
1	MSKM	0: Pseudo error of “ECM compare error” for ECM master is NOT masked. 1: Pseudo error of “ECM compare error” for ECM master is masked.
0	MSKC	0: Pseudo error of “ECM compare error” for ECM checker is NOT masked. 1: Pseudo error of “ECM compare error” for ECM checker is masked.

32.4.40 ECMEPCTL — ECM Error Pulse Control Register

This register selects the timer output in dynamic mode.

Access: This register can be read/written in 8-bit units.

Address: FFD6 3000_H

Value after reset: 00_H

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	ECMTMSL
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R/W

Table 32.53 ECMEPCTL Register Contents

Bit Position	Bit Name	Function
7 to 1	Reserved	When writing, write the value after reset.
0	ECMTMSL	Timer output selection to $\overline{\text{ERROROUT}}$/$\overline{\text{ERROROUT\_C}}$ 0: Channel 15 in TAUD1 1: OSTM1

Section 33 Data CRC Function A (DCRA)

Data CRC function (DCRA) can be used to verify or generate CRC (cyclic redundancy check) protecting a variety of data blocks.

After initialization of the DCRA data register, every write access to the DCRA input register generates a new CRC according to the chosen polynomial and the result is stored in the DCRA data register.

The CRC for any data of arbitrary bytes can be calculated with selectable CRC generator polynomials.

DCRA is implemented 4 units.

33.1 Features of RH850/P1M-E DCRA

33.1.1 Units and Channels

This microcontroller has the following number of DCRA units.

Table 33.1 Number of Units

Product	RH850/P1M-E 100 pins	RH850/P1M-E 144 pins
Number of Units	4	4
Name	DCRAn (n = 0 to 3)	DCRAn (n = 0 to 3)

Table 33.2 Unit Configurations and Channels

Unit Name (Channel Name) DCRAn	Channels per Unit	RH850/P1M-E 100 pins (4 ch)	RH850/P1M-E 144 pins (4 ch)
DCRA0	1	√	√
DCRA1	1	√	√
DCRA2	1	√	√
DCRA3	1	√	√

Table 33.3 Index

Index	Description
n	Throughout this section, the individual Data CRC function A units are identified by the index “n” (n = 0 to 3); for example, DCRAnCTL indicates the CRCn control register.

33.1.2 Register Base Address

DCRAn base addresses are listed in the following table.

DCRAn register addresses are given as offsets from the base addresses throughout this section.

Table 33.4 Register Base Addresses

Base Address Name	Base Address
<DCRA0_base>	FFD5 0000_H
<DCRA1_base>	FFD5 1000_H
<DCRA2_base>	FFD5 2000_H
<DCRA3_base>	FFD5 3000_H

33.1.3 Clock Supply

Clock supply by and to DCRAn is listed in the following table.

Table 33.5 Clock Supply

Unit Name	Unit Clock Name	Supply Clock Name
DCRAn	PCLK	High-speed peripheral clock CLK_HSB

33.1.4 Interrupt Requests

DCRAn has no interrupt request.

33.1.5 Reset Sources

Please refer to **Section 8, Reset Controller**.

33.1.6 External Input/Output Signals

DCRAn has no external pin.

33.2 Overview

33.2.1 Functional Overview

The Data CRC function A can be used to verify or generate CRC protected data streams of arbitrary length and different bit widths.

- 32-bit Ethernet CRC
  ($X^{32} + X^{26} + X^{23} + X^{22} + X^{16} + X^{12} + X^{11} + X^{10} + X^{8} + X^{7} + X^{5} + X^{4} + X^{2} + X^{1} + 1$)
- 16-bit CCITT CRC
  ($X^{16} + X^{12} + X^{5} + 1$)
- 8-bit SAE J1850
  ($X^{8} + X^{4} + X^{3} + X^{2} + 1$)
- 8-bit 0x2F
  ($X^{8} + X^{5} + X^{3} + X^{2} + X^{1} + 1$)
- CRC generation to an arbitrary data block length.
- After initialization of the CRC input register every write access to the CRC data register generates a new CRC according to the chosen polynomial and the result is stored in the CRC data register.

33.2.2 Block Diagram

The following picture shows the block diagram of the Data CRC function A.

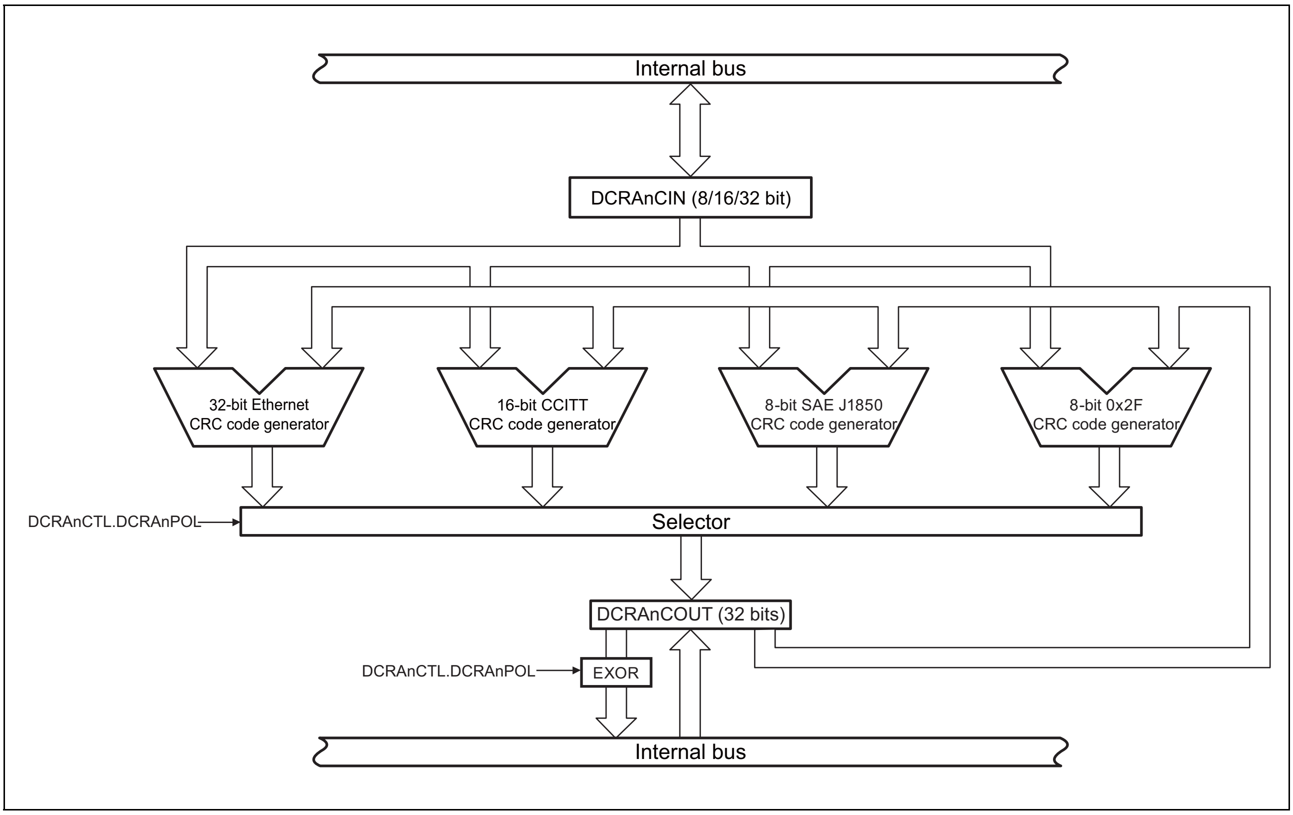

Figure 33.1 Block Diagram of Data CRC Function A

33.2.3 Operation Circuit

33.3 Registers

33.3.1 List of Registers

DCRA registers are listed in the following table.

<DCRAn_base> is defined in **Section 33.1.2, Register Base Address**.

Table 33.6 Registers

Module	Register	Symbol	Address
DCRAn	CRCn input register	DCRAnCIN	<DCRAn_base> + 00_H
DCRAn	CRCn data register	DCRAnCOUT	<DCRAn_base> + 04_H
DCRAn	CRCn control register	DCRAnCTL	<DCRAn_base> + 20_H

33.3.2 DCRAnCIN — CRCn Input Register

This register holds the input data for the CRC calculation. The effective bit width used for CRC calculation must be set by DCRAnCTL.DCRAnISZ[1:0].

When data is written to this register, the CRC code is generated.

The CRC calculation is immediately started after the DCRAnCIN register is written. The DCRAnCOUT register must be initialized, with the initial starting value, before the first data of the data block is written to DCRAnCIN register.

Access: This register can be read/written in 32-bit units.

Address: <DCRAn_base>

Value after reset: 0000 0000_H This register is initialized by any reset.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCIN[31:16]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCIN[15:0]															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Table 33.7 DCRAnCIN Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCIN [31:0]	Input Data for CRC Calculation The valid bits are: • For 32 bit effective bit width: DCRAnCIN[31:0] • For 16 bit effective bit width: DCRAnCIN[15:0] • For 8 bit effective bit width: DCRAnCIN[7:0]

33.3.3 DCRAnCOUT — CRCn Data Register

This register stores the result of the CRC code generated by any of the following polynomials.

- 32-bit Ethernet
- 16-bit CCITT
- 8-bit SAE J1850
- 8-bit 0x2F

Access: This register can be read/written in 32-bit units.

Address: <DCRAn_base> + 4_H

Value after reset: $0000\ 0000_H$

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DCRAnCOUT[31:16]															
Value after reset *1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DCRAnCOUT[15:0]															
Value after reset *1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note 1. The read value after reset is $0000\ 0000_H$ since the 32-bit ethernet CRC polynomial is selected as the CRC generating function after reset.

Table 33.8 DCRAnCOUT Register Contents

Bit Position	Bit Name	Function
31 to 0	DCRAnCOUT [31:0]	Result of the CRC Code Generation When the 16-bit CCITT polynomial is enabled, bits 15 to 0 show the CRC result. The values of bits 31 to 16 are undefined. When the 8-bit SAE J1850 or 0x2F polynomial is enabled, bits 7 to 0 show the CRC result. The values of bits 31 to 8 are undefined. The read value of this register is a value obtained by performing EXOR calculation for the following value: • For 32-bit ethernet polynomial: FFFF $FFFF_H$ • For 16-bit CCITT polynomial: 0000_H • For 8-bit SAE J1850 or 0x2F polynomial: 0000 $00FF_H$ For example, when DCRAnCOUT = 5555 5555_H for the 32-bit Ethernet polynomial, AAAA $AAAA_H$ is read.

CAUTION

This register must initialized by setting the initial start value before the first data of the data block is written to DCRAnCIN register.

33.3.4 DCRAnCTL — CRCn Control Register

This register controls the CRC generation process.

Access: This register can be read/written in 8-bit units.

Address: <DCRAn_base> + 20_H

Value after reset: 00_H This register is initialized by any reset.

Bit	7	6	5	4	3	2	1	0
	—	—	DCRAnISZ[1:0]		—	—	DCRAnPOL[1:0]	
Value after reset	0	0	0	0	0	0	0	0
R/W	R	R	R/W	R/W	R	R	R/W	R/W

Table 33.9 DCRAnCTL Register Contents

Bit Position	Bit Name	Function
7, 6	Reserved	When read, the value after reset is read. When writing, write the value after reset.
5, 4	DCRAnISZ[1:0]	Specifies the CRC input bit width: 00: 32 bit (DCRAnCIN[31:0]) 01: 16 bit (DCRAnCIN[15:0]) 10: 8 bit (DCRAnCIN[7:0]) 11: Setting prohibited
3, 2	Reserved	When read, the value after reset is read. When writing, write the value after reset.
1, 0	DCRAnPOL[1:0]	Specifies the CRC generating function: 00: 32-bit ethernet CRC polynomial The byte order of the DCRAnCIN register is LSB (least significant byte) first. This means that if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B), the input values are in bits 7 to 0 of the DCRAnCIN register and bit 0 (the LSB) is the first bit of the input data. 01: 16-bit CCITT CRC polynomial The byte order of the DCRAnCIN register is MSB (most significant byte) first, meaning input values are in bits 7 to 0 of the DCRAnCIN register and bit 7 (the MSB) is the first bit of the input data if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B). 10: 8-bit SAE J1850 polynomial The byte order of the DCRAnCIN register is MSB (most significant byte) first, meaning input values are in bits 7 to 0 of the DCRAnCIN register and bit 7 (the MSB) is the first bit of the input data if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B). 11: 8-bit 0x2F polynomial The byte order of the DCRAnCIN register is MSB (most significant byte) first, meaning input values are in bits 7 to 0 of the DCRAnCIN register and bit 7 (the MSB) is the first bit of the input data if the CRC input bit width is 8 bits (DCRAnISZ[1:0] = 10_B).

NOTE

If the CRC generation method (DCRAnCTL.DCRAnPOL) is changed, the DCRAnCOUT register must be initialized by setting the initial start value.

CAUTION

The CRC input bit width (DCRAnCTL.DCRAnISZ[1:0]) must be set according to the data block bit width. Changing the CRC input bit width is not allowed during processing of a data block (a data block consists of N bytes, half-words or one word). After the final CRC result is read from DCRAnCOUT register, the CRC input bit width can be changed. In that case, the DCRAnCOUT register must be initialized with the initial start value.

33.4 Operation

The Data CRC Function A generates a CRC (cyclic redundancy check) value of an arbitrary block length. The data for the CRC function is forwarded in 8-, 16-, or 32-bit units. The CRC polynomial can either be selected from 32-bit ethernet CRC or 16-bit CCITT CRC. The initial starting value must be set at the DCRAnCOUT register before the first write access to the CRC input register (DCRAnCIN) is performed.

The flow chart below shows the CRC value generating procedure.

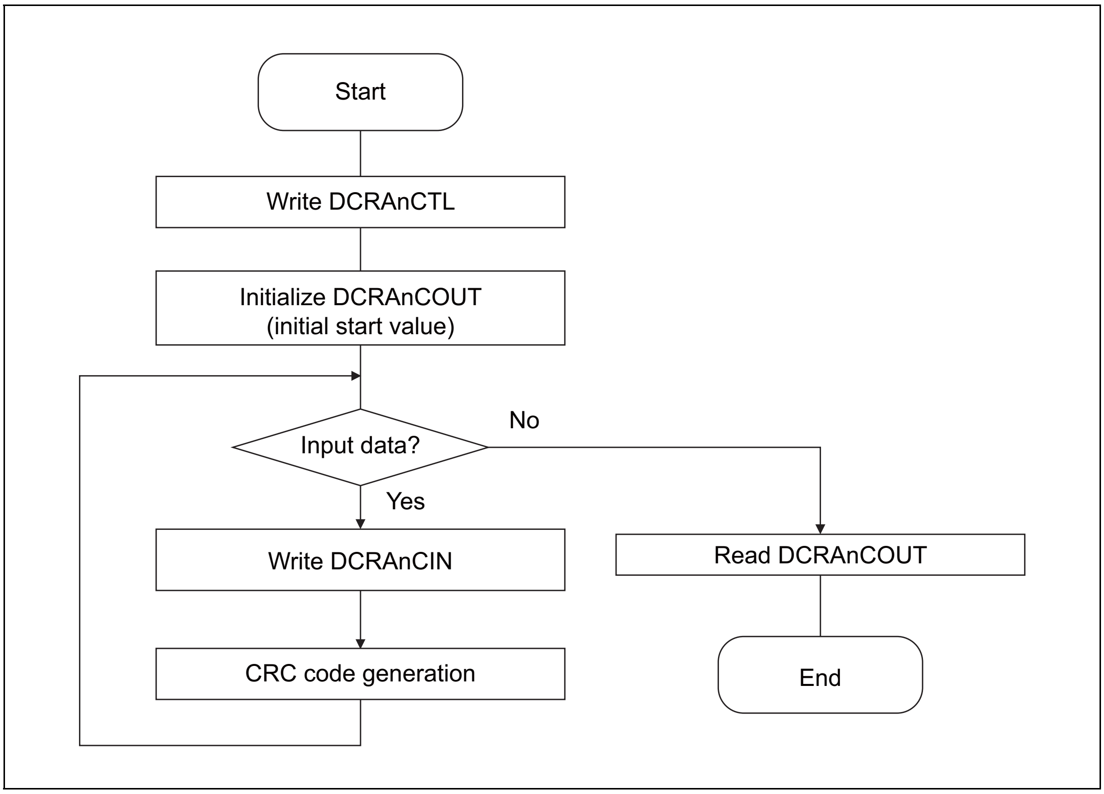

Figure 33.2 Data CRC Function A Flow Diagram

NOTES

1. Before writing the first data to DCRAnCIN, the CRC output register DCRAnCOUT must be initialized with the initial start value.
2. DCRAnCOUT must be initialized by setting the initial start value when the polynomial is changed by changing DCRAnCTL.DCRAnPOL.
3. Setting example of the initial start values of the respective polynomials
   The following is the example of setting values.

Table 33.10 Setting Example of the Initial Start Values (Reset when read)

	Initial Start Value	EXOR Value	DCRAnCOUT Read Value
8-bit SAE J1850/0x2F	XXXX XXFF$_H$	XXXX XXFF$_H$	XXXX XX00$_H$
16-bit CCITT	XXXX FFFF$_H$	XXXX 0000$_H$	XXXX FFFF$_H$
32-bit ethernet	FFFF FFFF$_H$	FFFF FFFF$_H$	0000 0000$_H$

Note: x: Undefined

Section 34 On-Chip Debugging Unit (OCD)

34.1 Debug Function

This product has an on-chip debug function. Using an on-chip debug emulator, the microcontroller included in the target system can debug its programs.

CAUTION

The debug function described in this section is supported by the microcontroller, but whether it can be used or not depends on the debugger. For details of the debugger, see the debugger's user's manual. For the necessary tool connection circuitry, please refer to the corresponding tool documentation.

(1) Debug Interface

This product supports the Nexus JTAG Interface, and Low Pin Debug Interface (4 pins) (hereinafter referred to as LPD (4 pins)) as the debug interfaces.

(2) Debug Monitor Function

In debug mode, the monitor program is run in the area dedicated to debugging.

Execution of the monitor program enables the following basic debug functions:

- Download of user programs
- Reading and writing of user resources including memory and registers while a user program is suspended.
- Execution of user programs starting from any addresses

(3) On-chip Break Function

Twelve break points are included in the CPU. Four of them can be designated for any accesses (access address and access data).

(4) Software Break Function

A software break point can be designated for any addresses on the user programs stored in the RAM.

(5) Forced Break Function

Execution of a user program can be forcibly suspended.

(6) Debug Interrupt Interface Function

Execution of a user program can be forcibly suspended by asserting an input to the $\overline{\text{EVTI}}$ pin from the outside.

(7) Forced Reset Function

The microcontroller (this product) can be forcibly reset by the Debugger Initiated Reset.

(8) Real-time RAM Monitor (RRM)

A memory can be read during execution of a program. The impact on program execution is minimal since this read access use a dedicated DMA unit for debugging.

(9) Dynamic Memory Modify (DMM)

A memory can be written during execution of a program. The impact on program execution is minimal since this write access use a dedicated DMA unit for debugging.

(10) Timer Function

Using a 32-bit counter, the execution time of a user program can be measured based on a dedicated debugging clock.

(11) Mask Function

Reset factors (pin reset, software reset, or ECM reset) can be masked.

(12) Event Detection Function

Events can be detected by the following: execution address, access address, access data, range (comparison in size), and sequential execution.

(13) Trigger Input Interface

This product incorporates an event trigger input interface to accept external events. It can accept an external event in response to an input to the $\overline{\text{EVTI}}$ pin.

(14) Trigger Output Interface

This product incorporates an event trigger output interface to notify the external debugger of event detection. Output from the $\overline{\text{EVTO}}$ pin can output a trigger of event detection to the outside.

(15) Hot Plug-in Function

Debugging can be started in normal operating mode without an input of a pin reset.

(16) Security Function

To prevent the contents of the flash memory from being read by an unauthorized person, a 128-bit ID code (OCD_ID) can be written to the microcontroller. If the code the user inputs when starting a debugger does not match the ID code, the flash memory cannot be accessed.

(17) Calibration Function

Emulation of the flash memory and tuning of ROM data can be executed by using the ERAM, the memory for emulation. For details, see **Section 34.2, Calibration Function**.

(18) Tracing Function

Information such as the user program execution history and variations in data can be obtained. For details, see **Section 34.3, Trace Control Function**.

34.2 Calibration Function

This product includes the Emulation RAM as an emulation memory for the on-chip flash memory.

(1) Emulation RAM

Products with 1-MB flash memory include 8-KB of emulation RAM with and products with 2-MB memory include 32-KB of emulation RAM.

(2) Flash Emulation Function

The emulation RAM can be mapped to any areas in the flash area. For details, see **Section 36.4, Emulation RAM**.

(3) Tuning Function

The ROM data can be dynamically tuned during execution of a user program via the Emulation RAM that has been mapped to the flash area.

(4) Flash Cache Clear Function

The flash cache is cleared when the Emulation RAM mapping is set. This preserves coherency of the contents between the on-chip flash memory or the Emulation RAM and the flash cache memory.

34.3 Trace Control Function

This product provides several trace functions including branch PC trace and data trace of the CPU and DMA data trace.

(1) Trace RAM

This product has 32 KB for the trace RAM.

The trace information in the trace RAM is accessible via the debug interfaces: Nexus, and LPD (4 pins).

(2) Software Trace

This function enables obtaining information such as the user program execution history and variations in data.

The software trace information can be output via the LPD debug interface.

34.4 Peripheral Break Control

Peripheral break is a function for stopping the peripheral modules when a user program is halted (at a break point, etc.).

The on-chip modules can be classified into two groups according to their operation in response to a peripheral break as follows:

1. Modules that are unconditionally stopped: WDTA0
2. Modules for which halting or continuing can be selected: OSTM0, OSTM1, OSTM3, OSTM4, OSTM5, OSTM6, OSTM7, TAPA0, TAPA1, TAPA2, TAPA3, TPBA0, TPBA1, TSG30, TSG31, ENCA0, ENCA1, TAUJ0, TAUJ1, TAUJ2, TAUD0, TAUD1, TAUD2, CSIG0, CSIH0, CSIH1, CSIH2, CSIH3, RLIN30, RLIN31

34.5 Usage Notes for On-chip Debugging

(1) Caution on Devices Used for Debugging
Do not mount a device used for debugging on mass-produced products. The number of times data can be written to the flash memory cannot be guaranteed because the memory has already been rewritten during debugging.

(2) When using a debugger, be aware that the execution will be started form the reset vector before preparation for communication between the OCD emulator and the microcomputer completes.

Section 35 Flash Memory

This section describes the flash memory mounted on RH850/P1M-E.

The first part in this section describes the characteristics of the mounted flash memory and the characteristics specific to RH850/P1M-E, such as the memory map, flash memory programming, and ECC.

35.1 Features

- Includes code flash memory and data flash memory
  The code flash memory can store program codes and data and has the user area and the extended user area.
  The data flash memory is used for storing data.
- Method of flash memory programming
  Flash memory programming via a serial interface and programming of flash memory by a user program (self-programming) are supported.
- Support for BGO (Back Ground Operation)
  The BGO function allows programs to be executed in the code flash memory while the data flash memory is being programmed/erased.
- Flash memory data security
  - Support for security functions to protect against illicit tampering with or reading out of data in the flash memory
  - Support for protection functions to protect against erroneous overwriting of the flash memory
- Option byte function
  Sets the operation after releasing reset for ports, and WDTA, and external bus clocks.
- Support for the error detection/correction function (ECC) in the code flash memory and data flash memory
  Built-in ECC function can detect 2-bit errors and detect/correct 1-bit errors.
- Interrupts can be acknowledged in self-programming mode.

For code flash sizes and data flash sizes of each product, see the following sections.

- **Section 4.1, Address Space**

35.2 Structure of Memory

35.2.1 Mapping of Code Flash Memory

Figure 35.1 illustrates the mapping of the code flash memory for the 2-Mbytes/1-Mbytes. device. The user area of the code flash memory of the RH850/P1M-E is divided into 8-and 32-Kbyte blocks, which serve as the units of erasure. A single block of 32 Kbyte extended user area is also incorporated.The user area and extended user area are available as areas for storing the user program.

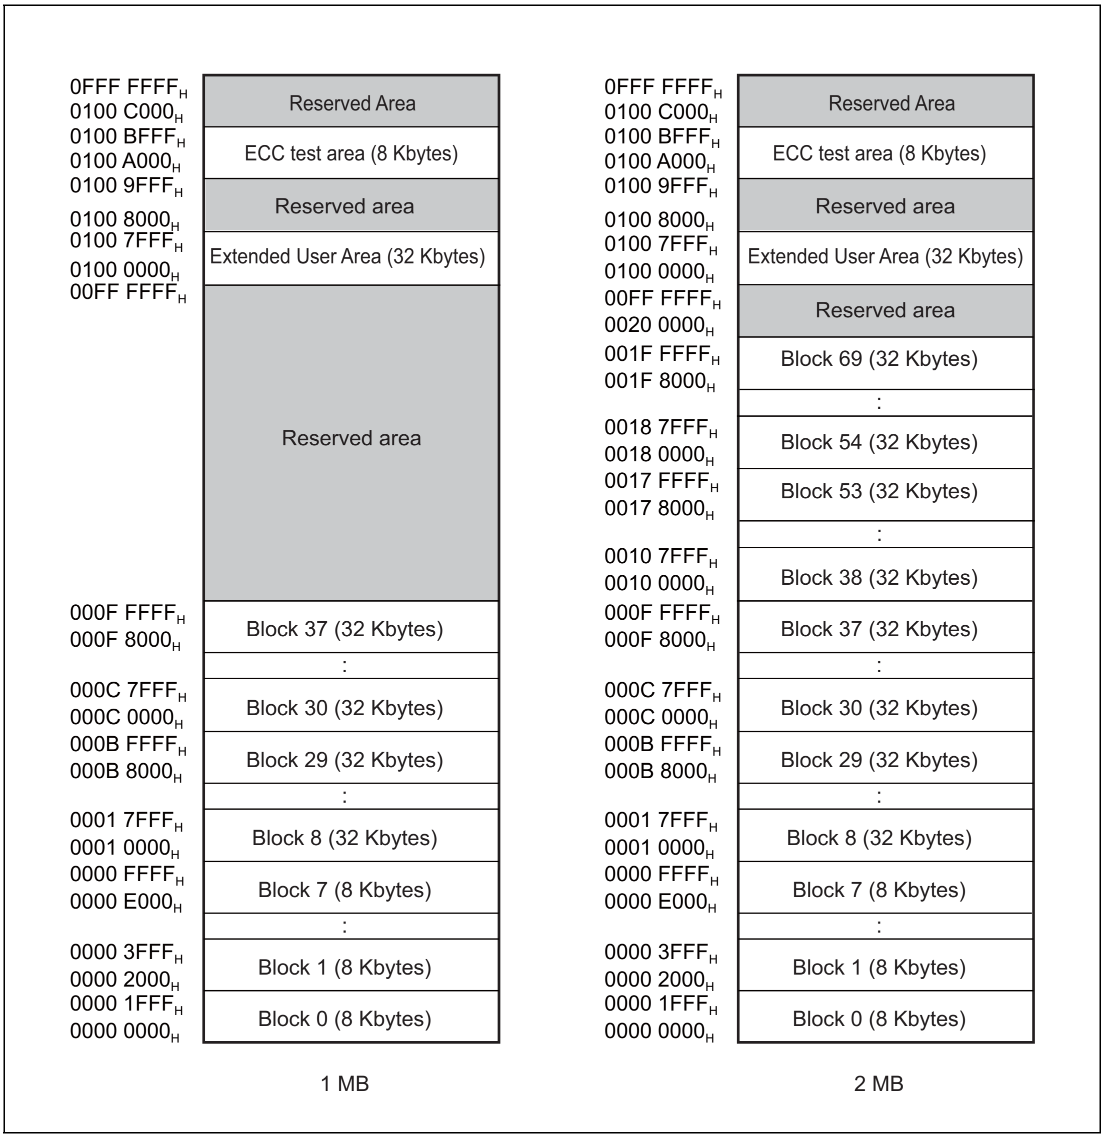

Figure 35.1 Mapping of the Code Flash Memory

35.2.2 Mapping of Data Flash Memory

The data area of the data flash memory in the RH850/P1M-E is divided into 64-byte blocks, with each being a unit for erasure. **Figure 35.2** shows the mapping of the data flash memory.

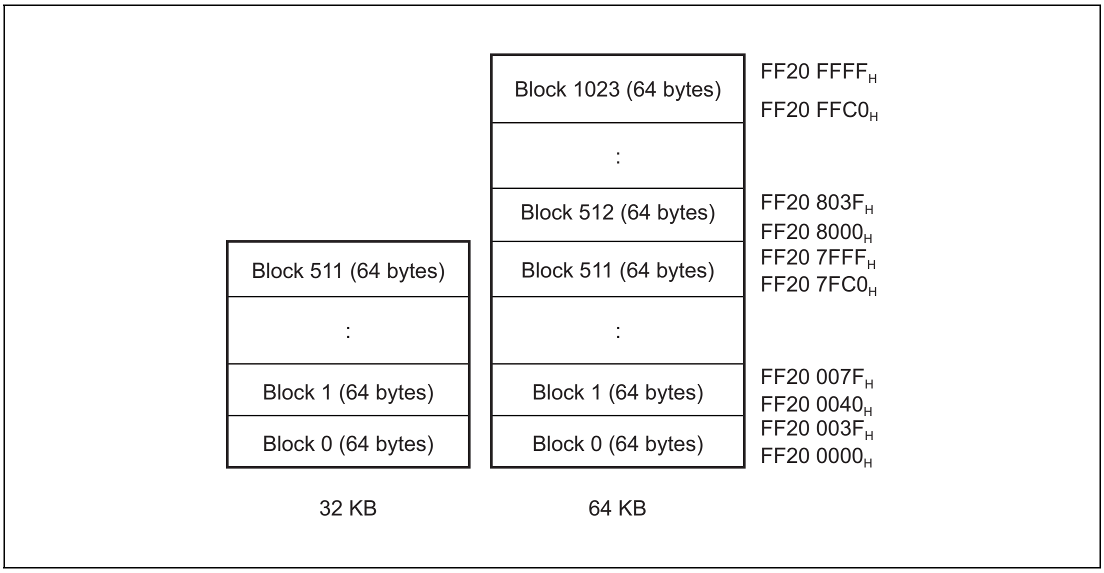

Figure 35.2 Mapping of the Data Flash Memory

35.3 Operating Modes Associated with Flash Memory

Figure 35.3 is a diagram of the mode transitions associated with the flash memory. For the procedures for setting the modes, see **Section 5, Operating Modes**.

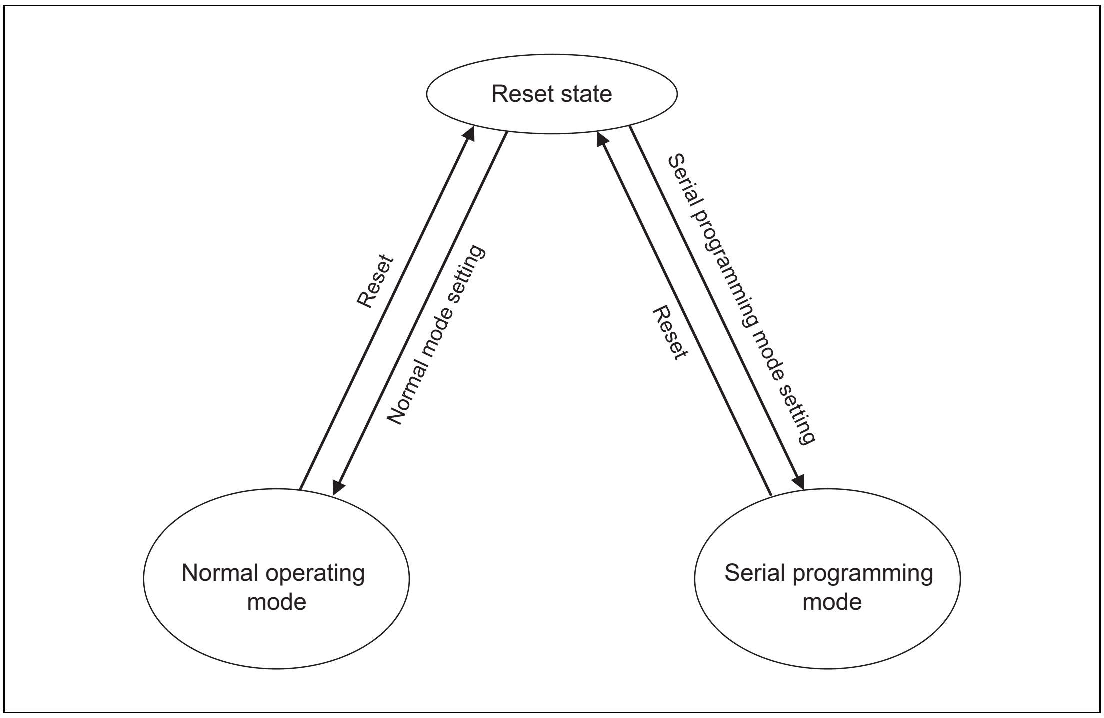

Figure 35.3 Mode Transition Associated with Flash Memory

Table 35.1 shows the flash memory area which is programmable and erasable in each mode and the boot program after reset release.

Table 35.1 Programmable and Erasable Area in Each Mode and the Boot Program after Reset Release

Item	Normal Operating Mode	Serial Programming Mode
Programmable and erasable area	• User area • Extended user area • Data area	• User area • Extended user area • Data area
Boot program after reset release	Program in user area or extended user area (Changeable by using the variable reset vector)	Firmware program for serial programming

35.4 Functions

35.4.1 Functional Overview

On-chip flash memory of RH850/P1M-E can be programmed regardless of before and after the mounting on the target system with dedicated flash memory programmer via serial interface (serial programming).

Furthermore, security functions to prohibit updating of the user program written in the flash memory are incorporated, and this can prevent tampering by third parties.

Programming by the user program (self-programming) is suited for applications where the target system program may require updating after deployed to the end user. Protection features for the safe rewriting of the flash memory are also incorporated. Furthermore, interrupt processing during self-programming is supported, so programming can proceed at the same time as external communications, etc., and this allows programming under various conditions.

Table 35.2 gives an overview of the methods of programming and the corresponding operating modes.

Table 35.2 Methods of Programming

Method of Programming	Overview of Functionality	Operating Mode
Serial programming	A dedicated flash memory programmer allows on-board programming of the flash memory after the device is mounted on the target system.	Serial programming mode
	A dedicated flash memory programmer and dedicated programming adapter board allow off-board programming of the flash memory, i.e. programming of the device before it is mounted on the target system.	
Self-programming	The user program that is written to code flash memory in advance by serial programming also allows updating the flash memory. The background operation capability makes it possible to fetch instructions or otherwise read data in code flash memory while the data flash memory is self-programming. For this reason, it is possible to update the data flash memory by executing a program written to the code flash memory. Instructions in the code flash memory cannot be fetched and data cannot be accessed while the code flash memory is being updated by self-programming. In such cases, a program for updating must be transferred to the local RAM in advance and executed.	Normal operating mode

Table 35.3 lists the functions of the flash memory. Dedicated flash memory programmer commands enable serial programming, while reading of the flash memory by the user program enables self-programming.

Table 35.3 Basic Functions at a Glance

Function	Description in Overview	Level of Support (√: Supported, Δ: Conditionally Supported, —: Not Supported)	
		Serial programming	Self-programming
Blank checking	This is used to check a specified block to ensure that writing to it has not already proceeded. Results of reading from code flash memory and data flash memory to which nothing has been written after erasure are not guaranteed, so use blank checking to confirm that writing to memory has not proceeded after erasure.	√	√
Block erasure	This is for erasing the contents of a specified block of memory.	√	√
Programming	This is for writing to a specified address.	√	√
Verification and checksum	Data that are read out from flash memory are compared with data transferred from the flash memory programmer.	√	— (Reading of data by the user program is possible)
Reading	Data that have been written to the flash memory are read out.	√	√
Setting for OTP (one-time programming)	A specified block of code flash memory is set for OTP (OTP can only be set, that is, it is not possible to release a block's OTP setting).	√	√
Setting an ID	An ID setting is made for use in controlling the connection of a dedicated flash memory programmer for serial programming, controlling of the on-chip debugger, and programming of the code flash memory by self-programming.	√	√
Security settings	Security settings are for use in serial programming.	√	Δ (Only when setting is prohibited after being permitted)
Protection settings	Protection settings specify the lock bits for all blocks of code flash memory and the reset vector value for the function of variable reset vector.	Δ (Reset vector value for the function of variable reset vector is not supported.)	√
Setting of option bytes	Option bytes are set to change them from the initial values for the RH850/P1M-E.	√	√
Clearing the configuration	ID setting, security settings, protection settings, and option byte settings are initialized.	√	—

For details on serial programming, see the user's manual of the flash programmer.

For details on self-programming, see the user's manuals for the flash memory hardware interface.

The flash memory supports various security functions.

The OTP setting and authentication of the ID code are security functions for use with serial programming and self-programming.

In serial programming, authentication of the ID code, prohibiting connection of a dedicated flash memory programmer, and prohibition of commands (for block erasure, programming, and reading) are available for use as security functions.

The security functions supported by the flash memory are listed in **Table 35.4**.

For details on security function, see the *RH850/P1M-E ICUSE User's Manual*.

Table 35.4 Summary of Security Functions

Function	Description
OTP	OTP can be individually set for each block of the user area and the extended user area of code flash memory. When the OTP setting is made for an area, programming by serial programming and by self-programming is prohibited. Once set, the OTP setting cannot be released. Furthermore, since execution of the configuration clearing command is prohibited for any area for which OTP has been set, changing a security setting from "prohibited" to "permitted" is not possible.
ID authentication	The result of ID authentication can be used to control the connection of a dedicated flash memory programmer for serial programming. The result of ID authentication can also be used to control enabling of self-programming.
Prohibition of connection of a dedicated flash memory programmer	The connection of a dedicated flash memory programmer for serial programming is prohibited. Since execution of the configuration clearing command is also prohibited when the connection of a dedicated flash memory programmer is prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of block erasure commands	Block erasure commands at the time of serial programming are prohibited. Since execution of the configuration clearing command is also prohibited when block erasure commands are prohibited, changing a security setting from "prohibited" to "permitted" is not possible.
Prohibition of programming commands	Block erasure commands and programming commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.
Prohibition of read commands	Read commands at the time of serial programming are prohibited. Only through execution of the configuration clearing command can the prohibition be lifted.

Table 35.5 Available Operations and Security Settings

Function	All Security Settings and Erasure, Programming, and Read Operations (√: Executable, ×: Not Executable, —: Not Supported)		Point for Caution Regarding the Security Setting	
	Serial programming	Self-programming	Serial programming	Self-programming
OTP	• Areas for which OTP is set - Block erasure commands: × - Programming commands: × - Read commands: √ • Areas for which OTP is not set - Block erasure commands: √ - Programming commands: √ - Read commands: √	• Areas for which OTP is set - Block erasure: × - Programming: × - Reading: √ • Areas for which OTP is not set - Block erasure: √ - Programming: √ - Reading: √	• The OTP setting cannot be released. • Execution of the configuration clearing command is not possible.	The OTP setting cannot be released.

ID authentication	• When the ID codes do not match
	- Block erasure commands: ×
	- Programming commands: ×
	- Read commands: ×
	• When the ID codes match
	- Block erasure commands: √
	- Programming commands: √
	- Read commands: √
		• When the ID codes do not match
		- Code flash memory
		  - Block erasure: ×
		  - Programming: ×
		  - Reading: √
		- Data flash memory
		  - Block erasure: √
		  - Programming: √
		  - Reading: √
		• When the ID codes match

		- Programming: √
		- Reading: √
			• The configuration clearing command can initialize the setting for prohibition.
			• The setting for prohibition of block erasure commands is not available.
			• The setting for prohibition of programming commands is not available.
			• The setting for prohibition of read commands is not available.
				ID authentication is always in effect.

Prohibition of the connection of a serial programmer	• Block erasure commands: × • Programming commands: × • Read commands: ×	• Block erasure: √ • Programming: √ • Reading: √	Since execution of the configuration clearing command is not supported, initialization of the setting for prohibition is not possible.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of block erasure commands	• Block erasure commands: × • Programming commands: √ • Read commands: √	• Block erasure: √ • Programming: √ • Reading: √	• Since execution of the configuration clearing command is not supported, initialization of the setting for prohibition is not possible. • The setting for prohibition of serial programmer connection is not available. • The setting for ID authentication to be effective for serial programming is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of programming commands	• Block erasure commands: × • Programming commands: × • Read commands: √	• Block erasure: √ • Programming: √ • Reading: √	• Executing the configuration clearing command only can initialize the settings prohibited. • The setting for ID authentication to be effective for serial programming is not available.	Initialization of the settings prohibited is impossible because the configuration clearing command is not supported.
Prohibition of read commands	• Block erasure commands: √ • Programming commands: √ • Read commands: ×	• Block erasure: √ • Programming: √ • Reading: √		

The flash memory supports various protection functions. The protection functions supported by the flash memory are listed in **Table 35.6**.

Table 35.6 Summary of Protection Functions

Function	Description
Block protection	Lock bit settings can be individually made to enable or disable programming and erasure of each block of the user area and the extended user area of code flash memory. Programming and erasure by self-programming of an area for which the lock bit is set and the lock bit function is enabled are prohibited. Programming or erasure can proceed again when the lock bit function is disabled after having been enabled. When a block of code flash memory is erased, the lock bit for that block is also erased.
Hardware protection	The level on the FLMD pin can be set to prohibit programming and erasure of the code flash memory. - FLMD0 = 0: Programming prohibited - FLMD0 = 1: Programming permitted
Variable reset vector	The protection settings include control of the reset vector. As shown in **Figure 35.4**, after programming of a new boot program while leaving the existing boot program in place, changing the reset vector is a safe way to change to the area holding the new boot program. The areas that can be specified by using the reset vector are the user area and the extended user area.

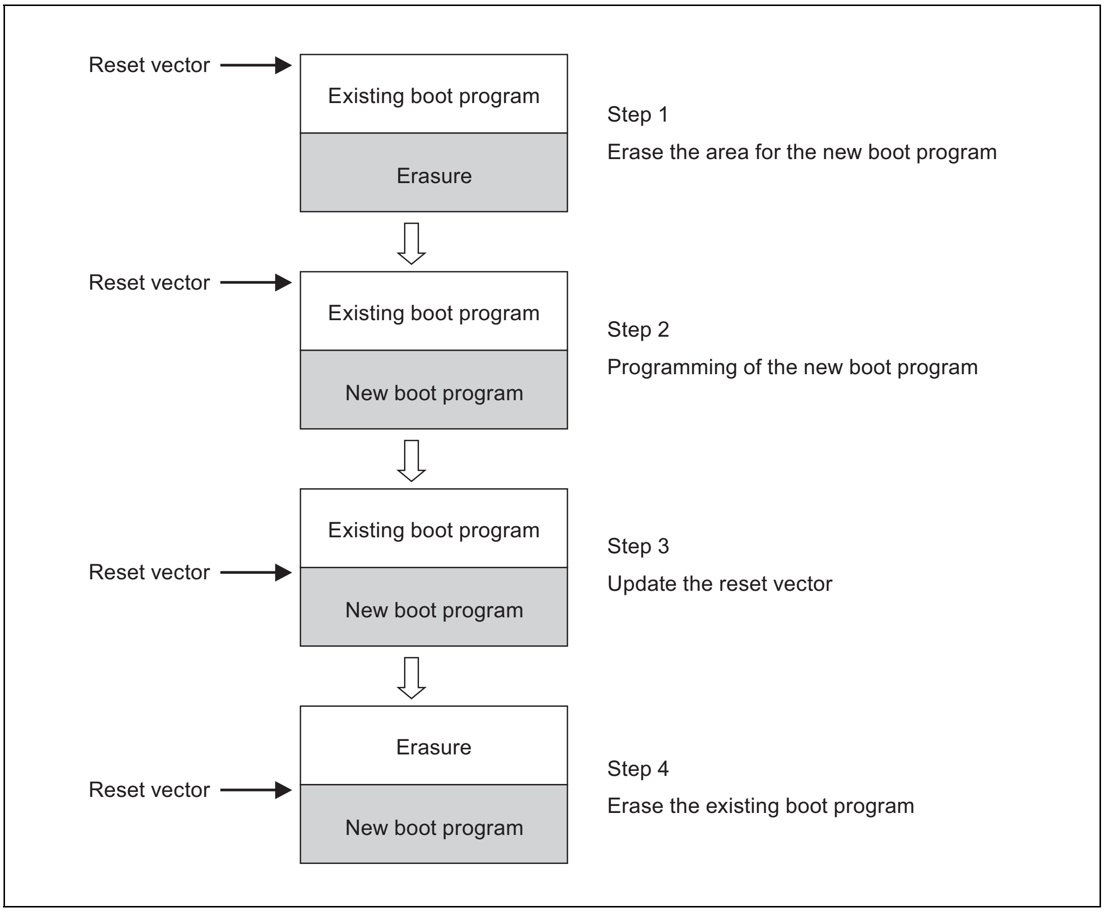

Figure 35.4 Utilizing the Variable Reset Vector Function to Update the Boot Program

NOTE

After step 4, a reset leads to updating of the reset vectors for which RBASE is changed.

35.5 Serial Programming

A dedicated flash memory programmer can be used to handle flash memory in serial programming mode.

35.5.1 Environments for Programming

The recommended environments for handling the flash memory of the microcontroller with data are described below.

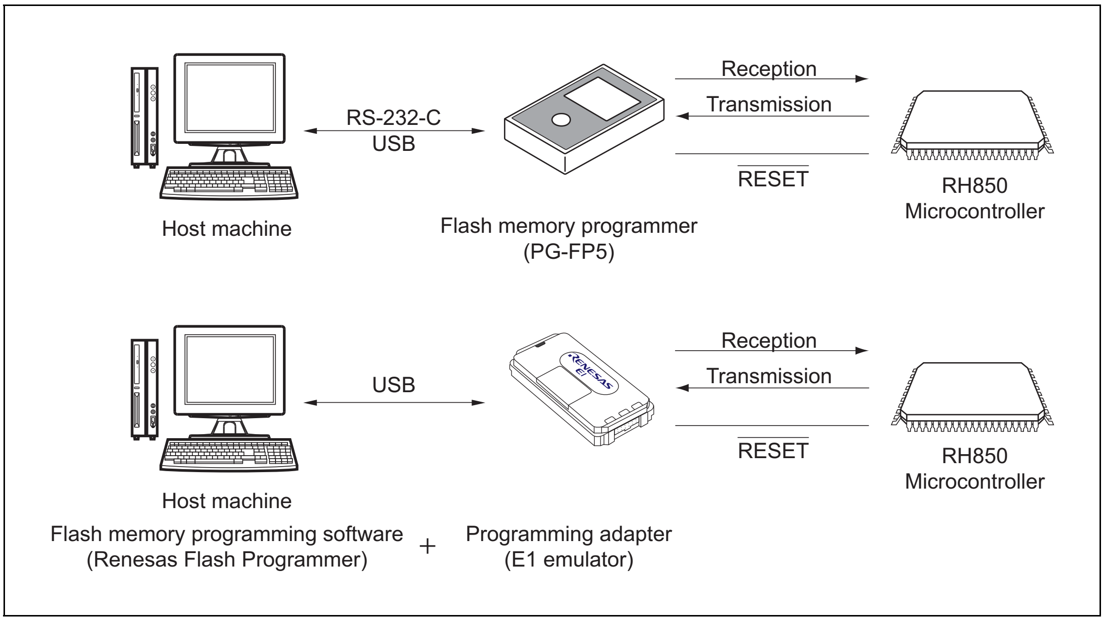

Figure 35.5 Flash Memory Programming Environment

By using the PG-FP5 flash memory programmer or the combination of the Renesas Flash Programmer (software for writing to flash memory) running on the host machine and the E1 emulator as an programming adaptor, the user is easily able to erase, program, and verify the contents of the on-chip memory of flash-memory-equipped microcontrollers from Renesas Electronics.

The PG-FP5 flash memory programmer handles programming from a host machine or programming in stand-alone mode while the Renesas Flash Programmer only handles programming from a host machine.

NOTE

For details on the PG-FP5, see the *PG-FP5 Flash Memory Programmer User's Manual*. For details on the Renesas Flash Programmer of flash programming software, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

35.6 Communication Modes

35.6.1 Asynchronous Flash Programming Interface — 1-Wire UART

The single-wire asynchronous serial programming interface, 1-wire UART is connected to the flash memory programmer with the following ports.

- FPDR(JP0_0): Receive data input/transmit data output

35.6.2 Asynchronous Flash Programming Interface — 2-Wire UART

The double-wire asynchronous serial programming interface, 2-wire UART is connected to the flash memory programmer with the following ports.

- FPDR(JP0_0): Receive data input
- FPDT(JP0_1): Transmit data output

35.6.3 Synchronous Flash Programming Interface CSI

The synchronous serial programming interface CSI is connected to the flash memory programmer with the following ports.

- FPDR(JP0_0): Receive data input
- FPDT(JP0_1): Transmit data output
- FPCK(JP0_2): Serial clock input

The flash memory programmer outputs the serial data clock SCK and the microcontroller operates as a slave.

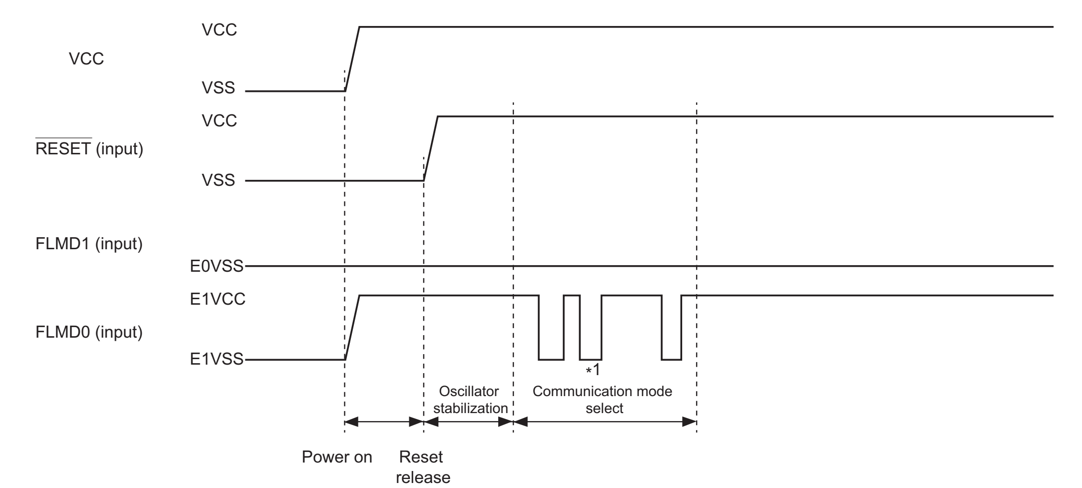
NOTE

For details on Renesas Flash Programmer, see the *Renesas Flash Programmer Flash Programming Software User's Manual*.

35.6.4 Selection of Communication Method

In RH850/P1M-E, communication method can be selected by pulse input to the FLMD0 pin (up to 7 pulses) after transition to the flash memory programming mode. The FLMD0 pulse is generated by a dedicated flash memory programmer.

Figure 35.6 shows the relation between the number of pulses and communication method.



Note 1. The number of clock cycles to be inserted depends on the communication method as in the following table.

FLMD0 Pulse	Communication Method
0	2-wire UART
7	1-wire UART
3	CSI
Other than above	Setting prohibited

Figure 35.6 Selection of Communication Method

35.7 Self-Programming

35.7.1 Outline

The RH850/P1M-E supports programming of the flash memory by the user program itself.

When the data flash memory is programmed, the background operation facility makes it possible to execute a programming program from the code flash memory to program the data flash memory. Furthermore, the programming program can be copied to local RAM in advance of the programming operation, and executed from the given destination to perform the programming.

The programming program can be copied to the local RAM in advance and executed to program the code flash memory.

35.7.2 Background Operation

Background operations can be used when the combination of the flash memory for writing and the flash memory for reading is any of those listed below.

Table 35.7 Conditions under which Background Operation is Usable

Range for Writing	Range for Reading
Data flash memory	Code flash memory

35.7.3 Enabling Self-Programming

The self-programming function can be activated in normal operating mode.

Erasure and programming of the code flash memory by the self-programming function is enabled by making the FLMD0 pin high level.

This prevents unnecessary overwriting of the program if the device operates incorrectly.

The FLMD0 pin is made high level by using one of the following methods.

- The FLMD0 pin is externally pulled up.
- The FLMD0 pin is pulled up by the FLMDCNT register.

The outline of the FLMDCNT register is described in **Section 35.7.3.1, FLMDCNT Register**.

35.7.3.1 FLMDCNT Register

This register specifies the internal pull-up or pull-down of the FLMD0 pin.

The correct write sequence using the FLMDPCMD register is required in order to update this register. For details, see **35.7.4, Write-Protected Registers**.

Access: This register can be read/written in 32-bit units.

Address: FFA0 0000_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

31 to 1	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
0	FLMDPUP	FLMD0 Pin Software Control 0: Pull-down selected 1: Pull-up selected

35.7.4 Write-Protected Registers

FLMDCNT register is a write-protected register.

This section describes how to write to write-protected registers.

Table 35.9 shows the list of write-protected registers.

Table 35.9 List of Write-protected Registers

Module Name	Address	Register Name	Description	Access Size	Value after Reset	Protection Register	
						Command Register	Status Register
FLMD	$FFA00000_H$	FLMDCNT Register	FLMD Control Register	32	0000 0000_H	FLMDPCMD	FLMDPS

35.7.4.1 Write Procedure to Write-Protected Registers

Write access to a write-protected register is enabled by using the following write sequence:

1. Write the fixed value 0000 $00A5_H$ to the protection command register.
2. Write the desired value to the protected register.
3. Write the inverse of the desired bit value to the protected register.
   Write the inverse of the desired bit value to the reserved bits of the protected register.
4. Write the value written in step 2 to the protected register.
5. Verify that the desired value has been written to the protected register.
   Verify successful write of the desired value to the protected register by verifying that the error monitor bit in the write sequence status register is “0”.
   In case the write was not successful, indicated by the error monitor bit set to “1”, the entire sequence has to be restarted from step 1.

In case of any write access to a different register during step 1 to step 4 of the above sequence, the protection mechanism behaves as follows. (The same mechanism takes place when an interrupt is accepted during write sequence and write access to a different register is made during interrupt processing.)

- When write access to a different register is made in the same module, the write to the write-protection target register fails and the error monitor bit is set to 1.
- When write access to a register in another module is made, the write to the write protection register can be completed successfully.

For read access to a different register in the same module or a register in a different module is made, the write sequence does not fail.

35.7.4.2 Interrupt during Write Sequence

If an interrupt is generated during the write sequence, the protection mechanism operates as follows:

(1) If an interrupt request is accepted during the write sequence and write access to a register of the same module is made:

The write operation to the write-protected register fails and the error monitor bit is set to 1. **Figure 35.7** shows an execution example.

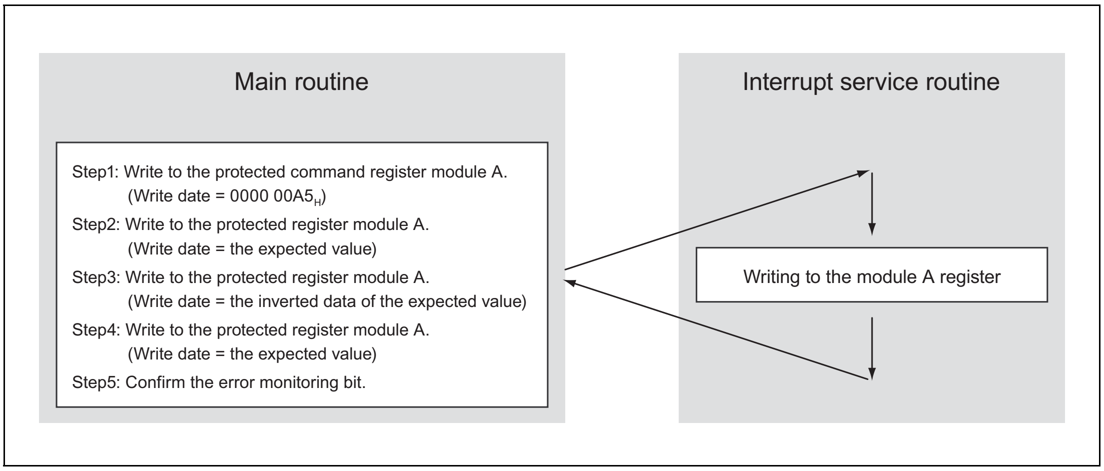

Figure 35.7 Example of Suspended Write Sequence

(2) If an interrupt request is accepted during the write sequence and write access to a register of a different module is made.

The write operation to the write-protected register can be completed. **Figure 35.8** shows an execution example.

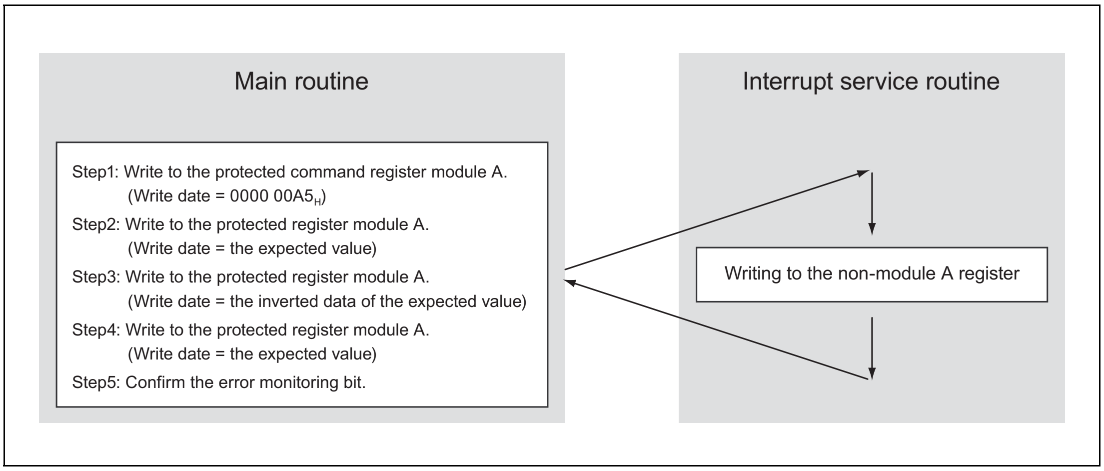

Figure 35.8 Example of Successful Write Sequence

For the write protection target registers of the RH850/P1M-E, see **Section Table 35.9, List of Write-protected Registers**.

35.7.4.3 Emulation Break during Write Sequence

If an emulation break occurs during the above write sequence, e.g. because of a breakpoint hit, the register protection is suspended until normal operation is resumed. Even if any register of the same module is accessed during the break, the write sequence is not suspended and the error monitor bit is not set to 1.

35.7.4.4 FLMDCNT Register Protection

(1) FLMDPCMD — FLMD Write Protection Command Register

This register is used as a command register to write to write-protection target registers.

Access: This register can only be written in 32-bit units.

Address: FFA0 0004_H

Value after reset: 0000 0000_H
This register is initialized by any reset source.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read.
0	FLMDPRERR	Write Sequence Error Monitor 0: A protection error does not occur. 1: A protection error does occur.

35.8 Reading Flash Memory

35.8.1 Reading Code Flash Memory

Special settings are not required to read code flash memory in normal mode. Data can simply be read out through access to addresses in the code flash memory.

Reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Furthermore, since the values of data cannot be guaranteed when an ECC error has been generated, use blank checking when you need to confirm that an area is in the non-programmed state.

NOTE

For details on blank checking, see the "*8.5 Blank Checking of Code Flash Memory*" of the *RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

35.8.2 Reading Data Flash Memory

Configure the number of read cycles in the EEPRDCYCL register prior to reading data from data flash memory in normal mode. Once this register is properly configured, data can be read by simply accessing addresses in the data flash memory.

Values read from data flash memory that has been erased but not yet been programmed again are undefined. Use blank checking when you need to confirm that an area is in the non-programmed state.

35.9 Description of Registers

35.9.1 Registers Related to Data Flash Memory

Table 35.12 shows the list of registers related to data flash memory.

Table 35.12 List of Registers Related to Data Flash Memory

Register Name	Abbreviation	R/W	Value after Reset	Address	Access Size
Data flash memory read cycle setting register	EEPRDCYCL	R/W	$0F_H$	FFC5 9810_H	8

35.9.1.1 EEPRDCYCL — Data Flash Memory Read Cycle Setting Register

This register sets the read cycle of data flash memory.

This register is initialized by Power On Reset, System Reset 1, System Reset 2, or Application Reset 1.

Access: This register can be read/written in 8-bit units.

Address: FFC5 9810_H

Value after reset: $0F_H$

Bit	7	6	5	4	3	2	1	0
	—	—	—	—	FRDCYCLD[3:0]			
Value after reset	0	0	0	0	1	1	1	1
R/W	R	R	R	R	R/W	R/W	R/W	R/W

Table 35.13 EEPRDCYCL Register Contents

Bit Position	Bit Name	Function
7 to 4	Reserved	When read, the value after reset is returned. When writing, write the value after reset.
3 to 0	FRDCYCLD[3:0]	Number of data flash memory read cycles. Data flash memory is read in setting value + 1 cycle.

FRDCYCLD[3:0]	Number of data flash memory read cycles
0000 to 0010	Setting prohibited
0011	4
0100	5
0101	6
0110	7
0111	8
1000	9
Other than above	10

35.9.2 Registers Related to Write and Erase Protect of Flash Memory

Table 35.14 shows the list of registers related to write and erase protect of flash memory.

Table 35.14 Registers Related to Write and Erase Protect of Flash Memory

Register Name	Abbreviation	R/W	Value after Reset	Address	Access Size
FHVE15 control register	FHVE15	R/W	0000 0000_H	FFF8 $A430_H$	32
FHVE3 control register	FHVE3	R/W	0000 0000_H	FFF8 2410_H	32

35.9.2.1 FHVE15 — FHVE15 Control Register

FHVE15 is a readable/writable register for software protection of flash memory against programming, erasure, and blank checking. Set both the FHVE15 and FHVE3 registers in the programmable, erasable, and blank-checkable state (0000 0001_H) to program, erase, or blank-check flash memory.

This register is initialized by Power On Reset, System Reset 1, Sytem Reset 2, or Application Reset 1.

Access: This register can be read/written in 32-bit units.

Address: FFF8 $A430_H$

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 35.15 FHVE15 Register Contents

Bit Position	Bit Name	Function
31 to 1	Reserved	When read, the value after reset is read. When writing, write the value after reset.
0	FHVE15CNT	0: Programming, erasure, and blank checking are disabled. 1: Programming, erasure, and blank checking are enabled.

35.9.2.2 FHVE3 — FHVE3 Control Register

FHVE3 is a readable/writable register for software protection of flash memory against programming, erasure, and blank checking. Set both the FHVE15 and FHVE3 registers in the programmable, erasable, and blank-checkable state (0000 0001_H) to program, erase, or blank-check flash memory.

This register is initialized by Power On Reset, System Reset 1, or System Reset 2.

Access: This register can be read/written in 32-bit units.

Address: FFF8 2410_H

Value after reset: 0000 0000_H

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

35.9.3 Registers Related to Product Information

Table 35.17 shows the list of registers related to product information.

Table 35.17 List of Registers Related to Product Information

Register Name	Abbreviation	R/W	Value after Reset	Address	Access Size
Product name storage register (1)	PRDNAME1	R	See **Table 35.19**	FFCD 00D0$_H$	32
Product name storage register (2)	PRDNAME2	R	See **Table 35.19**	FFCD 00D4$_H$	32
Product name storage register (3)	PRDNAME3	R	See **Table 35.19**	FFCD 00D8$_H$	32
Product name storage register (4)	PRDNAME4	R	See **Table 35.19**	FFCD 00DC$_H$	32

35.9.3.1 PRDNAMEn — Product Name Storage Register (n = 1 to 4)

This register stores the product name. The product model name is stored in 16-byte ASCII code, and PRDNAME1, PRDNAME2, PRDNAME3 and PRDNAME4 correspond to the fourth to first bytes, eighth to fifth bytes, twelfth to ninth bytes, and 16th to 13th bytes of the product model name respectively.

Access: This register can be read in 32-bit units.

Address: PRDNAME1: FFCD 00D0$_H$
PRDNAME2: FFCD 00D4$_H$
PRDNAME3: FFCD 00D8$_H$
PRDNAME4: FFCD 00DC$_H$

Value after reset: See **Table 35.19**.

35.9.4 Registers Related to Reset Vector

Table 35.20 shows the list of registers related to reset vector.

Table 35.20 List of Registers Related to Reset Vector

Register Name	Abbreviation	R/W	Value after Reset	Address	Access Size
Reset vector 0 register	GREG8	R	Specified by the user	FFCD 0020_H	32

35.9.4.1 GREG8 — Reset Vector 0 Register

Access: This register can be read in 32-bit units.

Address: FFCD 0020_H

Value after reset: Specified by the user

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Reset Vector 0															
Value after reset	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Reset Vector 0															
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0	1/0

Table 35.21 GREG8 Register Contents

Bit Position	Bit Name	Function
31 to 0	Reset Vector 0	Reset Vector

35.10 Option Bytes

The option bytes of the flash memory are an expansion area and hold data specified by the user for a variety of purposes. Initial settings for peripheral modules and so on as specified by the option bytes become effective on release from the reset state.

35.10.1 Option Byte Setting

Be sure to set the option byte area that corresponds to the optional functions listed below, before writing a program to the flash memory.

The optional functions specified by the option bytes are as follows.

- Function of port group JP0
- Activation code method of WDTA0
- Start mode of WDTA0
- Enabling or disabling WDTA0
- Initial value of the overflow interval time for WDTA0
- Setting of $\overline{\text{EVTO}}$/$\overline{\text{EVTI}}$
- $\overline{\text{ERROROUT}}$ output mode setting

35.10.1.1 Setting of Option Byte 0

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OPWDRUN	—	—	—	OPWDOVF[2:0]			—	—	OPWDVAC	OPWDMDS	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OPEVTO	OPEVTI	—	—	—	—	—	—	—	—	—	—	—	—	ERROUTSEL	—

Table 35.22 Option Byte 0 Setting

Bit Position	Bit Name	Function
31	OPWDRUN	Specifies the start mode for WDTA0. 0: Software trigger start mode 1: Default start mode
30 to 28	Reserved	When writing, write 1.
27 to 25	OPWDOVF[2:0]	Specifies the reset value of the overflow interval time control bits WDTAnMD.WDTAnOVF[2:0].

OPWDOVF2	OPWDOVF1	OPWDOVF0	Overflow Time
0	0	0	2^{9} / WDTATCKI
0	0	1	2^{10} / WDTATCKI
0	1	0	2^{11} / WDTATCKI
0	1	1	2^{12} / WDTATCKI
1	0	0	2^{13} / WDTATCKI
1	0	1	2^{14} / WDTATCKI
1	1	0	2^{15} / WDTATCKI
1	1	1	2^{16} / WDTATCKI

Bit Position	Bit Name	Function
24, 23	Reserved	When writing, write 1.
22	OPWDVAC	Specifies the trigger register for generating a counter restart trigger to avoid counter overflow. 0: WDTAnWDTE (fixed) 1: WDTAnEVAC (variable) Note: For details, see **Table 21.7, WDTA Start-up Options**.
21	OPWDMDS	Selects the counter clock source of WDTA0. 0: High-speed mode (CLK_IOSC): 8 MHz) 1: Low-speed mode (CLK_IOSC/32: 250 kHz)
20 to 16	Reserved	When writing, write 1.
15	OPEVTO	EVTO Setting 0: EVTO is used 1: EVTO is not used
14	OPEVTI	EVTI Setting 0: EVTI is used 1: EVTI is not used
13 to 2	Reserved	When writing, write 1.
1	ERROUTSEL	ERROUTSEL 0: ERROROUT signals from master and checker are output separately. 1: ERROROUT signals from master and checker are output after merged.
0	Reserved	When writing, write 1.

35.10.1.2 Setting of Option Byte 2

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	OPJTAG[1:0]		—	—	—	—	—	—	—	—	—	—	—	—	—

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—

Table 35.23 Option Byte 2 Setting

Bit Position	Bit Name	Function
31	Reserved	When writing, write 1.
30, 29	OPJTAG[1:0]	Switch of the Debug Interfaces The following debug interface is selected depending on the combination of the OPJTAG1 and OPJTAG0.
		OPJTAG1 / OPJTAG0 / Debug Interface: 0 / 0 / GPIO 0 / 1 / LPD (4 pins) 1 / 0 / Setting prohibited 1 / 1 / Nexus (JTAG)
28 to 0	Reserved	When writing, write 1.

35.10.2 OPBT0 — Option Byte 0

Access: This register can only be read in 32-bit units.

Address: FFCD 0030_H

Value after reset: Specified by the user

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	OPWD RUN	—	—	—	OPWDOVF[2:0]			—	—	OPWD VAC	OPWD MDS	—	—	—	—	—
Value after reset	0/1	1	1	1	0/1	0/1	0/1	1	1	0/1	0/1	1	1	1	1	1

35.11 ECC Test Area

In the ECC test area in **Figure 35.1**, data to test the ECC decoder of code flash is stored (**Table 35.26, ECC Test Data**). The user can attempt intentional error injection to the ECC decoder by reading data from this area.

Table 35.26 ECC Test Data

Address	Pattern name	Flash content																									
		ECC (bit)									Data (bit)																
		8	7	6	5	4	3	2	1	0	127	126	125	124	123	122	121	120	...	7	6	5	4	3	2	1	0

0100 BFF0$_H$	ALL-1	1	0	1	0	0	1	0	1	1	1	1	1	1	1	1	1	1	...	1	1	1	1	1	1	1	1

35.12 Usage Note

1. Reading areas where programming or erasure was interrupted
   When programming or erasure of an area of flash memory is interrupted, the data stored in the area become undefined. To avoid the reading out of undefined data, which might cause a malfunction, take care not to fetch instructions or read data from areas where programming or erasure was interrupted.

2. Reading the code flash memory that has been erased but not yet been programmed again
   Note that reading from an area of code flash memory that has been erased but not yet been programmed again (i.e. that is in the non-programmed state) can lead to the detection of an ECC error and generation of the corresponding exception. Use blank checking when you need to confirm that an area is in the non-programmed state.

NOTE

For details on blank checking, see the "*8.5 Blank Checking of Code Flash Memory*" of the *RH850/P1M-E Flash Memory User's Manual: Hardware Interface*.

3. Prohibition of additional writing
   Writing to a given area two or more times is not possible. When overwriting data in an area of flash memory after writing to the area has been completed, erase the area first.

4. Reset during programming and erasure
   In the case of a reset due to the signal on the $\overline{\text{RESET}}$ pin during programming and erasure, wait for at least the minimum width of reset pulse once the operating voltage is within the range stipulated in the electrical characteristics after assertion of the reset signal before releasing the device from the reset state.

5. Allocation of vectors for interrupts and other exceptions during programming and erasure
   Generation of an interrupt or other exception during programming or erasure may lead to fetching of the vector from the code flash memory. If this does not satisfy the conditions for using background operation, set the address for vector fetching to an address that is not in the code flash memory.

6. Abnormal termination of programming and erasure
   Even if programming/erasure ends abnormally due to reset input or power off, the programming/erasure state of the flash memory with undefined data cannot be verified or checked. For the area where programming/erasure ends abnormally, the blank check function cannot judge whether the area is erased successfully or not. Erase the area again to ensure that the corresponding area is completely erased before using.
   If programming and erasure of code flash memory are not completed normally, the lock bit for the target area may be enabled (locked). In such cases, erase the block to erase the lock bit while the lock bit is in the disabled state (the area is not locked).

7. Items prohibited during programming and erasure and blank checking
   Do not perform the following operations during programming and erasure and blank checking.
   - Set the operating voltage from the power supply outside the allowed range.
   - Update the value of FHVE15 and FHVE3.

Section 36 RAM

36.1 Features

This chip has the following RAMs:

- Instruction cache RAM for PE
- Local RAM (LRAM) for PE
- Global RAM (GRAM)
- Emulation RAM
- DTS RAM
- CSIH RAM
- FlexRay RAM
- RS-CANFD RAM

From the viewpoint of functional safety, all RAMs, except for Instruction cache RAM and ERAM, are protected by Error-Correcting Code (ECC). Instruction cache RAM provides only Error-Detecting Code (EDC).

36.1.1 List of On-chip RAM

Table 36.1 shows the list of on-chip RAM.

Table 36.1 List of On-chip RAM

RAM List	P1M-E
Instruction cache RAM (tag)	256words × 4
Instruction cache RAM (data)	4KB × 4
Local RAM (PE1)	128KB
Global RAM (Bank A/B)	64KB
Emulation RAM	32KB*1 / 8KB*2
DTS RAM	4KB
CSIH RAM	512B/channel
FlexRay RAM	8KB/module 512Bx2/module
RS-CANFD RAM	3KB/module 7.4KB/module

Note 1. Only available in devices with 2-MB flash memory

Note 2. Only available in devices with 1-MB flash memory

36.2 Overview

36.2.1 Function overview

36.2.1.1 Access

The CPU, DMAC/DTS, and H-Bus masters can access Local RAM (PE1) and Global RAM (Bank A/B). For details, see **Section 3, CPU System**.

36.2.1.2 Emulation RAM

The specific area of the code flash can be replaced with this RAM on a page unit basis. The access latency from the CPU after replacement is the same as that of the Code Flash.

36.2.1.3 ECC

From the viewpoint of functional safety, all RAM, except for Instruction cache RAM and Emulation RAM, are protected by Error-Correcting Code (ECC). Instruction cache RAM provides only Error-Detecting Code (EDC). For details, see **Section 31, Functional Safety**.

36.2.1.4 RAM initialization

To avoid time-consuming initialization by software, a hardware mechanism is implemented to initialize the following RAMs. This initialization includes correct setting of the related ECC bits.

- LRAM for PE
- GRAM
- DTS RAM
- CSIH RAM

RAM initialization to 0 is executed by all reset. RAM initialization can be disabled according to the setting in RAM Initialization Mode Control Registers. For details, see **Section 8, Reset Controller**.

36.3 Backup Register

36.3.1 List of Registers

The backup registers are listed in the following table.

Table 36.2 List of Registers

Register Name	Symbol	Address
Backup register 0	BRAMDAT0	FFC0 $A000_H$
Backup register 1	BRAMDAT1	FFC0 $A004_H$
Backup register 2	BRAMDAT2	FFC0 $A008_H$
Backup register 3	BRAMDAT3	FFC0 $A00C_H$

36.3.2 BRAMDATn — Backup Register

The BRAMDATn registers can be read/written in 32-bit units.

Storing data in backup registers before self-diagnosis (BIST) enables the retention of data during this test.

This register is not initialized by any reset.

Access: This register can be read/written in 32-bit units.

Address: FFC0 $A000_H$ + n x 4_H (n = 0 to 3)

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	BRAMDTn[31:16]

36.4 Emulation RAM

36.4.1 Emulation RAM

The RH850/P1M-E includes emulation RAM to emulate the code flash. The emulation RAM consists of 8 Kbytes (one 8-Kbyte bank) of flash memory for products with 1 Mbyte of flash memory, and 32 Kbytes (four 8-Kbyte banks) for products with 2 Mbytes of flash memory. The emulation RAM is available for the code flash emulation described below.

36.4.2 Code Flash Emulation Function Using the Emulation RAM

Mapping to the code flash area enables code flash to move to the emulation RAM and it enables the emulation RAM to emulate the code flash. The code flash data can be dynamically modified during execution of a user program via the emulation RAM which has been mapped to the code flash area.

Figure 36.1 shows the circuit configuration around the emulation RAM.

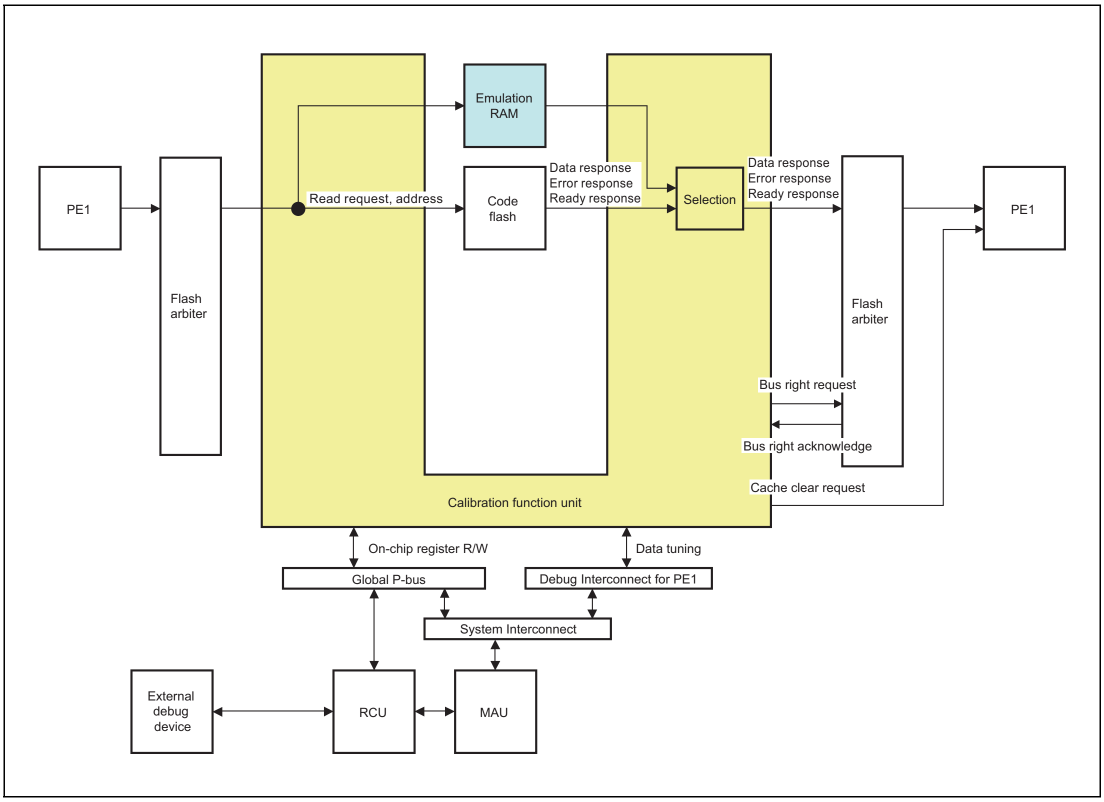

Figure 36.1 Circuit Around the Emulation RAM

36.4.3 EmulationRAM memory map

The ERAM memory map in RH850/P1M-E is shown below.

The ERAM area consists of four blocks of ERAM mapped at 128 KB intervals.

Each block contains 8 KB of ERAM, making a total of 32 KB.

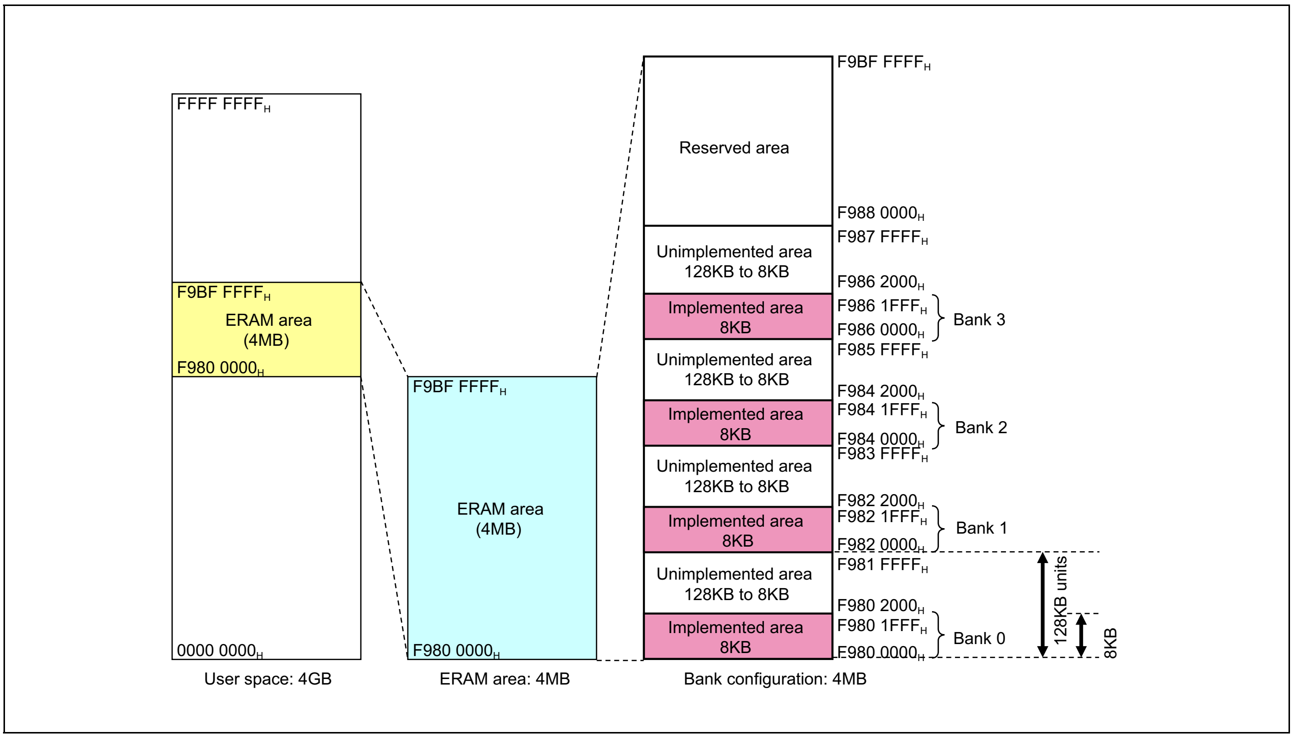

Figure 36.2 Emulation RAM memory map

36.5 Calibration Function

For the memory overlay and Emulation RAM functionality the Calibration Function Unit (CFU) is provided. This unit supports to configure overlay of Emulation RAM (ERAM) onto the Flash memory space accessed by PE1.

36.5.1 Calibration Function Unit (CFU)

The unit CFU is used to manage Flash overlay mechanism. Based on given configuration via debug control interface such as JTAG the unit manages to overlay RAM blocks onto Flash memory.

36.5.2 CFU Register List

Function registers of calibration function unit (CFU) are mapped to $FFFF7800_H$ to $FFFF79FF_H$ in the peripheral I/O area

Table 36.3 List of Registers

Address	Register	Function
FFFF 7808_H	TM_CC	Cache clear operation
FFFF 7810_H	TM_ME	ERAM bank 0 to 3 mapping enable
FFFF 7814_H	TM_MS	ERAM bank 0 to 3 mapping status
FFFF 7840_H	TM_MA0	ERAM bank 0 mapping address
FFFF 7844_H	TM_MA1	ERAM bank 1 mapping address
FFFF 7848_H	TM_MA2	ERAM bank 2 mapping address
FFFF $784C_H$	TM_MA3	ERAM bank 3 mapping address

36.5.3 TM_CC — Cache Clear Operation Register

This register is used to issue cache clear requests to the unit that has the flash memory data cache.

This register can be read or written in 32-bit units.

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	CCLR
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Table 36.4 TM_CC Register Contents

Bit Position	Bit Name	Function
0	CCLR	A cache clearing request is issued by writing 1 to this bit. Writing 0 has no effect. The value read is 1 if this bit is read before the response to a cache clear request is completed and 0 after the response to a cache clear request is completed. **CAUTION** After 1 has been written to this bit, writing 1 to the bit is ignored if this is done before the response to the earlier cache clear request is complete (the cache is not cleared in response to the latter request). After 1 has been written to this bit, if 0 is written before the response to the cache clear request is complete, this will not cancel the response to the earlier request. When executing cache clear requests in succession, it is necessary to check that the previous cache clear request is complete (by reading this bit and confirming that it is 0) before issuing the next cache clear request. 0: (When read) A cache clear request is not being processed or the response to a cache clear request is complete. 1: (When written) Issue a cache clear request. (When read) A cache clear request is being processed.

36.5.4 TM_ME — Tuning Memory Mapping Enable Register

The tuning memory mapping enable register is used to control mapping of ERAM banks 0 to3 to the flash area.

This register can be read or written in 32-bit units.

CAUTIONS

1. **When the mapping enable bit TMEn is updated (including writing of its current value again (updating without changing the value)), a cache clear request is issued. (n = 0 to 3)**
2. **Before ERAM bank n and tuning memory mapping address register n (the TM_MAn register) are updated, the corresponding mapping enable bit TMEn must be set to 0 (disabling mapping) (n = 0 to 3).**
3. **After updating the TM_ME register, wait and verify that the value read from the TM_MS register is the same as the setting of the TM_ME register (that is, wait until the mapping setting specified in the TM_ME register is actually applied).**
4. **After updating the mapping enable bit TMEn, the following processing is executed automatically and the mapping setting of each ERAM bank is switched.**
   (1) Updating mapping enable bits TME0 to TME3 causes the calibration function unit (CFU) to issue a flash memory bus right request to the flash arbiter.
   (2) After acquiring the flash memory bus right, the calibration function unit (CFU) switches the mapping settings of all the ERAM banks.
   (3) The calibration function unit (CFU) issues a cache clear request
   (→to maintain coherency between the data in the flash memory or ERAM and the cache).
   (4) The calibration function unit (CFU) releases the flash memory bus right.
   However, if the mapping enable bit TMEn is updated during a system reset while the debug circuit reset mask request signal is high (db_rmsk = "H"), the calibration function unit (CFU) immediately switches the mapping settings of the ERAM banks without acquiring the flash memory bus right.
5. **The mapping settings of the ERAM banks are switched independently of the CPU instruction execution sequence.**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Table 36.5 TM_ME Register Contents

Bit Position	Bit Name	Function
3 to 0	TME[3:0]	These bits control mapping for the user space of ERAM bank n (flash area). (n = 0 to 3) 0: Mapping disabled. 1: Mapping enabled. **CAUTION** In 1 MB flash memory products, only TME0 can be set to 1 (mapping enabled). Do not set TME1 to TME3 to 1 (mapping enabled).

36.5.5 TM_MS — Tuning Memory Mapping Status Register

The tuning memory mapping status register indicates the state of mapping for the flash area of ERAM banks 0 to 3.

This register is a read-only register that can be read in 32-bit units.

CAUTION

After updating the TM_ME register, wait and verify that the value read from the TM_MS register is the same as the setting of the TM_ME register (that is, wait until the mapping setting specified in the TM_ME register is actually applied).

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—	—
Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Value after reset	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Table 36.6 TM_MS Register Contents

Bit Position	Bit Name	Function
3 to 0	MES[3:0]	These bits indicate the state of mapping for the user space of ERAM bank n (flash area). (n = 0 to 3) 0: Mapping disabled. 1: Mapping enabled.

36.5.6 TM_MA0 to 3 — Tuning Memory Mapping Address Registers 0 to 3

Tuning memory mapping address registers 0 to 3 are used to set the mapping addresses of ERAM banks 0 to 3.

ERAM banks 0 to 3 can be mapped to any address range (up to 4 areas) in the flash memory. The area to which ERAM bank n (n = 0 to 3) is mapped in the flash memory (ROM) can be replaced by ERAM bank n (n = 0 to 3) (this is known as the flash emulation function). This allows any area in the flash memory to be read or written.

Mapping addresses are set in units of 8 KB/bank.

Mapping of up to 4 banks is possible.

This register can be read or written in 32-bit units.

CAUTIONS

1. **Before tuning memory mapping address register n (the TM_MAn register) is updated, the corresponding mapping enable bit TMEn must be set to 0 (disabling mapping). (n = 0 to 3)**
2. **Be sure to configure the external debugger so that the mapping settings (mapping address of the bank for which mapping is enabled) of ERAM banks 0 to 3 do not overlap. The CFU cannot access the ERAM correctly if the mapping settings are such that multiple banks are hit at the same time.**

Bit	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Table 36.7 TM_MA0 to 3 Register Contents

Bit Position	Bit Name	Function
31 to 0	TMAn[31:0]	These bits specify the mapping address of ERAM bank n. **CAUTION** • Specify an address within the flash area (flash cache) in the user space. If an address outside the flash area (flash cache) is specified, the operation is not guaranteed. • The TMAn31 to 25 and 12 to 0 bits are fixed to "0". <table><tr><th>Mapping unit</th><th>Bits that determine mapping</th><th>Ignored bits</th></tr><tr><td>8 KB/block</td><td>TMAn24 to 13</td><td>TMAn31 to25, 12 to 0</td></tr></table>

36.6 Usage Notes

On path between Local RAM and CPU, buffers are implemented to realize fast Local RAM access.

Therefore when a load instruction is executed for the same address after a store instruction to Local RAM, the load instruction may read out data from buffers instead of data on Local RAM. Either of following procedure is to surely read data on Local RAM, Either of following procedures can be used to surely read data on Local RAM.

1. Read out the first written data, only after more than 32 bytes of data are written into Local RAM.
2. Execute a SYNCM instruction before a load instruction is executed on the same address after a store instruction to the Local RAM.

Section 37 Electrical Specifications

37.1 Overview

The specifications in this section are for devices operating under the following conditions. Where a special condition is required for a given specification, the condition will be indicated. Furthermore, the specifications in this section are not guaranteed unless the conditions listed below are met.

37.1.1 General Measurement Conditions

37.1.1.1 Common Conditions

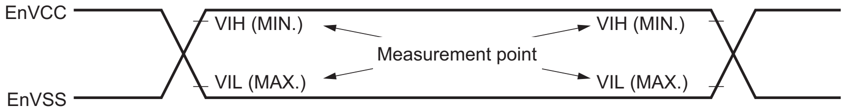
- Power supply
  - VCC = 3.0 V to 5.5 V
  - EnVCC = 3.0 V to 5.5 V
  - VDD = 1.20 V to 1.35 V*1
  - A0VCC, A1VCC = 3.0 V to 5.5 V
  - A0VREFH = 3.0 V to 5.5 V
  - A1VREFH = 3.0 V to 5.5 V
  - EnVSS = VSS = A0VSS = A1VSS = 0 V
- Capacitance of the internal regulator
  - CVCL: 0.1 µF +/– 30%*2
- Operating temperature
  - Tj = –40 to +150°C
- Load conditions
  - CL = 30 pF

Note 1. Only applicable for DPS products

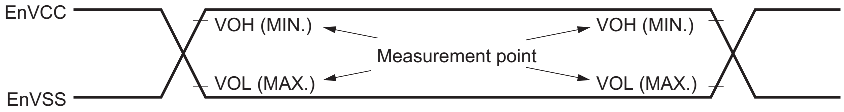
Note 2. See **Section 37.7, Regulator Characteristics**.

37.1.1.2 AC Characteristic Measurement Condition

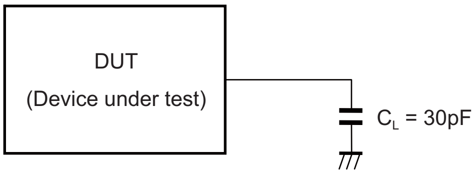
(1) AC test input measurement points



(2) AC test output measurement points



(3) Load conditions



CAUTION

If the load capacitance exceeds 30 pF due to the circuit configuration, it is recommended to insert a buffer in order to reduce the capacitance to a value less than or equal to 30 pF.

37.2 Absolute Maximum Ratings

The absolute maximum ratings are shown in the table below.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Power voltage	VCC		–0.3		6.5	V
	EnVCC		–0.3		6.5	V
	A0VCC		–0.3		6.5	V
	A1VCC		–0.3		6.5	V
	VDD		–0.3		1.8	V
Input voltage	VI	EnVCC pin	–0.3		EnVCC+0.3	V
		VCC pin	–0.3		VCC+0.3	V
Analogue reference voltage	A0VREFH		–0.3		A0VCC+0.3	V
	A1VREFH		–0.3		A1VCC+0.3	V
Analog input voltage	VAIN	A0VCC pin	–0.3		A0VCC+0.3	V
		A1VCC pin	–0.3		A1VCC+0.3	V
Low level output current	IOL	1 pin			10	mA
		Total			80	mA
High level output current	IOH	1 pin			–10	mA
		Total			–80	mA
Junction temperature	Tj		–40		150	°C
Storage temperature	Tstg		–55		150	°C

Note: Ta = 25°C
VSS = EnVSS = A0VSS = A1VSS = 0 V

CAUTIONS

1. Using this device without observing these absolute maximum ratings may result in permanent breakdown of the device.
2. This device is used in combination of multiple power voltages simultaneously in some cases. Use this device by observing the power pin connections, conditions for combination of power voltages to be applied, voltages that can be applied to pins, and output voltage conditions, which are specified in the manual. Using this device with other than specified power connection or voltage may result in permanent breakdown of the device or damage to the system that contains the device.
3. The input voltage, analog reference voltage and analog input voltage must not exceed 6.5 V.

37.3 Supply Voltage Characteristics

Symbol	MIN.	TYP.	MAX.	Unit
VCC*1	3.0		5.5	V
EnVCC*1	3.0		5.5	V
VDD*2	1.20		1.35	V
A0VCC A1VCC	3.0		5.5	V
A0VREFH*3 A1VREFH	3.0		5.5	V

Note: VSS = EnVSS = A0VSS = A1VSS = 0 V

Note 1. VCC and EnVCC should be supplied from the same power source.

Note 2. Applicable only for DPS products.

Note 3. Do not exceed A0VCC or A1VCC.

CAUTION

During operations, supply the specified voltages to all power lines. When stopping operation, turn off all of the power supplies.

37.4 Oscillator Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
MainOSC frequency	f_{MOSC}			16		MHz

CAUTION

Oscillation stabilization times differ according to matching with the crystal oscillator. Secure an oscillation stabilization time determined through evaluation of matching.

37.5 Characteristics of High-Speed Internal Oscillator Circuit

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High-speed internal oscillator circuit (HS IntOSC) frequency	f_{RH}		15.44	16	16.56	MHz

37.6 PLL Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input frequency	$f_{PLLICLK}$			16		MHz
Output frequency (PLL for CPU)	f_{CPLL}	—		160		MHz

37.7 Regulator Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Input voltage	VCC		3.0		5.5	V
Output voltage	VCL		1.15	1.25	1.35	V
Capacitance	CVCL	Per pin*1	0.07	0.1	0.13	μF

Note 1. For the connection of the VCL pin, see **Section 2.5, DNF**.

37.8 DC Characteristics

37.8.1 Relationship between Power Name and Pin

The table below shows the relationship between power supply names and pins.

Pin Name	Power Supply Name	I/O	Input Buffer Type	Note
JP0_4	VCC	I	SchmittA	5 V tolerant
JP0_2	E1VCC	I	CMOS/SchmittA	
JPx_x other than the above	E1VCC	I/O	CMOS/SchmittB	Output driving ability selectable
P0_10	E1VCC	I/O	CMOS	Output driving ability selectable
Py_y Pins listed in **Table 2.34, Selection of Input Buffer Characteristics**	EnVCC[*1]	I/O	CMOS/SchmittB	Output driving ability selectable
Pz_z other than the above	EnVCC[*1]	I/O	SchmittB	Output driving ability selectable
ADCG0Ixx	A0VCC	I	Analog (ADC)	
ADCG1Ixx	A1VCC	I	Analog (ADC)	
$\overline{\text{RESET}}$	VCC	I	SchmittA	5 V tolerant
FLMD0	E1VCC	I	SchmittC	5 V tolerant
$\overline{\text{ERROROUT}}$	E0VCC	O	—	
$\overline{\text{CVMOUT}}$	E1VCC	O	—	
X1	VCC	I	—	
X2	VCC	O	—	

Note 1. Regarding the power supply names (E0VCC or E1VCC), please refer to **Table 2.1, Pin Assignment**.

37.8.2 Buffer Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Measuring Condition		MIN.	TYP.	MAX.	Unit
High level input voltage	VIH	CMOS	3.0 V ≤ EnVCC < 4.3 V	0.65 × EnVCC		EnVCC + 0.3	V
			4.3 V ≤ EnVCC ≤ 5.5 V	0.65 × EnVCC		EnVCC + 0.3	V
		SchmittA	3.0 V ≤ EnVCC < 4.3 V	0.8 × EnVCC 0.8 × VCC		EnVCC + 0.3 VCC + 0.3	V
			4.3 V ≤ EnVCC ≤ 5.5 V	0.75 × EnVCC 0.75 × VCC		EnVCC + 0.3 VCC + 0.3	V
		SchmittB	3.0 V ≤ EnVCC < 4.3 V	0.75 × EnVCC		EnVCC + 0.3	V
			4.3 V ≤ EnVCC ≤ 5.5 V	0.75 × EnVCC		EnVCC + 0.3	V
		SchmittC	3.0 V ≤ EnVCC < 4.3 V	0.75 × EnVCC		EnVCC + 0.3	V
			4.3 V ≤ EnVCC ≤ 5.5 V	0.7 × EnVCC		EnVCC + 0.3	V
Low level input voltage	VIL	CMOS	3.0 V ≤ EnVCC < 4.3 V	–0.3		0.35 × EnVCC	V
			4.3 V ≤ EnVCC ≤ 5.5 V	–0.3		0.35 × EnVCC	V
		SchmittA	3.0 V ≤ EnVCC < 4.3 V	–0.3		0.25 × EnVCC 0.25 × VCC	V
			4.3 V ≤ EnVCC ≤ 5.5 V	–0.3		0.25 × EnVCC 0.25 × VCC	V
		SchmittB	3.0 V ≤ EnVCC < 4.3 V	–0.3		0.4 × EnVCC	V
			4.3 V ≤ EnVCC ≤ 5.5 V	–0.3		0.42 × EnVCC	V
		SchmittC	3.0 V ≤ EnVCC ≤ 5.5V	–0.3		0.3 × EnVCC	V
High level output voltage	VOH	IOH = –3mA*1	3.0 V ≤ EnVCC < 4.3 V	EnVCC –1.0			V
			4.3 V ≤ EnVCC ≤ 5.5 V	EnVCC –1.0			V
		IOH = –1mA*1	3.0 V ≤ EnVCC < 4.3 V	EnVCC –1.0			V
			4.3 V ≤ EnVCC ≤ 5.5 V	EnVCC –1.0			V
		IOH = –0.1mA*1	3.0 V ≤ EnVCC < 4.3 V	EnVCC –0.5			V
			4.3 V ≤ EnVCC ≤ 5.5 V	EnVCC –0.5			V
Low level output voltage	VOL	IOL = 3mA*1	3.0 V ≤ EnVCC < 4.3 V			0.6	V
			4.3 V ≤ EnVCC ≤ 5.5 V			0.5	V
		IOL = 1mA*1	3.0 V ≤ EnVCC < 4.3 V			0.4	V
			4.3 V ≤ EnVCC ≤ 5.5 V			0.4	V
Pull-up resistance	RU	Other than below VIN = EnVSS	3.0V ≤ EnVCC < 4.3 V	30	60	150	kΩ
			4.3V ≤ EnVCC ≤ 5.5V	20	40	100	kΩ
		FLMD0 VIN = EnVSS	3.0V ≤ EnVCC < 4.3V	10	19	50	kΩ
			4.3V ≤ EnVCC ≤ 5.5V	10	19	50	kΩ
Pull-down resistance	RD	Other than below VIN = EnVCC	3.0 V ≤ EnVCC < 4.3 V	15	40	125	kΩ
			4.3 V ≤ EnVCC ≤ 5.5 V	15	40	100	kΩ
		$\overline{\text{RESET}}$, FLMD0 VIN = EnVCC	3.0 V ≤ EnVCC < 3.6 V	20	60	150	kΩ
			3.6 V ≤ EnVCC < 4.3 V	20	60	150	kΩ
			4.3 V ≤ EnVCC ≤ 5.5 V	20	40	100	kΩ
Input leak current	ILIH1	Other than below	Vin = VCC, EnVCC			2	μA
		ADCGnIm (n = 0,1, m = 0 to 11)	Vin = A0VCC, A1VCC When AD conversion is not performed:			0.2	μA
	ILIL1	Other than below	Vin = 0 V			–2	μA
		ADCGnIm (n = 0,1, m = 0 to 11)	Vin = 0 V When AD conversion is not performed:			–0.2	μA
Hysteresis width	VH	SchmittA			0.27 × EnVCC		V
		SchmittB			0.1 × EnVCC		V
		SchmittC			0.2 × EnVCC		V

Note 1. Total load current is 48 mA for the pins when everything is switched on at the same time. However, the total load current must be no greater than 12 mA for pins 38 to 53 on 100-pin devices and no greater than 30 mA for pins 52 to 82 on 144-pin devices.

37.8.3 Allowable Output Current

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	MIN.	TYP.	MAX.	Unit
Output high-level allowable current (per pin)	I_{OH}			–3	mA
Output high-level allowable current (total)*1	$\Sigma\ I_{OH}$			–48	mA
Output low-level allowable current (per pin)	I_{OL}			3	mA
Output low-level allowable current (total)*1	$\Sigma\ I_{OL}$			48	mA

Note 1. Total load current is 48 mA for the pins when everything is switched on at the same time. However, the total load current must be no greater than 12 mA for pins 38 to 53 on 100-pin devices and no greater than 30 mA for pins 52 to 82 on 144-pin devices.

CAUTION

This item affects the calorific value and Tj of the chip. In addition to these restrictions, take thermal design into consideration.

37.8.4 Injection Current

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item		Symbol	MIN.	TYP.	MAX.	Unit
DC injection current (per pin)	Digital pin	IINJ_DIN	–2		2	mA
	Analogue pin	IINJ_AIN	–3		3	mA
DC injection current (Total)		IINJ_TOT	–50		50	mA

37.8.5 Input Capacitance

Conditions: See **Section 37.1.1.1, Common Conditions**.
As for temperature conditions, refer measurement conditions.

Item	Symbol	MIN.	TYP.	MAX.	Unit	Measuring Condition
Input capacitance	CI			10	pF	f = 1 MHz Pins not to be measured: 0 V Tj = 25°C
Input/output capacitance	CIO			10	pF	
Output capacitance	CO			10	pF	
Input capacitance for X1	CX1			20	pF	

NOTE

For the analogue input pins (ADCGnlm), see the description of the equal input capacitance in related **Section 37.14, A/D Convertor Characteristics**.

37.8.6 Power Current Characteristics

Table 37.1 Power Current of eVR Product

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item		Symbol	MIN.	TYP.	MAX.	Unit
VCC power current*1	Run mode	IVCCEVR			230	mA
	When BIST is executed	IVCCBEVR			230	mA
	When rewriting flash memory*2	IVCCFEVR			230	mA
AnVCC power current		IAVCC			6.5	mA
AnVREFH current		IAVREF			0.5	mA

Note 1. The MAX. value includes the operating current of peripheral devices. However, the current in A/D converter, I/O port, or on-chip pull-up/-down resistor is not included.

Note 2. This is the value of the power current when rewriting code flash memory or data flash memory.

Table 37.2 Power Current of DPS Product

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item		Symbol	MIN.	TYP.	MAX.	Unit
VDD power current*1	Run mode	IVDDDPS			210	mA
	When BIST is executed	IVDDBDPS			210	mA
	When rewriting flash memory*2	IVDDFDPS			185	mA
VCC power current	Run mode	IVCCDPS			20	mA
	When BIST is executed	IVCCBDPS			20	mA
	When rewriting flash memory*2	IVCCFDPS			45	mA

Note 1. The MAX. value includes the operating current of peripheral devices. However, the current in A/D converter, I/O port, or on-chip pull-up/-down resistor is not included.

Note 2. This is the value of the power current when rewriting code flash memory or data flash memory.

Note 3. AnVCC and AnVREFH current are the same as those of the eVR products.

37.9 AC Characteristics

37.9.1 Power UP/Down Timing

Table 37.3 eVR Products

Conditions: See **Section 37.1.1.1, Common Conditions**.

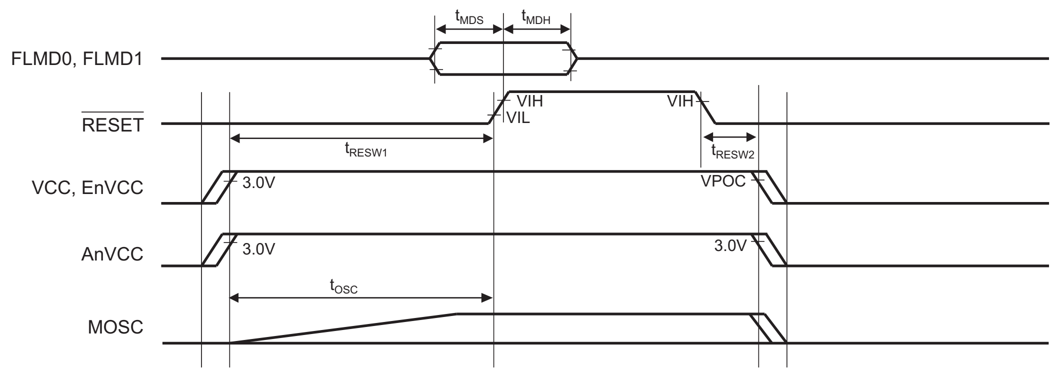
Item	Symbol	MIN.	MAX.	Unit	Remarks
Pin reset time at low level for power on	t_{RESW1}	10		ms	*1
Pin reset time at low level for power off	t_{RESW2}	2		μs	*2
Operating mode setup time	t_{MDS}	1		ms	
Operating mode hold time	t_{MDH}	1		ms	
VCC/AnVCC voltage ramp	t_{VS1}	0.02	500	V/ms	

Note 1. t_{RESW1} is the time over which assertion of the reset signal is required to continue until the supply of internal clock signals becomes stable after all power supplies have been turned on. Release the pin reset after the periods of t_{RESW1} and t_{OSC} have elapsed. VCC and EnVCC should be supplied from the same source. No restriction applies to potential differences between the levels of the VCC/EnVCC supplies and the AnVCC supply during power up.

Note 2. t_{RESW2} is the time over which assertion of the reset signal is required until either of the power voltages has dropped below the lower limit.

Note 3. The states of I/O pins are not reset during the noise cancellation interval (max. 1.2 μs) of the reset signal following its assertion while power is being turned off. During that time, do not allow any input of mid-range potential to a pin or the contention of output data.

Note 4. If the power is turned off during the programming or erasure of flash memory, the data in the area that was programmed or erased cannot be guaranteed.



Note: t_{OSC}: OSC oscillation stabilization time

Figure 37.1 Power UP/Down Timing: eVR Products

Table 37.4 DPS Products

Conditions: See **Section 37.1.1.1, Common Conditions**.

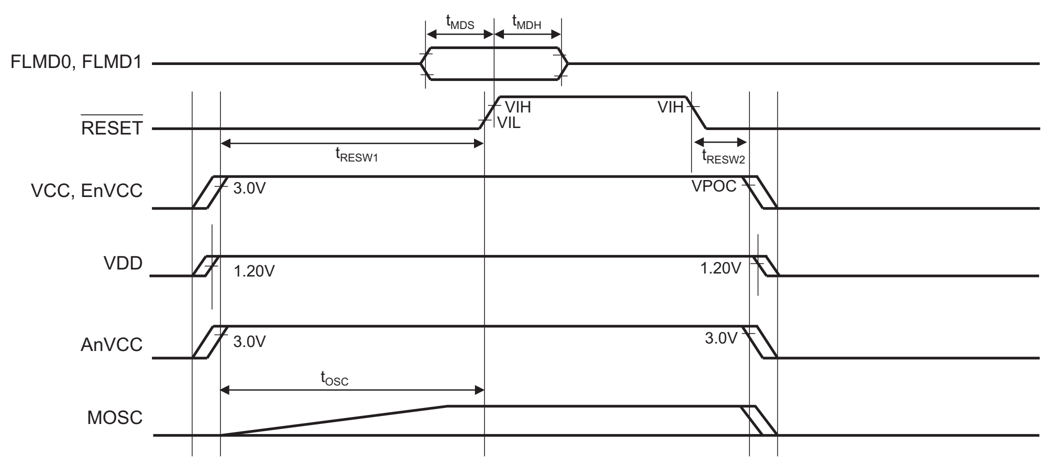
Item	Symbol	MIN.	MAX.	Unit	Remarks
Pin reset time at low level for power on	t_{RESW1}	10		ms	*1
Pin reset time at low level for power off	t_{RESW2}	2		µs	*2
Operating mode setup time	t_{MDS}	1		ms	
Operating mode hold time	t_{MDH}	1		ms	
VCC/AnVCC voltage ramp	t_{VS1}	0.02	500	V/ms	
VDD voltage ramp	t_{VS2}	2	500	V/ms	

Note 1. t_{RESW1} is the time over which assertion of the reset signal is required to continue until the supply of internal clock signals becomes stable after all power supplies have been turned on. Release the pin reset after the periods of t_{RESW1} and t_{OSC} have elapsed. VCC and EnVCC should be supplied from the same source. No restriction applies to potential differences between the levels of the VCC/EnVCC supplies, the AnVCC supply, and the VDD supply during power up.

Note 2. t_{RESW2} is the time over which assertion of the reset signal is required until either of the power voltages has dropped below the lower limit.

Note 3. The states of I/O pins are not reset during the noise cancellation interval (max. 1.2 µs) of the reset signal following its assertion while power is being turned off. During that time, do not allow any input of mid-range potential to a pin or the contention of output data.

Note 4. If the power is turned off during the programming or erasure of flash memory, the data in the area that was programmed or erased cannot be guaranteed.



Note: t_{OSC}: OSC oscillation stabilization time

Figure 37.2 Power UP/Down Timing: DPS Products

37.9.2 Driving Ability

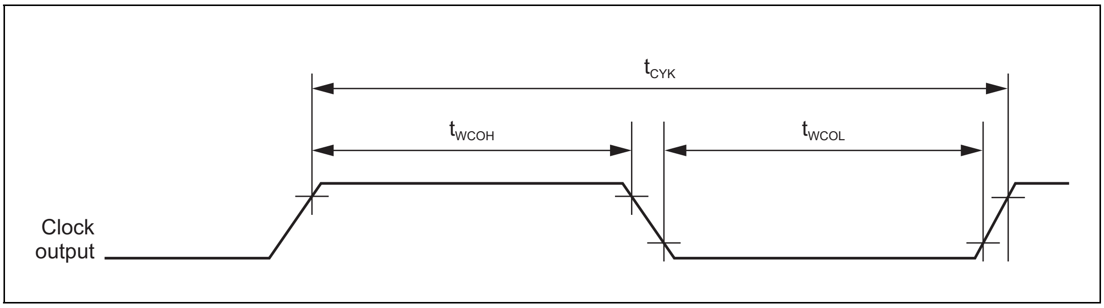
Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output frequency		High-speed mode			20	MHz
		Medium-speed mode			14	MHz
		Low-speed mode			4	MHz
Output rising/falling time		High-speed mode			10	ns
		Medium-speed mode			20	ns
		Low-speed mode			50	ns

37.9.3 Clock Output Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.
Output pin are the fast mode.

Item	Symbol	MIN.	TYP.	MAX.	Unit
Clock output cycle time	t_{CYK}	50 (20MHz)			ns
Clock output high level width	t_{WCOH}	$t_{CYK}/2 - 12$			ns
Clock output low level width	t_{WCOL}	$t_{CYK}/2 - 12$			ns

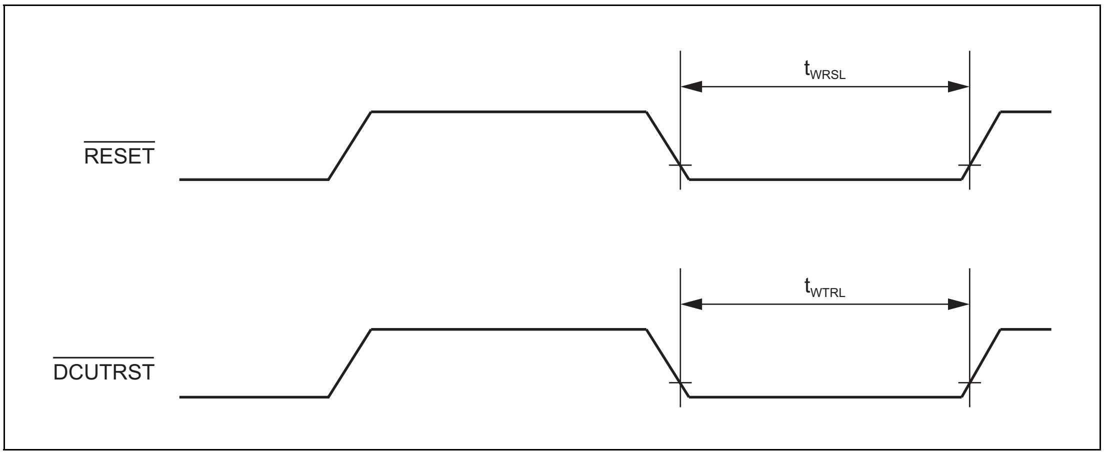


37.9.4 Control Signal Timing

37.9.4.1 Reset

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
$\overline{\text{RESET}}$ input low level width	t_{WRSL}	Other than power-on	1.5	—	—	µs
$\overline{\text{DCUTRST}}$ input low level width	t_{WTRL}		1.5	—	—	µs



37.9.4.2 Interrupts/ADTRG

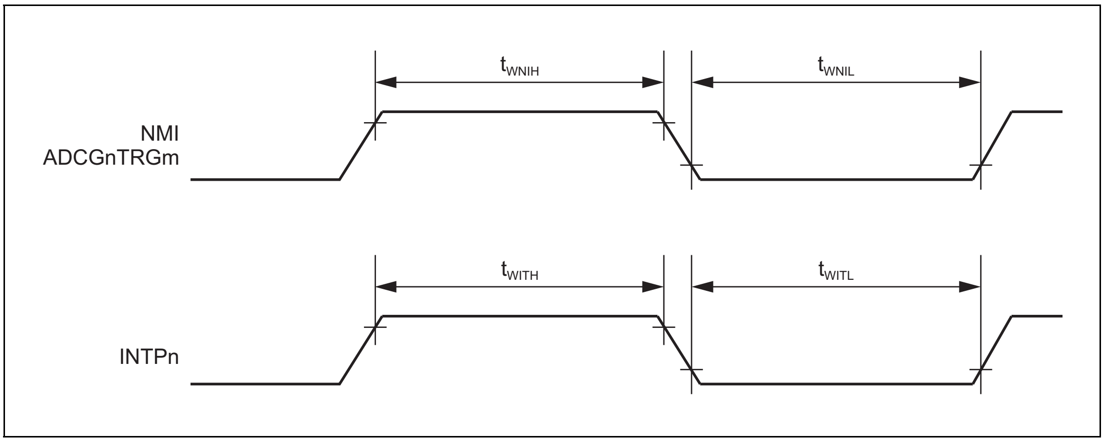
Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
NMI input high level width	t_{WNIH}	Digital filter	k × Tsamp + 20*1			ns
NMI input low level width	t_{WNIL}	Digital filter	k × Tsamp + 20*1			ns
INTPn input high level width	t_{WITH}	Digital filter	k × Tsamp + 20*1			ns
		Analog filter, n = 7, 8	600			ns
INTPn input low level width	t_{WITL}	Digital filter	k × Tsamp + 20*1			ns
		Analog filter, n = 7, 8	600			ns
ADCGnTRGm input high level width	t_{WNIH}	Digital filter, n = 0,1, m = 0, 1	k × Tsamp + 20*1			ns
ADCGnTRGm input low level	t_{WNIL}	Digital filter, n = 0, 1, m = 0, 1	k × Tsamp + 20*1			ns

Note 1. k is the number of samples taken by the digital noise filter for the input.
Tsamp is the sampling interval of the digital noise filter for the input.

CAUTION

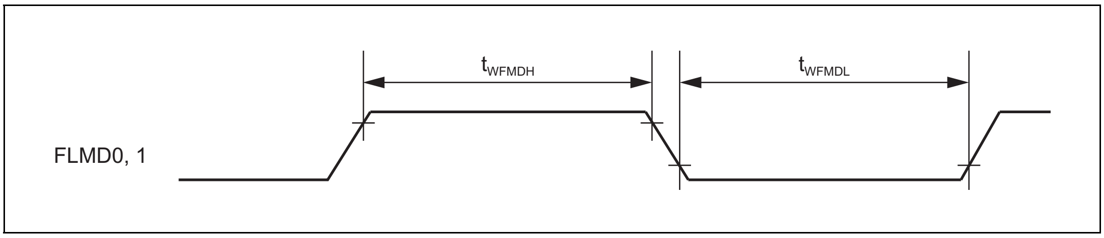
The specifications above indicate the pulse width to be always detected as an effective edge. Even when a pulse width smaller than above is input, such value may be detected as an effective edge.



37.9.4.3 Mode

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
FLMD0,1 input high level width	t_{WFMDH}		600			ns
FLMD0,1 input low level width	t_{WFMDL}		600			ns



37.9.5 Timer Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
TAUDnIm input high/low level width (n = 3, m = 0 to 15)	t_{WTDIH}/ t_{WTDIL}		k × Tsamp + 20*1			ns
TAUJnIm input high/low level width (n = 3, m = 0 to 3)	t_{WTJIH}/ t_{WTJIL}		k × Tsamp + 20*1			ns
ENCAnTINm input high/low level width (n = 0, 1; m = 0, 1)	t_{WTDIH}/ t_{WTDIL}		k × Tsamp + 20*1			ns
ENCAnEm input high/low level width (n = 0, 1, m = 0, 1, C)	t_{WENIH}/ t_{WENIL}		k × Tsamp + 20*1			ns
TSG3nPTSIm input high/low level width (n = 0, 1, m = 0, 1, 2)	t_{WTSPIH}/ t_{WTSPIL}		k × Tsamp + 20*1			ns
TSG3nCLKI input high/low level width (n = 0, 1)	t_{WTSCIH}/ t_{WTSCIL}		k × Tsamp + 20*1			ns
TAPAnESO input high/low level width (n = 0, 1)	t_{WESIH}/ t_{WESIL}		600			ns

Note 1. k is the number of samples taken by the digital noise filter for the input.
Tsamp is the sampling interval of the digital noise filter for the input.

37.9.6 CSI Timing

37.9.6.1 CSIG Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.
Output are specified for buffer "fast mode".

Table 37.5 CSIG Timing (Master Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro operation clock cycle time	t_{KCYGn}		12.5 (max. 80 MHz)			ns
CSIGnSC cycle time	t_{KCYMGn}		125			ns
CSIGnSC high level width	t_{KWHMGn}		t_{KCYMGn} /2 – 12			ns
CSIGnSC low level width	t_{KWLMGn}		t_{KCYMGn} /2 – 12			ns
CSIGnSI setup time (vs. CSIGnSC)	t_{SSIMGn}		30			ns
CSIGnSI hold time (vs. CSIGnSC)	t_{HSIMGn}		0			ns
CSIGnSO output delay time (vs. CSIGnSC)	t_{DSOMGn}				7	ns
CSIGnRYI setup time (vs. CSIGnSC)	t_{SRYIGn}	CSIGnCTL1.CSIGnSIT = x CSIGnCTL1.CSIGnHSE = 1	2 × t_{KCYGn} + 25			ns

Table 37.6 CSIG Timing (Slave Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro operation clock cycle time	t_{KCYGn}		12.5 (max. 80 MHz)			ns
CSIGnSC cycle time	t_{KCYSGn}		150			ns
CSIGnSC high level width	t_{KWHSGn}		t_{KCYSGn} /2 – 12			ns
CSIGnSC low level width	t_{KWLSGn}		t_{KCYSGn} /2 – 12			ns
CSIGnSI setup time (vs. CSIGnSC)	t_{SSISGn}		20			ns
CSIGnSI hold time (vs. CSIGnSC)	t_{HSISGn}		t_{KCYGn} + 5			ns
CSIGnSO output delay time (vs. CSIGnSC)	t_{DSOSGn}				30	ns
CSIGnRYO output delay time (vs. CSIGnSC)	t_{SRYOGn}				38	ns

37.9.6.2 CSIH Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.
Output are specified for buffer "fast mode".

Table 37.7 CSIH Timing (Master Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro Operation clock cycle time	t_{KCYHn}		12.5 (max. 80MHz)			ns
CSIHnSC cycle time	t_{KCYMHn}		100			ns
CSIHnSC high level width	t_{KWHMHn}		$t_{KCYMHn}/2 - 12$			ns
CSIHnSC low level width	t_{KWLMHn}		$t_{KCYMHn}/2 - 12$			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSIMHn}		25			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSIMHn}		0			ns
CSIHnSO output delay (vs. CSIHnSC)	t_{DSOMHn}				7	ns
CSIHnRYI setup time (vs. CSIHnSC)	t_{SRYIHn}	CSIHnCTL1.CSIHnSIT = x CSIHnCTL1.CSIHnHSE = 1	$2 \times t_{KCYMHn} + 25$			ns
CSIHnCSS0 to CSIHnCSS7 inactive level width	$t_{WSCSBHn}$		CSIDLE × $t_{KCYMHn} - 20$			ns
CSIHnCSS0 to CSIHnCSS7 setup time (vs. CSIHnSC)	$t_{SSCSBHn0}$	CSIHnCFGx.CSIHnDAPx = 0	CSSETUP × $t_{KCYMHn} - 10$			ns
	$t_{SSCSBHn1}$	CSIHnCFGx.CSIHnDAPx = 1	(CSSETUP + 0.5) × $t_{KCYMHn} - 10$			ns
CSIHnCSS0 to CSIHnCSS7 hold time (vs. CSIHnSC)	$t_{HSCSBHn0}$	CSIHnCTL1.CSIHnSIT = 0	CSHOLD × $t_{KCYMHn} - 10$			ns
	$t_{HSCSBHn1}$	CSIHnCTL1.CSIHnSIT = 1	(CSHOLD + 0.5) × $t_{KCYMHn} - 10$			ns

Note: CSSETUP: The values set in CSIHnCFGx.CSIHnSPx[3:0]
CSHOLD: The values set in CSIHnCFGx.CSIHnHDx[3:0]
CSIDLE: The value set in CSIHnCFGx.CSIHnIDx[2:0]

Table 37.8 CSIH Timing (Slave Mode)

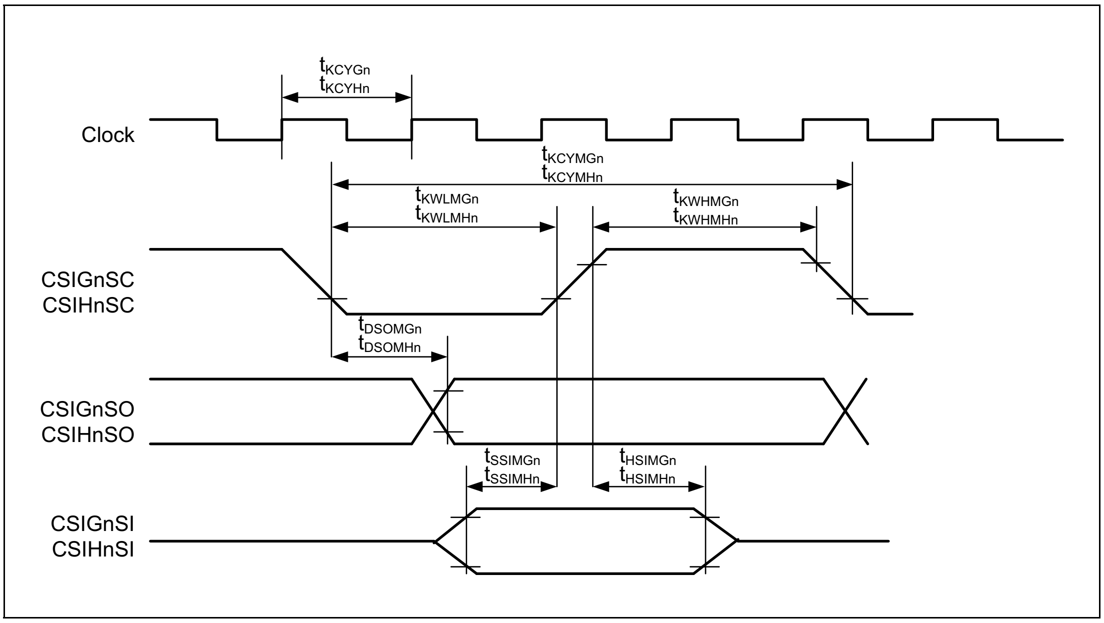
Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Macro Operation clock cycle time	t_{KCYHn}		12.5 (max. 80MHz)			ns
CSIHnSC cycle time	t_{KCYSHn}		150			ns
CSIHnSC high level width	t_{KWHSHn}		$t_{KCYSHn}/2 - 12$			ns
CSIHnSC low level width	t_{KWLSHn}		$t_{KCYSHn}/2 - 12$			ns
CSIHnSI setup time (vs. CSIHnSC)	t_{SSISHn}		20			ns
CSIHnSI hold time (vs. CSIHnSC)	t_{HSISHn}		$t_{KCYHn} + 5$			ns
CSIHnSO output delay time (vs. CSIHnSC)	t_{DSOSHn}				30	ns
CSIHnRYO output delay time (vs. CSIHnSC)	t_{SRYOHn}				38	ns
CSIHnSSI setup time (vs. CSIHnSC)	$t_{SSSISHn}$		$t_{KCYSHn}/2 - 5$			ns
CSIHnSSI hold time (vs. CSIHnSC)	$t_{HSSISHn}$		$t_{KCYHn} + 30$			ns

37.9.6.3 CSIG/CSIH Timing Charts

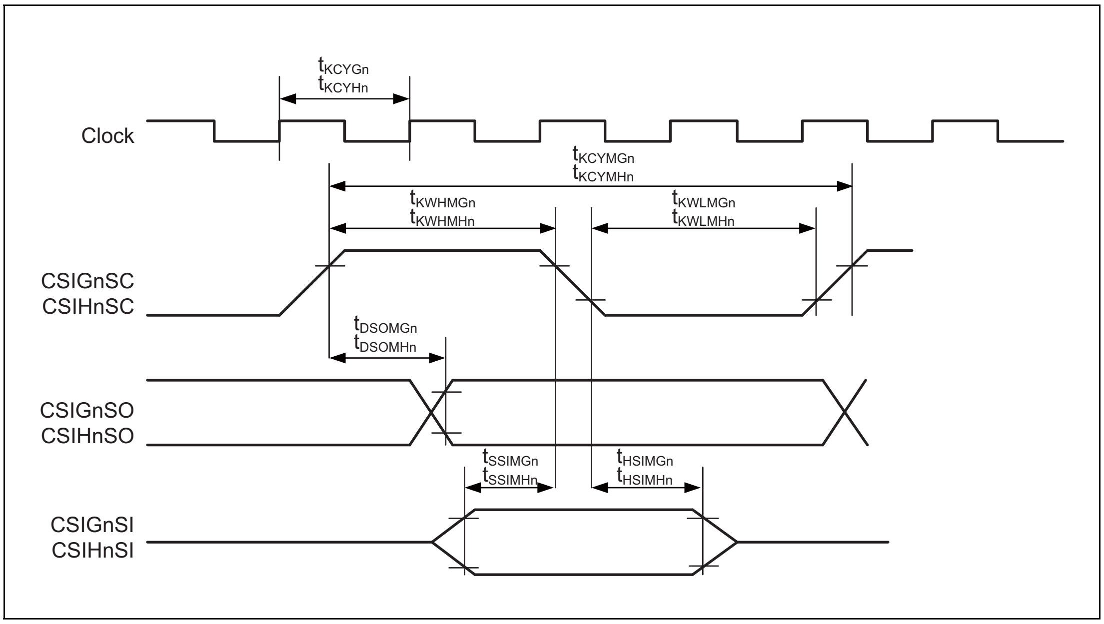
(1) SCKO/SI/SO

Master Mode:

- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 0/0 or 1/1)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 0/0 or 1/1)



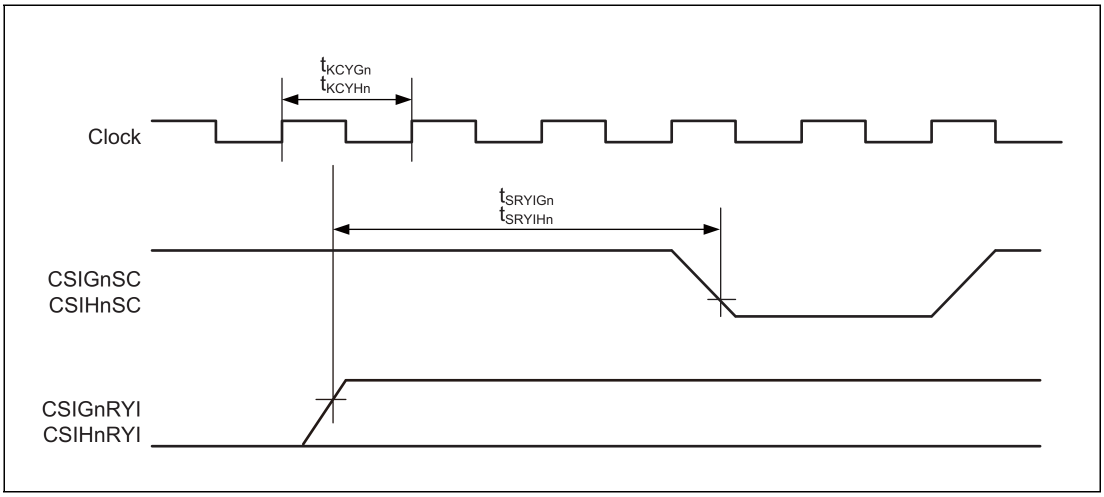
- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 1/0 or 0/1)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 1/0 or 0/1)



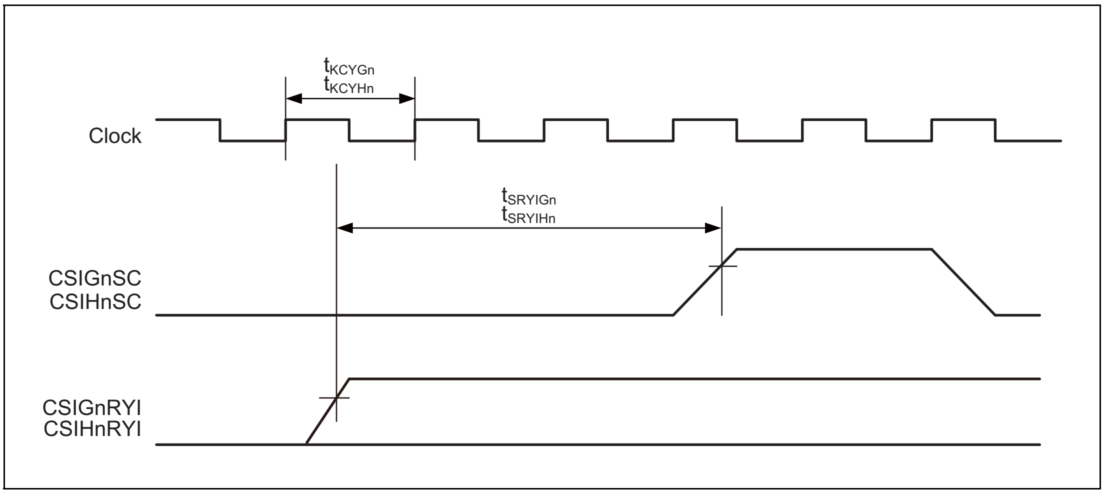
(2) RYI

- CSIG: Only master mode (CSIGnCTL1: CSIGnHSE = 1, CSIGnCTL1: CSIGnSIT = 0)
- CSIH: Only master mode (CSIHnCTL1: CSIHnHSE = 1, CSIHnCTL1: CSIHnSIT = 0)

– CSIG (CSIGnCTL1: CSIGnCKR = 0)
– CSIH (CSIHnCFGx: CSIHnCKPx = 0)



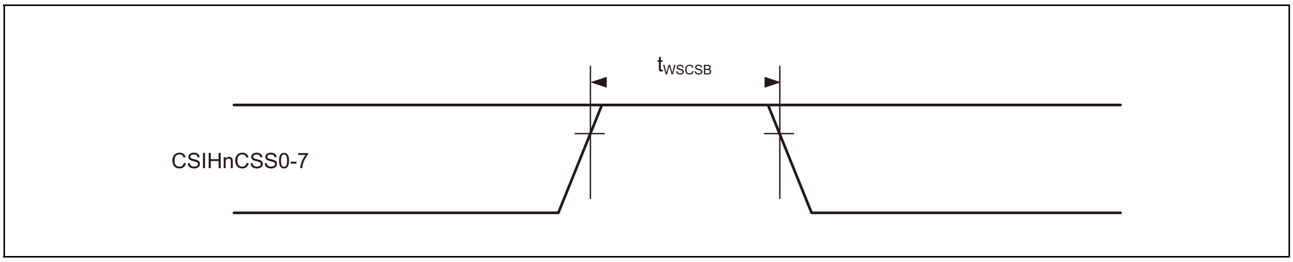
– CSIG (CSIGnCTL1: CSIGnCKR = 1)
– CSIH (CSIHnCFGx: CSIHnCKPx = 1)



(3) CSSn

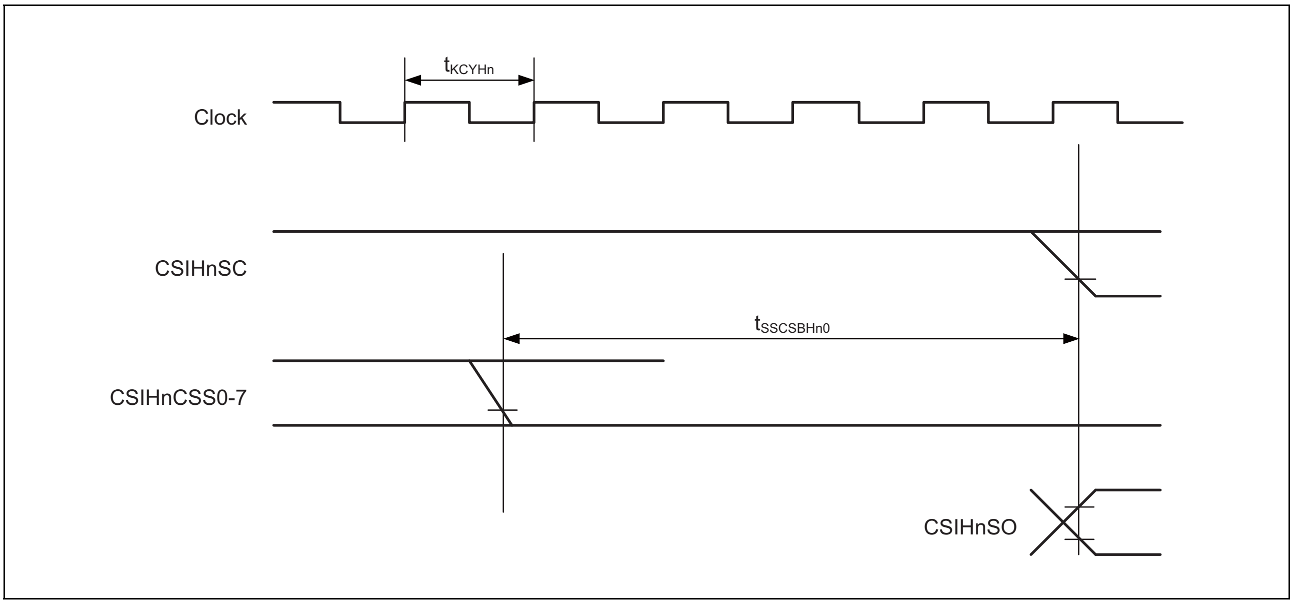
Only Master Mode (Inactive Level Width):

- CSIHnCFGx: CSIHnCKPx = 0, CSIHnCFGx: CSIHnDAPx = 0

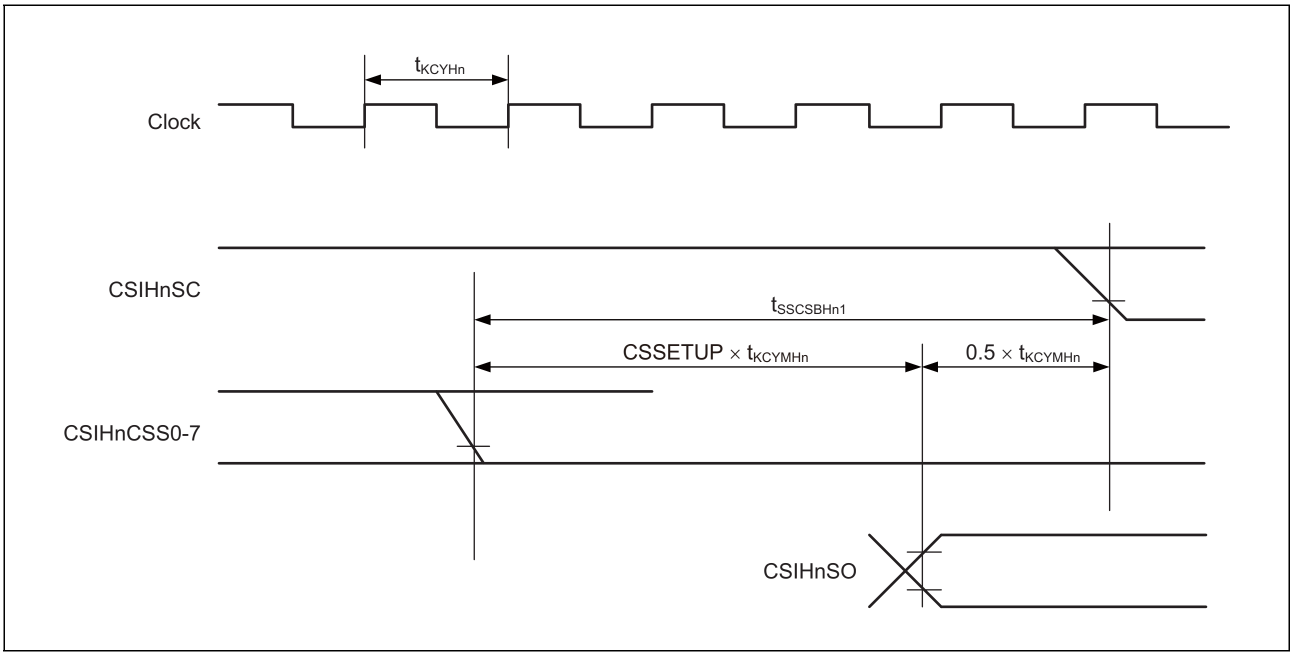


Only Master Mode (Setup Time):

- CSIHnCFGx: CSIHnCKPx = 0, CSIHnCFGx: CSIHnDAPx = 0

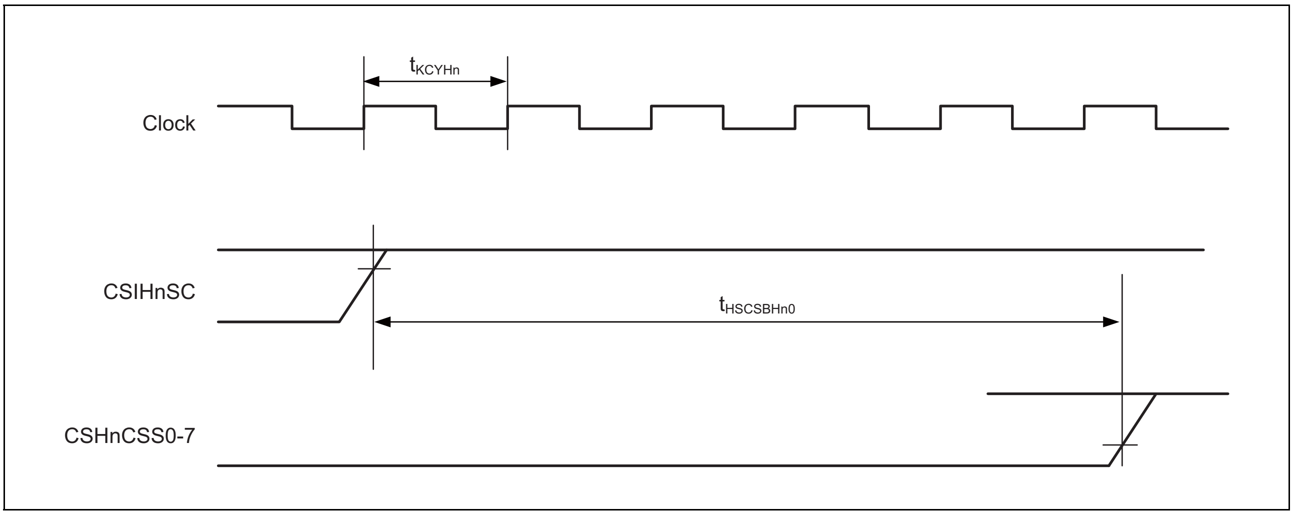


- CSIHnCFGx: CSIHnCKPx = 0, CSIHnCFGx: CSIHnDAPx = 1

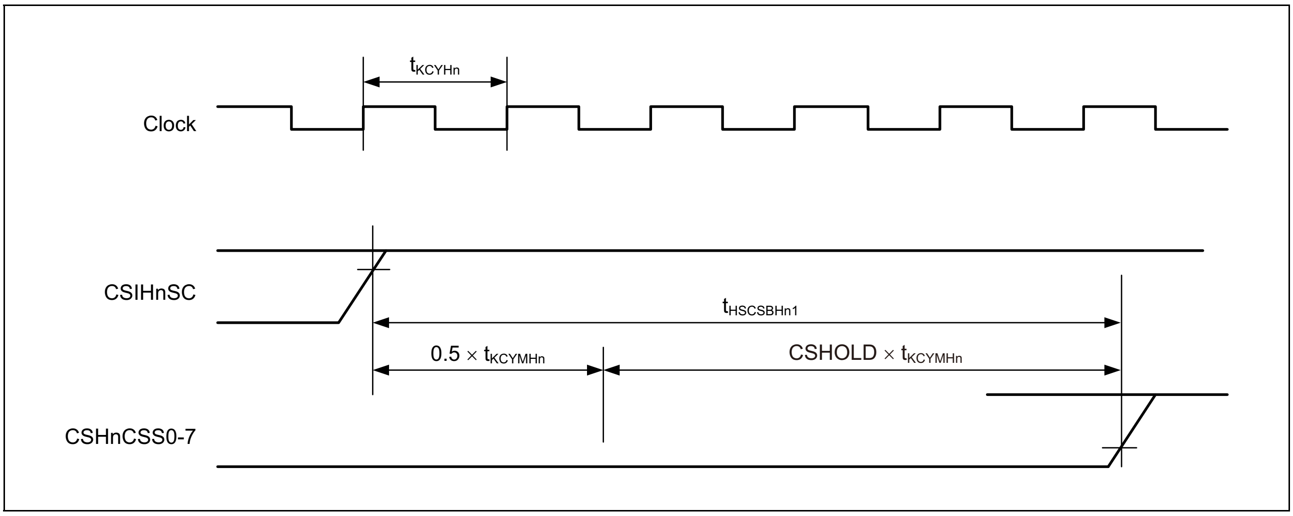


Only Master Mode (Hold Time):

- CSIHnCTL1: CSIHnSIT = 0, CSIHnCFGx: CSIHnCKPx = 0, CSIHnCFGx: CSIHnDAPx = 0



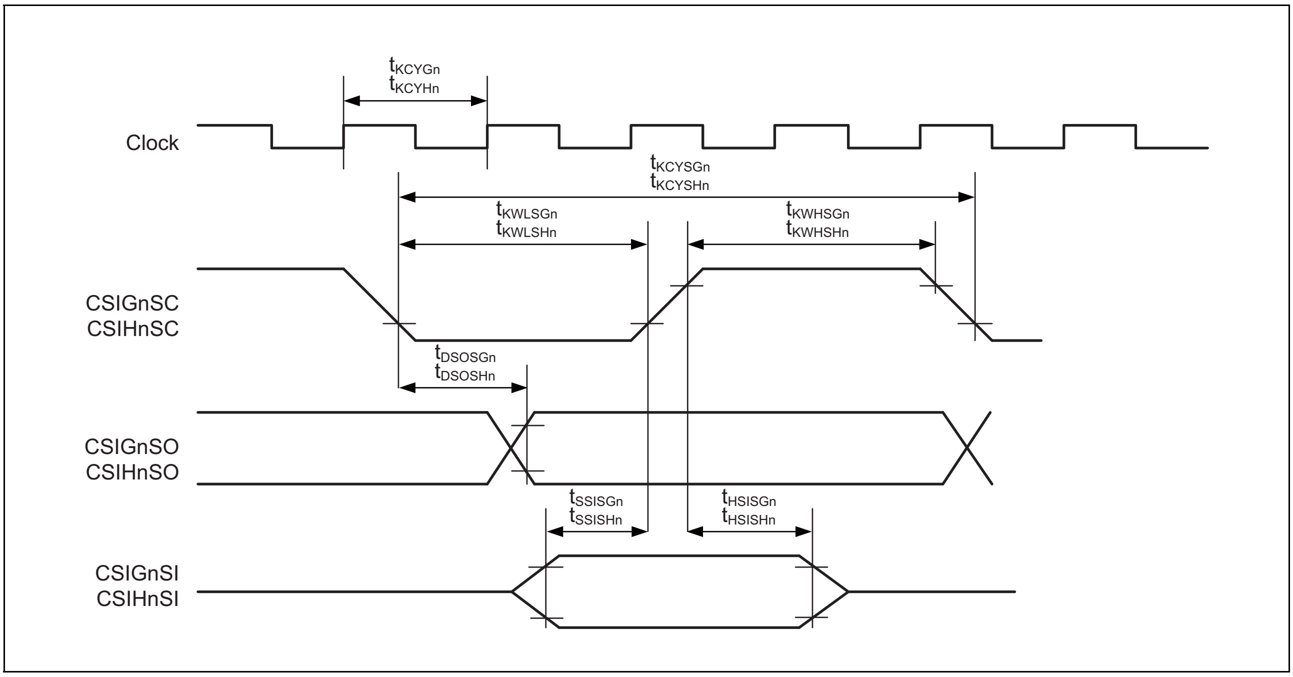
- CSIHnCTL1: CSIHnSIT = 1, CSIHnCFGx: CSIHnCKPx = 0, CSIHnCFGx: CSIHnDAPx = 0



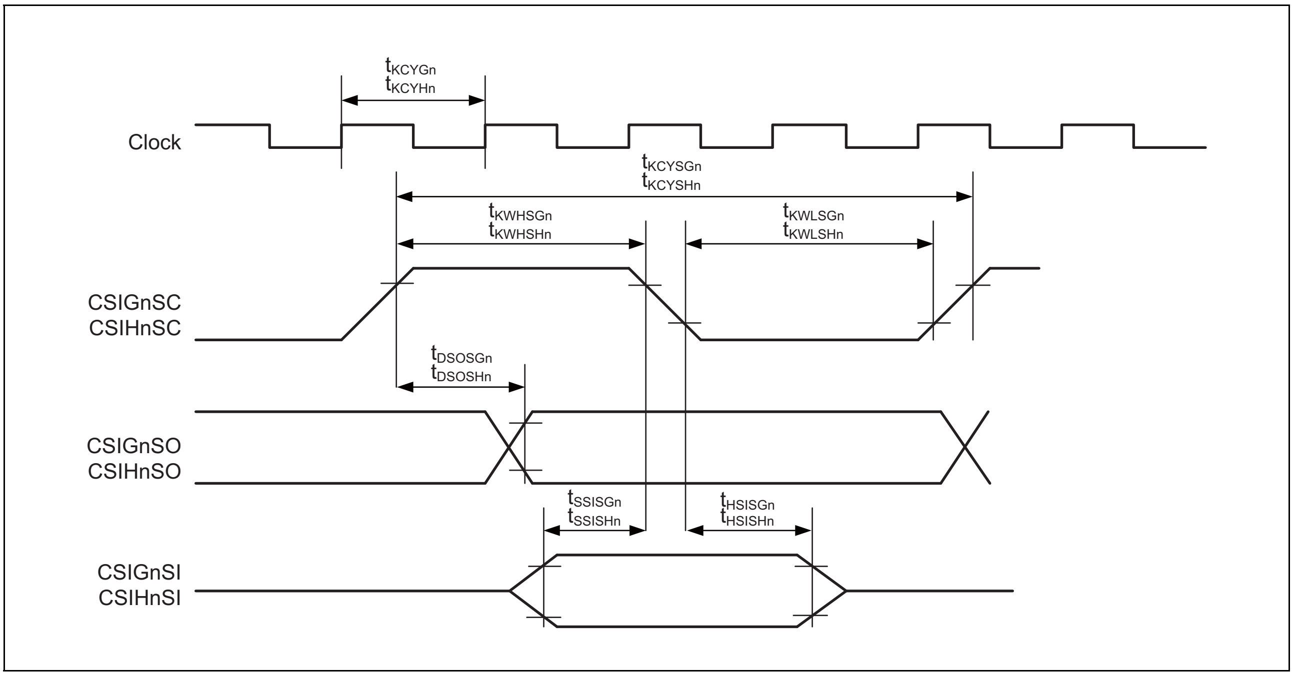
(4) SCKO/SI/SO

Slave Mode:

- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 0/0 or 1/1)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 0/0 or 1/1)

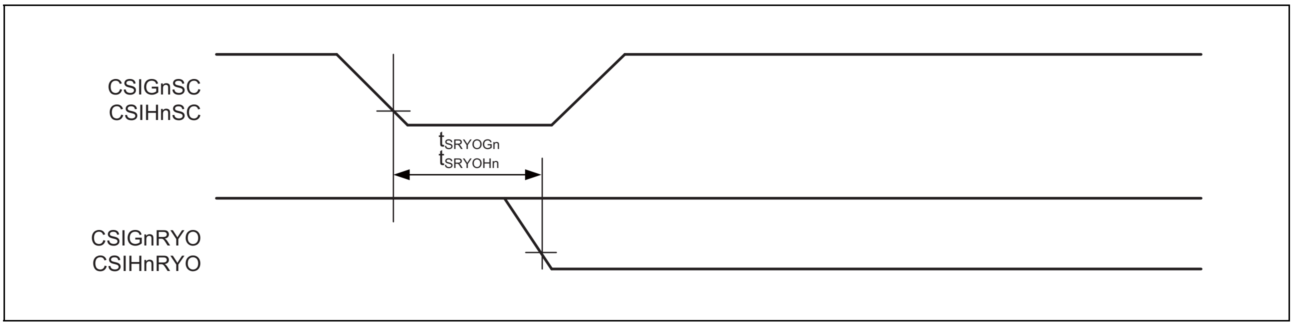


- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 1/0 or 0/1)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 1/0 or 0/1)

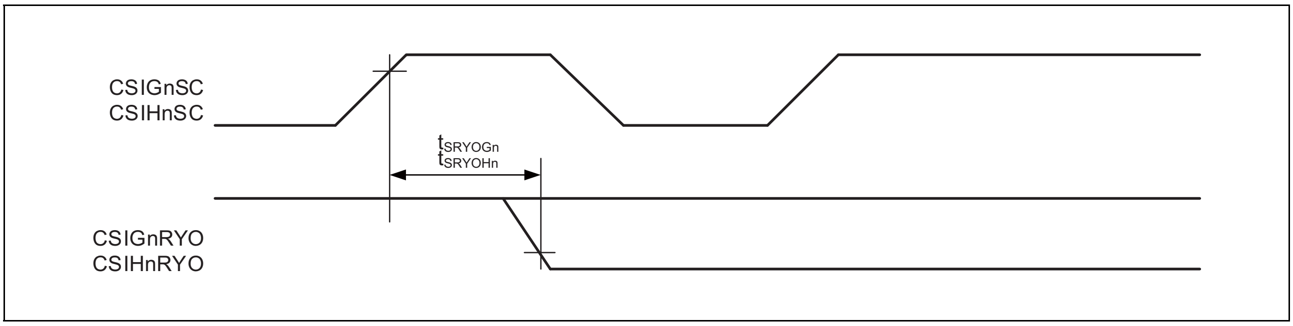


(5) RYO

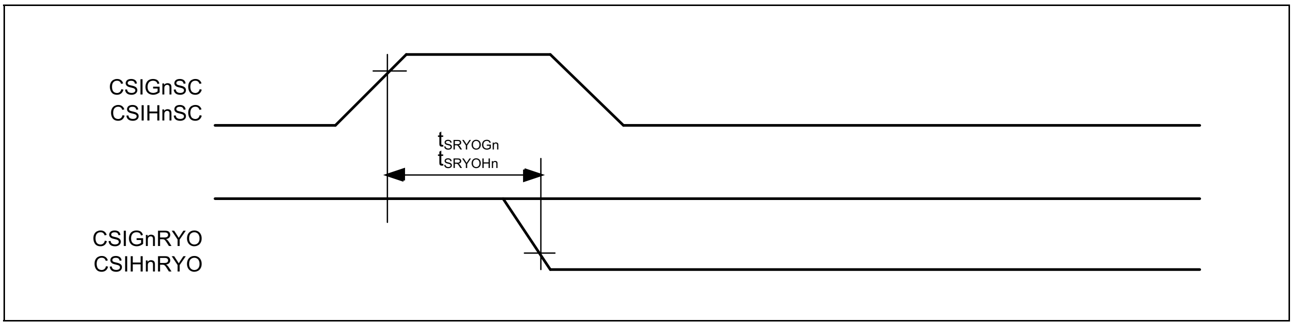
- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP0 = 0/0)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 0/0)



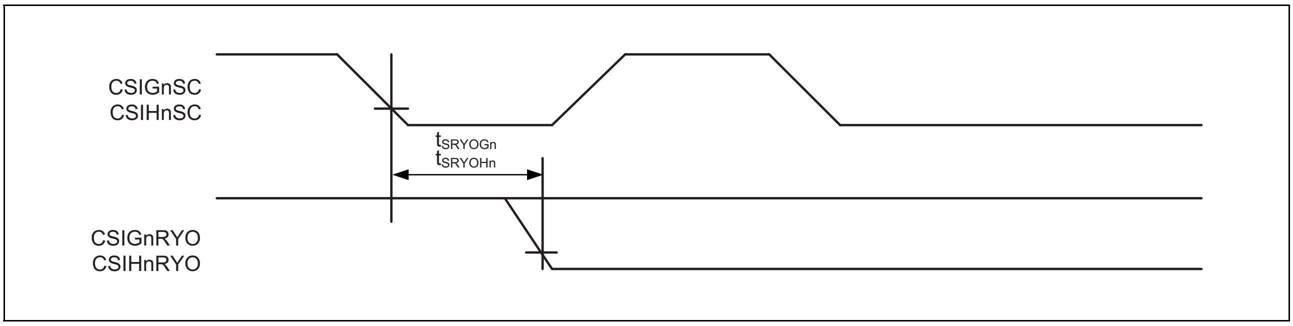
- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 0/1)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 0/1)



- CCSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 1/0)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 1/0)



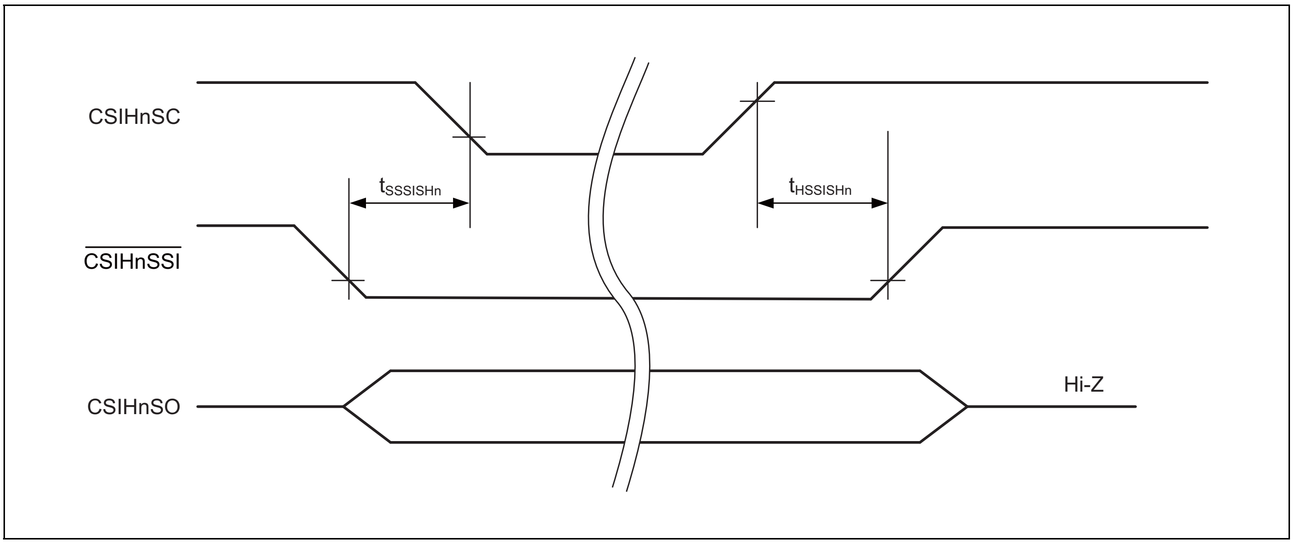
- CSIG (CSIGnCTL1: CSIGnCKR/CSIGnCFG0: CSIGnDAP = 1/1)
- CSIH (CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 1/1)



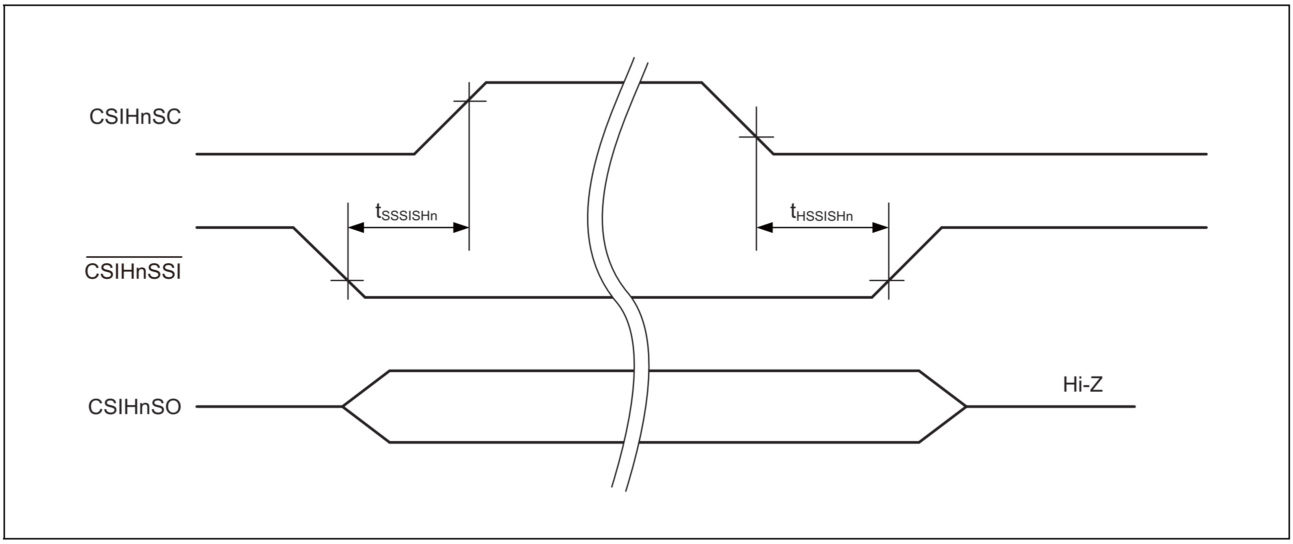
(6) SSI

Slave Mode:

- CSIH (CSIHnCTL1: CSIHnSSE=1, CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 0/0 or 1/1)



- CSIH (CSIHnCTL1: CSIHnSSE=1, CSIHnCFGx: CSIHnCKPx/CSIHnCFGx: CSIHnDAPx = 1/0 or 0/1)



37.9.7 SCI3 Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.
Output pin are specified for buffer “fast mode".

Table 37.9 SCI3 Timing (Master Mode)

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Output cycle time	t_{Scyc}	Asynchronous	16 × t_{PCLK}			ns
		Clock synchronous	16 × t_{PCLK}			ns
Output clock pulse width	t_{SCKW}		0.4 × t_{Scyc}		0.6 × t_{Scyc}	ns
Transmit data delay time	t_{TXD}				40	ns
Receive data setup time	t_{RXS}	Clock synchronous	2 × t_{PCLK}			ns
Receive data hold time	t_{RXH}	Clock synchronous	2 × t_{PCLK}			ns

Note: t_{PCLK} is the operating clock of SCI3.

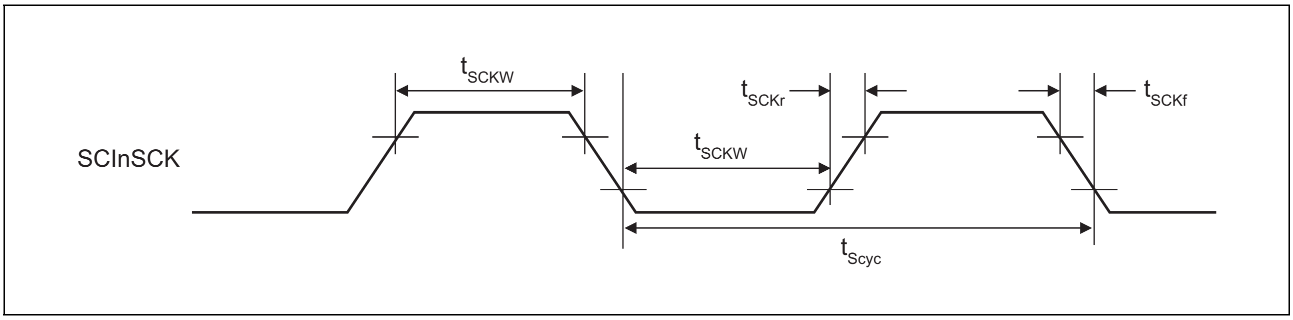


Figure 37.3 SCI Clock Input/Output Timing

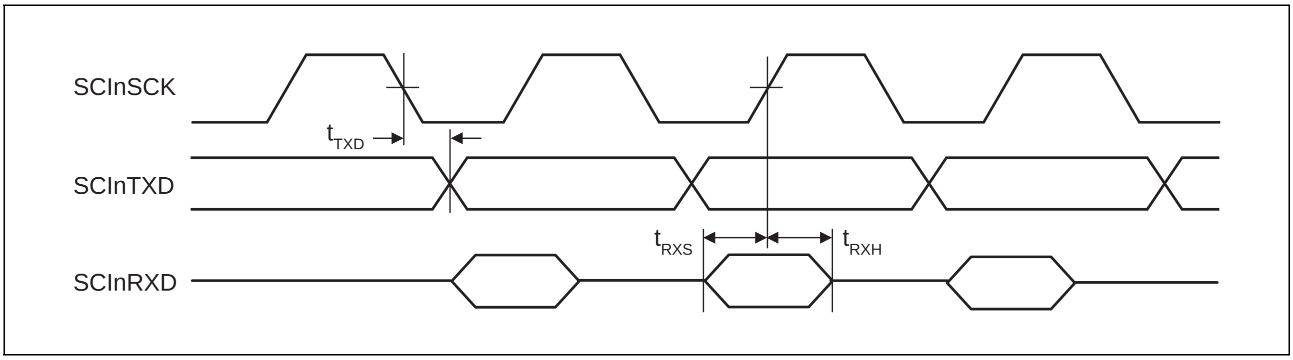

Figure 37.4 SCI Input/Output Timing, Clock Synchronous Mode (in Master Mode)

Table 37.10 SCI3 Timing (Slave Mode)

Item	Symbol	MIN.	TYP.	MAX.	Unit
Input cycle time	t_{Scyc}	12 × t_{PCLK}			ns
Input clock pulse width	t_{SCKW}	0.4 × t_{Scyc}		0.6 × t_{Scyc}	ns
Transmit data delay time*1	t_{TXD}	2 × t_{PCLK}		50 + 3 × t_{PCLK}	ns
Input clock rising time	t_{SCKr}			20	ns
Input clock falling time	t_{SCKf}			20	ns
Receive data setup time	t_{RXS}	2 × t_{PCLK}			ns
Receive data hold time	t_{RXH}	2 × t_{PCLK}			ns

Note 1. This does not apply to transmission of Data 0 (the first bit), which is not transferred in continuous transfer mode.
Transmission of Data 0 (the first bit), which is not transferred in continuous transfer mode, starts when TDRE becomes 0.

Note: t_{PCLK} is the operating clock of SCI3.

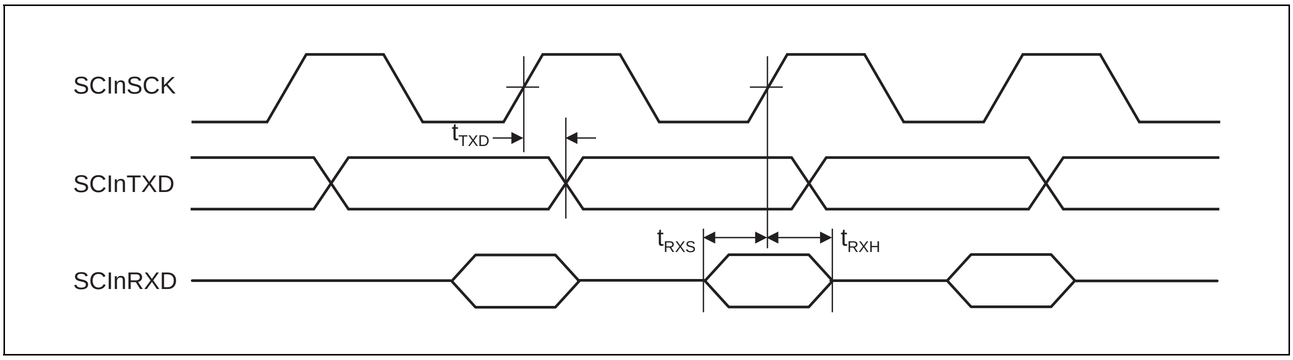

Figure 37.5 SCI Input/Output Timing, Clock Synchronous Mode (in Slave Mode)

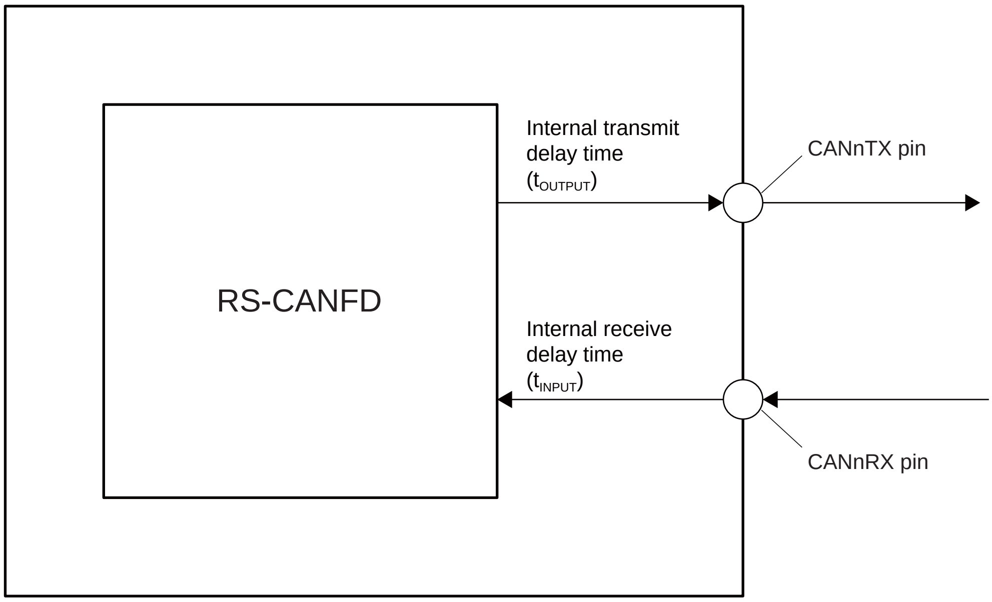
37.9.8 RS-CANFD Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.
Output signals are specified for the buffer “fast mode” and “middle mode”.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Internal delay time	t_{NODE}				50	ns
Transfer rate		CAN FD arbitration and CAN 2.0B			1	Mbps
		CAN FD data phase			8	Mbps

Internal delay time (t_{NODE}) = Internal transmit delay time (t_{OUTPUT}) + Internal receive delay time (t_{INPUT})



37.9.9 RLIN3 Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
RLIN3 transfer rate		LIN function	1		20	Kbps
		UART function			8	Mbps

37.9.10 FlexRay Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.
Output signals are specified for the buffer “fast mode”.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Transfer rate					10	Mbps

37.9.11 PSI5 Timing

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Bit time	(1)	125 Kbps	7.6	8.0	8.4	µs
	(2)	189 Kbps	5.0	5.3	5.6	µs
	(3)	250 Kbps		4.0		µs
Gap time	(4)	125 Kbps	8.4			µs
	(5)	189 Kbps	5.6			µs
	(6)	250 Kbps	2.0			µs

37.9.12 RSENT Timing

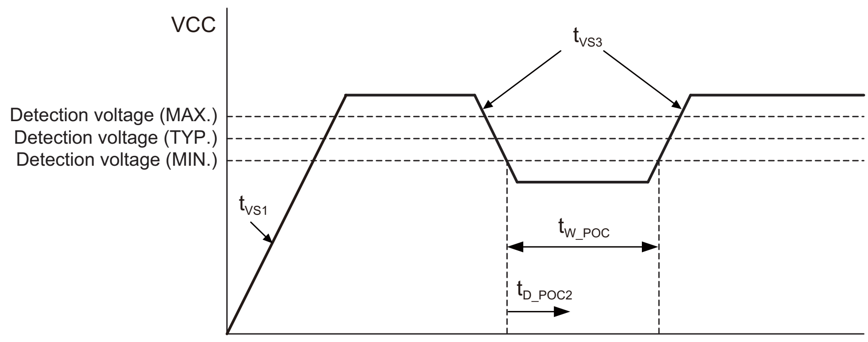
Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Tick Time			1		90	µs

37.10 POC Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Detection voltage	VPOC	Rising	2.7	2.85	3.0	V
		Falling	2.7	2.8	2.9	V
Response time 2	t_{D_POC2}	After power on Voltage ramp (t_{VS3}) = 0.02 V/ms to 20 V/ms			2	ms
VCC minimum width	t_{W_POC}		0.2			ms
VCC voltage ramp	t_{VS3}		0.02		20	V/ms



37.11 Core Voltage Monitor Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
High VDD Detection voltage	VCVMH		1.35	1.40	1.45	V
Low VDD Detection voltage	VCVML		1.10	1.15	1.20	V
Response time	t_{D_CVM}				12	μs

37.12 Temperature Sensor

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Temperature precision		Tj = +25 to +150°C	–6		6	°C
		Tj = –40 to +25°C	–12		12	°C
Operation stabilization waiting time	t_{TSSB}		200			μs

37.13 BIST Execution Time

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
BIST execution time					30	ms

37.14 A/D Convertor Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

(1/2)

Item	Symbol	Condition		MIN.	TYP.	MAX.	Unit
Macro operation clock						40	MHz
Resolution	RESn				12		bit
Conversion time	t_{CONn}	ADCGnSMPCR = 0000_H, CLK_ADC = 40 MHz			1		μs
		ADCGnSMPCR = $90CC_H$, CLK_ADC = 20 MHz			11.3		μs
Total errors[*1]	TOEn	AnVCC, AnVREFH = 4.3 V to 5.5 V, AnVCC – AnVREFH < 1V	ADCGnIm, When channel T&H is not used			±4.0	LSB
			ADCGnIm, When channel T&H is used			±6.0	LSB

			ADCGnIm, When channel T&H is used			±7.5	LSB
Analog input voltage	VAINmSN	AnVCC – AnVREFH < 1 V	When channel T&H is not used	AnVSS		AnVREFH	V
			When channel T&H is used	AnVSS + 0.2 V		AnVREFH –0.2 V	V
Sampling time	t_{SMP}	ADCGnSMPCR = 0000_H, CLK_ADC = 40 MHz			t_{CONn} × (18/40)		μs
		ADCGnSMPCR = $90CC_H$, CLK_ADC = 20 MHz			t_{CONn} × (204/226)		μs
Channel T&H hold time*2	t_{THHOLD}					10	μs
Pull-up resistor for A/D wiring break detection	RU_AIN	VIN = AnVSS		10	20	40	kΩ
Pull-down resistor for A/D wiring break	RD_AIN	VIN = AnVCC		10	20	40	kΩ
Total errors at self-diagnosis	TESH0SN	When A/D conversion circuit self-diagnostic function is used				±40	LSB
		When pin-level self-diagnosis is used	AnVREFH = 4.3 V to 5.5 V			±80	LSB
			AnVREFH = 3.0 V to 4.3 V			±170	LSB
Equivalent input capacitance	CIN	During standby				10	pF
		During sampling				20	pF
Allowable analog signal impedance		Apply 0.1μF to analog pin				20	kΩ

Note 1. The values in the above table do not include quantization errors.

Note 2. Available retain time of sampling value by T&H circuit. Between sampling completion by T&H circuit and sampling completion of 12 bit SAR-AD by S/H circuit need to be executed within this time.

Note: n = 0,1 (number of units)
m = 0 to 11 (number of channels)

CAUTION

If current is injected to an analog input pin during the pin-level self-diagnosis, the conversion accuracy of the diagnostic voltage for the corresponding channel is not guaranteed.

37.15 Code Flash Characteristics

Table 37.11 Code Flash Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Flash Sequencer Operating frequency	f_{CLKP_L}				40	MHz
Programming endurance*1	CWRT	Retained for 20 years*2	1000			Times
Temperature range of programming	TPRG	Tj	–40		150	°C
Temperature range of reading	TREAD	Tj	–40		150	°C

Note 1. Programming endurance is defined as the number of times each block is erased. Where programming endurance is n times (n = 1000 in this case), each block is erasable n times. For example, given a memory device that has 32-Kbyte erasure blocks, programming in the address range of each 256-byte programming block (128 programming operations, one for each block) in an erasure block and then erasing the block counts as one time in terms of programming endurance. However, programming of a given address range more than once after erasure is not possible (overwriting after programming is prohibited).

Note 2. This is the case when the average Ta is 85°C.

Table 37.12 Code Flash Programming Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Condition	Block Size	MIN.	TYP.	MAX.	Unit
Programming time*1	Programming endurance < 100 times	256 B		2*1	6*1	ms
		32 KB		200	360	ms
	Programming endurance ≥ 100 times	256 B		2.4*1	7.2*1	ms
		32 KB		240	432	ms
Erasing time*1	Programming endurance < 100 times	8 KB		50	120	ms
		32 KB		200	480	ms
	Programming endurance ≥ 100 times	8 KB		60	144	ms
		32 KB		240	576	ms

Note 1. Values are only for processing by hardware. Software overhead is not taken into account.

37.16 Data Flash Characteristics

Table 37.13 Data Flash Basic Characteristics

Item	Symbol	Condition	MIN.	TYP.	MAX.	Unit
Flash Sequencer Operating frequency	f_{CLKP_L}				40	MHz
Programming endurance*1	DWRT	Retained for 20 years*2	125000			Times
		Retained for 3 years*2	250000			Times
Temperature range of programming	TPRG	Tj	–40		150	°C
Temperature range of reading	TREAD	Tj	–40		150	°C

Note 1. Programming endurance is defined as the number of times each block is erased. Where programming endurance is n times (n = 125000 in this case), each block is erasable n times. For example, given a memory device that has 64-byte erasure blocks, programming in the address range of each 4-byte programming block (16 programming operations, one for each block) in an erasure block and then erasing the block counts as one time in terms of programming endurance. However, programming of a given address range more than once after erasure is not possible (overwriting after programming is prohibited).

Note 2. This is the case when the average Ta is 85°C.

Table 37.14 Data Flash Programing Characteristics

Conditions: See **Section 37.1.1.1, Common Conditions**.

Item	Block Size	MIN.	TYP.	MAX.	Unit
Programming time	4 B		0.3*1	1.7*1	ms
	32 KB		2.5	6.8	s
Erasing time	64 B		3*1	10*1	ms
	32 KB		1.6	5.2	s
Blank check time	4 B			30*1	µs
	64 B			100*1	µs

Note 1. Values are only for processing by hardware. Software overhead is not taken into account.
